## AP Practice Questions ........................................ 1051
Chapter 1

Functions

1.1 Review of Functions

1.1.1 A function is a rule which assigns each domain element to a unique range element. The independent variable is associated with the domain, while the dependent variable is associated with the range.

1.1.2 The independent variable belongs to the domain, while the dependent variable belongs to the range.

1.1.3 The vertical line test is used to determine whether a given graph represents a function. (Specifically, it tests whether the variable associated with the vertical axis is a function of the variable associated with the horizontal axis). If every vertical line intersects the graph at most one point, then the given graph represents a function. If any vertical line \( x = a \) intersects the curve in more than one point, then there is more than one range value for the domain value \( x = a \), so the given curve does not represent a function.

1.1.4 \( f(2) = \frac{1}{2^2 + 1} = \frac{1}{5} \cdot f(y^2) = \frac{1}{(y^2)^2 + 1} = \frac{1}{y^4 + 1}. \)

1.1.5 Item i. is true while item ii. isn’t necessarily true. In the definition of function, item i. is stipulated. However, item ii. need not be true – for example, the function \( f(x) = x^2 \) has two different domain values associated with the one range value 4, because \( f(2) = f(-2) = 4. \)

1.1.6 We have

\[
(f \circ g)(x) = f(g(x)) = f(x^3 - 2) = \sqrt{x^3 - 2}
\]

\[
(g \circ f)(x) = g(f(x)) = g(\sqrt{x}) = x^{3/2} - 2
\]

\[
(f \circ f)(x) = f(f(x)) = f(\sqrt{x}) = \sqrt{\sqrt{x}} = \sqrt{x}
\]

\[
(g \circ g)(x) = g(g(x)) = g(x^3 - 2) = (x^3 - 2)^3 - 2 = x^9 - 6x^6 + 12x^3 - 10.
\]

1.1.7 \( f(g(2)) = f(-2) = f(2) = 2. \) The fact that \( f(-2) = f(2) \) follows from the fact that \( f \) is an even function. Also, \( g(f(-2)) = g(f(2)) = g(2) = -2 \), again using the fact that \( f(-2) = f(2) \) since \( f \) is an even function.

1.1.8 The domain of \( f \circ g \) is the subset of the domain of \( g \) whose range is in the domain of \( f \). Thus, we need to look for elements \( x \) in the domain of \( g \) so that \( g(x) \) is in the domain of \( f \).
1.1.9

The defining property for an even function is that \( f(-x) = f(x) \), which ensures that the graph of the function is symmetric about the y-axis. The plot to the right is the graph of \( f(x) = x^4 - 3x^2 + 2 \), which is an even function.

1.1.10

The defining property for an odd function is that \( f(-x) = -f(x) \), which ensures that the graph of the function is symmetric about the origin.

1.1.11 Graph A does not represent a function, while graph B does. Note that graph A fails the vertical line test, while graph B passes it.

1.1.12 Graph A does not represent a function, while graph B does. Note that graph A fails the vertical line test, while graph B passes it.

1.1.13

The natural domain of this function is the set of all real numbers. The range is \([-10, \infty)\).

1.1.14

The natural domain of this function is \((-\infty, -2) \cup (-2, 3) \cup (3, \infty)\). The range is the set of all real numbers.
1.1.15

The natural domain of this function is \([-2, 2]\). The range is \([0, 2]\).

1.1.16

The natural domain of this function is \((-\infty, 2]\). The range is \([0, \infty)\).

1.1.17

The natural domain and the range for this function are both the set of all real numbers.

1.1.18

The natural domain of this function is \([-5, \infty)\). The range is approximately \([-9.03, \infty)\).
1.1.19

The natural domain of this function is $[-3, 3]$. The range is $[0, 27]$.

1.1.20

The natural domain of this function is the set of all real numbers. The range is $(0, 1)$.

1.1.21 The independent variable $t$ is elapsed time and the dependent variable $d$ is distance above the ground. The domain in context is $[0, 8]$, since the stone is thrown at time $t = 0$ and it hits the ground at time $t = 8$.

1.1.22 The independent variable $t$ is elapsed time and the dependent variable $d$ is distance above the water. The domain in context is $[0, 2]$, since the stone is dropped at time $t = 0$ and hits the water at time $t = 2$.

1.1.23 The independent variable $h$ is the height of the water in the tank and the dependent variable $V$ is the volume of water in the tank. The domain in context is $[0, 50]$, since the height of the water must be nonnegative and cannot exceed the height of the tank itself.

1.1.24 The independent variable $r$ is the radius of the balloon and the dependent variable $V$ is the volume of the balloon. The domain in context is $\left[0, \sqrt{\frac{3}{\pi}}\right]$, since this is the radius corresponding to the maximum volume of $1 \text{ m}^3$.

1.1.25 $f(10) = 96$

1.1.26 $f(p^2) = (p^2)^2 - 4 = p^4 - 4$

1.1.27 $g\left(\frac{1}{2}\right) = \left(\frac{1}{2}\right)^3 = \frac{1}{8}$

1.1.28 $F(y^4) = \frac{1}{y^{1/3}}$

1.1.29 $F(g(y)) = F(y^3) = \frac{1}{y^{1/3}}$

1.1.30 $f(g(w)) = f(w^3) = (w^3)^2 - 4 = w^6 - 4$

1.1.31 $g(f(u)) = g(u^2 - 4) = (u^2 - 4)^3$

1.1.32 $\frac{f(2 + h) - f(2)}{h} = \frac{(2 + h)^2 - 4 - 0}{h} = \frac{4 + 4h + h^2 - 4}{h} = \frac{4h + h^2}{h} = 4 + h$

1.1.33 $F(F(x)) = F\left(\frac{1}{x - 3}\right) = \frac{1}{x - 3} - 3 = \frac{1}{x - 3} - \frac{3(x - 3)}{x - 3} = \frac{1}{x - 3} - \frac{10 - 3x}{10 - 3x} = \frac{x - 3}{10 - 3x}$

1.1.34 $g(F(x^2 - 4)) = g(F(x^2 - 3)) = g\left(\frac{1}{x^2 - 4 - 3}\right) = \left(\frac{1}{x^2 - 7}\right)^3$
1.1.35  \( f(\sqrt{x + 4}) = (\sqrt{x + 4})^2 - 4 = x + 4 - 4 = x \).

1.1.36  \( F\left(\frac{3x + 1}{x}\right) = \frac{1}{\frac{3x+1}{x} - 3} = \frac{1}{\frac{3x+1-3x}{x}} = \frac{x}{3x+1-3x} = x \).

1.1.37  \( g(x) = x^3 - 5 \) and \( f(x) = x^{10} \). The domain of \( h \) is the set of all real numbers.

1.1.38  \( g(x) = x^6 + x^2 + 1 \) and \( f(x) = \frac{2}{x} \). The domain of \( h \) is the set of all real numbers.

1.1.39  \( g(x) = x^4 + 2 \) and \( f(x) = \sqrt[3]{x} \). The domain of \( h \) is the set of all real numbers.

1.1.40  \( g(x) = x^3 - 1 \) and \( f(x) = \frac{1}{\sqrt[3]{x}} \). The domain of \( h \) is the set of all real numbers for which \( x^3 - 1 > 0 \), which corresponds to the set \((1, \infty)\).

1.1.41  \((f \circ g)(x) = f(g(x)) = f(x^2 - 4) = |x^2 - 4|\). The domain of this function is the set of all real numbers.

1.1.42  \((g \circ f)(x) = g(f(x)) = g(|x|) = |x|^2 - 4 = x^2 - 4 \). The domain of this function is the set of all real numbers.

1.1.43  \((f \circ G)(x) = f(G(x)) = f\left(\frac{1}{x^2 - 2}\right) = \left|\frac{1}{x^2 - 2}\right|.\) The domain of this function is the set of all real numbers except for the number 2, so it is \(\{x : x \neq 2\}\).

1.1.44  \((f \circ g \circ G)(x) = f(g(G(x))) = f\left(\frac{1}{\sqrt{x}}\right) = f\left(\frac{1}{\sqrt{x}} \right)^2 - 4 = \left|\frac{1}{\sqrt{x}}\right|^2 - 4 \). The domain of this function is the set of all real numbers except for the number 2, so it is \(\{x : x \neq 2\}\).

1.1.45  \((G \circ g \circ f)(x) = G(f(g(x))) = G(g(|x|)) = G(x^2 - 4) = \frac{1}{x^2 - 4} = \frac{1}{x^2 - 6}.\) The domain of this function is the set of all real numbers except for the numbers \(\pm\sqrt{6}\), so it is \(\{x : x \neq \pm\sqrt{6} \}\).

1.1.46  \((F \circ g \circ g)(x) = F(g(g(x))) = F((x^2 - 4)^2 - 4) = \sqrt{(x^2 - 4)^2 - 4} = \sqrt{x^4 - 8x^2 + 12}.\) The domain of this function consists of the numbers \(x\) so that \(x^4 - 8x^2 + 12 \geq 0\). Because \(x^4 - 8x^2 + 12 = (x^2 - 6) \cdot (x^2 - 2)\), we see that this expression is zero for \(x = \pm\sqrt{6}\) and \(x = \pm\sqrt{2}\). By looking between these points, we see that the expression is greater than or equal to zero for the set \((-\infty, -\sqrt{6}] \cup [-\sqrt{2}, \sqrt{2}] \cup [\sqrt{6}, \infty)\).

1.1.47  \((g \circ g)(x) = g(g(x)) = (x^2 - 4)^2 - 4 = x^4 - 8x^2 + 16 - 4 = x^4 - 8x^2 + 12.\) Since the domain of \(g\) is all real numbers, so is the domain of \(g \circ g\).

1.1.48  \((G \circ g)(x) = G(G(x)) = G(1/(x - 2)) = \frac{1}{x-2} = \frac{1}{\frac{1-2(x-2)}{x-2}} = \frac{x-2}{1-2x+4} = \frac{x-2}{5-2x}.\) Then \(G \circ G\) is defined except where the denominator vanishes, so its domain is all real numbers except for \(x = \frac{5}{2}\).

1.1.49  Because \((x^2 + 3) - 3 = x^2\), we may choose \(f(x) = x - 3\).

1.1.50  Because the reciprocal of \(x^2 + 3\) is \(\frac{1}{x^2+3}\), we may choose \(f(x) = \frac{1}{x}\).

1.1.51  Because \((x^2 + 3)^2 = x^4 + 6x^2 + 9\), we may choose \(f(x) = x^2\).

1.1.52  Because \((x^2 + 3)^2 = x^4 + 6x^2 + 9\), and the given expression is 11 more than this, we may choose \(f(x) = x^2 + 11\).

1.1.53  Because \((x^2)^2 + 3 = x^4 + 3\), this expression results from squaring \(x^2\) and adding 3 to it. Thus we may choose \(f(x) = x^2\).

1.1.54  Because \(x^{2/3} + 3 = (\sqrt[3]{x})^2 + 3\), we may choose \(f(x) = \sqrt[3]{x}\).

1.1.55

\begin{itemize}
\item[a.] \(f(g(2)) = f(2) = 4\)
\item[b.] \(g(f(2)) = g(4) = 1\)
\item[c.] \(f(g(4)) = f(1) = 3\)
\item[d.] \(g(f(5)) = g(6) = 3\)
\item[e.] \(f(g(7)) = f(4) = 7\)
\item[f.] \(f(f(8)) = f(8) = 8\)
\end{itemize}
1.1.56

a. \( h(g(0)) = h(0) = -1 \)  
b. \( g(f(4)) = g(-1) = -1 \)
c. \( h(h(0)) = h(-1) = 0 \)  
d. \( g(h(f(4))) = g(h(-1)) = g(0) = 0 \)
e. \( f(f(f(1))) = f(f(0)) = f(1) = 0 \)  
f. \( h(h(h(0))) = h(h(-1)) = h(0) = -1 \)
g. \( f(h(g(2))) = f(h(3)) = f(0) = 1 \)  
h. \( g(f(h(4))) = g(f(4)) = g(-1) = -1 \)
i. \( g(g(g(1))) = g(g(2)) = g(3) = 4 \)  
j. \( f(f(f(h(3)))) = f(f(0)) = f(1) = 0 \)

1.1.57 We have

\[
\frac{f(x+h) - f(x)}{h} = \frac{(x+h)^2 - x^2}{h} = \frac{(x^2 + 2hx + h^2) - x^2}{h} = \frac{h(2x + h)}{h} = 2x + h
\]

\[
\frac{f(x) - f(a)}{x-a} = \frac{x^2 - a^2}{x-a} = \frac{(x-a)(x+a)}{x-a} = x + a.
\]

1.1.58 We have

\[
\frac{f(x+h) - f(x)}{h} = \frac{4(x+h) - 3 - (4x - 3)}{h} = \frac{4x + 4h - 3 - 4x + 3}{h} = \frac{4h}{h} = 4
\]

\[
\frac{f(x) - f(a)}{x-a} = \frac{4x - 3 - (4a - 3)}{x-a} = \frac{4x - 4a}{x-a} = \frac{4(x-a)}{x-a} = 4.
\]

1.1.59 We have

\[
\frac{f(x+h) - f(x)}{h} = \frac{\frac{2x}{x+h} - \frac{2}{x}}{h} = \frac{\frac{2x-2(x+h)}{x(x+h)}}{h} = \frac{2x - 2x - 2h}{hx(x+h)} = \frac{-2h}{hx(x+h)} = -\frac{2}{x(x+h)}
\]

\[
\frac{f(x) - f(a)}{x-a} = \frac{\frac{2}{x} - \frac{2}{a}}{x-a} = \frac{\frac{2a - 2x}{ax}}{x-a} = \frac{2(a-x)}{(x-a)ax} = \frac{2(x-a)}{(x-a)ax} = \frac{2}{ax}.
\]

1.1.60 We have

\[
\frac{f(x+h) - f(x)}{h} = \frac{2(x+h)^2 - 3(x+h) + 1 - (2x^2 - 3x + 1)}{h}
\]

\[
= \frac{2x^2 + 4xh + 2h^2 - 3x - 3h + 1 - 2x^2 + 3x - 1}{h}
\]

\[
= \frac{4xh + 2h^2 - 3h}{h}
\]

\[
= \frac{h(4x + 2h - 3)}{h} = 4x + 2h - 3
\]

\[
\frac{f(x) - f(a)}{x-a} = \frac{2x^2 - 3x + 1 - (2a^2 - 3a + 1)}{x-a}
\]

\[
= \frac{2(x^2 - a^2) - 3(x-a)}{x-a}
\]

\[
= \frac{(x-a)(2x + a) - 3(x-a)}{x-a} = \frac{(x-a)(2x + a - 3) = 2(x + a) - 3 = 2x + 2a - 3}{x-a}
\]

Copyright © 2014 Pearson Education, Inc.
1.1.61 We have

\[
\frac{f(x + h) - f(x)}{h} = \frac{x + h - x}{x + 1} = \frac{(x + h)(x + 1) - x(x + h + 1)}{(x + 1)(x + h + 1)} = \frac{h}{x + h + 1}
\]

\[
= \frac{x^2 + x + h - x^2 - xh - x}{h(x + 1)(x + h + 1)}
\]

\[
= \frac{h(x + 1)(x + h + 1)}{h}
\]

\[
= \frac{1}{(x + 1)(x + h + 1)}
\]

1.1.62 We have

\[
\frac{f(x + h) - f(x)}{h} = \frac{(x + h)^4 - x^4}{h}
\]

\[
= \frac{x^4 + 4x^3h + 6x^2h^2 + 4xh^3 + h^4 - x^4}{h}
\]

\[
= \frac{h(x^4 + 6x^2h + 4xh^2 + h^3)}{h}
\]

\[
= \frac{4x^3 + 6x^2h + 4xh^2 + h^3}{h}
\]

\[
\frac{f(x) - f(a)}{x - a} = \frac{x^4 - a^4}{x - a} = \frac{(x - a)(x + a)(x^2 + a^2)}{x - a} = \frac{x - a}{x + 1}(x + 1)(a + 1) = (x + a)(x^2 + a^2).
\]

1.1.63 We have

\[
\frac{f(x + h) - f(x)}{h} = \frac{(x + h)^3 - 2(x + h) - (x^3 - 2x)}{h}
\]

\[
= \frac{x^3 + 3x^2h + 3xh^2 + h^3 - 2x - 2h - x^3 - 2x}{h}
\]

\[
= \frac{h(3x^2 + 3xh + h^2 - 2)}{h}
\]

\[
= 3x^2 + 3xh + h^2 - 2
\]

\[
\frac{f(x) - f(a)}{x - a} = \frac{x^3 - 2x - (a^3 - 2a)}{x - a}
\]

\[
= \frac{(x^3 - a^3) - 2(x - a)}{x - a}
\]

\[
= \frac{(x - a)(x^2 + ax + a^2) - 2(x - a)}{x - a}
\]

\[
= \frac{(x - a)(x^2 + ax + a^2 - 2)}{x - a} = x^2 + ax + a^2 - 2.
\]
1.1.64 We have
\[
\frac{f(x+h) - f(x)}{h} = \frac{4-4(x+h) - (x+h)^2 - (4-4x-x^2)}{h} = \frac{4-4x-4h-x^2-2xh-h^2-4+4x+x^2}{h} = \frac{-4h-2xh-h^2}{h} = -4-2x
\]
\[
\frac{f(x) - f(a)}{x-a} = \frac{4-4x-x^2-(4-4a-a^2)}{x-a} = \frac{-4(x-a) - (x^2-a^2)}{x-a} = \frac{-4(x-a)-(x-a)(x+a)}{x-a} = \frac{(x-a)(-4-(x+a))}{x-a} = -4-x-a.
\]

1.1.65 We have
\[
\frac{f(x+h) - f(x)}{h} = \frac{-4}{(x+h)^2} - \frac{4}{x^2} = \frac{-4x^2+4x^2}{x^2(x+h)^2} = \frac{-4x^2+4x^2+8xh+4h^2}{x^2(x+h)^2h} = \frac{8x+4h}{x^2(x+h)^2}
\]
\[
\frac{f(x) - f(a)}{x-a} = \frac{-4}{x^2} - \frac{-4}{a^2} = \frac{a^2-4}{x^2} = \frac{4(x^2-a^2)}{(x-a)a^2x^2} = \frac{4(x-a)(x+a)}{a^2x^2} = \frac{4(x+a)}{a^2x^2}.
\]

1.1.66 We have
\[
\frac{f(x+h) - f(x)}{h} = \frac{\frac{1}{x+h} - (x+h)^2 - \left(\frac{1}{x} - x^2\right)}{h} = \frac{\frac{1}{x+h} - \frac{1}{x} - (x+h)^2 - x^2}{h} = \frac{x-(x+h)}{x(x+h)} = \frac{x^2+2xh+h^2-x^2}{x(x+h)} = -\frac{h(2x+h)}{hx(x+h)} = -\frac{1}{x(x+h)} - \frac{2x+h}{x(x+h)}
\]
\[
\frac{f(x) - f(a)}{x-a} = \frac{\frac{1}{x} - x^2 - \left(\frac{1}{a} - a^2\right)}{x-a} = \frac{\frac{1}{x} - \frac{1}{a} - x^2 + a^2}{x-a} = \frac{\frac{a-x}{ax} - (x-a)(x+a)}{x-a} = -\frac{1}{ax} - (x+a).
\]

1.1.67

a.

b. The slope of the secant line is given by \[
\frac{400-64}{\frac{1}{2}} = \frac{336}{1} = 112 \text{ feet per second. The object falls at an average rate of 112 feet per second over the interval } 2 \leq t \leq 5.
\]
1.1.68

a. The slope of the secant line is given by \[ \frac{H_{20} - H_{5}}{20 - 5} = \frac{90}{15} = 6 \text{ degrees per second.} \] The second hand moves at an average rate of 6 degrees per second over the interval \( 5 \leq t \leq 20 \).

b. The slope of the secant line is given by \[ \frac{H_{20} - H_{5}}{20 - 5} = \frac{90}{15} = 6 \text{ degrees per second.} \] The second hand moves at an average rate of 6 degrees per second over the interval \( 5 \leq t \leq 20 \).

1.1.69

a. The slope of the secant line is given by \[ \frac{V_{(2,1)} - V_{(1/2,4)}}{2 - (1/2)} = \frac{-3}{\sqrt{2}} = -2 \text{ cubic cm per atmosphere.} \] The volume decreases at an average rate of 2 cubic cm per atmosphere over the interval \( 0.5 \leq p \leq 2 \).

b. The slope of the secant line is given by \[ \frac{V_{(2,1)} - V_{(1/2,4)}}{2 - (1/2)} = \frac{-3}{\sqrt{2}} = -2 \text{ cubic cm per atmosphere.} \] The volume decreases at an average rate of 2 cubic cm per atmosphere over the interval \( 0.5 \leq p \leq 2 \).

1.1.70

a. The slope of the secant line is given by \[ \frac{S_{(50,30\sqrt{5})} - S_{(50,10\sqrt{3})}}{150 - 50} \approx 0.284 \text{ mph per foot.} \] The speed of the car changes with an average rate of about 0.284 mph per foot over the interval \( 50 \leq l \leq 150 \).

b. The slope of the secant line is given by \[ \frac{S_{(50,30\sqrt{5})} - S_{(50,10\sqrt{3})}}{150 - 50} \approx 0.284 \text{ mph per foot.} \] The speed of the car changes with an average rate of about 0.284 mph per foot over the interval \( 50 \leq l \leq 150 \).

1.1.71 This function is symmetric about the \( y \)-axis, because
\[ f(-x) = (-x)^4 + 5(-x)^2 - 12 = x^4 + 5x^2 - 12 = f(x). \]

1.1.72 This function is symmetric about the origin, because
\[ f(-x) = 3(-x)^5 + 2(-x)^3 - (-x) = -3x^5 - 2x^3 + x = -(3x^5 + 2x^3 - x) = f(x). \]

1.1.73 This function has none of the indicated symmetries. For example, note that \( f(-2) = -26 \), while \( f(2) = 22 \), so \( f \) is not symmetric about either the origin or about the \( y \)-axis, and is not symmetric about the \( x \)-axis because it is a function.

1.1.74 This function is symmetric about the \( y \)-axis. Note that \( f(-x) = 2|x| = 2|x| = f(x) \).
1.1.75 This function is symmetric about the origin. Note that replacing either \( x \) by \(-x\) or \( y \) by \(-y\) (or both) yields the same equation. This is due to the fact that \((-x)^{2/3} = ((-x)^2)^{1/3} = (x^2)^{1/3} = x^{2/3}\), and a similar fact holds for the term involving \( y \).

1.1.76 This function is symmetric about the origin. Writing the function as \( y = f(x) = x^{3/5} \), we see that \( f(-x) = (-x)^{3/5} = -(x^{3/5}) = -f(x) \).

1.1.77 This function is symmetric about the origin. Note that \( f(-x) = -x \cdot |x| = -x \cdot |x| = -f(x) \).

1.1.78 This curve (which is not a function) is symmetric about the origin. Writing the function as \( f(x) = \frac{x}{|x|} \), we see that \( f(-x) = x/|x| = f(x) \). Then \( f(f(x)) = f(x) = x \), while \( (f(x))^2 = x^2 \).

1.1.79 Function \( A \) is symmetric about the \( y \)-axis, so is even. Function \( B \) is symmetric about the origin, so is odd. Function \( C \) is also symmetric about the \( y \)-axis, so is even.

1.1.80 Function \( A \) is symmetric about the \( y \)-axis, so is even. Function \( B \) is symmetric about the origin, so is odd. Function \( C \) is also symmetric about the origin, so is odd.

1.1.81

a. True. A real number \( z \) corresponds to the domain element \( \frac{z}{2} + 19 \), because

\[
f\left(\frac{z}{2} + 19\right) = 2\left(\frac{z}{2} + 19\right) - 38 = z + 38 - 38 = z.
\]

b. False. The definition of function does not require that each range element comes from a unique domain element, rather that each domain element is paired with a unique range element.

c. True. \( f\left(\frac{1}{x}\right) = \frac{1}{1/x} = x \), and \( \frac{1}{f(x)} = \frac{1}{1/x} = x \).

d. False. For example, suppose that \( f \) is the straight line through the origin with slope 1, so that \( f(x) = x \). Then \( f(f(x)) = f(x) = x \), while \( (f(x))^2 = x^2 \).

e. False. For example, let \( f(x) = x + 2 \) and \( g(x) = 2x - 1 \). Then \( f(g(x)) = f(2x - 1) = 2x - 1 + 2 = 2x + 1 \), while \( g(f(x)) = g(x + 2) = 2(x + 2) - 1 = 2x + 3 \).

f. True. In fact, this is the definition of \( f \circ g \).

g. True. If \( f \) is even, then \( f(-z) = f(z) \) for all \( z \), so this is true in particular for \( z = ax \). So if \( g(x) = cf(ax) \), then \( g(-x) = cf(-ax) = cf(ax) = g(x) \), so \( g \) is even.

h. False. For example, \( f(x) = x \) is an odd function, but \( h(x) = x + 1 \) isn’t, because \( h(2) = 3 \), while \( h(-2) = -1 \) which isn’t \(-h(2)\).

i. True. If \( f(-x) = -f(x) = f(x) \), then in particular \(-f(x) = f(x)\), so \( 0 = 2f(x) \), so \( f(x) = 0 \) for all \( x \).
If $n$ is odd, then $n = 2k + 1$ for some integer $k$, and $(x)^n = (x^{2k+1}) = x(x)^{2k}$, which is less than 0 when $x < 0$ and greater than 0 when $x > 0$. For any number $P$ (positive or negative) the number $\sqrt{P}$ is a real number when $n$ is odd, and $f(\sqrt{P}) = P$. So the range of $f$ in this case is the set of all real numbers.

If $n$ is even, then $n = 2k$ for some integer $k$, and $x^n = (x^2)^k$. Thus $g(-x) = g(x) = (x^2)^k \geq 0$ for all $x$. Also, for any nonnegative number $M$, we have $g(\sqrt{M}) = M$, so the range of $g$ in this case is the set of all nonnegative numbers.

We will make heavy use of the fact that $|x|$ is $x$ if $x > 0$, and is $-x$ if $x < 0$. In the first quadrant where $x$ and $y$ are both positive, this equation becomes $x - y = 1$ which is a straight line with slope 1 and $y$-intercept $-1$. In the second quadrant where $x$ is negative and $y$ is positive, this equation becomes $-x - y = 1$, which is a straight line with slope $-1$ and $y$-intercept $-1$. In the third quadrant where both $x$ and $y$ are negative, we obtain the equation $-x - (-y) = 1$, or $y = x + 1$, and in the fourth quadrant, we obtain $x + y = 1$.

Graphing these lines and restricting them to the appropriate quadrants yields the following curve:

**1.1.84**

a. No. For example $f(x) = x^2 + 3$ is an even function, but $f(0)$ is not 0.

b. Yes. Because $f(-x) = -f(x)$, and because $0 = 0$, we must have $f(-0) = f(0) = -f(0)$, so $f(0) = -f(0)$, and the only number which is its own additive inverse is 0, so $f(0) = 0$.

**1.1.85** Because the composition of $f$ with itself has first degree, $f$ has first degree as well, so let $f(x) = ax + b$.

Then $(f \circ f)(x) = f(ax + b) = a(ax + b) + b = a^2x + (ab + b)$. Equating coefficients, we see that $a^2 = 9$ and $ab + b = -8$. If $a = 3$, we get that $b = -2$, while if $a = -3$ we have $b = 4$. So the two possible answers are $f(x) = 3x - 2$ and $f(x) = -3x + 4$.

**1.1.86** Since the square of a linear function is a quadratic, we let $f(x) = ax + b$. Then $f(x)^2 = a^2x^2 + 2abx + b^2$.

Equating coefficients yields that $a = \pm 3$ and $b = \pm 2$. However, a quick check shows that the middle term is correct only when one of these is positive and one is negative. So the two possible such functions are $f(x) = 3x - 2$ and $f(x) = -3x + 2$.

**1.1.87** Let $f(x) = ax^2 + bx + c$. Then $(f \circ f)(x) = f(ax^2 + bx + c) = a(ax^2 + bx + c)^2 + b(ax^2 + bx + c) + c$.

Expanding this expression yields $a^3x^4 + 2a^2bx^3 + 2ab^2x^2 + 2abx^2 + abc + abx^2 + b^2x + bc + c$, which simplifies to $a^3x^4 + 2a^2bx^3 + (2a^2c + ab^2 + ab)x^2 + (2abc + b^2)x + (ac^2 + bc + c)$. Equating coefficients yields $a^3 = 1$, so $a = 1$. Then $2a^2b = 0$, so $b = 0$. It then follows that $c = -6$, so the original function was $f(x) = x^2 - 6$. 

Copyright © 2014 Pearson Education, Inc.
Because the square of a quadratic is a quartic, we let \( f(x) = ax^2 + bx + c \). Then the square of \( f \) is \( c^2 + 2bex + b^2x^2 + 2acx^2 + 2abx^3 + a^2x^4 \). By equating coefficients, we see that \( a^2 = 1 \) and so \( a = \pm 1 \). Because the coefficient on \( x^3 \) must be 0, we have that \( b = 0 \). And the constant term reveals that \( c = \pm 6 \). A quick check shows that the only possible solutions are thus \( f(x) = x^2 + 6 \) and \( f(x) = -x^2 + 6 \).

\[
\frac{f(x + h) - f(x)}{h} = \frac{\sqrt{x + h} - \sqrt{x}}{h} = \frac{\sqrt{x + h} - \sqrt{x}}{h} \cdot \frac{\sqrt{x + h} + \sqrt{x}}{\sqrt{x + h} + \sqrt{x}} = \frac{(x + h) - x}{h(\sqrt{x + h} + \sqrt{x})} = \frac{1}{\sqrt{x + h} + \sqrt{x}}.
\]

\[
\frac{f(x) - f(a)}{x - a} = \frac{\sqrt{x} - \sqrt{a}}{x - a} = \frac{\sqrt{x} + \sqrt{a}}{\sqrt{x} + \sqrt{a}} - \frac{x - a}{(x - a)(\sqrt{x} + \sqrt{a})} = \frac{1}{\sqrt{x} + \sqrt{a}}.
\]

\[
\frac{f(x + h) - f(x)}{h} = \frac{\sqrt{1 - 2(x + h)} - \sqrt{1 - 2x}}{h}
= \frac{\sqrt{1 - 2(x + h)} - \sqrt{1 - 2x}}{h} \cdot \frac{\sqrt{1 - 2(x + h)} + \sqrt{1 - 2x}}{\sqrt{1 - 2(x + h)} + \sqrt{1 - 2x}}
= \frac{1 - 2(x + h) - (1 - 2x)}{h(\sqrt{1 - 2(x + h)} + \sqrt{1 - 2x})}
= -\frac{2}{\sqrt{1 - 2(x + h)} + \sqrt{1 - 2x}}.
\]

\[
\frac{f(x) - f(a)}{x - a} = \frac{\sqrt{1 - 2x} - \sqrt{1 - 2a}}{x - a}
= \frac{\sqrt{1 - 2x} - \sqrt{1 - 2a}}{x - a} \cdot \frac{\sqrt{1 - 2x} + \sqrt{1 - 2a}}{\sqrt{1 - 2x} + \sqrt{1 - 2a}}
= \frac{(1 - 2x) - (1 - 2a)}{(x - a)(\sqrt{1 - 2x} + \sqrt{1 - 2a})}
= \frac{2}{(x - a)(\sqrt{1 - 2x} + \sqrt{1 - 2a})}.
\]

Copyright © 2014 Pearson Education, Inc.
\[
\frac{f(x) - f(a)}{x - a} = \frac{\sqrt{a^2 + 1} - \sqrt{x^2 + 1}}{x - a} = \frac{\sqrt{a^2 + 1} - \sqrt{x^2 + 1}}{x - a} \cdot \frac{\sqrt{x^2 + 1} + \sqrt{a^2 + 1}}{\sqrt{x^2 + 1} + \sqrt{a^2 + 1}} = \frac{x + a}{\sqrt{x^2 + 1} + \sqrt{a^2 + 1}}.
\]

\[
\frac{f(x + h) - f(x)}{h} = \frac{(x + h)^2 + 1 - x^2 + 1}{h} = \frac{(x + h)^2 + 1 - x^2 + 1}{h} \cdot \frac{\sqrt{(x + h)^2 + 1} + \sqrt{x^2 + 1}}{\sqrt{(x + h)^2 + 1} + \sqrt{x^2 + 1}} = \frac{2x + h}{\sqrt{(x + h)^2 + 1} + \sqrt{x^2 + 1}}.
\]
1.1.93

a. The formula for the height of the rocket is valid from $t = 0$ until the rocket hits the ground, which is the positive solution to $-16t^2 + 96t + 80 = 0$, which the quadratic formula reveals is $t = 3 + \sqrt{14}$. Thus, the domain is $[0, 3 + \sqrt{14}]$.

b.

![Graph of a rocket's height over time]

The maximum appears to occur at $t = 3$. The height at that time would be 224.

1.1.94

a. $d(0) = (10 - 2.2 \cdot 0)^2 = 100$.

b. The tank is first empty when $d(t) = 0$, which is when $10 - 2.2t = 0$, or $t = \frac{50}{11}$.

c. An appropriate domain would be $[0, \frac{50}{11}]$.

1.1.95 This would not necessarily have either kind of symmetry. For example, $f(x) = x^2$ is an even function and $g(x) = x^3$ is odd, but the sum of these two is neither even nor odd.

1.1.96 This would be an odd function, so it would be symmetric about the origin. Suppose $f$ is even and $g$ is odd. Then $(f \cdot g)(-x) = f(-x)g(-x) = f(x) \cdot (-g(x)) = -(f \cdot g)(x)$.

1.1.97 This would be an odd function, so it would be symmetric about the origin. Suppose $f$ is even and $g$ is odd. Then $\frac{f}{g}(-x) = \frac{f(-x)}{g(-x)} = \frac{f(x)}{-g(x)} = -\frac{f}{g}(x)$.

1.1.98 This would be an even function, so it would be symmetric about the $y$-axis. Suppose $f$ is even and $g$ is odd. Then $f(g(-x)) = f(g(x))$, because $g(-x) = g(x)$.

1.1.99 This would be an even function, so it would be symmetric about the $y$-axis. Suppose $f$ is even and $g$ is even. Then $f(g(-x)) = f(g(x))$, because $g(-x) = g(x)$.

1.1.100 This would be an odd function, so it would be symmetric about the origin. Suppose $f$ is odd and $g$ is odd. Then $f(g(-x)) = f(-g(x)) = -f(g(x))$.

1.1.101 This would be an even function, so it would be symmetric about the $y$-axis. Suppose $f$ is even and $g$ is odd. Then $g(f(-x)) = g(f(x))$, because $f(-x) = f(x)$.

1.1.102

a. $f(g(-1)) = f(g(1)) = f(3) = 3$

b. $g(f(-4)) = g(f(4)) = g(-4) = -g(4) = -2$

c. $f(g(-3)) = f(g(3)) = f(4) = -4$

d. $f(g(-2)) = f(-g(2)) = f(1) = 2$

e. $g(f(-1)) = g(-g(1)) = g(3) = -4$

f. $f(g(0)-1) = f(-1) = f(1) = 2$

g. $f(g(-2)) = f(g(-2)) = f(g(1)) = f(-3) = 3$

h. $g(f(f(-4))) = g(f(-4)) = g(-4) = 2$

i. $g(g(g(-1))) = g(g(-g(1)) = g(g(3)) = g(-4) = 2$

1.1.103

a. $f(g(-2)) = f(-g(2)) = f(-2) = 4$

b. $g(f(-2)) = g(f(2)) = g(4) = 1$

c. $f(g(-4)) = f(-g(4)) = f(-1) = 3$

d. $g(f(5)-8) = g(-2) = -g(2) = -2$

e. $g(g(-7)) = g(-g(7)) = g(-4) = -1$

f. $f(1 - f(8)) = f(-7) = 7$
1.2 Representing Functions

1.2.1 Functions can be defined and represented by a formula, through a graph, via a table, and by using words.

1.2.2 The domain of every polynomial is the set of all real numbers.

1.2.3 The domain of a rational function \( \frac{p(x)}{q(x)} \) is the set of all real numbers for which \( q(x) \neq 0 \).

1.2.4 A piecewise linear function is one that is linear over intervals in the domain.

1.2.5 Compared to the graph of \( f(x) \), the graph of \( f(x + 2) \) will be shifted 2 units to the left.

1.2.6 Compared to the graph of \( f(x) \), the graph of \( -3f(x) \) will be stretched vertically by a factor of 3 and flipped about the \( x \) axis.

1.2.7 Compared to the graph of \( f(x) \), the graph of \( f(3x) \) will be compressed horizontally by a factor of 3.

1.2.8 To produce the graph of \( y = 4(x + 3)^2 + 6 \) from the graph of \( x^2 \), one must
   a. shift the graph horizontally by 3 units to left
   b. scale the graph vertically by a factor of 4
   c. shift the graph vertically up 6 units.

1.2.9 The slope of the line shown is \( m = \frac{-3-(-1)}{3-0} = -\frac{2}{3} \). The \( y \)-intercept is \( b = -1 \). Thus the function is given by \( f(x) = -\frac{2}{3}x - 1 \).

1.2.10 The slope of the line shown is \( m = \frac{1-(-5)}{5-0} = \frac{4}{5} \). The \( y \)-intercept is \( b = 5 \). Thus the function is given by \( f(x) = -\frac{4}{5}x + 5 \).

1.2.11 The slope is given by \( \frac{5-3}{2-1} = 2 \), so the equation of the line is \( y - 3 = 2(x - 1) \), which can be written as \( y = 2x - 2 + 3 \), or \( y = 2x + 1 \).
1.2.14

The slope is given by \( \frac{0 - (-3)}{5 - 2} = 1 \), so the equation of the line is \( y - 0 = 1(x - 5) \), or \( y = x - 5 \).

1.2.15 Using price as the independent variable \( p \) and the average number of units sold per day as the dependent variable \( d \), we have the ordered pairs \((250, 12)\) and \((200, 15)\). The slope of the line determined by these points is \( m = \frac{15 - 12}{200 - 250} = \frac{3}{-50} \). Thus the demand function has the form \( d(p) = -\frac{3}{50}p + b \) for some constant \( b \). Using the point \((200, 15)\), we find that \( 15 = -\frac{3}{50} \cdot 200 + b \), so \( b = 27 \). Thus the demand function is \( d = -\frac{3}{50}p + 27 \). While the natural domain of this linear function is the set of all real numbers, the formula is only likely to be valid for some subset of the interval \([0, 450]\), because outside of that interval either \( p < 0 \) or \( d < 0 \).

1.2.16 The profit is given by \( p = f(n) = 8n - 175 \). The break-even point is when \( p = 0 \), which occurs when \( n = \frac{175}{8} = 21.875 \), so they need to sell at least 22 tickets to not have a negative profit.

1.2.17 The slope is given by the rate of growth, which is 24. When \( t = 0 \) (years past 2010), the population is 500, so the point \((0, 500)\) satisfies our linear function. Thus the population is given by \( p(t) = 24t + 500 \). In 2025, we have \( t = 15 \), so the population will be approximately \( p(15) = 360 + 500 = 860 \).

1.2.18 The cost per mile is the slope of the desired line, and the intercept is the fixed cost of 3.5. Thus, the cost per mile is given by \( c(m) = 2.5m + 3.5 \). When \( m = 9 \), we have \( c(9) = 2.5 \cdot 9 + 3.5 = 22.5 + 3.5 = 26 \) dollars.
1.2.19 For $x < 0$, the graph is a line with slope 1 and $y$-intercept 3, while for $x > 0$, it is a line with slope $-\frac{1}{2}$ and $y$-intercept 3. Note that both of these lines contain the point $(0, 3)$. The function shown can thus be written

$$f(x) = \begin{cases} 
  x + 3 & \text{if } x < 0; \\
  -\frac{1}{2}x + 3 & \text{if } x \geq 0.
\end{cases}$$

1.2.20 For $x < 3$, the graph is a line with slope 1 and $y$-intercept 1, while for $x > 3$, it is a line with slope $= \frac{1}{3}$. The portion to the right thus is represented by $y = -\frac{1}{3}x + b$, but because it contains the point $(6, 1)$, we must have $1 = -\frac{1}{3} \cdot 6 + b$ so $b = 3$. The function shown can thus be written

$$f(x) = \begin{cases} 
  x + 1 & \text{if } x < 3; \\
  -\frac{1}{3}x + 3 & \text{if } x \geq 3.
\end{cases}$$

Note that at $x = 3$ the value of the function is 2, as indicated by our formula.

1.2.21

The cost is given by

$$c(t) = \begin{cases} 
  0.05t & \text{for } 0 \leq t \leq 60 \\
  1.2 + 0.03t & \text{for } 60 < t \leq 120.
\end{cases}$$

1.2.22

The cost is given by

$$c(m) = \begin{cases} 
  3.5 + 2.5m & \text{for } 0 \leq m \leq 5 \\
  8.5 + 1.5m & \text{for } m > 5.
\end{cases}$$

1.2.23

1.2.24
1.2.25

1.2.26

1.2.27

1.2.28

1.2.29

a.

b. The function is a polynomial, so its domain is the set of all real numbers.

c. It has one peak near its y-intercept of (0, 6) and one valley near $x = 1.3$. Its x-intercept is near $x = -1.3$.

1.2.30

a.

b. The function is an algebraic function. Its domain is the set of all real numbers.

c. It has a valley at the y-intercept of (0, -2), and is very steep at $x = -2$ and $x = 2$ which are the x-intercepts. It is symmetric about the y-axis.
1.2.31

a. 

b. The domain of the function is the set of all real numbers except \(-3\), which is \(\{x : x \neq -3\}\).

c. There is a valley near \(x = -5.2\) and a peak near \(x = -0.8\). The \(x\)-intercepts are at \(-2\) and \(2\), where the curve does not appear to be smooth; there are also valleys there. There is a vertical asymptote at \(x = -3\). The function is never below the \(x\)-axis. The \(y\)-intercept is \((0, \frac{4}{3})\).

b. The domain of the function is \((-\infty, -2] \cup [2, \infty)\)

c. \(x\)-intercepts are at \(-2\) and \(2\). Because 0 isn’t in the domain, there is no \(y\)-intercept. The function has a valley at \(x = -4\).

1.2.33

a. 

b. The domain of the function is the set of all real numbers.

c. The function has a maximum of 3 at \(x = \frac{1}{2}\), and a \(y\)-intercept of 2.

1.2.34

a. 

b. The domain of the function is the set of all real numbers.

c. The function contains a jump at \(x = 1\). The maximum value of the function is 1 and the minimum value is \(-1\). The \(y\)-intercept is at \((0, -1)\).

1.2.35 The slope of this line is constantly 2, so the slope function is \(s(x) = 2\).

1.2.36 The function can be written as \(|x| = \begin{cases} -x & \text{if } x \leq 0 \\ x & \text{if } x > 0 \end{cases}\)
The slope function is \( s(x) = \begin{cases} -1 & \text{if } x < 0 \\ 1 & \text{if } x > 0 \end{cases} \).

**1.2.37** The slope function is given by \( s(x) = \begin{cases} 1 & \text{if } x < 0; \\ -\frac{1}{2} & \text{if } x > 0. \end{cases} \)

**1.2.38** The slope function is given by \( s(x) = \begin{cases} 1 & \text{if } x < 3; \\ -\frac{1}{3} & \text{if } x > 3. \end{cases} \)

**1.2.39**

a. Because the area under consideration is that of a rectangle with base 2 and height 6, \( A(2) = 12 \).

b. Because the area under consideration is that of a rectangle with base 6 and height 6, \( A(6) = 36 \).

c. Because the area under consideration is that of a rectangle with base \( x \) and height 6, \( A(x) = 6x \).

**1.2.40**

a. Because the area under consideration is that of a triangle with base 2 and height 1, \( A(2) = 1 \).

b. Because the area under consideration is that of a triangle with base 6 and height 3, the \( A(6) = 9 \).

c. Because \( A(x) \) represents the area of a triangle with base \( x \) and height \( \frac{1}{2}x \), the formula for \( A(x) \) is \( \frac{1}{2} \cdot x \cdot \frac{x}{2} = \frac{x^2}{4} \).

**1.2.41**

a. Because the area under consideration is that of a trapezoid with base 2 and heights 8 and 4, we have \( A(2) = 2 \cdot \frac{8+4}{2} = 12 \).

b. Note that \( A(3) \) represents the area of a trapezoid with base 3 and heights 8 and 2, so \( A(3) = 3 \cdot \frac{8+2}{2} = 15 \). So \( A(6) = 15 + (A(6) - A(3)) \), and \( A(6) - A(3) \) represents the area of a triangle with base 3 and height 2. Thus \( A(6) = 15 + 6 = 21 \).

c. For \( x \) between 0 and 3, \( A(x) \) represents the area of a trapezoid with base \( x \), and heights 8 and \( 8 - 2x \). Thus the area is \( x \cdot \frac{8+8-2x}{2} = 8x - x^2 \). For \( x > 3 \), \( A(x) = A(3) + A(x) - A(3) = 15 + 2(x-3) = 2x + 9 \). Thus

\[ A(x) = \begin{cases} 8x - x^2 & \text{if } 0 \leq x \leq 3; \\ 2x + 9 & \text{if } x > 3. \end{cases} \]

**1.2.42**

a. Because the area under consideration is that of trapezoid with base 2 and heights 3 and 1, we have \( A(2) = 2 \cdot \frac{3+1}{2} = 4 \).

b. Note that \( A(6) = A(2) + (A(6) - A(2)) \), and that \( A(6) - A(2) \) represents a trapezoid with base 6 and heights 1 and 5. The area is thus \( 4 + (4 \cdot \frac{1+5}{2}) = 4 + 12 = 16 \).

c. For \( x \) between 0 and 2, \( A(x) \) represents the area of a trapezoid with base \( x \), and heights 3 and \( 3 - x \). Thus the area is \( x \cdot \frac{3+3-x}{2} = 3x - \frac{x^2}{2} \). For \( x > 2 \), \( A(x) = A(2) + A(x) - A(2) = 4 + (A(x) - A(2)) \). Note that \( A(x) - A(2) \) represents the area of a trapezoid with base \( x-2 \) and heights 1 and \( x-1 \). Thus \( A(x) = 4 + (x-2) \cdot \frac{1+x-1}{2} = 4 + (x-2) \left( \frac{x}{2} \right) = \frac{x^2}{2} - x + 4 \). Thus

\[ A(x) = \begin{cases} 3x - \frac{x^2}{2} & \text{if } 0 \leq x \leq 2; \\ \frac{x^2}{2} - x + 4 & \text{if } x > 2. \end{cases} \]
1.2.43 \( f(x) = |x - 2| + 3 \), because the graph of \( f \) is obtained from that of \(|x|\) by shifting 2 units to the right and 3 units up.

\( g(x) = -|x + 2| - 1 \), because the graph of \( g \) is obtained from the graph of \(|x|\) by shifting 2 units to the left, then reflecting about the \( x \)-axis, and then shifting 1 unit down.

1.2.44

a.

b.

c.

d.

e.

f.

1.2.45

a. Shift 3 units to the right.

b. Since \( f(2x - 4) = f(2(x - 2)) \), compress horizontally by a factor of 2 and then shift 2 units to the right.
c. Shift 2 units to the right, scale vertically by a factor of 3 and flip around the $x$ axis (due to the minus sign in front of the 3). Then shift up by 4 units.

d. Expand horizontally by a factor of 3 and then shift right horizontally by 2 units. Expand vertically by a factor of 6 and then shift up one unit.

1.2.46

a. 

b. 

c. 

d. 

1.2.47

The graph is obtained by shifting the graph of $x^2$ two units to the right and one unit up.
1.2.48

Write \( x^2 - 2x + 3 \) as \( (x^2 - 2x + 1) + 2 = (x-1)^2 + 2 \). The graph is obtained by shifting the graph of \( x^2 \) one unit to the right and two units up.

1.2.49

This function is \(-3 \cdot f(x)\) where \( f(x) = x^2 \). So stretch the graph of \( x^2 \) vertically by a factor of 3 and flip it about the \( x \) axis.

1.2.50

This function is \( 2 \cdot f(x) - 1 \) where \( f(x) = x^3 \). So stretch the graph of \( x^3 \) vertically by a factor of 2 and then shift it down by 1 unit.

1.2.51

This function is \( 2 \cdot f(x + 3) \) where \( f(x) = x^2 \). So shift the graph of \( x^2 \) left 3 units and then stretch it vertically by a factor of 2.

1.2.52

By completing the square, we have that

\[
p(x) = \left( x^2 + 3x + \frac{9}{4} \right) - \frac{29}{4} = \left( x + \frac{3}{2} \right)^2 - \frac{29}{4}.
\]

So it is \( f \left( x + \frac{3}{2} \right) - \frac{29}{4} \) where \( f(x) = x^2 \). So shift the graph of \( x^2 \) left \( \frac{3}{2} \) units and down by \( \frac{29}{4} \) units.
1.2.53

By completing the square, we have that
\[ h(x) = -4(x^2 + x - 3) = -4 \left( x^2 + x + \frac{1}{4} - \frac{1}{4} - 3 \right) = -4 \left( x + \frac{1}{2} \right)^2 + 13. \]

So it is \(-4f(x + \frac{1}{2}) + 13\) where \(f(x) = x^2\). So shift the graph of \(x^2\) left by \(\frac{1}{2}\) unit, then stretch vertically by a factor of 4 and reflect about the x axis. Finally, shift up by 13 units.

1.2.54

Because \(|3x - 6| + 1 = 3|x - 2| + 1\), this is \(3f(x - 2) + 1\) where \(f(x) = |x|\). So shift the graph of \(|x|\) right by 2 units and stretch it vertically by a factor of 3. Finally, shift it up by one unit.

1.2.55

a. True. A polynomial \(p(x)\) can be written as the ratio of polynomials \(\frac{p(x)}{1}\), so it is a rational function. However, a rational function like \(\frac{1}{x}\) is not a polynomial.

b. False. For example, if \(f(x) = 2x\), then \((f \circ f)(x) = f(f(x)) = f(2x) = 4x\) is linear, not quadratic.

c. True. In fact, if \(f\) is degree \(m\) and \(g\) is degree \(n\), then the degree of the composition of \(f\) and \(g\) is \(m \cdot n\), regardless of the order they are composed.

d. False. The graph would be shifted two units to the left.

1.2.56 The points of intersection are found by solving \(x^2 + 2 = x + 4\). This yields the quadratic equation \(x^2 - x - 2 = 0\) or \((x - 2)(x + 1) = 0\). So the \(x\)-values of the points of intersection are 2 and -1. The actual points of intersection are (2, 6) and (-1, 3).

1.2.57 The points of intersection are found by solving \(x^2 = -x^2 + 8x\). This yields the quadratic equation \(2x^2 - 8x = 0\) or \((2x)(x - 4) = 0\). So the \(x\)-values of the points of intersection are 0 and 4. The actual points of intersection are (0, 0) and (4, 16).

1.2.58 \(y = x + 1\), because the \(y\) value is always 1 more than the \(x\) value.

1.2.59 \(y = \sqrt{x} - 1\), because the \(y\) value is always 1 less than the square root of the \(x\) value.

1.2.60

\[ y = x^3 - 1. \] The domain is the set of all real numbers.
1.2.61

\[ y = 5x \]  
The natural domain for the situation is \([0, h]\) where \(h\) represents the maximum number of hours that you can run at that pace before keeling over.

1.2.62

\[ y = \frac{50}{x} \]  
Theoretically the domain is \((0, \infty)\), but the world record for the “hour ride” is just short of 50 miles.

1.2.63

\[ y = \frac{3200}{x} \]  
Note that \(\frac{x}{32}\) miles per gallon \cdot y\) miles would represent the numbers of dollars, so this must be 100. So we have \(\frac{xy}{32} = 100\), or \(y = \frac{3200}{x}\). We certainly have \(x > 0\), so the domain is \((0, p]\), where \(p\) is the maximum gas price we are willing to consider.

1.2.64

1.2.65

1.2.66

1.2.67
1.2.68  

1.2.69  

1.2.70  

1.2.71  

a. The zeros of \( f \) are the points where the graph crosses the \( x \) axis, so these are points A, D, F, and I.

b. The only high point, or peak, of \( f \) occurs at point E, since it appears that the graph has larger and larger \( y \) values as \( x \) moves further away from zero past points A and I.

c. The only low points, or valleys, of \( f \) are at points B and H, again assuming that the graph of \( f \) continues its apparent behavior for larger values of \( x \).

d. Past point H, the graph is rising, and is rising faster and faster as \( x \) increases. It is also rising between points B and E, but not as quickly as it is past point H. So the marked point at which it is rising most rapidly is I.

e. Before point B, the graph is falling, and falls more and more rapidly as \( x \) gets more and more negative. It is also falling between points E and H, but not as rapidly as it is before point B. So the marked point at which it is falling most rapidly is A.

1.2.72  

a. The zeros of \( g \) appear to be at \( x = 0 \), \( x = 1 \), \( x = 1.6 \), and \( x \approx 3.15 \).

b. The two peaks of \( g \) appear to be at \( x \approx 0.5 \) and \( x \approx 2.6 \), with corresponding points \( \approx (0.5, 0.4) \) and \( \approx (2.6, 3.4) \).

c. The only valley of \( g \) is at \( \approx (1.3, -0.2) \).

d. Moving right from \( x \approx 1.3 \), the graph is rising more and more rapidly until about \( x = 2 \), at which point it starts rising less rapidly (since, by \( x \approx 2.6 \), it is not rising at all). So the coordinates of the point at which it is rising most rapidly are approximately \( (2.1, g(2)) \approx (2.1, 2) \). Note that while the curve is also rising between \( x = 0 \) and \( x \approx 0.5 \), it is not rising as rapidly as it is near \( x = 2 \).

e. To the right of \( x \approx 2.6 \), the curve is falling, and falling more and more rapidly as \( x \) moves to the right. So the point at which it is falling most rapidly in the interval \([0, 3]\) is at \( x = 3 \), which has the approximate coordinates \((3, 1.4)\). Note that while the curve is also falling between \( x \approx 0.5 \) and \( x \approx 1.3 \), it is not falling as rapidly as it is near \( x = 3 \).
1.2. REPRESENTING FUNCTIONS

1.2.73

a.

b. This appears to have a maximum when \( \theta = 0 \). Our vision is sharpest when we look straight ahead.

c. For |\( \theta \)| \( \leq .19^\circ \). We have an extremely narrow range where our eyesight is sharp.

1.2.74

a. \( f(0.75) = \frac{0.75^2}{1 - 2 \cdot 0.75 \cdot 0.25} = 0.9 \). There is a 90% chance that the server will win from deuce if they win 75% of their service points.

b. \( f(0.25) = \frac{0.25^2}{1 - 2 \cdot 0.25 \cdot 0.75} = 0.1 \). There is a 10% chance that the server will win from deuce if they win 25% of their service points.

1.2.75

a. Using the points (1986, 1875) and (2000, 6471) we see that the slope is about 328.3. At \( t = 0 \), the value of \( p \) is 1875. Therefore a line which reasonably approximates the data is \( p(t) = 328.3t + 1875 \).

b. Using this line, we have that \( p(9) = 4830 \).

1.2.76

a. We know that the points (32, 0) and (212, 100) are on our line. The slope of our line is thus \( \frac{100 - 0}{212 - 32} = \frac{100}{180} = \frac{5}{9} \). The function \( f(F) \) thus has the form \( C = \frac{5}{9}F + b \), and using the point (32, 0) we see that \( 0 = \frac{5}{9} \cdot 32 + b \), so \( b = -\frac{160}{9} \). Thus \( C = \frac{5}{9}F - \frac{160}{9} \).

b. Solving the system of equations \( C = \frac{5}{9}F - \frac{160}{9} \) and \( C = F \), we have that \( F = \frac{5}{9}F - \frac{160}{9} \), so \( \frac{4}{9}F = -\frac{160}{9} \), so \( F = -40 \) when \( C = -40 \).

1.2.77

a. Because you are paying $350 per month, the amount paid after \( m \) months is \( y = 350m + 1200 \).

b. After 4 years (48 months) you have paid 350 \( \cdot 48 + 1200 = 18000 \) dollars. If you then buy the car for $10,000, you will have paid a total of $28,000 for the car instead of $25,000. So you should buy the car instead of leasing it.

1.2.78

Because \( S = 4\pi r^2 \), we have that \( r^2 = \frac{S}{4\pi} \), so |\( r \)| = \( \frac{\sqrt{S}}{2\sqrt{\pi}} \). But because \( r \) is positive, we can write \( r = \frac{\sqrt{S}}{2\sqrt{\pi}} \).
1.2.79

The function makes sense for $0 \leq h \leq 2$.

1.2.80

a. Note that the island, the point $P$ on shore, and the point down shore $x$ units from $P$ form a right triangle. By the Pythagorean theorem, the length of the hypotenuse is $\sqrt{40000 + x^2}$. So Kelly must row this distance and then jog $600 - x$ meters to get home. So her total distance $d(x) = \sqrt{40000 + x^2} + (600 - x)$.

b. Because distance is rate times time, we have that time is distance divided by rate. Thus $T(x) = \frac{\sqrt{40000 + x^2}}{2} + \frac{600 - x}{4}$.

c. By inspection, it looks as though she should head to a point about 115 meters down shore from $P$. This would lead to a time of about 236.6 seconds.

1.2.81

a. The volume of the box is $x^2h$, but because the box has volume 125 cubic feet, we have that $x^2h = 125$, so $h = \frac{125}{x^2}$. The surface area of the box is given by $x^2$ (the area of the base) plus $4 \cdot hx$, because each side has area $hx$. Thus $S = x^2 + 4hx = x^2 + \frac{4 \cdot 125 \cdot x}{x} = x^2 + 500$.

b. By inspection, it looks like the value of $x$ which minimizes the surface area is about 6.3.

1.2.82 Let $f(x) = a_nx^n + \text{ smaller degree terms}$ and let $g(x) = b_mx^m + \text{ some smaller degree terms}$.

a. The largest degree term in $f \cdot g$ is $a_nx^n \cdot b_mx^m = a_n^2x^{n+m}$, so the degree of this polynomial is $n + m = 2n$.

b. The largest degree term in $f \circ f$ is $a_n \cdot (a_nx^n)^n$, so the degree is $n^2$.

c. The largest degree term in $f \cdot g$ is $a_n b_mx^{m+n}$, so the degree of the product is $m + n$.

d. The largest degree term in $f \circ g$ is $a_n \cdot (b_mx^m)^n$, so the degree is $mn$. 

Copyright © 2014 Pearson Education, Inc.
1.2.83 Suppose that the parabola \( f \) crosses the \( x \)-axis at \( a \) and \( b \), with \( a < b \). Then \( a \) and \( b \) are roots of the polynomial, so \( (x - a) \) and \( (x - b) \) are factors. Thus the polynomial must be \( f(x) = c(x - a)(x - b) \) for some non-zero real number \( c \). So \( f(x) = cx^2 - c(a + b)x + abc \). Because the vertex always occurs at the \( x \) value which is \( \frac{-\text{coefficient on } x}{2\text{coefficient on } x^2} \) we have that the vertex occurs at \( \frac{c(a+b)}{2c} = \frac{a+b}{2} \), which is halfway between \( a \) and \( b \).

1.2.84

a. We complete the square to rewrite the function \( f \). Write \( f(x) = ax^2 + bx + c \) as \( f(x) = a(x^2 + \frac{b}{a}x + \frac{c}{a}) \).

Completing the square yields \( a \left( x^2 + \frac{b}{a}x + \frac{b^2}{4a^2} \right) + \left( \frac{c}{a} - \frac{b^2}{4a^2} \right) = a \left( x + \frac{b}{2a} \right)^2 + \left( \frac{c}{a} - \frac{b^2}{4a} \right) \).

Thus the graph of \( f \) is obtained from the graph of \( x^2 \) by shifting \( \frac{b}{2a} \) units to the left (and then doing some scaling and vertical shifting) – moving the vertex from 0 to \( -\frac{b}{2a} \). The vertex is therefore \( \left( -\frac{b}{2a}, c - \frac{b^2}{4a} \right) \).

b. We know that the graph of \( f \) touches the \( x \)-axis twice if the equation \( ax^2 + bx + c = 0 \) has two real solutions. By the quadratic formula, we know that this occurs exactly when the discriminant \( b^2 - 4ac \) is positive. So the condition we seek is for \( b^2 - 4ac > 0 \), or \( b^2 > 4ac \).

</table>

b. The domain of this function consists of the positive integers.

c. Using trial and error and a calculator yields that \( T(n) > 1000 \) for the first time for \( n = 14 \).
1.2.88  a. \( f(x) \) is clearly defined for any value of \( x \), so its domain is the set of all real numbers.

b. Symmetry with respect to the origin means that \( f(-x) = -f(x) \). However, since

\[
\begin{align*}
  f(1) &= 1 - 3 - 144 - 140 = -286, \\
f(-1) &= -1 - 3 + 144 - 140 = 0,
\end{align*}
\]

this condition does not hold. So \( f \) is not symmetric with respect to the origin. Symmetry with respect to the \( y \) axis means that \( f(-x) = f(x) \). However, from the above, \( f(1) \neq f(-1) \), so that \( f \) is not symmetric with respect to the \( y \) axis either.

c. Plots of \( f(x) \) in four different intervals are shown below:

![Graphs showing different intervals of \( f(x) \)]

d. The first window shows a root at \( x = -1 \), while the third shows two more at about \( x = -10 \) and \( x = 14 \). The final window shows that there are likely no more.

e. From the first graph, the \( y \)-intercept appears to be at \((0, -140)\).

f. From the third graph, \( f \) seems to have a local maximum at \( x = -6 \) and a local minimum at \( x = 8 \). At these points, we have

\[
\begin{align*}
  f(-6) &= (-6)^3 - 3(-6)^2 - 144(-6) - 140 = -216 - 108 + 864 - 140 = 400 \\
  f(8) &= 8^3 - 3 \cdot 8^2 - 144 \cdot 8 - 140 = 512 - 192 - 1152 - 140 = -972.
\end{align*}
\]

g. From the third graph, the curve is falling most rapidly just to the right of \( x = 0 \). From the second graph, we can see more precisely that it appears to be falling most rapidly at \( x = 1 \), where the point is \((1, -286)\).

1.2.89  a. \( f(x) \) is defined except where the denominator is zero, so it is defined for all \( x \) except \( x = \pm 3 \).

b. Since

\[
f(-x) = \frac{(-x)^3}{(-x)^2 - 9} = \frac{-x^3}{x^2 - 9} = -\frac{x^3}{x^2 - 9} = -f(x),
\]

\( f \) is an odd function, so it is symmetric with respect to the \( y \) axis since in general \( f(x) \neq f(-x) \).

c. Plots of \( f(x) \) in four different intervals are shown below:

![Graphs showing different intervals of \( f(x) \)]

d. The first graph shows a root at \( x = 0 \); the remaining graphs show that this is the only root.

e. It appears that there is no local maximum or minimum near \( x = 0 \), so the only local maximum is on the left branch of the curve, at about \((-5.2, -7.8)\), and the only local minimum is on the right branch, at about \((5.2, 7.8)\). (The precise answers are that \( f \) has a local maximum at \((-3\sqrt{3}, -\frac{9}{2}\sqrt{3})\) and a local minimum at \((3\sqrt{3}, \frac{9}{2}\sqrt{3})\).
f. As \( x \to 3 \) from the left, the graph of \( f \) becomes increasingly negative, and approaches \(-\infty\). As \( x \to 3 \) from the right, the graph of \( f \) becomes increasingly positive, and approaches \( \infty \).

g. As \( x \) becomes increasingly large and positive, the \( y \) coordinate also becomes increasingly large and positive. As \( x \) becomes increasingly negative, so does the \( y \) coordinate — it increases in magnitude without bound.

1.2.90  
a. Since \( x^4 \geq 0 \) for any value of \( x \), we see that \( x^4 + 2 \) is always strictly greater than zero, so that the denominator is defined and nonzero everywhere. Since the numerator is defined everywhere, the domain of the function is the set of all real numbers.

b. Since
\[
f(1) = \frac{1^2 - 1 + 1}{\sqrt{1^4 + 2}} = \frac{1}{\sqrt{3}}, \quad f(-1) = \frac{(-1)^2 - (-1) + 1}{\sqrt{(-1)^4 + 2}} = \frac{3}{\sqrt{3}},
\]
neither \( f(1) = f(-1) \) nor \(-f(1) = f(-1)\) holds, so the function is not symmetric either with respect to the origin or with respect to the \( y \) axis.

c. Plots of \( f(x) \) in four different intervals are shown below:

It seems clear that all the interesting behavior of the function is displayed on these graphs.

d. \( f \) appears to have no roots since its graph never crosses the \( x \) axis.

e. From the first graph, \( f \) has a \( y \)-intercept at \( y \approx 0.7 \) (the actual value is \( \frac{\sqrt{3}}{3} \)).

f. From the first graph, \( f \) has a local maximum at \( \approx (-1.3, 1.81) \) and a local minimum at \( \approx (0.56, 0.52) \).

g. The curve is falling only between the local maximum and the local minimum. Checking the first graph, the point at which it falls most rapidly appears to be around \( \approx (-0.54, 1.26) \). The curve seems to be rising most rapidly just to the left of the local maximum; this is \( \approx (-1.86, 1.69) \).

h. As \( x \) becomes increasingly large and positive, or as it becomes increasingly negative, the function values appear to approach 1 — the graph of the function looks like it gets increasingly close to the line \( y = 1 \).

1.2.91  
a. The denominator is defined and nonzero everywhere, since \( x^4 + 1 \geq 1 \). The numerator is defined everywhere, since \( |x^2 - 1| \geq 0 \). Thus the function is defined everywhere, so its domain is the set of all real numbers.

b. Since
\[
f(-x) = \frac{(-x)\sqrt{[(x)^2 - 1]}}{(-x)^4 + 1} = \frac{-x\sqrt{|x^2 - 1|}}{x^4 + 1} = -\frac{x\sqrt{|x^2 - 1|}}{x^4 + 1} = -f(x),
\]
the function is odd, so is symmetric with respect to the origin.

c. Plots of \( f(x) \) in four different intervals are shown below:
It seems clear that all the interesting behavior of the function is displayed on these graphs.

d. From the first graph, \( f \) appears to have roots at \( x = \pm 1 \) and at \( x = 0 \). From the remaining graphs, it appears that there are no other roots.

e. From the first graph, the graph of \( f \) appears to cross the \( y \) axis at the origin, so the \( y \)-intercept is \( (0,0) \).

f. \( f \) has cusps at \( x = -1 \) and \( x = 1 \); at both of those points, \( f(x) = 0 \), so the cusps are at \((\pm1,0)\).

g. All the local maxima and minima seem to be shown in the second graph. The two cusps are \((\pm1,0)\).

h. As \( x \) becomes increasingly large, either positively or negatively, the graph of the function appears to approach the \( x \) axis, so that \( f(x) \) approaches zero.

1.2.92   a. The denominator is defined and nonzero everywhere, since \( x^2 + 10 \geq 10 \). The numerator is defined whenever \( x^2 - x - 12 \geq 0 \). Since \( x^2 - x - 12 = (x - 4)(x + 3) \), this is negative exactly when one factor is negative and the other is positive. This happens for \(-3 < x < 4\), so that \( x + 3 > 0 \) while \( x - 4 < 0 \). Thus the numerator is defined outside of that range, so it is defined on \((-\infty, -3] \cup [4, \infty)\). Thus that is the domain of the function.

b. Since \( f(-3) = \frac{6\sqrt{3}x^2-112}{3x+10} = 0 \) while \( f(3) \) is not even defined, clearly we do not have in general \( f(x) = f(-x) \) or \( -f(x) = f(-x) \). Thus this function is not symmetric around either the origin or the \( y \) axis.

c. Plots of \( f(x) \) in four different intervals are shown below:

![Graphs of f(x) in different intervals]

It seems clear that all the interesting behavior of the function is displayed on these graphs.

d. From the second graph, the zeros of \( f \) are at \( x = -3 \) and \( x = 4 \); from the remaining graphs, these appear to be all of the zeros.

e. \( f \) appears to have no local minima, and two local maxima. They are (from the second graph) at about \( x \approx 6 \) and \( x \approx -5 \). The function values at those points look to be \( f(-5) \approx 0.7 \) and \( f(6) \approx 0.55 \).

f. From the last graph, it appears that as \( x \) becomes increasingly large, either positively or negatively, the graph of the function approaches the \( x \) axis, so that \( f(x) \) approaches zero.

1.3 Inverse, Exponential and Logarithmic Functions

1.3.1 \( D = \mathbb{R}, R = \{ y : y > 0 \} \).

1.3.2 \( f(x) = 2x + 1 \) is one-to-one on all of \( \mathbb{R} \). If \( f(a) = f(b) \), then \( 2a + 1 = 2b + 1 \), so it must follow that \( a = b \).

1.3.3 If a function \( f \) is not one-to-one, then there are domain values \( x_1 \neq x_2 \) with \( f(x_1) = f(x_2) \). If \( f^{-1} \) were to exist, then \( f^{-1}(f(x_1)) = f^{-1}(f(x_2)) \) which would imply that \( x_1 = x_2 \), a contradiction.
Recall that the graph of \( f^{-1}(x) \) is obtained from the graph of \( f(x) \) by reflecting across the line \( y = x \). Thus, if \((a, b)\) is on the graph of \( y = f(x) \), then \((b, a)\) must be on the graph of \( y = f^{-1}(x) \).

To find the inverse of \( y = 3x - 4 \), we write \( x = 3y - 4 \) and solve for \( y \). We have \( x + 4 = 3y \), so \( y = \frac{x + 4}{3} \). Thus \( f^{-1}(x) = \frac{x + 4}{3} \).

\( \log_b x \) represents the power to which \( b \) must be raised in order to obtain \( x \). So, \( b^{\log_b x} = x \).

The properties are related in that each can be used to derive the other. Assume \( b^{x+y} = b^x b^y \), for all real numbers \( x \) and \( y \). Then applying this rule to the numbers \( \log_b x \) and \( \log_b y \) gives \( b^{\log_b x + \log_b y} = b^{\log_b x} b^{\log_b y} = xy \). Taking logs of the leftmost and rightmost sides of this equation yields \( \log_b x + \log_b y = \log_b(xy) \).

Now assume that \( \log_b(xy) = \log_b x + \log_b y \) for all positive numbers \( x \) and \( y \). Applying this rule to the product \( b^x b^y \), we have \( \log_b b^x b^y = \log_b b^x + \log_b b^y = x + y \). Now looking at the leftmost and rightmost sides of this equality and applying the definition of logarithm yields \( b^{x+y} = b^x b^y \), as was desired.

Because the domain of \( b^x \) is \( \mathbb{R} \) and the range of \( b^x \) is \((0, \infty)\), and because \( \log_b x \) is the inverse of \( b^x \), we must have that the domain of \( \log_b x \) is \((0, \infty)\) and the range is \( \mathbb{R} \).

Let \( 2^5 = z \). Then \( \ln(2^5) = \ln(z) \), so \( \ln(z) = 5 \ln 2 \). Taking the exponential function of both sides gives \( z = e^{5 \ln 2} \). Therefore, \( 2^5 = e^{5 \ln 2} \).

\( f \) is one-to-one on \((-\infty, -1]\), on \([-1, 1)\), and on \([1, \infty)\).

\( f \) is one-to-one on \((-\infty, -2]\), on \([-2, 0]\), on \([0, 2]\), and on \([2, \infty)\).
1.3.15 \( f \) is one-to-one on \( \mathbb{R} \), so it has an inverse on \( \mathbb{R} \).

1.3.16 \( f \) is one-to-one on \( [-\frac{1}{2}, \infty) \), so it has an inverse on that set. (Alternatively, it is one-to-one on the interval \((-\infty, -\frac{1}{2}]\), so that interval could be used as well).

1.3.17 \( f \) is one-to-one on its domain, which is \((-\infty, 5) \cup (5, \infty)\), so it has an inverse on that set.

1.3.18 \( f \) is one-to-one on the set \((-\infty, 6]\), so it has an inverse on that set. (Alternatively, it is one-to-one on the interval \([6, \infty)\), so that interval could be used as well).

1.3.19 \( f \) is one-to-one on the interval \((0, \infty)\), so it has an inverse on that interval. (Alternatively, it is one-to-one on the interval \((-\infty, 0)\), so that interval could be used as well).

1.3.20 Note that \( f \) can be written as \( f(x) = x^2 - 2x + 8 = x^2 - 2x + 1 + 7 = (x - 1)^2 + 7 \). It is one-to-one on the interval \([1, \infty)\), so it has an inverse on that interval. (Alternatively, it is one-to-one on the interval \((-\infty, 1]\), so that interval could be used as well).

1.3.21
   a. Switching \( x \) and \( y \), we have \( x = 2y \), so \( y = \frac{1}{2}x \). Thus \( y = f^{-1}(x) = \frac{1}{2}x \).
   b. \( f(f^{-1}(x)) = f \left( \frac{1}{2}x \right) = 2 \cdot \frac{1}{2}x = x \). Also, \( f^{-1}(f(x)) = f^{-1}(2x) = \frac{1}{2} \cdot 2x = x \).

1.3.22
   a. Switching \( x \) and \( y \) yields \( x = \frac{y}{4} + 1 \). Solving for \( y \) gives \( y = 4(x - 1) \), so \( f^{-1}(x) = 4x - 4 \).
   b. \( f(f^{-1}(x)) = f(4x - 4) = \frac{4x - 4}{4} + 1 = x - 1 + 1 = x \). Also, \( f^{-1}(f(x)) = f^{-1} \left( \frac{y}{4} + 1 \right) = 4 \left( \frac{y}{4} + 1 \right) - 4 = x \).

1.3.23
   a. Switching \( x \) and \( y \), we have \( x = 6 - 4y \). Solving for \( y \) in terms of \( x \) we have \( 4y = 6 - x \), so \( y = f^{-1}(x) = \frac{6-x}{4} \).
   b. \( f(f^{-1}(x)) = f \left( \frac{6-x}{4} \right) = 6 - 4 \cdot \left( \frac{6-x}{4} \right) = 6 - (6 - x) = x \).
   \( f^{-1}(f(x)) = f^{-1}(6 - 4x) = \frac{6 - (6 - 4x)}{4} = \frac{4x}{4} = x \).

1.3.24
   a. Switching \( x \) and \( y \), we have \( x = 3y^3 \). Solving for \( y \) in terms of \( x \) we have \( y = \sqrt[3]{\frac{x}{3}} \), so \( y = f^{-1}(x) = \sqrt[3]{\frac{x}{3}} \).
   b. \[ f(f^{-1}(x)) = f \left( \sqrt[3]{\frac{x}{3}} \right) = 3 \left( \frac{x}{3} \right)^{\frac{3}{3}} = 3 \left( \frac{x}{3} \right) = x \]
   \[ f^{-1}(f(x)) = f^{-1} \left( 3x^3 \right) = \frac{3x^3}{3} = 3x^3 = x. \]

1.3.25
   a. Switching \( x \) and \( y \), we have \( x = 3y + 5 \). Solving for \( y \) in terms of \( x \) we have \( y = \frac{x-5}{3} \), so \( y = f^{-1}(x) = \frac{x-5}{3} \).

Copyright © 2014 Pearson Education, Inc.
1.3. INVERSE, EXPONENTIAL AND LOGARITHMIC FUNCTIONS

1.3.26

b. $f(f^{-1}(x)) = f\left(\frac{2 - x}{2}\right) = 3\left(\frac{2 - x}{2}\right) + 5 = (x - 5) + 5 = x.$

$f^{-1}(f(x)) = f^{-1}(3x + 5) = \frac{(3x + 5) - 5}{3} = \frac{3x}{3} = x.$

1.3.27

a. Switching $x$ and $y$, we have $x = y^2 + 4$. Solving for $y$ in terms of $x$ we have $y^2 = x - 4$, so $|y| = \sqrt{x - 4}$. But because we are given that the domain of $f$ is $\{x: x \geq 0\}$, we know that the range of $f^{-1}$ is also non-negative. So $y = f^{-1}(x) = \sqrt{x - 4}.$

b. $f(f^{-1}(x)) = f\left(\sqrt{x - 4}\right) = (\sqrt{x - 4})^2 + 4 = x - 4 + 4 = x.$

$f^{-1}(f(x)) = f^{-1}(x^2 + 4) = \sqrt{x^2 + 4 - 4} = \sqrt{x^2} = |x| = x$, because $x \geq 0.$

1.3.28

a. Switching $x$ and $y$, we have $x = \frac{2}{y^2 + 1}$. Solving for $y$ in terms of $x$ we have $y^2 + 1 = \frac{2}{x}$. Thus $y^2 = \frac{2}{x} - 1$, so $|y| = \sqrt{\frac{2}{x} - 1}$. Note that the domain of $f$ is $[0, \infty)$ and that this is therefore the range of $f^{-1}$, so we must have $f^{-1}(x) = \sqrt{\frac{2}{x} - 1}.$

b. $f(f^{-1}(x)) = f\left(\sqrt{\frac{2}{x} - 1}\right) = \frac{2}{\sqrt{\frac{2}{x} - 1} + 1} = \frac{2}{x} = x.$

$f^{-1}(f(x)) = f^{-1}\left(\sqrt{\frac{2}{x^2 + 1}}\right) = \sqrt{\frac{2}{x^2 + 1} - 1} = \sqrt{x^2 + 1 - 1} = |x| = x,$

because $x$ is in the domain of $f$ and is thus non-negative.

1.3.29 First note that because the expression is symmetric, switching $x$ and $y$ doesn’t change the expression. Solving for $y$ gives $|y| = \sqrt{1 - x^2}$. To get the four one-to-one functions, we restrict the domain and choose either the upper part or lower part of the circle as follows:

a. $f_1(x) = \sqrt{1 - x^2}, \; 0 \leq x \leq 1$

$b_1(x) = -\sqrt{1 - x^2}, \; -1 \leq x \leq 0$

$b_2(x) = \sqrt{1 - x^2}, \; -1 \leq x \leq 0$

$4_1(x) = -\sqrt{1 - x^2}, \; 0 \leq x \leq 1$

b. Reflecting these functions across the line $y = x$ yields the following:

$f_1^{-1}(x) = \sqrt{1 - x^2}, \; 0 \leq x \leq 1$

$f_2^{-1}(x) = -\sqrt{1 - x^2}, \; 0 \leq x \leq 1$

$f_3^{-1}(x) = -\sqrt{1 - x^2}, \; -1 \leq x \leq 0$

$f_4^{-1}(x) = \sqrt{1 - x^2}, \; -1 \leq x \leq 0$

1.3.30 First note that because the expression is symmetric, switching $x$ and $y$ doesn’t change the expression. Solving for $y$ gives $|y| = \sqrt{2|x|}$. To get the four one-to-one functions, we restrict the domain and choose either the upper part or lower part of the parabola as follows:

a. $f_1(x) = \sqrt{2x}, \; x \geq 0$

$f_2(x) = \sqrt{-2x}, \; x \leq 0$

$f_3(x) = -\sqrt{-2x}, \; x \leq 0$

$f_4(x) = -\sqrt{2x}, \; x \geq 0$

Copyright © 2014 Pearson Education, Inc.
b. Reflecting these functions across the line \( y = x \) yields the following:

\[
\begin{align*}
    f_1^{-1}(x) &= \frac{x^2}{2}, \quad x \geq 0 \\
    f_2^{-1}(x) &= -\frac{x^2}{2}, \quad x \geq 0 \\
    f_3^{-1}(x) &= -\frac{x^2}{2}, \quad x \leq 0 \\
    f_4^{-1}(x) &= \frac{x^2}{2}, \quad x \leq 0
\end{align*}
\]

1.3.31

Switching \( x \) and \( y \) gives \( x = 8 - 4y \). Solving this for \( y \) yields \( y = f^{-1}(x) = \frac{8-x}{4} \).

1.3.32

Switching \( x \) and \( y \) gives \( x = 4y - 12 \). Solving this for \( y \) yields \( y = f^{-1}(x) = \frac{x}{4} + 3 \).

1.3.33

Switching \( x \) and \( y \) gives \( x = \sqrt{y} \). Solving this for \( y \) yields \( y = f^{-1}(x) = x^2 \), but note that the range of \( f \) is \([0, \infty)\) so that is the domain of \( f^{-1} \).
1.3.34

Switching $x$ and $y$ gives $x = \sqrt{3 - y}$. Solving this for $y$ yields $y = f^{-1}(x) = 3 - x^2$, but note that the range of $f$ is $[0, \infty)$ so that is the domain of $f^{-1}$.

1.3.35

Switching $x$ and $y$ gives $x = y^4 + 4$. Solving this for $y$ yields $y = f^{-1}(x) = \sqrt[4]{x - 4}$.

1.3.36

Switching $x$ and $y$ gives $x = \frac{6}{y^2 - 9}$. Solving yields $y^2 - 9 = \frac{6}{x}$, or $|y| = \sqrt{\frac{6}{x} + 9}$, but because the domain of $f$ is positive, the range of $f^{-1}$ must be positive as well, so we have $f^{-1}(x) = \sqrt{\frac{6}{x} + 9}$. 

Copyright © 2014 Pearson Education, Inc.
1.3.37

Begin by completing the square: \( f(x) = x^2 - 2x + 6 = (x^2 - 2x + 1) + 5 = (x - 1)^2 + 5. \) Switching \( x \) and \( y \) yields \( x = (y - 1)^2 + 5. \) Solving for \( y \) gives \( |y - 1| = \sqrt{x - 5}. \) Choosing the principal square root (because the original given interval has \( x \) positive) gives \( y = f^{-1}(x) = \sqrt{x - 5} + 1, \) \( x \geq 5. \)

1.3.38

Begin by completing the square: \( f(x) = -x^2 - 4x - 3 = -(x^2 + 4x + 3) = -(x^2 + 4x + 4 - 1) = -(x + 2)^2 - 1 = 1 - (x + 2)^2. \) Switching \( x \) and \( y \) yields \( x = 1 - (y + 2)^2, \) and solving for \( y \) gives \( |y + 2| = \sqrt{1 - x}. \) Since the given domain of \( f \) was negative, the range of \( f^{-1} \) must be negative, so we must have \( y + 2 = -\sqrt{1 - x}, \) so the inverse function is \( f^{-1}(x) = -\sqrt{1 - x} - 2. \)

1.3.41 If \( \log_{10} x = 3, \) then \( 10^3 = x, \) so \( x = 1000. \)

1.3.42 If \( \log_5 x = -1, \) then \( 5^{-1} = x, \) so \( x = \frac{1}{5}. \)

1.3.43 If \( \log_8 x = \frac{1}{3}, \) then \( x = 8^{1/3} = 2. \)

Copyright © 2014 Pearson Education, Inc.
1.3.44 If \( \log_b 125 = 3 \), then \( b^3 = 125 \), so \( b = 5 \) because \( 5^3 = 125 \).

1.3.45 If \( \ln x = -1 \), then \( e^{-1} = x \), so \( x = \frac{1}{e} \).

1.3.46 If \( \ln y = 3 \), then \( y = e^3 \).

1.3.47 \( \log_b (\frac{x}{y}) = \log_b x - \log_b y = 0.36 - 0.56 = -0.2 \).

1.3.48 \( \log_b x^2 = 2 \log_b x = 2 \cdot 0.36 = 0.72 \).

1.3.49 \( \log_b xz = \log_b x + \log_b z = 0.36 + 0.83 = 1.19 \).

1.3.50 \( \log_b \sqrt[3]{x} = \log_b (xy)^{1/2} - \log_b z = \frac{1}{2} \log_b x + \log_b y - \log_b z = \frac{0.36}{2} + \frac{0.56}{2} - 0.83 = -0.37 \).

1.3.51 \( \log_b \sqrt[2]{y^z} = \log_b x^{1/2} - \log_b z^{1/3} = \frac{1}{2} \log_b x - \frac{1}{3} \log_b z = \frac{0.36}{2} - \frac{0.83}{3} = -0.095 \).

1.3.52 \( \log_b \sqrt[3]{y^2} = \log_b y^{2/3} - \log_b y^{1/2} = \log_b b^2 + \frac{5}{2} \log_b x - \frac{1}{2} \log_b y = 2 + \frac{5}{2} (0.36) - \frac{1}{2} (0.56) = 2.62 \).

1.3.53 Since \( 7^x = 21 \), we have that \( \ln 7^x = \ln 21 \), so \( x \ln 7 = \ln 21 \), and \( x = \frac{\ln 21}{\ln 7} \).

1.3.54 Since \( 2^x = 55 \), we have that \( \ln 2^x = \ln 55 \), so \( x \ln 2 = \ln 55 \), and \( x = \frac{\ln 55}{\ln 2} \).

1.3.55 Since \( 3^{3x-4} = 15 \), we have that \( \ln 3^{3x-4} = \ln 15 \), so \( (3x - 4) \ln 3 = \ln 15 \). Thus, \( 3x - 4 = \frac{\ln 15}{\ln 3} \), so

\[
x = \frac{(\ln 15)/(\ln 3) + 4}{3} = \frac{\ln 15}{3 \ln 3} + \frac{4}{3} = \frac{\ln 5}{3 \ln 3} + \frac{\ln 3}{3 \ln 3} + \frac{4}{3} = \frac{\ln 5}{3 \ln 3} + \frac{5}{3}
\]

1.3.56 Since \( 5^{3x} = 29 \), we have that \( \ln 5^{3x} = \ln 29 \), so \( (3x) \ln 5 = \ln 29 \). Solving for \( x \) gives \( x = \frac{\ln 29}{3 \ln 5} \).

1.3.57 We are seeking \( t \) so that \( 50 = 100e^{-t/650} \). This occurs when \( e^{-t/650} = \frac{1}{2} \), which is when \( -\frac{t}{650} = \ln \frac{1}{2} \), so \( t = 650 \ln 2 \approx 451 \) years.

1.3.58 In 2010 (when \( t = 0 \)), the population is \( P(0) = 100 \). So we are seeking \( t \) so that \( 200 = 100e^{t/650} \), or \( e^{t/650} = 2 \). Taking the natural logarithm of both sides yields \( \frac{t}{650} = \ln 2 \), or \( t = 50 \ln 2 \approx 35 \) years.

1.3.59 \( \log_2 15 = \frac{\ln 15}{\ln 2} \approx 3.907 \).

1.3.60 \( \log_3 30 = \frac{\ln 30}{\ln 3} \approx 3.096 \).

1.3.61 \( \log_4 40 = \frac{\ln 40}{\ln 4} \approx 2.661 \).

1.3.62 \( \log_6 60 = \frac{\ln 60}{\ln 6} \approx 2.285 \).

1.3.63 Let \( 2^x = z \). Then \( \ln 2^x = \ln z \), so \( x \ln 2 = \ln z \). Taking the exponential function of both sides gives \( z = e^{x \ln 2} \).

1.3.64 Let \( 3^{\sin x} = z \). Then \( \ln 3^{\sin x} = \ln z \), so \( (\sin x) \ln 3 = \ln z \). Taking the exponential function of both sides gives \( z = e^{(\sin x) \ln 3} \).

1.3.65 Let \( z = \ln |x| \). Then \( e^z = |x| \). Taking logarithms with base 5 of both sides gives \( \log_5 e^z = \log_5 |x| \), so \( z \cdot \log_5 e = \log_5 |x| \), and thus \( z = \frac{\log_5 |x|}{\log_5 e} \).

1.3.66 Using the change of base formula, \( \log_2 (x^2 + 1) = \frac{\ln (x^2 + 1)}{\ln 2} \).

1.3.67 Let \( z = a^{1/\ln a} \). Then \( \ln z = \ln (a^{1/\ln a}) = \frac{1}{\ln a} \cdot \ln a = 1 \). Thus \( z = e \).

1.3.68 Let \( z = a^{1/\log a} \). Then \( \log z = \log (a^{1/\log a}) = \frac{1}{\log a} \cdot \log a = 1 \). Thus \( z = 10 \).
1.3.69
a. False. For example, $3 = 3^1$, but $1 \neq \sqrt[3]{3}$.

b. False. For example, suppose $x = y = b = 2$. Then the left-hand side of the equation is equal to 1, but the right-hand side is 0.

c. False. $\log_5 4^6 = 6 \log_5 4 > 4 \log_5 6$.

d. True. This follows because $10^x$ and $\log_{10}$ are inverses of each other.

e. False. $\ln 2^e = e \ln 2 < 2$.

f. False. For example $f(0) = 1$, but the alleged inverse function evaluated at 1 is not 0 (rather, it has value $\frac{1}{2}$).

g. True. $f$ is its own inverse because $f(f(x)) = f\left(\frac{1}{x}\right) = \frac{1}{\sqrt[3]{x}} = x$.

1.3.70

1.3.71

1.3.72

1.3.73

1.3.74 Since $e^x = x^{123}$, we have $x = \ln(x^{123})$, so $x = 123 \ln x$. Consider the function $f(x) = x - 123 \ln x$. Plotting this function using a computer or calculator reveals a graph which crosses the $x$ axis twice, near $x = 1$ and near $x = 826$. (Try graphing it using the domain $(0, 900)$). Using a calculator and some trial and error reveals that the roots of $f$ are approximately 1.008 and 826.166.

1.3.75 Note that $f$ is one-to-one, so there is only one inverse. Switching $x$ and $y$ gives $x = (y + 1)^3$. Then $\sqrt[3]{x} = y + 1$, so $y = f^{-1}(x) = \sqrt[3]{x} - 1$. The domain of $f^{-1}$ is $\mathbb{R}$.

1.3.76 Note that to get a one-to-one function, we should restrict the domain to either $[4, \infty)$ or $(-\infty, 4]$. Switching $x$ and $y$ yields $x = (y - 4)^2$, so $\sqrt{x} = |y - 4|$. So $y = 4 \pm \sqrt{x}$. So the inverse of $f$ when the domain of $f$ is restricted to $[4, \infty)$ is $f^{-1}(x) = 4 + \sqrt{x}$, while if the domain of $f$ is restricted to $(-\infty, 4]$ the inverse is $f^{-1}(x) = 4 - \sqrt{x}$. In either case, the domain of $f^{-1}$ is $[0, \infty)$.

1.3.77 Note that to get a one-to-one function, we should restrict the domain to either $[0, \infty)$ or $(-\infty, 0]$. Switching $x$ and $y$ yields $x = \frac{2}{y^2 + 2}$, so $y^2 + 2 = \frac{2}{x}$. So $y = \pm \sqrt{\frac{2}{x} - 2}$. So the inverse of $f$ when the domain of $f$ is restricted to $[0, \infty)$ is $f^{-1}(x) = \sqrt{\frac{2}{x} - 2}$, while if the domain of $f$ is restricted to $(-\infty, 0]$ the inverse is $f^{-1}(x) = -\sqrt{\frac{2}{x} - 2}$. In either case, the domain of $f^{-1}$ is $(0, 1]$. 
1.3.78 Note that $f$ is one-to-one. Switching $x$ and $y$ yields $x = \frac{2y}{y+2}$, so $x(y + 2) = 2y$. Thus $xy + 2x = 2y$, so $2x = 2y - xy = y(2 - x)$. Thus, $y = \frac{2x}{2-x}$. The domain of $f^{-1}(x) = \frac{2x}{2-x}$ is $(-\infty, 2) \cup (2, \infty)$.

1.3.79

a. $p(0) = 150 \cdot \frac{2^0}{12} = 150$.

b. At a given time $t$, let the population be $z = 150 \cdot \frac{2^{t/12}}{12}$. Then 12 hours later, the time is $12 + t$, and the population is $150 \cdot \frac{2^{(t+12)/12}}{12} = 150 \cdot \frac{2^{(t/12)+1}}{12} = 150 \cdot \frac{2^{t/12} \cdot 2}{12} = 2z$.

c. Since 4 days is 96 hours, we have $p(96) = 150 \cdot \frac{2^{96/12}}{12} = 150 \cdot \frac{2^8}{12} = 38,400$.

d. We can find the time to triple by solving $450 = 150 \cdot \frac{2^{t/12}}{12}$, which is equivalent to $3 = \frac{2^{t/12}}{12}$. By taking logs of both sides we have $\ln 3 = \frac{t}{12} \ln 2$, so $t = \frac{12 \ln 3}{\ln 2} \approx 19.020$ hours.

e. The population will reach 10,000 when $10,000 = 150 \cdot \frac{2^{12/t}}{12}$, which is equivalent to $\frac{200}{3} = \frac{2^{t/12}}{12}$. By taking logs of both sides we have $\ln \frac{200}{3} = \frac{t}{12} \ln 2$, so $t = \frac{12 \ln(200/3)}{\ln 2} \approx 72.707$ hours.

1.3.80

a. The relevant graph is:

Varying $a$ while holding $c$ constant scales the curve vertically. It appears that the steady-state charge is equal to $a$.

b. Varying $c$ while holding $a$ constant scales the curve horizontally. It appears that the steady-state charge does not vary with $c$.

d. As $t$ grows large, the term $ae^{-t/c}$ approaches zero for any fixed $c$ and $a$. So the steady-state charge for $a - ae^{-t/c}$ is $a$.

1.3.81

a. No. The function takes on the values from 0 to 64 as $t$ varies from 0 to 2, and then takes on the values from 64 to 0 as $t$ varies from 2 to 4, so $h$ is not one-to-one.

b. Solving for $h$ in terms of $t$ we have $h = 64t - 16t^2$, so (completing the square) we have $h - 64 = -16(t^2 - 4t + 4)$. Thus, $h = 64 - 16(t - 2)^2$. Therefore $|t - 2| = \sqrt{64 - h}$. When the ball is on the way up we know that $t < 2$, so the inverse of $f$ is $f^{-1}(h) = 2 - \sqrt{64 - h}$.
c. Using the work from the previous part of this problem, we have that when the ball is on the way down (when \( t > 2 \)) we have that the inverse of \( f \) is \( f^{-1}(h) = 2 + \sqrt{\frac{64 - h}{4}} \).

d. On the way up, the ball is at a height of 30 ft at \( 2 - \sqrt{\frac{64 - 30}{4}} \approx 0.542 \) seconds.

e. On the way down, the ball is at a height of 10 ft at \( 2 + \sqrt{\frac{64 - 10}{4}} \approx 3.837 \) seconds.

1.3.82

Estimating from the graph, the terminal velocity for \( k = 11 \) is about 55 m/s.

1.3.83 Using the change of base formula, we have \( \log_{1/10} x = \frac{\ln x}{\ln 1/10} = \frac{\ln x}{\ln 1 - \ln 10} = \frac{\ln x}{-\ln 10} = -\ln x = -\log_{10} x \).

1.3.84

a. Given \( x = b^p \), we have \( p = \log_b x \), and given \( y = b^q \), we have \( q = \log_b y \).

b. \( xy = b^p b^q = b^{p+q} \).

c. \( \log_b xy = \log_b b^{p+q} = p + q = \log_b x + \log_b y \).

1.3.85 Using the same notation as in the previous problem, we have:

\[
\frac{x}{y} = \frac{b^p}{b^q} = b^{p-q}.
\]

Thus \( \log_b \frac{x}{y} = \log_b b^{p-q} = p - q = \log_b x - \log_b y \).

1.3.86

a. Given \( x = b^p \), we have \( p = \log_b x \).

b. \( x^y = (b^p)^y = b^{yp} \).

\[ \text{c. } \log_b x^y = \log_b b^{yp} = yp = y \log_b x. \]

1.3.87

a. From the graph, \( f \) is one-to-one on \( \approx (-\infty, -0.7] \), on \([-0.7, 0] \), on \([0, 0.7] \), and on \([0.7, \infty) \).

b. If \( u = x^2 \), then our function becomes \( y = u^2 - u \). Completing the square gives \( y + \frac{1}{4} = u^2 - u + \frac{1}{4} = (u - \frac{1}{2})^2 \). Thus \( |u - \frac{1}{2}| = \sqrt{y + \frac{1}{4}} \), so \( u = \frac{1}{2} \pm \sqrt{y + \frac{1}{4}} \), with the “+” applying for \( u = x^2 > \frac{1}{2} \) and the “−” applying when \( u = x^2 < \frac{1}{2} \). Now letting \( u = x^2 \), we have \( x^2 = \frac{1}{2} \pm \sqrt{y + \frac{1}{4}} \), so \( x = \pm \sqrt{\frac{1}{2} \pm \sqrt{y + \frac{1}{4}}} \). Now switching the \( x \) and \( y \) gives the following inverses:

Copyright © 2014 Pearson Education, Inc.
1.3.88

a. \( f(x) = g(h(x)) = g(x^3) = 2x^3 + 3 \). To find the inverse of \( f \), we switch \( x \) and \( y \) to obtain \( x = 2y^3 + 3 \), so that \( y^3 = \frac{x-3}{2} \), so \( f^{-1}(x) = \sqrt[3]{\frac{x-3}{2}} \). Note that \( g^{-1}(x) = \frac{x}{2} \), and \( h^{-1}(x) = \sqrt{\frac{x}{2}} \), and so \( f^{-1}(x) = h^{-1}(g^{-1}(x)) \).

b. \( f(x) = g(h(x)) = g(\sqrt{x}) = (\sqrt{x})^2 + 1 = x + 1 \). so the inverse of \( f \) is \( f^{-1}(x) = x - 1 \).

Note that \( g^{-1}(x) = \sqrt{x - 1} \), and \( h^{-1}(x) = x^2 \), and so \( f^{-1}(x) = h^{-1}(g^{-1}(x)) \).

c. If \( h \) and \( g \) are one-to-one, then their inverses exist, and \( f^{-1}(x) = h^{-1}(g^{-1}(x)) \), because \( f(f^{-1}(x)) = g(h(h^{-1}(g^{-1}(x)))) = g^{-1}(x) = x \) and likewise, \( f^{-1}(f(x)) = h^{-1}(g^{-1}(g(h(x)))) = h^{-1}(h(x)) = x \).

1.3.89 Let \( y = x^3 + 2x \). This function is one-to-one, so it has an inverse. Making the suggested substitution yields \( y = (z - \frac{2}{3})^3 + 2(z - \frac{2}{3}) \). Expanding gives

\[
y = z^3 - 2z + \frac{4}{3}z^2 + 2z - \frac{4}{3} = z^3 - \frac{2z^3}{27}.
\]

Thus we have \( y = z^3 - \frac{8}{27}z \), so \( 27z^3y = 27(z^3)^2 - 8 \), or \( 27(z^3)^2 - 27y(z^3) - 8 = 0 \). Applying the quadratic formula gives \( z^3 = \frac{y}{2} \pm \frac{\sqrt{3}\sqrt{32 + 27y^2}}{18} \). We will take the “+” part and finish solving to obtain:

\[
z = \sqrt[3]{\frac{y}{2} + \frac{\sqrt{3}\sqrt{32 + 27y^2}}{18}}.
\]

Now,

\[
x = z - \frac{2}{3} = \frac{3z^2 - 2}{3z} = \frac{3\left(\sqrt[3]{\frac{y}{2} + \frac{\sqrt{3}\sqrt{32 + 27y^2}}{18}}\right)^2 - 2}{3\sqrt[3]{\frac{y}{2} + \frac{\sqrt{3}\sqrt{32 + 27y^2}}{18}}}.
\]

so the inverse function \( f^{-1}(x) \) is now obtained by switching \( y \) and \( x \).

1.3.90 Let \( y = x^3 - 2x \). This function is one-to-one, so it has an inverse. Making the suggested substitution yields \( y = (z + \frac{2}{3})^3 - 2(z + \frac{2}{3}) \). Expanding gives

\[
y = z^3 + 2z + \frac{4}{3}z^2 + 2z - \frac{4}{3} = z^3 + \frac{8}{27}z^3.
\]

Thus we have \( y = z^3 + \frac{8}{27}z \), so \( 27z^3y = 27(z^3)^2 + 8 \), or \( 27(z^3)^2 - 27y(z^3) + 8 = 0 \). Applying the quadratic formula gives \( z^3 = \frac{y}{2} \pm \frac{\sqrt{3}\sqrt{-32 + 27y^2}}{18} \). We will take the “+” part and finish solving to obtain:

\[
z = \sqrt[3]{\frac{y}{2} + \frac{\sqrt{3}\sqrt{-32 + 27y^2}}{18}}.
\]

Now

\[
x = z - \frac{2}{3} = \frac{3z^2 - 2}{3z} = \frac{3\left(\sqrt[3]{\frac{y}{2} + \frac{\sqrt{3}\sqrt{-32 + 27y^2}}{18}}\right)^2 - 2}{3\sqrt[3]{\frac{y}{2} + \frac{\sqrt{3}\sqrt{-32 + 27y^2}}{18}}}.
\]

so the inverse function \( f^{-1}(x) \) is now obtained by switching \( y \) and \( x \).
1.3.91 Using the change of base formulas $\log_b c = \frac{\ln c}{\ln b}$ and $\log_c b = \frac{\ln b}{\ln c}$ we have

$$(\log_b c) \cdot (\log_c b) = \frac{\ln c}{\ln b} \cdot \frac{\ln b}{\ln c} = 1.$$ 

1.3.92 a. Since $\ln x$ is defined for $x > 0$ and the remainder of the definition of $f$ is defined everywhere, the domain of $f$ is $(0, \infty)$.

b. Plots of $f(x)$ in four different intervals are shown below:

c. It appears that $f$ has two roots. The first appears to be about $x \approx 0.02$, while the second is $x \approx 1.30$.

1.3.93 a. A plot of the two curves is

The first intersection point is at $x \approx 1.63$, so that $y \approx 0.3 \cdot 1.63 \approx 0.49$. The second intersection point is at $x \approx 5.94$, so that $y \approx 0.3 \cdot 5.94 \approx 1.78$.

b. A plot of the two curves is

These two curves do not intersect.

c. Experimenting, we get the plot below for $a = 0.367$; this appears to be close to the correct answer. (The exact answer is $a = e^{-1}$).
The \( x \) coordinate of the intersection point is \( x \approx 2.72 \), so the \( y \) coordinate is \( 2.72 \cdot 0.367 \approx 0.998 \). (In fact, the point of intersection is \((e, 1)\)).

1.3.94  

a. A plot of the two curves is

\[ \text{The first intersection point is at } \approx (0.715, 2 \cdot 0.715) \approx (0.715, 1.430). \text{ The second intersection point is at } \approx (4.307, 2 \cdot 4.307) \approx (4.307, 8.613). \]

b. A plot of the two curves is

\[ \text{These two curves do not intersect.} \]

c. Experimenting, we get the plot below for \( a = 1.36 \); this appears to be close to the correct answer. (The true answer is \( a = \frac{e}{2} \)).
The $x$ coordinate of the intersection point appears to be $x \approx 2$, so the $y$ coordinate is $2 \cdot 1.36 \approx 2.72$. (In fact, the point of intersection is $(2,e)$).

1.3.95 First plot the two curves for a few values of $a$ to get an idea of how the curves behave:

It appears that for values of $a$ less than about 10, the curves do not intersect, while for larger values of $a$, they intersect twice. Explore further around $a = 10$, and contract the viewing window to see more detail there:

The critical value appears to be $a \approx 10.3$; a more precise value is $a \approx 10.282$. For that value of $a$, the curves intersect exactly once, approximately at $(0.567, 1.763)$.

1.4 Trigonometric Functions and Their Inverses

1.4.1 Let $O$ be the length of the side opposite the angle $x$, let $A$ be length of the side adjacent to the angle $x$, and let $H$ be the length of the hypotenuse. Then $\sin x = \frac{O}{H}$, $\cos x = \frac{A}{H}$, $\tan x = \frac{O}{A}$, $\csc x = \frac{H}{O}$, $\sec x = \frac{H}{A}$, and $\cot x = \frac{A}{O}$.

1.4.2 We consider the angle formed by the positive $x$ axis and the ray from the origin through the point $P(x,y)$. A positive angle is one for which the rotation from the positive $x$ axis to the other ray is counterclockwise. We then define the six trigonometric functions as follows: let $r = \sqrt{x^2 + y^2}$. Then $\sin \theta = \frac{y}{r}$, $\cos \theta = \frac{x}{r}$, $\csc \theta = \frac{r}{y}$, $\sec \theta = \frac{r}{x}$, and $\cot \theta = \frac{x}{y}$.

1.4.3 The radian measure of an angle $\theta$ is the length of the arc $s$ on the unit circle associated with $\theta$. 

Copyright © 2014 Pearson Education, Inc.
1.4.4 The period of a function is the smallest positive real number \( k \) so that \( f(x + k) = f(x) \) for all \( x \) in the domain of the function. The sine, cosine, secant, and cosecant function all have period \( 2\pi \). The tangent and cotangent functions have period \( \pi \).

1.4.5 \( \sin^2 x + \cos^2 x = 1 \), \( 1 + \cot^2 x = \csc^2 x \), and \( \tan^2 x + 1 = \sec^2 x \).

1.4.6 \( \csc x = \frac{1}{\sin x} \), \( \sec x = \frac{1}{\cos x} \), \( \tan x = \frac{\sin x}{\cos x} \), and \( \cot x = \frac{\cos x}{\sin x} \).

1.4.7 The tangent function is undefined where \( \cos x = 0 \), which is at all real numbers of the form \( \frac{\pi}{2} + k\pi \), \( k \) an integer.

1.4.8 \( \sec x \) is defined wherever \( \cos x \neq 0 \), which is \( \{ x : x \neq \frac{\pi}{2} + k\pi, k \) an integer \( \} \).

1.4.9 The sine function is not one-to-one over its whole domain, so in order to define an inverse, it must be restricted to an interval on which it is one-to-one.

1.4.10 In order to define an inverse for the cosine function, we restricted the domain to \([0, \pi]\) in order to get a one-to-one function. Because the range of the inverse of a function is the domain of the function, we have that the values of \( \cos^{-1} x \) lie in the interval \([0, \pi]\).

1.4.11 \( \tan(\tan^{-1} x) = x \) for all real numbers \( x \). (Note that the domain of the inverse tangent is \( \mathbb{R} \)). However, it is not always true that \( \tan^{-1}(\tan x) = x \). For example, \( \tan 27\pi = 0 \), and \( \tan^{-1} 0 = 0 \). Thus \( \tan^{-1}(\tan 27\pi) \neq 27\pi \).

1.4.12

\[
\begin{array}{c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|
1.4.17

The point on the unit circle associated with $-\frac{3\pi}{4}$ is $\left(-\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}\right)$, so $\tan\left(-\frac{3\pi}{4}\right) = 1$.

1.4.18

The point on the unit circle associated with $\frac{15\pi}{4}$ is $\left(\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}\right)$, so $\tan\left(\frac{15\pi}{4}\right) = -1$.

1.4.19

The point on the unit circle associated with $-\frac{13\pi}{3}$ is $\left(\frac{1}{2}, -\frac{\sqrt{3}}{2}\right)$, so $\cot\left(-\frac{13\pi}{3}\right) = -\frac{1}{\sqrt{3}} = -\frac{\sqrt{3}}{3}$. 

Copyright © 2014 Pearson Education, Inc.
1.4.20

The point on the unit circle associated with \( \frac{7\pi}{6} \) is \((-\frac{\sqrt{3}}{2}, -\frac{1}{2})\), so sec \( \frac{7\pi}{6} \) = \(-\frac{2}{\sqrt{3}}\) = \(-\frac{2\sqrt{3}}{3}\).

\[ \left(-\frac{\sqrt{3}}{2}, -\frac{1}{2}\right) \]

1.4.21

The point on the unit circle associated with \(-\frac{17\pi}{3}\) is \(\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)\), so \(\cot\left(-\frac{17\pi}{3}\right) = \frac{1}{\sqrt{3}} = \frac{\sqrt{3}}{3}\).

1.4.22

The point on the unit circle associated with \(\frac{16\pi}{3}\) is \((-\frac{1}{2}, -\frac{\sqrt{3}}{2})\), so \(\sin\left(\frac{16\pi}{3}\right) = -\frac{\sqrt{3}}{2}\).

1.4.23 Because the point on the unit circle associated with \(\theta = 0\) is the point \((1, 0)\), we have \(\cos 0 = 1\).

1.4.24 Because \(-\frac{\pi}{2}\) corresponds to a quarter circle clockwise revolution, the point on the unit circle associated with \(-\frac{\pi}{2}\) is the point \((0, -1)\). Thus \(\sin\left(-\frac{\pi}{2}\right) = -1\).

1.4.25 Because \(-\pi\) corresponds to a half circle clockwise revolution, the point on the unit circle associated with \(-\pi\) is the point \((-1, 0)\). Thus \(\cos(-\pi) = -1\).

1.4.26 Because \(3\pi\) corresponds to one and a half counterclockwise revolutions, the point on the unit circle associated with \(3\pi\) is \((-1, 0)\), so \(\tan 3\pi = \frac{0}{-1} = 0\).
1.4.27 Because $\frac{5\pi}{2}$ corresponds to one and a quarter counterclockwise revolutions, the point on the unit circle associated with $\frac{5\pi}{2}$ is the same as the point associated with $\frac{\pi}{2}$, which is $(0, 1)$. Thus $\sec \frac{5\pi}{2}$ is undefined.

1.4.28 Because $\pi$ corresponds to one half circle counterclockwise revolution, the point on the unit circle associated with $\pi$ is $(-1, 0)$. Thus $\cot \pi$ is undefined.

1.4.29 From our definitions of the trigonometric functions via a point $P(x, y)$ on a circle of radius $r = \sqrt{x^2 + y^2}$, we have $\sec \theta = \frac{r}{x} = \frac{1}{\cos \theta}$.

1.4.30 From our definitions of the trigonometric functions via a point $P(x, y)$ on a circle of radius $r = \sqrt{x^2 + y^2}$, we have $\tan \theta = \frac{y}{x} = \frac{\sin \theta}{\cos \theta}$.

1.4.31 We have already established that $\sin^2 \theta + \cos^2 \theta = 1$. Dividing both sides by $\cos^2 \theta$ gives $\tan^2 \theta + 1 = \sec^2 \theta$.

1.4.32 We have already established that $\sin^2 \theta + \cos^2 \theta = 1$. We can write this as $\sin \theta (1/\sin \theta) + \cos \theta (1/\cos \theta) = 1$, or $\sin \theta \csc \theta + \cos \theta \sec \theta = 1$.

1.4.33 Using the triangle pictured, we see that $\sec \left( \frac{\pi}{2} - \theta \right) = \frac{c}{a} = \csc \theta$.

This also follows from the sum identity $\cos(a+b) = \cos a \cos b - \sin a \sin b$ as follows:

\[
\sec \left( \frac{\pi}{2} - \theta \right) = \frac{1}{\cos(\pi/2 + (-\theta))} = \frac{1}{\cos(\pi/2) \cos(-\theta) - \sin(\pi/2) \sin(-\theta)} = \frac{1}{0 - (-\sin \theta)} = \csc \theta.
\]

1.4.34 Using the trig identity for the cosine of a sum (mentioned in the previous solution) we have:

$\sec(x + \pi) = \frac{1}{\cos(x + \pi)} = \frac{1}{\cos x \cos \pi - \sin x \sin \pi} = \frac{1}{\cos x \cdot (-1) - \sin x \cdot 0} = \frac{1}{-\cos x} = -\sec x$.

1.4.35 Using the fact that $\frac{\pi}{12} = \frac{\pi/6}{2}$ and the half-angle identity for cosine:

\[
\cos^2 \frac{\pi}{12} = \frac{1 + \cos \frac{\pi}{6}}{2} = \frac{1 + \sqrt{3}}{2} = \frac{2 + \sqrt{3}}{4}.
\]

Thus, $\cos \frac{\pi}{12} = \sqrt{\frac{2 + \sqrt{3}}{4}}$.

1.4.36 Using the fact that $\frac{3\pi}{8} = \frac{3\pi/4}{2}$ and the half-angle identities for sine and cosine, we have:

\[
\cos^2 \frac{3\pi}{8} = \frac{1 + \cos \frac{3\pi}{4}}{2} = \frac{1 - \sqrt{2}}{2} = \frac{2 - \sqrt{2}}{4},
\]

Copyright © 2014 Pearson Education, Inc.
and using the fact that \( \frac{3\pi}{8} \) is in the first quadrant (and thus has positive value for cosine) we deduce that \( \cos \frac{3\pi}{8} = \frac{\sqrt{2+\sqrt{2}}}{2} \). A similar calculation using the sine function results in \( \sin \frac{3\pi}{8} = \frac{\sqrt{2-\sqrt{2}}}{2} \). Thus 
\[ \tan \frac{3\pi}{8} = \sqrt{ \frac{2+\sqrt{2}}{2-\sqrt{2}} }, \]
which simplifies as
\[ \sqrt{ \frac{2+\sqrt{2}}{2-\sqrt{2}} } \cdot \frac{2+\sqrt{2}}{2+\sqrt{2}} = \sqrt{ \frac{(2+\sqrt{2})^2}{2} } = \frac{2+\sqrt{2}}{\sqrt{2}} = 1 + \sqrt{2}. \]

1.4.37 First note that \( \tan x = 1 \) when \( \sin x = \cos x \). Using our knowledge of the values of the standard angles between 0 and \( 2\pi \), we recognize that the sine function and the cosine function are equal at \( \frac{\pi}{4} \). Then, because we recall that the period of the tangent function is \( \pi \), we know that \( \tan \left( \frac{\pi}{4} + k\pi \right) = \tan \frac{\pi}{4} = 1 \) for every integer value of \( k \). Thus the solution set is \( \{ \frac{\pi}{4} + k\pi, \text{where } k \text{ is an integer} \} \).

1.4.38 Given that \( 2\theta \cos(\theta) + \theta = 0 \), we have \( \theta(2\cos(\theta) + 1) = 0 \). Which means that either \( \theta = 0 \), or \( 2\cos(\theta) + 1 = 0 \). The latter leads to the equation \( \cos \theta = -\frac{1}{2} \), which occurs at \( \theta = \frac{2\pi}{3} \) and \( \theta = \frac{4\pi}{3} \). Using the fact that the cosine function has period \( 2\pi \) the entire solution set is thus
\[ \{0\} \cup \left\{ \frac{2\pi}{3} + 2k\pi, \text{where } k \text{ is an integer} \right\} \cup \left\{ \frac{4\pi}{3} + 2l\pi, \text{where } l \text{ is an integer} \right\}. \]

1.4.39 Given that \( \sin^2 \theta = \frac{1}{4} \), we have \( |\sin \theta| = \frac{1}{2} \), so \( \sin \theta = \frac{1}{2} \) or \( \sin \theta = -\frac{1}{2} \). It follows that \( \theta = \frac{\pi}{6}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{11\pi}{6} \).

1.4.40 Given that \( \cos^2 \theta = \frac{1}{2} \), we have \( |\cos \theta| = \frac{\sqrt{2}}{2} \). Thus \( \cos \theta = \frac{\sqrt{2}}{2} \) or \( \cos \theta = -\frac{\sqrt{2}}{2} \). We have \( \theta = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4} \).

1.4.41 The equation \( \sqrt{2}\sin x - 1 = 0 \) can be written as \( \sin x = \frac{\sqrt{2}}{2} \). Standard solutions to this equation occur at \( x = \frac{\pi}{4} \) and \( x = \frac{3\pi}{4} \). Because the sine function has period \( 2\pi \) the set of all solutions can be written as:
\[ \left\{ \frac{\pi}{4} + 2k\pi, \text{where } k \text{ is an integer} \right\} \cup \left\{ \frac{3\pi}{4} + 2l\pi, \text{where } l \text{ is an integer} \right\}. \]

1.4.42 Let \( u = 3x \). Note that because \( 0 \leq x < 2\pi \), we have \( 0 \leq u < 6\pi \). Because \( \sin u = \frac{\sqrt{2}}{2} \) for \( u = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}, \frac{9\pi}{4}, \frac{11\pi}{4}, \frac{13\pi}{4}, \frac{15\pi}{4}, \frac{17\pi}{4}, \frac{19\pi}{4} \), we must have that \( \sin 3x = \frac{\sqrt{2}}{2} \) for \( 3x = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{9\pi}{4}, \frac{11\pi}{4}, \frac{13\pi}{4}, \frac{15\pi}{4}, \frac{17\pi}{4}, \frac{19\pi}{4} \), which translates into
\[ x = \frac{\pi}{12}, \frac{\pi}{4}, \frac{3\pi}{4}, \frac{11\pi}{12}, \frac{17\pi}{12}, \text{and } \frac{19\pi}{12}. \]

1.4.43 As in the previous problem, let \( u = 3x \). Then we are interested in the solutions to \( \cos u = \sin u \), for \( 0 \leq u < 6\pi \). This would occur for \( u = 3x = \frac{\pi}{4}, \frac{5\pi}{4}, \frac{9\pi}{4}, \frac{13\pi}{4}, \frac{17\pi}{4}, \text{and } \frac{21\pi}{4} \). Thus there are solutions for the original equation at
\[ x = \frac{\pi}{12}, \frac{5\pi}{12}, \frac{3\pi}{4}, \frac{13\pi}{12}, \frac{17\pi}{12}, \text{and } \frac{7\pi}{4}. \]

1.4.44 \( \sin^2 \theta = 1 \) whenever \( \sin^2 \theta = \pm 1 \). This occurs for \( \theta = \frac{\pi}{2} + k\pi \), where \( k \) is an integer.

1.4.45 If \( \sin \theta \cos \theta = 0 \), then either \( \sin \theta = 0 \) or \( \cos \theta = 0 \). This occurs for \( \theta = 0, \frac{\pi}{2}, \pi, \frac{3\pi}{2} \).

1.4.46 If \( \tan^2 2\theta = 1 \), then \( \sin^2 2\theta = \cos^2 2\theta \), so we have either \( \sin 2\theta = \cos 2\theta \) or \( \sin 2\theta = -\cos 2\theta \). This occurs for \( 2\theta = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4} \) for \( 0 \leq 2\theta \leq 2\pi \), so the corresponding values for \( \theta \) are \( \frac{\pi}{8}, \frac{3\pi}{8}, \frac{5\pi}{8}, \frac{7\pi}{8} \) for \( 0 \leq \theta \leq \pi \).

1.4.47 Let \( z = \sin^{-1} 1 \). Then \( z = 1 \), and because \( \sin \frac{\pi}{2} = 1 \), and \( \frac{\pi}{2} \) is in the desired interval, \( z = \frac{\pi}{2} \).

Copyright © 2014 Pearson Education, Inc.
1.4.48 Let \( z = \cos^{-1}(-1) \). Then \( \cos z = -1 \), and because \( \cos \pi = -1 \) and \( \pi \) is in the desired interval, \( z = \pi \).

1.4.49 Let \( z = \tan^{-1} 1 \). Then \( \tan z = 1 \), so \( \frac{\sin z}{\cos z} = 1 \), so \( \sin z = \cos z \). Because \( \cos \frac{\pi}{4} = \sin \frac{\pi}{4} \), and \( \frac{\pi}{4} \) is in the desired interval, \( z = \frac{\pi}{4} \).

1.4.50 Let \( z = \cos^{-1} \left( -\frac{\sqrt{2}}{2} \right) \). Then \( \cos z = -\frac{\sqrt{2}}{2} \). Because \( \cos \frac{3\pi}{4} = -\frac{\sqrt{2}}{2} \) and \( \frac{3\pi}{4} \) is in the desired interval, we have \( z = \frac{3\pi}{4} \). (Note that \( \cos \left( -\frac{\pi}{4} \right) \) is also equal to \( -\frac{\sqrt{2}}{2} \), but \( -\frac{\pi}{4} \) isn’t in the desired interval \([0, \pi]\)).

1.4.51 \( \sin^{-1} \frac{\sqrt{3}}{2} = \frac{\pi}{3} \), because \( \sin \frac{\pi}{3} = \frac{\sqrt{3}}{2} \).

1.4.52 \( \cos^{-1} 2 \) does not exist, because 2 is not in the domain of the inverse cosine function (because 2 is not in the range of the cosine function).

1.4.53 \( \cos^{-1} \left( -\frac{1}{2} \right) = \frac{2\pi}{3} \), because \( \cos \frac{2\pi}{3} = -\frac{1}{2} \).

1.4.54 \( \sin^{-1}(-1) = -\frac{\pi}{2} \), because \( \sin \left( -\frac{\pi}{2} \right) = -1 \).

1.4.55 \( \cos(\cos^{-1}(-1)) = \cos \pi = -1 \).

1.4.56 \( \cos^{-1} \left( \cos \frac{7\pi}{6} \right) = \cos^{-1} \left( -\frac{\sqrt{3}}{2} \right) = \frac{5\pi}{6} \). Note that the range of the inverse cosine function is \([0, \pi]\).

1.4.57

\[
\cos(\sin^{-1}(x)) = \frac{\text{side adjacent to } \sin^{-1}(x)}{\text{hypotemuse}} = \frac{\sqrt{1-x^2}}{1} = \sqrt{1-x^2}.
\]
1.4.58

\[
\cos \left( \sin^{-1} \frac{x}{3} \right) = \frac{\text{side adjacent to } \sin^{-1} \frac{x}{3}}{\text{hypotenuse}} = \frac{\sqrt{9 - x^2}}{3}.
\]

1.4.59

\[
\sin \left( \cos^{-1} \frac{x}{2} \right) = \frac{\text{side opposite of } \cos^{-1} \frac{x}{2}}{\text{hypotenuse}} = \frac{\sqrt{4 - x^2}}{2}.
\]
1.4.60

Note (from the triangle pictured) that \( \cos \theta = \frac{b}{c} = \sin(\frac{\pi}{2} - \theta) \). Thus \( \sin^{-1}(\cos \theta) = \sin^{-1}(\sin(\frac{\pi}{2} - \theta)) = \frac{\pi}{2} - \theta \).

1.4.61

Using the identity given, we have \( \sin(2 \cos^{-1} x) = 2 \sin(\cos^{-1} x) \cos(\cos^{-1} x) = 2x \sin(\cos^{-1} x) = 2x \sqrt{1 - x^2} \).
1.4.62

First note that \( \cos(\sin^{-1} \theta) = \sqrt{1 - \theta^2} \), as indicated in the triangle shown.

Using the identity given, we have

\[
\cos(2 \sin^{-1} x) = \cos^2(\sin^{-1} x) - \sin^2(\sin^{-1} x) = (\sqrt{1 - x^2})^2 - x^2 = 1 - 2x^2.
\]

1.4.63

Let \( \theta = \cos^{-1} x \), and note from the diagram that it then follows that \( \cos^{-1}(-x) = \pi - \theta \). So \( \cos^{-1} x + \cos^{-1}(-x) = \theta + \pi - \theta = \pi \).

1.4.64 Let \( \theta = \sin^{-1} y \). Then \( \sin \theta = y \), and \( \sin(-\theta) = -\sin \theta = -y \) (because the sine function is an odd function) and it then follows that \( -\theta = \sin^{-1}(-y) \). Therefore, \( \sin^{-1} y + \sin^{-1}(-y) = \theta + (-\theta) = 0 \). It would be instructive for the reader to draw his or her own diagram like that in the previous solution.

1.4.65 The graphs appear to be identical: so \( \sin^{-1} x = \frac{\pi}{2} - \cos^{-1} x \).

1.4.66 The graphs appear to be identical: so \( \tan^{-1} x = \frac{\pi}{2} - \cot^{-1} x \).

1.4.67 \( \tan^{-1} \sqrt{3} = \tan^{-1} \frac{\sqrt{3}}{2} = \frac{\pi}{3} \), because \( \sin \frac{\pi}{3} = \frac{\sqrt{3}}{2} \) and \( \cos \frac{\pi}{3} = \frac{1}{2} \).

1.4.68 \( \cot^{-1} \left( -\frac{1}{\sqrt{3}} \right) = \cot^{-1} \left( \frac{1}{\sqrt{3}} \right) = \frac{2\pi}{3} \), because \( \sin \frac{2\pi}{3} = \frac{\sqrt{3}}{2} \) and \( \cos \frac{2\pi}{3} = -\frac{1}{2} \).

1.4.69 \( \sec^{-1} 2 = \sec^{-1} \frac{1}{2} = \frac{\pi}{3} \), because \( \sec \frac{\pi}{3} = \frac{1}{\cos \frac{\pi}{3}} = \frac{1}{1/2} = 2 \).

1.4.70 \( \csc^{-1}(-1) = \sin^{-1}(-1) = -\frac{\pi}{2} \).

1.4.71 \( \tan^{-1} (\tan \frac{\pi}{4}) = \tan^{-1} 1 = \frac{\pi}{4} \).

1.4.72 \( \tan^{-1} (\tan \frac{3\pi}{4}) = \tan^{-1}(-1) = -\frac{\pi}{4} \).

1.4.73 Let \( \csc^{-1}(\sec 2) = z \). Then \( \csc z = \sec 2 \), so \( \sin z = \cos 2 \). Now by applying the result of problem 60, we see that \( z = \sin^{-1}(\cos 2) = \frac{\pi}{2} - 2 = \frac{\pi - 4}{2} \).

1.4.74 \( \tan(\tan^{-1} 1) = \tan \frac{\pi}{4} = 1 \).
1.4.75

\[ \cos(\tan^{-1} x) = \frac{\text{side adjacent to } \tan^{-1} x}{\text{hypotenuse}} = \frac{1}{\sqrt{1 + x^2}}. \]

1.4.76

\[ \tan(\cos^{-1} x) = \frac{\text{side opposite of } \cos^{-1} x}{\text{side adjacent to } \cos^{-1} x} = \frac{\sqrt{1 - x^2}}{x}. \]

1.4.77

\[ \cos(\sec^{-1} x) = \frac{\text{side adjacent to } \sec^{-1} x}{\text{hypotenuse}} = \frac{1}{x}. \]
1.4.78
\[
cot(\tan^{-1} 2x) = \frac{\text{side adjacent to } \tan^{-1} 2x}{\text{side opposite of } \tan^{-1} 2x} = \frac{1}{2x}.
\]

1.4.79
Assume \(x > 0\). Then
\[
\sin\left(\sec^{-1}\left(\frac{\sqrt{x^2 + 16}}{4}\right)\right) = \frac{\text{side opposite of } \sec^{-1}\left(\frac{\sqrt{x^2 + 16}}{4}\right)}{\text{hypotenuse}} = \frac{|x|}{\sqrt{x^2 + 16}}.
\]
Note: If \(x < 0\), then the expression results in a positive number, hence the necessary absolute value sign in the result.
1.4.80

\[
\cos \left( \tan^{-1} \left( \frac{x}{\sqrt{9 - x^2}} \right) \right) = \frac{\text{side adjacent to } \tan^{-1} \left( \frac{x}{\sqrt{9 - x^2}} \right)}{\text{hypotenuse}} = \frac{\sqrt{9 - x^2}}{3}.
\]

1.4.81 Because \( \sin \theta = \frac{x}{6} \), \( \theta = \sin^{-1} \frac{x}{6} \). Also, \( \theta = \tan^{-1} \frac{x}{\sqrt{36 - x^2}} = \sec^{-1} \frac{6}{\sqrt{36 - x^2}} \).

1.4.82

First note that \( \tan \psi = \frac{2x}{\sqrt{144 - 9x^2}} \), so \( \psi = \tan^{-1} \left( \frac{2x}{\sqrt{144 - 9x^2}} \right) \). Also, \( \sin(\theta + \psi) = \frac{3\pi}{12} = \frac{\pi}{4} \), so \( \theta + \psi = \sin^{-1} \frac{\pi}{4} \). Therefore, \( \theta = \sin^{-1} \frac{\pi}{4} - \psi = \sin^{-1} \frac{\pi}{4} - \tan^{-1} \left( \frac{2x}{\sqrt{144 - 9x^2}} \right) \).

1.4.83

a. False. For example, \( \sin \left( \frac{\pi}{2} + \frac{\pi}{2} \right) = \sin \pi = 0 \neq \sin \frac{\pi}{2} + \sin \frac{\pi}{2} = 1 + 1 = 2 \).

b. False. That equation has zero solutions, because the range of the cosine function is \([-1, 1]\).

c. False. It has infinitely many solutions of the form \( \frac{\pi}{6} + 2k\pi \), where \( k \) is an integer (among others).

d. False. It has period \( \frac{2\pi}{5/12} = 24 \).

e. True. The others have a range of either \([-1, 1]\) or \((-\infty, -1] \cup [1, \infty)\).

f. False. For example, suppose \( x = 0.5 \). Then \( \sin^{-1} x = \frac{\pi}{6} \) and \( \cos^{-1} x = \frac{\pi}{3} \), so that \( \frac{\sin^{-1} x}{\cos^{-1} x} = \frac{\pi/6}{\pi/3} = 0.5 \). However, note that \( \tan^{-1} 0.5 \neq 0.5 \).

g. True. Note that the range of the inverse cosine function is \([0, \pi]\).

h. False. For example, if \( x = 0.5 \), we would have \( \sin^{-1} 0.5 = \frac{\pi}{6} \neq \frac{1}{\sin 0.5} \).

1.4.84 If \( \sin \theta = -\frac{4}{5} \), then the Pythagorean identity gives \( |\cos \theta| = \frac{3}{5} \). But if \( \pi < \theta < \frac{3\pi}{2} \), then the cosine of \( \theta \) is negative, so \( \cos \theta = -\frac{3}{5} \). Thus \( \tan \theta = \frac{4}{3} \), \( \cot \theta = \frac{3}{4} \), \( \sec \theta = -\frac{5}{3} \), and \( \csc \theta = -\frac{5}{4} \).
1.4.85 If \( \cos \theta = \frac{5}{13} \), then the Pythagorean identity gives \( |\sin \theta| = \frac{12}{13} \). But if \( 0 < \theta < \frac{\pi}{2} \), then the sine of \( \theta \) is positive, so \( \sin \theta = \frac{12}{13} \). Thus \( \tan \theta = \frac{12}{5} \), \( \cot \theta = \frac{5}{12} \), \( \sec \theta = \frac{13}{5} \), and \( \csc \theta = \frac{13}{12} \).

1.4.86 If \( \sec \theta = \frac{5}{3} \), then \( \cos \theta = \frac{3}{5} \), and the Pythagorean identity gives \( |\sin \theta| = \frac{4}{5} \). But if \( \frac{3\pi}{2} < \theta < 2\pi \), then the sine of \( \theta \) is negative, so \( \sin \theta = -\frac{4}{5} \). Thus \( \tan \theta = -\frac{4}{3} \), \( \cot \theta = -\frac{3}{4} \), and \( \csc \theta = -\frac{5}{4} \).

1.4.87 If \( \csc \theta = \frac{13}{12} \), then \( \sin \theta = \frac{12}{13} \), and the Pythagorean identity gives \( |\cos \theta| = \frac{5}{13} \). But if \( 0 < \theta < \frac{\pi}{2} \), then the cosine of \( \theta \) is positive, so \( \cos \theta = \frac{5}{13} \). Thus \( \tan \theta = \frac{12}{5} \), \( \cot \theta = \frac{5}{12} \), and \( \sec \theta = \frac{13}{5} \).

1.4.88 The amplitude is 2, and the period is \( \frac{2\pi}{2} = \pi \).

1.4.89 The amplitude is 3, and the period is \( \frac{2\pi}{\frac{1}{3}} = 6\pi \).

1.4.90 The amplitude is 2.5, and the period is \( \frac{2\pi}{\frac{1}{2}} = 4\pi \).

1.4.91 The amplitude is 3.6, and the period is \( \frac{2\pi}{\frac{1}{24}} = 48 \).

1.4.92

Compress the graph of \( \sin x \) horizontally by a factor of 2 and stretch it vertically by a factor of 3.

1.4.93

Expand the graph of \( \cos x \) horizontally by a factor of 3 and stretch it vertically by a factor of 2. Then flip it across the \( x \) axis.
1.4.94

Since \(3 \sin \left(2x - \frac{\pi}{3}\right) + 1 = 3 \sin \left(2 \left(x - \frac{\pi}{6}\right)\right) + 1\), compress the graph of \(\sin x\) horizontally by a factor of 2 and shift it right by \(\frac{\pi}{6}\). Then expand it vertically by a factor of 3 and shift up by one unit.

1.4.95

Expand the graph of \(\cos x\) horizontally by a factor of \(\frac{24\pi}{7}\) and vertically by a factor of 3.6. Then shift the graph up by 2 units.

1.4.96

It is helpful to imagine first shifting the function horizontally so that the \(x\) intercept is where it should be, then stretching the function horizontally to obtain the correct period, and then stretching the function vertically to obtain the correct amplitude. Because the old \(x\)-intercept is at \(x = 0\) and the new one should be at \(x = 3\) (halfway between where the maximum and the minimum occur), we need to shift the function 3 units to the right. Then to get the right period, we need to multiply (before applying the sine function) by \(\frac{\pi}{6}\) so that the new period is \(\frac{2\pi}{\frac{\pi}{6}} = 12\). Finally, to get the right amplitude and to get the max and min at the right spots, we need to multiply on the outside by 4. Thus, the desired function is:

\[
f(x) = 4 \sin \left(\frac{\pi}{6} (x - 3)\right) = 4 \sin \left(\frac{\pi}{6} x - \frac{\pi}{2}\right).
\]
1.4.97
It is helpful to imagine first shifting the function horizontally so that the $x$ intercept is where it should be, then stretching the function horizontally to obtain the correct period, and then stretching the function vertically to obtain the correct amplitude, and then shifting the whole graph up. Because the old $x$-intercept is at $x = 0$ and the new one should be at $x = 9$ (halfway between where the maximum and the minimum occur), we need to shift the function 9 units to the right. Then to get the right period, we need to multiply (before applying the sine function) by $\frac{\pi}{12}$ so that the new period is $\frac{2\pi}{\pi/12} = 24$. Finally, to get the right amplitude and to get the max and min at the right spots, we need to multiply on the outside by 3, and then shift the whole thing up 13 units. Thus, the desired function is:

$$f(x) = 3\sin\left(\frac{\pi}{12}(x - 9)\right)+13 = 3\sin\left(\frac{\pi}{12}x - \frac{3\pi}{4}\right)+13.$$ 

1.4.98 Let $C$ be the point on the end line so that segment $AC$ is perpendicular to the endline. Then the distance $G_1C = 38.3$, $G_2C = 15$, and $AC = 69$ and $BC = 84$, where all lengths are in feet. Thus

$$m(\angle G_1AG_2) = m(\angle G_1AC) - m(\angle G_2AC) = \tan^{-1}\left(\frac{38.3}{69}\right) - \tan^{-1}\left(\frac{15}{69}\right) \approx 16.79^\circ,$$

while

$$m(\angle G_1BG_2) = m(\angle G_1BC) - m(\angle G_2BC) = \tan^{-1}\left(\frac{38.3}{84}\right) - \tan^{-1}\left(\frac{15}{84}\right) \approx 14.4^\circ.$$ 

The kicking angle was not improved by the penalty.

1.4.99 Let $C$ be the circumference of the earth. Then the first rope has radius $r_1 = \frac{C}{2\pi}$. The circle generated by the longer rope has circumference $C + 38$, so its radius is $r_2 = \frac{C + 38}{2\pi} = \frac{C}{2\pi} + \frac{38}{2\pi} \approx r_1 + 6$, so the radius of the bigger circle is about 6 feet more than the smaller circle.

1.4.100 This curve looks like a sine curve except for the scaling. Now, $\sin x = 1$ first for $x = \frac{\pi}{2}$; since this curve is first 2 at $x = \pi$, it must be the curve $y = 2\sin \frac{x}{2}$. As a check, this satisfies the required properties $0 = 2\sin\left(-\frac{2\pi}{2}\right) = 2\sin(-\pi)$, $-2 = 2\sin\left(-\frac{\pi}{2}\right)$, $2 = 2\sin\frac{\pi}{2}$, and $0 = 2\sin\frac{2\pi}{2} = 2\sin \pi$.

1.4.101 If this curve were reflected about the $x$ axis, it would look like a cosine curve except for the scaling. Since the amplitude is 2 and the period is $\pi$, the equation must be $y = -2\cos 2x$. Checking a couple of the points shows that

$$-2 = -2\cos(2(-\pi)) = -2\cos(-2\pi), \quad 2 = -2\cos\left(2 \cdot \frac{3\pi}{2}\right) = -2\cos 3\pi,$$

as desired.

1.4.102 This curve is shifted up by $\frac{1}{2}$. When shifted back down, it is exactly a cosine curve: it starts at 1, is zero at $\frac{\pi}{2}$ and $-1$ at $\pi$, and it has a period of $2\pi$. Thus the equation is $y = \frac{1}{2} + \cos x$.

1.4.103 This curve has amplitude 1; if shifted left by $\frac{\pi}{4}$, it would be zero at $x = 0$ and 1 at $x = \frac{\pi}{4}$, with a period of $2\pi$, so it would be the curve $y = \sin x$. Thus this is the graph of $y = \sin \left(x - \frac{\pi}{4}\right)$.
1.4.104  

a. The period of this function is \( \frac{2\pi}{2\pi/365} = 365 \).

b. Because the maximum for the regular sine function is 1, and this function is scaled vertically by a factor of 2.8 and shifted 12 units up, the maximum for this function is \( 2.8 \cdot 1 + 12 = 14.8 \). Similarly, the minimum is \( 2.8 \cdot (-1) + 12 = 9.2 \). Because of the horizontal shift, the point at \( t = 81 \) is the midpoint between where the max and min occur. Thus the max occurs at \( 81 + \frac{365}{4} \approx 172 \) and the min occurs approximately \( \frac{365}{2} \) days later at about \( t = 355 \).

c. The solstices occur halfway between these points, at \( 81 \) and \( 81 + \frac{365}{2} \approx 264 \).

1.4.105  We are seeking a function with amplitude 10 and period 1.5, and value 10 at time 0, so it should have the form \( 10 \cos(kt) \), where \( \frac{2\pi}{k} = 1.5 \). Solving for \( k \) yields \( k = \frac{4\pi}{3} \), so the desired function is \( d(t) = 10 \cos \frac{4\pi}{3} t \).

1.4.106  

a. Because \( \tan \theta = \frac{50}{x} \), we have \( d = \frac{50}{\tan \theta} \).

b. Because \( \sin \theta = \frac{50}{L} \), we have \( L = \frac{50}{\sin \theta} \).

1.4.107  The figure in the text is abstracted and labeled below:

Since \( \angle ABC = 75^\circ \) and \( \angle FBE = 45^\circ \), we must have \( \angle CBE = 60^\circ \). Since \( BC = BE \), \( \triangle BCE \) is isosceles, so that \( \angle BCE = \angle BEC \). Since they must sum to \( 120^\circ \) because \( \angle CBE = 60^\circ \), it follows that they are each equal to \( 60^\circ \), so that \( \triangle BCE \) is equilateral, and thus \( CE = a \) as well. Now, \( \angle BEF = 45^\circ \) and \( \angle BEC = 60^\circ \), so that \( \angle CED = 75^\circ \) and thus \( \angle DCE = 15^\circ \). So \( \triangle DCE \) and \( \triangle ACB \) are congruent, since they have the same angles and one of the corresponding sides is equal. It follows that \( CD = h \). But \( CD \) is the distance between the walls. So the distance between the walls is \( h \).  

Copyright (c) 2014 Pearson Education, Inc.
Let the corner point $P$ divide the pole into two pieces, $L_1$ (which spans the 3-ft hallway) and $L_2$ (which spans the 4-ft hallway). Then $L = L_1 + L_2$. Now $L_2 = \frac{4}{\sin \theta}$, and $\frac{3}{\cos \theta} = \cos \theta$ (see diagram). Thus $L = L_1 + L_2 = \frac{3}{\cos \theta} + \frac{4}{\sin \theta}$. When $L = 10$, $\theta \approx 0.927$.

To find $s(t)$ note that we are seeking a periodic function with period 365, and with amplitude 87.5 (which is half of the number of minutes between 7:25 and 4:30). We need to shift the function 4 days plus one fourth of 365, which is about 95 days so that the max and min occur at $t = 4$ days and at half a year later. Also, to get the right value for the maximum and minimum, we need to multiply by negative one and add 117.5 (which represents 30 minutes plus half the amplitude, because $s = 0$ corresponds to 4:00 AM). Thus we have

$$s(t) = 117.5 - 87.5 \sin \left( \frac{\pi}{182.5} (t - 95) \right).$$

A similar analysis leads to the formula

$$S(t) = 843.5 + 87.5 \sin \left( \frac{\pi}{182.5} (t - 67) \right).$$

The graph pictured shows $D(t) = S(t) - s(t)$, the length of day function, which has its max at the summer solstice which is about the 172nd day of the year, and its min at the winter solstice.

Let $\theta_1$ be the viewing angle to the bottom of the television. Then $\theta_1 = \tan^{-1} \frac{3}{4}$. Now $\tan(\theta + \theta_1) = \tan^{-1} \frac{3}{4}$, so $\theta + \theta_1 = \tan^{-1} \frac{3}{4} - \theta_1 = \tan^{-1} \frac{3}{4} - \tan^{-1} \frac{3}{4}$.

The area of the entire circle is $\pi r^2$. The ratio $\frac{\theta}{2\pi}$ represents the proportion of the area swept out by a central angle $\theta$. Thus the area of a sector of a circle is this same proportion of the entire area, so it is $\frac{\theta}{2\pi} \pi r^2 = \frac{r^2 \theta}{2}$.

Using the given diagram, drop a perpendicular from the point $(b \cos \theta, b \sin \theta)$ to the $x$ axis, and consider the right triangle thus formed whose hypotenuse has length $c$. By the Pythagorean theorem, $(b \sin \theta)^2 + (a - b \cos \theta)^2 = c^2$. Expanding the binomial gives $b^2 \sin^2 \theta + a^2 - 2ab \cos \theta + b^2 \cos^2 \theta = c^2$. Now because $b^2 \sin^2 \theta + b^2 \cos^2 \theta = b^2$, this reduces to $a^2 + b^2 - 2ab \cos \theta = c^2$.

Note that $\sin A = \frac{b}{c}$ and $\sin C = \frac{b}{a}$, so $b = c \sin A = a \sin C$. Thus

$$\frac{\sin A}{a} = \frac{\sin C}{c}.$$
Now drop a perpendicular from the vertex A to the line determined by $\overline{BC}$, and let $h_2$ be the length of this perpendicular. Then $\sin C = \frac{h_2}{b}$ and $\sin B = \frac{h_2}{c}$, so $h_2 = b \sin C = c \sin B$. Thus

$$\frac{\sin C}{c} = \frac{\sin B}{b}.\]$$

Putting the two displayed equations together gives

$$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}.\]$$

1.4.114  a. A plot of the two curves is

The only intersection point is at $\approx (1.03, 0.51)$.

b. A plot of the two curves is

The three intersection points are $\approx (1.40, 0.17)$, $(5.46, 0.68)$, and $(6.83, 0.85)$.

c. Experimenting, we get the plot below for $a = 6.2$; this appears to be close to the correct answer.

The $x$ coordinate of the first intersection point is $x \approx 1.35$; the second is $x \approx 6.12$. The corresponding points are approximately $(1.35, 0.22)$ and $(6.12, 0.99)$.
1.4. TRIGONOMETRIC FUNCTIONS AND THEIR INVERSES

1.4.115  a. The function \( \frac{\sin x}{x} \) is defined whenever \( x \neq 0 \), so its domain is \( \{ x : x \neq 0 \} \).

b. A plot of \( \text{sinc} x \) is

![Sinc Function Graph](image)

c. Since the denominator of \( \frac{\sin x}{x} \) vanishes at \( x = 0 \), that cannot be used as a definition for \( \text{sinc} x \) everywhere. However, from the graph, it is clear that for \( x \) near zero, \( \frac{\sin x}{x} \) is near 1, so that 1 is a reasonable definition for the value of \( \text{sinc}(0) \).

d. From the graph, it appears that the range of \( \text{sinc} x \) is from about \(-0.22\) to 1, so \( \approx [-0.22, 1] \).

e. \( \text{sinc} x = 0 \) when the numerator of the function \( \frac{\sin x}{x} \) vanishes (except for \( x = 0 \), where \( \sin 0 = 1 \)), so that \( \text{sinc} x \) has roots at \( n\pi \) for \( n \) a non-negative integer.

f. Note that as \( x \) increases, the denominator gets larger and larger in magnitude, while the numerator remains between \(-1\) and 1. So as \( x \) increases in magnitude, the magnitude of \( \text{sinc} x \) will approach zero. It will, however, continue to oscillate, since the sign of the denominator will remain the same (positive as \( x \to \infty \) and negative as \( x \to -\infty \)), while the sign of the numerator will continue to change with a period of \( 2\pi \).

1.4.116  a. The two plots below are both on \([0, 10]\), but the second has restricted the vertical view so as to better emphasize the behavior away from \( x = 0 \):

![Function Graphs](image)

b. It appears that the range of \( f \) is \([0, 1]\). And in fact, since the numerator is never negative and the denominator is always positive, \( f(x) \geq 0 \) everywhere. Since the numerator is at most 1 and the denominator is at least 1, we have \( f(x) \leq 1 \) everywhere. Finally, \( f(0) = 1 \) and \( f \left( \frac{\pi}{2} \right) = 0 \). So the range is in fact \([0, 1]\).

c. From the graphs above, it appears that \( f \) has a root near \( x = 1.5 \) and another near \( x = 8 \). Expanding the view around these two points gives

Copyright © 2014 Pearson Education, Inc.
The roots are at about $x = 1.57$ and $x = 7.85$ (by examining the function, we can also see that the roots occur when $\sin x = 1$, so on $[0, 10]$ this is at $x = \frac{\pi}{2} \approx 1.57$ and $x = \frac{5\pi}{2} \approx 7.85$).

d. From the graphs in part (c), clearly $f$ has local minima at $(1.57, 0)$ and $(7.85, 0)$. There also appear to be peaks and valleys between $x = 2$ and $x = 8$. Expanding those views gives

On the left-hand graph, we find local maxima at $\approx (2.65, 0.11)$ and $\approx (4.41, 0.091)$, and a local minimum at $\approx (3.62, 0.078)$. On the right-hand graph, there are no local maxima or minima to the left of the root. To the right, there appears to be a local maximum at $\approx (9.15, 0.012)$ and a local minimum at $(9.70, 0.011)$.

14.117  a. The function $\frac{1}{2} + \frac{1}{\pi^2} \cos x$ looks like:

b. The graphs for 3, 4, and 5 terms are
c. The graphs for 6, 7, and 8 terms are

The graph appears to be approaching a graph of two lines, described by the piecewise function

\[
f(x) = \begin{cases} 
\frac{1}{\pi} x + 1, & -\pi \leq x < 0, \\
1 - \frac{1}{\pi} x, & 0 \leq x < \pi.
\end{cases}
\]

Chapter Review

1.

a. True. For example, \( f(x) = x^2 \) is such a function.

b. False. For example, \( \cos \left( \frac{\pi}{2} + \frac{\pi}{2} \right) = \cos \pi = -1 \neq \cos \frac{\pi}{2} + \cos \frac{\pi}{2} = 0 + 0 = 0 \).

c. False. Consider \( f(1 + 1) = f(2) = 2m + b \neq f(1) + f(1) = (m + b) + (m + b) = 2m + 2b \). (At least these aren't equal when \( b \neq 0 \)).

d. True. \( f(f(x)) = f(1 - x) = 1 - (1 - x) = x \).

e. False. This set is the union of the disjoint intervals \((-\infty, -7)\) and \((1, \infty)\).

f. False. For example, if \( x = y = 10 \), then \( \log_{10} xy = \log_{10} 100 = 2 \), but \( \log_{10} 10 \cdot \log_{10} 10 = 1 \cdot 1 = 1 \).

g. True. \( \sin^{-1}(\sin 2\pi) = \sin^{-1}(0) = 0 \).

2.

a. Because the quantity under the radical must be non-zero, the domain of \( f \) is \([0, \infty)\). The range is also \([0, \infty)\).

b. The domain is \((-\infty, 2) \cup (2, \infty)\). The range is \((-\infty, 0) \cup (0, \infty)\). (Note that if 0 were in the range then \( \frac{1}{y-2} = 0 \) for some value of \( y \), but this expression has no real solutions).

c. Because \( h \) can be written \( h(z) = \sqrt{(z - 3)(z + 1)} \), we see that the domain is \((-\infty, -1) \cup [3, \infty)\). The range is \([0, \infty)\). (Note that as \( z \) gets large, \( h(z) \) gets large as well).
3.

This line has slope \( \frac{2 - (-3)}{4 - 2} = \frac{5}{2} \). Therefore the equation of the line is \( y - 2 = \frac{5}{2}(x - 4) \), so \( y = \frac{5}{2}x - 8 \).

b.

This line has the form \( y = \frac{3}{4}x + b \), and because \((-4, 0)\) is on the line, \(0 = \frac{3}{4}(-4) + b\), so \( b = 3 \). Thus the equation of the line is given by \( y = \frac{3}{4}x + 3 \).

c.

This line has slope \( \frac{0 - (-2)}{4 - 0} = \frac{1}{2} \), and the \( y \)-intercept is given to be \( -2 \), so the equation of this line is \( y = \frac{1}{2}x - 2 \).

4.

The function is a piecewise step function which jumps up by one every half-hour step.
5. Because $|x| = \begin{cases} -x & \text{if } x < 0; \\ x & \text{if } x \geq 0, \end{cases}$ we have 

$$2(x - |x|) = \begin{cases} 2(x - (-x)) = 4x & \text{if } x < 0; \\ 2(x - x) = 0 & \text{if } x \geq 0. \end{cases}$$

6. Because the trip is 500 miles in a car that gets 35 miles per gallon, $\frac{500}{35} = \frac{100}{7}$ represents the number of gallons required for the trip. If we multiply this times the number of dollars per gallon we will get the cost. Thus $C = f(p) = \frac{100}{7}p$ dollars.

7. a.

This is a straight line with slope $\frac{2}{3}$ and $y$-intercept $\frac{10}{3}$.

b.

Completing the square gives $y = (x^2 + 2x + 1) - 4$, or $y = (x+1)^2 - 4$, so this is the standard parabola shifted one unit to the left and down 4 units.

c.

Completing the square, we have $x^2 + 2x + 1 + y^2 + 4y + 4 = -1 + 1 + 4$, so we have $(x+1)^2 + (y+2)^2 = 4$, a circle of radius 2 centered at $(-1, -2)$. 

Copyright © 2014 Pearson Education, Inc.
Completing the square, we have \( x^2 - 2x + 1 + y^2 - 8y + 16 = -5 + 1 + 16 \), or \((x - 1)^2 + (y - 4)^2 = 12\), which is a circle of radius \( \sqrt{12} \) centered at \((1, 4)\).

To solve \( x^{1/3} = x^{1/4} \) we raise each side to the 12th power, yielding \( x^4 = x^3 \). This gives \( x^4 - x^3 = 0 \), or \( x^3(x - 1) = 0 \), so the only solutions are \( x = 0 \) and \( x = 1 \) (which can be easily verified as solutions). Between 0 and 1, \( x^{1/4} > x^{1/3} \), but for \( x > 1 \), \( x^{1/3} > x^{1/4} \).

The domain of \( x^{1/7} \) is the set of all real numbers, as is its range. The domain of \( x^{1/4} \) is the set of non-negative real numbers \([0, \infty)\), as is its range.

Completing the square in the second equation, we have \( x^2 + y^2 - 7y + \frac{49}{4} = -8 + \frac{49}{4} \), which can be written as \( x^2 + (y - \frac{7}{2})^2 = \frac{17}{4} \). Thus we have a circle of radius \( \frac{\sqrt{17}}{2} \) centered at \((0, \frac{7}{2})\), along with the standard parabola. These intersect when \( y = 7y - y^2 - 8 \), which occurs for \( y^2 - 6y + 8 = 0 \), so for \( y = 2 \) and \( y = 4 \), with corresponding \( x \) values of \( \pm 2 \) and \( \pm \sqrt{2} \).

We are looking for the line between the points \((0, 212)\) and \((6000, 200)\). The slope is \( \frac{212 - 200}{0 - 6000} = -\frac{12}{6000} = -\frac{1}{500} \). Because the intercept is given, we deduce that the line is \( B = f(a) = -\frac{1}{500} a + 212 \).

a. The cost of producing \( x \) books is \( C(x) = 1000 + 2.5x \).
b. The revenue generated by selling $x$ books is $R(x) = 7x$.

c. The break-even point is where $R(x) = C(x)$. This is where $7x = 1000 + 2.5x$, or $4.5x = 1000$. So $x = \frac{1000}{4.5} \approx 222$.

a. 
\[h \left( \frac{\pi}{2} \right) = h(1) = 1\]

b. 
\[h(f(x)) = h(x^3) = x^{3/2}\]

c. 
\[f(g(h(x))) = f(g(\sqrt{x})) = f(\sin(\sqrt{x})) = (\sin(\sqrt{x}))^3\]

d. The domain of \(g(f(x))\) is \(\mathbb{R}\), because the domain of both functions is the set of all real numbers.

e. The range of \(f(g(x))\) is \([-1, 1]\). This is because the range of \(g\) is \([-1, 1]\), and on the restricted domain \([-1, 1]\), the range of \(f\) is also \([-1, 1]\).

16.

a. If \(g(x) = x^2 + 1\) and \(f(x) = \sin x\), then \(f(g(x)) = f(x^2 + 1) = \sin(x^2 + 1)\).

b. If \(g(x) = x^2 - 4\) and \(f(x) = x^{-3}\) then \(f(g(x)) = f(x^2 - 4) = (x^2 - 4)^{-3}\).

c. If \(g(x) = \cos 2x\) and \(f(x) = e^x\), then \(f(g(x)) = f(\cos 2x) = e^{\cos 2x}\).

17.
\[
\begin{align*}
\frac{f(x + h) - f(x)}{h} &= \frac{(x + h)^2 - 2(x + h) - (x^2 - 2x)}{h} \\
&= \frac{x^2 + 2hx + h^2 - 2x - 2h - x^2 + 2x}{h} \\
&= \frac{2hx + h^2 - 2h}{h} = 2x + h - 2
\end{align*}
\]

\[
\begin{align*}
\frac{f(x) - f(a)}{x - a} &= \frac{x^2 - 2x - (a^2 - 2a)}{x - a} \\
&= \frac{(x^2 - a^2) - 2(x - a)}{x - a} = \frac{(x - a)(x + a) - 2(x - a)}{x - a} = x + a - 2.
\end{align*}
\]

18.
\[
\begin{align*}
\frac{f(x + h) - f(x)}{h} &= \frac{4 - 5(x + h) - (4 - 5x)}{h} = \frac{4 - 5x - 5h - 4 + 5x}{h} = \frac{-5h}{h} = -5
\end{align*}
\]

\[
\begin{align*}
\frac{f(x) - f(a)}{x - a} &= \frac{4 - 5x - (4 - 5a)}{x - a} = \frac{-5(x - a)}{x - a} = -5.
\end{align*}
\]

Copyright © 2014 Pearson Education, Inc.
19.  
\[ f(x + h) - f(x) \]  
\[ \frac{h}{h} \]  
\[ = \frac{(x + h)^3 + 2 - (x^3 + 2)}{h} \]  
\[ = \frac{x^3 + 3x^2h + 3xh^2 + h^3 + 2 - x^3 - 2}{h} \]  
\[ = h(3x^2 + 3xh + h^2) = 3x^2 + 3xh + h^2 \]  
\[ f(x) - f(a) \]  
\[ \frac{x - a}{x - a} \]  
\[ = \frac{x^3 + 2 - (a^3 + 2)}{x - a} = \frac{x^3 - a^3}{x - a} = \frac{(x - a)(x^2 + ax + a^2)}{x - a} = x^2 + ax + a^2. \]

20.  
\[ f(x + h) - f(x) \]  
\[ \frac{h}{h} \]  
\[ = \frac{7}{x + h + 3} - \frac{7}{x + 3} \]  
\[ = \frac{7x + 21 - (7x + 7h + 21)}{(x + 3)(x + h + 3)} \]  
\[ = \frac{-7h}{(h)(x + 3)(x + h + 3)} = -\frac{7}{(x + 3)(x + h + 3)} \]  
\[ f(x) - f(a) \]  
\[ \frac{x - a}{x - a} \]  
\[ = \frac{7}{x + 3} - \frac{7}{a + 3} \]  
\[ = \frac{7a + 21 - (7a + 21)}{(x + 3)(a + 3)} \]  
\[ = \frac{-7(x - a)}{(x - a)(x + 3)(a + 3)} = -\frac{7}{(x + 3)(a + 3)}. \]

21.  
a. Because \( f(-x) = \cos(-3x) = \cos 3x = f(x) \), this is an even function, and is symmetric about the \( y \)-axis.

b. Because \( f(-x) = 3(-x)^4 - 3(-x)^2 + 1 = 3x^4 - 3x^2 + 1 = f(x) \), this is an even function, and is symmetric about the \( y \)-axis.

c. Because replacing \( x \) by \(-x\) and/or replacing \( y \) by \(-y\) gives the same equation, this represents a curve which is symmetric about the \( y \)-axis and about the origin and about the \( x \)-axis.

22. We have \( 8 = e^{4k} \), and so \( \ln 8 = 4k \), so \( k = \frac{\ln 8}{4} \).

23. If \( \log x^2 + 3 \log x = \log 32 \), then \( \log(x^2 \cdot x^3) = \log(32) \), so \( x^5 = 32 \) and \( x = 2 \). The answer does not depend on the base of the log.

24.  
The functions are as labelled.

25.  
By graphing, it is clear that this function is not one-to-one on its whole domain, but it is one-to-one on the interval \(( -\infty, 0] \), on the interval \([0, 2]\), and on the interval \([2, \infty)\), so it would have an inverse if we restricted it to any of these particular intervals.
26. This function is a stretched version of the sine function, it is one-to-one on the interval \([-\frac{3\pi}{2}, \frac{3\pi}{2}]\) (and on other intervals as well . . .) 

\[ y = \sin(2x) \]

\[ -\frac{\pi}{2} \leq x \leq \frac{\pi}{2} \]

27. Completing the square gives 

\[ f(x) = x^2 - 4x + 4 + 1 = (x - 2)^2 + 1. \]

Switching the \(x\) and \(y\) and solving for \(y\) yields 

\[ (y - 2)^2 = x - 1, \]

so \(|y - 2| = \sqrt{x - 1}\), and thus 

\[ y = f^{-1}(x) = 2 + \sqrt{x - 1} \]

(we choose the “+” rather than the “−” because the domain of \(f\) is \(x > 2\), so the range of \(f^{-1}\) must also consist of numbers greater than 2). 

28. If \(y = \frac{1}{x^2}\), then switching \(x\) and \(y\) gives 

\[ x = \frac{1}{y^2}, \]

so 

\[ y = f^{-1}(x) = \frac{1}{\sqrt{x}}. \]

29. a. A 135 degree angle measures \(135 \cdot \frac{\pi}{180}\) radians, which is \(\frac{3\pi}{4}\) radians.

b. A \(\frac{4\pi}{5}\) radian angle measures \(\frac{4\pi}{5} \cdot \frac{180}{\pi}\) degrees, which is 144 degrees.

c. Because the length of the arc is the measure of the subtended angle (in radians) times the radius, this arc would be 

\[ \frac{4\pi}{3} \cdot 10 = \frac{40\pi}{3} \]

units long.

30. a. This function has period \(\frac{2\pi}{1/2} = 4\pi\) and amplitude 4.
b. This function has period \( \frac{2\pi}{2\pi/3} = 3 \) and amplitude 2.

\[
\begin{align*}
\text{Graph of } y &= 2 \cos\left(\frac{\pi}{3} (t - 3)\right) \\
&= 2 \cos\left(\frac{\pi}{3} t - \pi\right) \\
&= -2 \cos\frac{\pi}{3} t
\end{align*}
\]

\[\text{Graph of } y = 2 \cos\left(\frac{\pi}{3} (t - 3)\right)\]

\[\text{Graph of } y = -2 \cos\frac{\pi}{3} t\]

c. This function has period \( \frac{2\pi}{2} = \pi \) and amplitude 1. Compared to the ordinary cosine function it is compressed horizontally, flipped about the x-axis, and shifted \( \frac{\pi}{4} \) units to the right.

\[
\begin{align*}
\text{Graph of } y &= 15 + 5 \cos\left(\frac{\pi}{12} (t - 6)\right) \\
&= 15 + 5 \cos\left(\frac{\pi}{12} t - \frac{\pi}{2}\right) \\
&= 15 + 5 \sin\frac{\pi}{12} t
\end{align*}
\]

\[\text{Graph of } y = 15 + 5 \sin\frac{\pi}{12} t\]

31. a. We need to scale the ordinary cosine function so that its period is 6, and then shift it 3 units to the right, and multiply it by 2. So the function we seek is (using the difference identity for cosine)

\[
y = 2 \cos\left(\frac{\pi}{3} (t - 3)\right) = 2 \cos\left(\frac{\pi}{3} t - \pi\right) = -2 \cos\frac{\pi}{3} t.
\]

b. We need to scale the ordinary cosine function so that its period is 24, and then shift it to the right 6 units. We then need to change the amplitude to be half the difference between the maximum and minimum, which would be 5. Then finally we need to shift the whole thing up by 15 units. The function we seek is thus (using the difference identity for cosine)

\[
y = 15 + 5 \cos\left(\frac{\pi}{12} (t - 6)\right) = 15 + 5 \cos\left(\frac{\pi}{12} t - \frac{\pi}{2}\right) = 15 + 5 \sin\frac{\pi}{12} t.
\]

32. The pictured function has an amplitude of 2 and a period of \( \pi \). If you visualize it shifted down by 1 unit, it looks like \( \cos 2x \) reflected in the x axis and expanded vertically by a factor of 2. Thus the equation is \( y = 1 - 2 \cos 2x \).

33. a. \( -\sin x \) is pictured in F.

b. \( \cos 2x \) is pictured in E.

c. \( \tan \frac{x}{2} \) is pictured in D.

d. \( -\sec x \) is pictured in B.

e. \( \cot 2x \) is pictured in C.

f. \( \sin^2 x \) is pictured in A.

34. If \( \sec x = 2 \), then \( \cos x = \frac{1}{2} \). This occurs for \( x = -\frac{\pi}{3} \) and \( x = \frac{\pi}{3} \), so the intersection points are \( \left(-\frac{\pi}{3}, 2\right) \) and \( \left(\frac{\pi}{3}, 2\right) \).
35. \[ \sin x = -\frac{1}{2} \] for \( x = \frac{7\pi}{6} \) and for \( x = \frac{11\pi}{6} \), so the intersection points are \( \left( \frac{7\pi}{6}, -\frac{1}{2} \right) \) and \( \left( \frac{11\pi}{6}, -\frac{1}{2} \right) \). 

36. Because \( \sin \frac{\pi}{3} = \frac{\sqrt{3}}{2} \), \( \sin^{-1} \frac{\sqrt{3}}{2} = \frac{\pi}{3} \).

37. Because \( \cos \frac{\pi}{6} = \frac{\sqrt{3}}{2} \), \( \cos^{-1} \frac{\sqrt{3}}{2} = \frac{\pi}{6} \).

38. Because \( \cos \frac{2\pi}{3} = -\frac{1}{2} \), \( \cos^{-1} \left( -\frac{1}{2} \right) = \frac{2\pi}{3} \).

39. Because \( \sin \left( -\frac{\pi}{2} \right) = -1 \), \( \sin^{-1}(-1) = -\frac{\pi}{2} \).

40. \( \cos(\cos^{-1}(-1)) = \cos \pi = -1 \).

41. \( \sin(\sin^{-1} x) = x \), for all \( x \) in the domain of the inverse sine function.

42. \( \cos^{-1}(\sin 3\pi) = \cos^{-1} 0 = \frac{\pi}{2} \).

43. If \( \theta = \sin^{-1} \frac{12}{13} \), then \( 0 < \theta < \frac{\pi}{2} \), and \( \sin \theta = \frac{12}{13} \). Then (using the Pythagorean identity) we can deduce that \( \cos \theta = \frac{5}{13} \). It must follow that \( \tan \theta = \frac{12}{5} \), \( \cot \theta = \frac{5}{12} \), \( \sec \theta = \frac{13}{5} \), and \( \csc \theta = \frac{13}{12} \).

44.

\[ \cos(\tan^{-1} x) = \frac{\text{side adjacent to } \tan^{-1} x}{\text{hypotenuse}} = \frac{1}{\sqrt{1 + x^2}}. \]

45.

\[ \sin \left( \cos^{-1} \frac{x}{2} \right) = \frac{\text{side opposite of } \cos^{-1} \frac{x}{2}}{\text{hypotenuse}} = \frac{\sqrt{4 - x^2}}{2}. \]
46. \[
\tan \left( \sec^{-1} \frac{x}{2} \right) = \frac{\text{side opposite of } \sec^{-1} \frac{x}{2}}{\text{side adjacent to } \sec^{-1} \frac{x}{2}} = \frac{\sqrt{x^2 - 4}}{2}.
\]

47. Note that \[
\tan \theta = \frac{a}{b} = \cot \left( \frac{\pi}{2} - \theta \right).
\]
Thus, \( \cot^{-1}(\tan \theta) = \cot^{-1} \left( \cot \left( \frac{\pi}{2} - \theta \right) \right) = \frac{\pi}{2} - \theta. \)
48.

Using the figure from the previous solution, note that
\[ \sec \theta = \frac{c}{b} = \csc \left( \frac{\pi}{2} - \theta \right). \]
Thus, \( \csc^{-1}(\sec \theta) = \csc^{-1}(\csc \left( \frac{\pi}{2} - \theta \right)) = \frac{\pi}{2} - \theta. \)

49. Let \( \theta = \sin^{-1} x \). Then \( \sin \theta = x \) and note that then \( \sin(-\theta) = -\sin \theta = -x \), so \( -\theta = \sin^{-1}(-x) \). Then \( \sin^{-1} x + \sin^{-1}(-x) = \theta + -\theta = 0 \).

50. Using the hint, we have \( \sin(2 \cos^{-1} x) = 2 \sin(\cos^{-1} x) \cos(\cos^{-1} x) = 2x \sqrt{1-x^2} \).

51. Using the hint, we have \( \cos(2 \sin^{-1} x) = \cos^2(\sin^{-1} x) - \sin^2(\sin^{-1} x) = (\sqrt{1-x^2})^2 - x^2 = 1 - 2x^2 \).

52. Let \( N \) be the north pole, and \( C \) the center of the given circle, and consider the angle \( \angle CNP \). This angle measures \( \frac{\pi}{2} - \theta \). (Note that the triangle \( CNP \) is isosceles). Now consider the triangle \( NOX \) where \( O \) is the origin and \( X \) is the point \((x,0)\). Using triangle \( NOX \), we have \( \tan \left( \frac{\pi}{2} - \theta \right) = \frac{x^2}{R} \), so \( x = 2R \tan \left( \frac{\pi}{2} - \theta \right). \)

**AP Practice Questions**

**Multiple Choice**

1. D is correct. For \( f(x) \) to be defined, the argument of the square root must be nonnegative, so that we must have \( 4 - x^2 \geq 0 \). Thus \( x^2 \leq 4 \), so that \( |x| \leq 2 \). The domain is \( |x| \leq 2 \), or \(-2 \leq x \leq 2 \), which is choice D.

2. A is correct. The graph of \( f(x-2) \) is the graph of \( f \) shifted to the right by 2 units. Multiplying by \(-1\) reflects the graph through the \( x \) axis, so that the parabola now opens downwards. Finally, adding 1 shifts it up.

3. B is correct. The range of \( A \) is \( 0 \leq y < \infty \). C takes on negative values, say for \( x = \frac{1}{4} \), as does \( D \), say for \( x = \frac{3\pi}{4} \). Finally, the range of \( E \) is \( 1 \leq y < \infty \), since \( x^2 + 1 \geq 1 \). For B, note that it is never zero and always positive, and that as \( x \) takes on larger and larger negative values, the exponent is large positively, so that \( y \) approaches infinity.

4. C is correct; only function III is symmetric around the origin. Symmetry about the origin requires that \( f(-x) = -f(x) \). Evaluating each of the three functions gives
\[
\begin{align*}
    f(-x) &= (-x) \sin(-x) = -x \cdot (-\sin x) = x \sin x = f(x) \\
    f(-x) &= (-x)^5 + 3(-x) + 1 = -x^5 - 3x + 1 = -f(x) + 2 \\
    f(-x) &= (-x)^3 - 4(-x) = -x^3 + 4x = -f(x).
\end{align*}
\]
Only the third function satisfies the required condition.

Copyright © 2014 Pearson Education, Inc.
5. E is correct. Except for scale, this graph looks like a cosine function. Its amplitude is 2, so C and D are out. Both A and B take the value 0 at \( x = 0 \), so the only remaining choice is E. This matches, since for \( x = \pm \pi \), \( f(\pm \pi) = 2 \cos \left( \frac{\pi}{2} \right) = 0 \) and \( f(0) = 2 \cos \frac{\pi}{2} = 2 \).

6. Only A is true. Since \( g(1) = 2 \), we have \( f(g(1)) = f(2) = 2 \). Also, since \( f(1) = 4 \), we have \( g(f(1)) = g(4) = 6 \). So A holds. B is false since \( g(f(0)) = g(6) \), which is not defined by the given graphs. C is false since \( f(g(2)) = f(5) \), which is not defined by the given graphs. D is false since \( f(g(3)) = f(7) \), which is not defined by the given graphs. Finally, E is false since \( g(f(4)) = g(4) = 6 \), not 5.

7. D is correct. The difference quotient is
\[
\frac{f(x + h) - f(h)}{h} = \frac{f(h + 4) - f(4)}{h} = \frac{(h + 4)^2 - 3 - (4^2 - 3)}{h} = \frac{h^2 + 8h + 4^2 - 3 - 4^2 + 3}{h} = \frac{h^2 + 8h}{h} = 8 + h.
\]

8. C is correct. The equation of the upper half of the unit circle is \( y = \sqrt{1 - x^2} \), so this is the definition of \( f(x) \) for \( x \leq 0 \). The line has slope 1 and \( y \)-intercept 1, so it is the line \( y = 1 + x \). Thus this is the definition of \( f(x) \) for \( x > 0 \). This corresponds to choice C.

9. \( f(g(x)) = g(f(x)) \) only for \( x = 1 \) and \( x = 4 \), so D is correct. We have
\[
\begin{align*}
f(g(1)) &= f(2) = 4, \quad g(f(1)) = g(3) = 4, \\
f(g(2)) &= f(1) = 3, \quad g(f(2)) = g(4) = 5, \\
f(g(3)) &= f(4) = 1, \quad g(f(3)) = g(5) = 3, \\
f(g(4)) &= f(5) = 2, \quad g(f(4)) = g(1) = 2, \\
f(g(5)) &= f(3) = 5, \quad g(f(5)) = g(2) = 1.
\end{align*}
\]

10. A is correct. We have
\[
6e^{2\ln 4 + 3} = 6e^3 e^{2\ln 4} = 6e^3 \cdot (e^{\ln 4})^2 = 6e^3 \cdot 4^2 = 96e^3.
\]

11. C is correct. The range of \( \cos^{-1} x \) is defined to be \([0, \pi]\), so the range of \( 2\cos^{-1} x \) is \([0, 2\pi]\).

12. C is correct. \( y = e^{-x} - 2 \) intersects the \( y \)-axis when \( x = 0 \), so at \( y = e^{-0} - 2 = 1 - 2 = -1 \). It intersects the \( x \)-axis when \( y = 0 \), which is when \( 0 = e^{-x} - 2 \). Simplifying gives \( e^{-x} = 2 \). Now take logs to get \( -x = \ln 2 \), so that \( x = -\ln 2 = \ln \frac{1}{2} \).

13. B is correct. A plot of the given function is

14. A is correct. The slope of the line between the two given points is
\[
\frac{\pi/2 - 0}{1 - 0} = \frac{\pi}{2}.
\]
Free Response

1. a. The numerator and denominator are defined everywhere. However, the denominator is zero when \(2e^x - e^{-x} = 0\), so when \(2e^x = e^{-x}\). Multiply through by \(e^x\) to get \(2e^{2x} = 1\), so that \(e^{2x} = \frac{1}{2}\). Taking logs gives \(2x = \ln \frac{1}{2} = -\frac{1}{2} \ln 2 = -\ln \sqrt{2}\). Taking \(\ln\) gives \(2x = \ln \frac{1}{2} = -\ln 2 = -\ln \sqrt{2}\). This is the only value of \(x\) at which the denominator vanishes, so the domain of \(f\) is all points except for \(x = -\ln \sqrt{2}\).

b. A plot of \(f(x)\) on \([-3, 3]\), with the line \(x = -\ln \sqrt{2}\) shown as a dashed line, is

(The other two lines, which are \(y = \frac{1}{2}\) and \(y = -3\), are used in parts e and f, below). Clearly the computation above is consistent with the graph, as it does not appear the function is defined at \(x = -\ln \sqrt{2}\).

c. \(f\) is never increasing. To the left of \(-\ln \sqrt{2}\), it is decreasing to \(-\infty\) as \(x\) increases, and to the right of \(-\ln \sqrt{2}\), it is decreasing as \(x\) increases.

d. From the analysis in part (c), \(f\) is decreasing everywhere in its domain. Thus \(f\) is decreasing on \((-\infty, -\ln \sqrt{2}) \cup (-\ln \sqrt{2}, \infty)\).

e. As \(x\) becomes large and positive, it appears that \(f(x)\) tends to \(\frac{1}{2}\) from above, since the graph of \(f\) seems to approach the line \(x = \frac{1}{2}\).

f. As \(x\) becomes large in magnitude and negative, it appears that \(f(x)\) approaches the line \(y = -3\) from below, so that \(f(x)\) tends to \(-3\).

2. a. \(f\) is defined when the argument of the square root is nonnegative, so when \(9 - x^2 \geq 0\). This means that \(x^2 \leq 9\), so that \(|x| \leq 3\). The domain is \(\{x : |x| \leq 3\}\).

b. Clearly \(f\) is never negative, and \(f(3) = f(-3) = 0\). The largest \(f\) can be is when \(x = 0\); then \(f(0) = \sqrt{9 - 0} = 3\). So the range of \(f\) is \([0, 3]\).

c. \(f(x) = \sqrt{9 - x^2} = 0\) means that \(9 - x^2 = 0\), so that \(x^2 = 9\) and \(x = \pm 3\). These are the zeros of \(f\).

d. \(f(0) = \sqrt{9 - 0^2} = \sqrt{9} = 3\). Note that we always use the positive square root — that is what the square root symbol means.

e. Since \(f(-3) = \sqrt{9 - (-3)^2} = \sqrt{9 - 9} = 0\) and \(f(0) = 3\), the values increase. Note that the graph of \(f\) is the upper half of the circle of radius 3 centered at the origin, and the values from \(x = -3\) to \(x = 0\) are the left half of that semicircle; clearly the values are increasing as \(x\) increases there.
f. Since $f(3) = \sqrt{9 - 3^2} = \sqrt{9 - 9} = 0$ and $f(0) = 3$, the values decrease. Note that as in the previous part, the graph of $f$ is the upper half of the circle of radius 3 centered at the origin, and the values from $x = 0$ to $x = 3$ are the right half of that semicircle; clearly the values are decreasing as $x$ increases there.

g. Many different answers are possible if you do not know or assume that this is the equation of a half-circle. All that is required is that the graph be increasing from 0 to 3 as $x$ goes from $-3$ to 0, and decreasing back down to zero as $x$ goes from 0 to 3. The actual graph is

![Graph of a half-circle]

3. 

a. Algebraic manipulation gives

$$f(x) = 2 \sin \left(2x - \frac{\pi}{2}\right) = 2 \sin \left(2 \left(x - \frac{\pi}{4}\right)\right).$$

Thus $c = 2$, $a = 2$, and $b = \frac{\pi}{4}$.

b. The graph of $y = \sin x$ is

![Graph of \(y = \sin x\)]

c. The graph of $y = \sin 2x$ is

![Graph of \(y = \sin 2x\)]

d. The graph of $y = \sin 2 \left(x - \frac{\pi}{4}\right)$ is

Copyright © 2014 Pearson Education, Inc.
e. The graph of \( y = 2 \sin 2 \left( x - \frac{\pi}{4} \right) \) is

4. Write \( t = f(d) \).

a. A graph of the function is

The horizontal axis represents distance, and is measured in feet from the problem statement. The vertical axis represents time, which is measured in seconds, again from the problem statement.

b. The slope of the secant line is

\[
\frac{f(64) - f(16)}{64 - 16} = \frac{2 - 1}{64 - 16} = \frac{1}{48}.
\]

Since the numerator is seconds and the denominator is feet, the units of this quotient are seconds per foot. Since the line passes through \((16, f(16)) = (16, 1)\), the equation of the secant line is \( t - 1 = \frac{1}{48}(d - 16) = \frac{1}{48}d - \frac{1}{3} \). Simplifying gives \( t = \frac{1}{48}d + \frac{2}{3} \).
c. The difference quotient is

\[
\frac{f(d) - f(a)}{d - a} = \frac{\sqrt{d} - \sqrt{a}}{d - a}
\]

\[
= \frac{\sqrt{d} - \sqrt{a}}{4(d - a)}
\]

\[
= \frac{(\sqrt{d} - \sqrt{a})(\sqrt{d} + \sqrt{a})}{4(d - a)(\sqrt{d} + \sqrt{a})}
\]

\[
= \frac{d - a}{4(d - a)(\sqrt{d} + \sqrt{a})}
\]

\[
= \frac{1}{4\left(\sqrt{d} + \sqrt{a}\right)}.
\]

Since \(f(d)\) is the time it takes to fall \(d\) feet, the difference quotient measures the average rate of change of the time it takes to fall with respect to the fall distance, over the interval \([a, d]\).
Chapter 2

Limits

2.1 The Idea of Limits

2.1.1 The average velocity of the object between time \( t = a \) and \( t = b \) is the change in position divided by the elapsed time: \( v_{av} = \frac{s(b) - s(a)}{b - a} \).

2.1.2 In order to compute the instantaneous velocity of the object at time \( t = a \), we compute the average velocity over smaller and smaller time intervals of the form \([a, t]\), using the formula: \( v_{av} = \frac{s(t) - s(a)}{t - a} \). We let \( t \) approach \( a \). If the quantity \( \frac{s(t) - s(a)}{t - a} \) approaches a limit as \( t \to a \), then that limit is called the instantaneous velocity of the object at time \( t = a \).

2.1.3 The slope of the secant line between points \((a, f(a))\) and \((b, f(b))\) is the ratio of the differences \( f(b) - f(a) \) and \( b - a \). Thus \( m_{sec} = \frac{f(b) - f(a)}{b - a} \).

2.1.4 In order to compute the slope of the tangent line to the graph of \( y = f(t) \) at \((a, f(a))\), we compute the slope of the secant line over smaller and smaller time intervals of the form \([a, t]\). Thus we consider \( \frac{f(t) - f(a)}{t - a} \) and let \( t \to a \). If this quantity approaches a limit, then that limit is the slope of the tangent line to the curve \( y = f(t) \) at \( t = a \).

2.1.5 Both problems involve the same mathematics, namely finding the limit as \( t \to a \) of a quotient of differences of the form \( \frac{g(t) - g(a)}{t - a} \) for some function \( g \).

2.1.6

Because \( f(x) = x^2 \) is an even function, \( f(-a) = f(a) \) for all \( a \). Thus the slope of the secant line between the points \((a, f(a))\) and \((-a, f(-a))\) is \( m_{sec} = \frac{f(-a) - f(a)}{-a - a} = \frac{0}{-2a} = 0 \). The slope of the tangent line at \( x = 0 \) is also zero.

\[ (-a, f(-a)) \quad \text{and} \quad (a, f(a)) \]

2.1.7 The average velocity is \( \frac{s(3) - s(2)}{3 - 2} = 156 - 136 = 20 \).

2.1.8 The average velocity is \( \frac{s(4) - s(1)}{4 - 1} = \frac{144 - 84}{3} = \frac{60}{3} = 20 \).

2.1.9 a. Over \([1, 4]\), we have \( v_{av} = \frac{s(4) - s(1)}{4 - 1} = \frac{256 - 112}{3} = 48 \).
b. Over [1, 3], we have $v_{av} = \frac{s(3) - s(1)}{3 - 1} = \frac{240 - 112}{2} = 64$.

c. Over [1, 2], we have $v_{av} = \frac{s(2) - s(1)}{2 - 1} = 192 - 112 = 80$.

d. Over $[1, 1 + h]$, we have

$$v_{av} = \frac{s(1 + h) - s(1)}{1 + h - 1} = \frac{-16(1 + h)^2 + 128(1 + h) - (112)}{h} = \frac{-16h^2 - 32h + 128h}{h} = \frac{h(-16h + 96)}{h} = 96 - 16h.$$

2.1.10

a. Over $[0, 3]$, we have $v_{av} = \frac{s(3) - s(0)}{3 - 0} = \frac{65.9 - 20}{3} = 15.3$.

b. Over $[0, 2]$, we have $v_{av} = \frac{s(2) - s(0)}{2 - 0} = \frac{60.4 - 20}{2} = 20.2$.

c. Over $[0, 1]$, we have $v_{av} = \frac{s(1) - s(0)}{1 - 0} = \frac{45.1 - 20}{1} = 25.1$.

d. Over $[0, h]$, we have $v_{av} = \frac{s(h) - s(0)}{h} = \frac{-4.9h^2 + 30h + 20 - 20}{h} = \frac{(h)(-4.9h + 30)}{h} = -4.9h + 30$.

2.1.11

a. $s'_{2}(0) = \frac{72 - 0}{2} = 36$.

b. $s'_{1.5}(0) = \frac{66 - 0}{1.5} = 44$.

c. $s'_{1}(0) = \frac{52 - 0}{1} = 52$.

d. $s'_{0.5}(0) = \frac{30 - 0}{0.5} = 60$.

2.1.12

a. $s'_{2.5}(0.5) = \frac{150 - 46}{2} = 52$.

b. $s'_{2.0}(0.5) = \frac{136 - 46}{1.5} = 60$.

c. $s'_{1.5}(0.5) = \frac{114 - 46}{1} = 68$.

d. $s'_{1.0}(0.5) = \frac{84 - 46}{0.5} = 76$.

2.1.13

The slope of the secant line is given by $\frac{s(2) - s(0.5)}{2 - 0.5} = \frac{136 - 46}{1.5} = 60$. This represents the average velocity of the object over the time interval $[0.5, 2]$.

2.1.14

The slope of the secant line is given by $\frac{s(0.5) - s(0)}{0.5 - 0} = \frac{1}{0.5} = 2$. This represents the average velocity of the object over the time interval $[0, 0.5]$.

Copyright © 2014 Pearson Education, Inc.
2.1.15

\[
\begin{array}{c|c|c|c|c}
\text{Time interval} & [1, 2] & [1, 1.5] & [1, 1.1] & [1, 1.01] \\
\hline
\text{Average velocity} & 80 & 88 & 94.4 & 95.84 \\
\end{array}
\]

The instantaneous velocity appears to be 96 ft/s.

2.1.16

\[
\begin{array}{c|c|c|c|c}
\hline
\text{Average velocity} & 5.5 & 9.175 & 9.91 & 10.351 \\
\end{array}
\]

The instantaneous velocity appears to be 10.4 m/s.

2.1.17 $\frac{s(1.01)−s(1)}{0.01} = 47.84$, while $\frac{s(1.001)−s(1)}{0.001} = 47.984$ and $\frac{s(1.0001)−s(1)}{0.0001} = 47.9984$. It appears that the instantaneous velocity at $t = 1$ is approximately 48.

2.1.18 $\frac{s(2.01)−s(2)}{0.01} = −4.16$, while $\frac{s(2.001)−s(2)}{0.001} = −4.016$ and $\frac{s(2.0001)−s(2)}{0.0001} = −4.0016$. It appears that the instantaneous velocity at $t = 2$ is approximately −4.

2.1.19

\[
\begin{array}{c|c|c|c|c}
\hline
\text{Average velocity} & 20 & 5.6 & 4.16 & 4.016 \\
\end{array}
\]

The instantaneous velocity appears to be 4 ft/s.

2.1.20

\[
\begin{array}{c|c|c|c|c}
\text{Time interval} & \left[\frac{\pi}{2}, \pi\right] & \left[\frac{\pi}{2}, \pi + 0.1\right] & \left[\frac{\pi}{2}, \pi + 0.01\right] & \left[\frac{\pi}{2}, \pi + 0.001\right] \\
\hline
\text{Average velocity} & −1.910 & −0.1499 & −0.015 & −0.0015 \\
\end{array}
\]

The instantaneous velocity appears to be 0 ft/s.

2.1.21

\[
\begin{array}{c|c|c|c|c}
\hline
\text{Average velocity} & −17.6 & −16.16 & −16.016 & −16.002 \\
\end{array}
\]

The instantaneous velocity appears to be −16 ft/s.

2.1.22

\[
\begin{array}{c|c|c|c|c}
\text{Time interval} & \left[\frac{\pi}{2}, \pi\right] & \left[\frac{\pi}{2}, \pi + 0.1\right] & \left[\frac{\pi}{2}, \pi + 0.01\right] & \left[\frac{\pi}{2}, \pi + 0.001\right] \\
\hline
\text{Average velocity} & −12.732 & −19.967 & −20.000 & −20.000 \\
\end{array}
\]

The instantaneous velocity appears to be −20 ft/s.

2.1.23

\[
\begin{array}{c|c|c|c|c}
\text{Time interval} & [0, 0.1] & [0, 0.01] & [0, 0.001] & [0, 0.0001] \\
\hline
\text{Average velocity} & 79.468 & 79.995 & 80.000 & 80.000 \\
\end{array}
\]

The instantaneous velocity appears to be 80 ft/s.

2.1.24

\[
\begin{array}{c|c|c|c|c}
\text{Time interval} & [0, 1] & [0, 0.1] & [0, 0.01] & [0, 0.001] \\
\hline
\text{Average velocity} & −10 & −18.182 & −19.802 & −19.98 \\
\end{array}
\]

The instantaneous velocity appears to be −20 ft/s.

</table>

The slope of the tangent line appears to be 2.

2.1.29

a. Note that the graph is a parabola with vertex (2, -1).

b. At (2, -1) the function has tangent line with slope 0.

c. Note that the graph is a parabola with vertex (2, -1).

The slope of the tangent line at (2, -1) appears to be 0.

2.1.30

a. Note that the graph is a parabola with vertex (0, 4).

b. At (0, 4) the function has a tangent line with slope 0.

c. This is true for this function – because the function is symmetric about the y-axis and we are taking pairs of points symmetrically about the y axis. Thus $f(0 + h) = 4 - (0 + h)^2 = 4 - (-h)^2 = f(0 - h)$. So the slope of any such secant line is

$$\frac{4 - h^2 - (4 - h^2)}{h - (-h)} = \frac{0}{2h} = 0.$$

Copyright © 2014 Pearson Education, Inc.
2.1.31

a. Note that the graph is a parabola with vertex (4, 448).

b. At (4, 448) the function has tangent line with slope 0, so \(a = 4\).

c. The slopes of the secant lines appear to be approaching zero.

d. On the interval \([0, 4)\) the instantaneous velocity of the projectile is positive.

e. On the interval \((4, 9]\) the instantaneous velocity of the projectile is negative.

2.1.32

a. The rock strikes the water when \(s(t) = 96\). This occurs when \(16t^2 = 96\), or \(t^2 = 6\), whose only positive solution is \(t = \sqrt{6} \approx 2.45\) seconds.

b. The average velocity is

<table>
<thead>
<tr>
<th>Interval</th>
<th>Average velocity</th>
</tr>
</thead>
<tbody>
<tr>
<td>([\sqrt{6} - 0.1, \sqrt{6}])</td>
<td>76.784</td>
</tr>
<tr>
<td>([\sqrt{6} - 0.01, \sqrt{6}])</td>
<td>78.224</td>
</tr>
<tr>
<td>([\sqrt{6} - 0.001, \sqrt{6}])</td>
<td>78.368</td>
</tr>
<tr>
<td>([\sqrt{6} - 0.0001, \sqrt{6}])</td>
<td>78.382</td>
</tr>
</tbody>
</table>

When the rock strikes the water, its instantaneous velocity is about 78.38 ft/s.

2.1.33 For line \(AD\), we have

\[
m_{AD} = \frac{y_D - y_A}{x_D - x_A} = \frac{f(\pi) - f(\pi/2)}{\pi - (\pi/2)} = \frac{1}{\pi/2} \approx .6366.
\]

For line \(AC\), we have

\[
m_{AC} = \frac{y_C - y_A}{x_C - x_A} = \frac{f(\pi/2 + .5) - f(\pi/2)}{(\pi/2 + .5) - (\pi/2)} = \frac{-\cos(\pi/2 + .5)}{.5} \approx .9589.
\]

For line \(AB\), we have

\[
m_{AB} = \frac{y_B - y_A}{x_B - x_A} = \frac{f(\pi/2 + .05) - f(\pi/2)}{(\pi/2 + .05) - (\pi/2)} = \frac{-\cos(\pi/2 + .05)}{.05} \approx .9996.
\]

Computing one more slope of a secant line:

\[
m_{sec} = \frac{f(\pi/2 + .01) - f(\pi/2)}{(\pi/2 + .01) - (\pi/2)} = \frac{-\cos(\pi/2 + .01)}{.01} \approx 1.0000.
\]

Conjecture: The slope of the tangent line to the graph of \(f\) at \(x = \pi/2\) is 1.
2.2 Definition of a Limit

2.2.1 Suppose the function \( f \) is defined for all \( x \) near \( a \) except possibly at \( a \). If \( f(x) \) is arbitrarily close to a number \( L \) whenever \( x \) is sufficiently close to (but not equal to) \( a \), then we write \( \lim_{x \to a} f(x) = L \).

2.2.2 False. For example, consider the function 
\[
\begin{align*}
f(x) &= \begin{cases} 
  x^2 & \text{if } x \neq 0 \\
  4 & \text{if } x = 0
\end{cases}
\end{align*}
\]
Then \( \lim_{x \to 0} f(x) = 0 \), but \( f(0) = 4 \).

2.2.3 Suppose the function \( f \) is defined for all \( x \) near \( a \) but greater than \( a \). If \( f(x) \) is arbitrarily close to \( L \) for \( x \) sufficiently close to (but strictly greater than) \( a \), then \( \lim_{x \to a^+} f(x) = L \).

2.2.4 Suppose the function \( f \) is defined for all \( x \) near \( a \) but less than \( a \). If \( f(x) \) is arbitrarily close to \( L \) for \( x \) sufficiently close to (but strictly less than) \( a \), then \( \lim_{x \to a^-} f(x) = L \).

2.2.5 It must be true that \( L = M \).

2.2.6 Because graphing utilities generally just plot a sampling of points and “connect the dots,” they can sometimes mislead the user investigating the subtleties of limits.

2.2.7
a. \( h(2) = 5 \).
b. \( \lim_{x \to 2} h(x) = 3 \).
c. \( h(4) \) does not exist.
d. \( \lim_{x \to 4} f(x) = 1 \).
e. \( \lim_{x \to 5} h(x) = 2 \).

2.2.8
a. \( g(0) = 0 \).
b. \( \lim_{x \to 0} g(x) = 1 \).
c. \( g(1) = 2 \).
d. \( \lim_{x \to 1} g(x) = 2 \).

2.2.9
a. \( f(1) = -1 \).
b. \( \lim_{x \to 1} f(x) = 1 \).
c. \( f(0) = 2 \).
d. \( \lim_{x \to 0} f(x) = 2 \).

2.2.10
a. \( f(2) = 2 \).
b. \( \lim_{x \to 2} f(x) = 4 \).
c. \( \lim_{x \to 4} f(x) = 4 \).
d. \( \lim_{x \to 5} f(x) = 2 \).

2.2.11
\[
\begin{array}{|c|c|c|c|c|c|c|c|c|}
\hline
x & 1.9 & 1.99 & 1.999 & 1.9999 & 2.0001 & 2.001 & 2.01 & 2.1 \\
\hline
f(x) = \frac{x^2 - 1}{x - 1} & 3.9 & 3.99 & 3.999 & 3.9999 & 4.0001 & 4.001 & 4.01 & 4.1 \\
\hline
\end{array}
\]
(b. \( \lim_{x \to 2} f(x) = 4 \).

2.2.12
\[
\begin{array}{|c|c|c|c|c|c|c|c|}
\hline
x & 0.9 & 0.99 & 0.999 & 0.9999 & 1.0001 & 1.001 & 1.01 & 1.1 \\
\hline
f(x) = \frac{x^2 - 1}{x - 1} & 2.71 & 2.970 & 2.997 & 3.000 & 3.000 & 3.003 & 3.030 & 3.310 \\
\hline
\end{array}
\]
b. \( \lim_{x \to 1} \frac{x^3 - 1}{x - 1} = 3 \)

### 2.2.13

<table>
<thead>
<tr>
<th>( t )</th>
<th>8.9</th>
<th>8.99</th>
<th>8.999</th>
<th>9.001</th>
<th>9.01</th>
<th>9.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>( g(t) = \frac{t - 9}{\sqrt{t} - 3} )</td>
<td>5.983</td>
<td>5.998</td>
<td>6.000</td>
<td>6.000</td>
<td>6.002</td>
<td>6.0167</td>
</tr>
</tbody>
</table>

b. \( \lim_{t \to 9} \frac{t - 9}{\sqrt{t} - 3} = 6 \).

### 2.2.14

<table>
<thead>
<tr>
<th>( x )</th>
<th>0.01</th>
<th>0.001</th>
<th>0.0001</th>
<th>0.00001</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) = (1 + x)^{1/x} )</td>
<td>2.705</td>
<td>2.717</td>
<td>2.718</td>
<td>2.718</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>( x )</th>
<th>-0.01</th>
<th>-0.001</th>
<th>-0.0001</th>
<th>-0.00001</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) = (1 + x)^{1/x} )</td>
<td>2.732</td>
<td>2.720</td>
<td>2.718</td>
<td>2.718</td>
</tr>
</tbody>
</table>

b. \( \lim_{x \to 0} (1 + x)^{1/x} \approx 2.718 \).

c. \( \lim_{x \to 0} (1 + x)^{1/x} = e \).

### 2.2.15

<table>
<thead>
<tr>
<th>( x )</th>
<th>1.99</th>
<th>1.999</th>
<th>1.9999</th>
<th>2.0001</th>
<th>2.001</th>
<th>2.01</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) )</td>
<td>.00217</td>
<td>.00014</td>
<td>.0000109</td>
<td>-.0000109</td>
<td>-.00014</td>
<td>-.00217</td>
</tr>
</tbody>
</table>

From both the graph and the table, the limit appears to be 0.

### 2.2.16

<table>
<thead>
<tr>
<th>( x )</th>
<th>-0.1</th>
<th>-0.01</th>
<th>-0.001</th>
<th>0.001</th>
<th>0.01</th>
<th>0.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) )</td>
<td>1.873</td>
<td>1.987</td>
<td>1.999</td>
<td>2.001</td>
<td>2.013</td>
<td>2.140</td>
</tr>
</tbody>
</table>

From both the graph and the table, the limit appears to be 2.
2.2.17

a.

b.

\[
\begin{array}{ccccccc}
 x & 0.9 & 0.99 & 0.999 & 1.001 & 1.01 & 1.1 \\
f(x) & 1.993342 & 1.99933 & 1.999999 & 1.999999 & 1.999933 & 1.993342 \\
\end{array}
\]

From both the graph and the table, the limit appears to be 2.

2.2.18

a.

b.

\[
\begin{array}{cccccccc}
 x & -0.1 & -0.01 & -0.001 & 0.001 & 0.01 & 0.1 \\
f(x) & 2.895 & 2.99 & 2.999 & 3.001 & 3.010 & 3.095 \\
\end{array}
\]

From both the graph and the table, the limit appears to be 3.

2.2.19

\[
\begin{array}{cccccccc}
 x & 4.9 & 4.99 & 4.999 & 4.9999 & 5.0001 & 5.001 & 5.1 \\
f(x) = \frac{x^2 - 25}{x-5} & 9.9 & 9.99 & 9.999 & 9.9999 & 10.0001 & 10.001 & 10.1 \\
\end{array}
\]

\[
\lim_{x \to 5^+} \frac{x^2 - 25}{x-5} = 10, \quad \lim_{x \to 5^-} \frac{x^2 - 25}{x-5} = 10, \quad \text{and thus} \quad \lim_{x \to 5} \frac{x^2 - 25}{x-5} = 10.
\]

2.2.20

\[
\begin{array}{cccccccc}
 x & 99.9 & 99.99 & 99.999 & 99.9999 & 100.0001 & 100.001 & 100.01 \\
f(x) = \frac{x - 100}{\sqrt{x} - 10} & 19.995 & 20.000 & 20.000 & \approx 20 & \approx 20 & 20.000 & 20.000 \\
\end{array}
\]

\[
\lim_{x \to 100^+} \frac{x - 100}{\sqrt{x} - 10} = 20, \quad \lim_{x \to 100^-} \frac{x - 100}{\sqrt{x} - 10} = 20, \quad \text{and thus} \quad \lim_{x \to 100} \frac{x - 100}{\sqrt{x} - 10} = 20.
\]

2.2.21

a. \( f(1) = 0. \)

b. \( \lim_{x \to 1^-} f(x) = 1. \)

c. \( \lim_{x \to 1^+} f(x) = 0. \)

d. \( \lim_{x \to 1} f(x) \) does not exist, since the two one-sided limits aren’t equal.

2.2.22

a. \( g(2) = 3. \)

b. \( \lim_{x \to 2^-} g(x) = 2. \)

c. \( \lim_{x \to 2^+} g(x) = 3. \)

d. \( \lim_{x \to 2} g(x) \) does not exist.

e. \( g(3) = 2. \)

f. \( \lim_{x \to 3^-} g(x) = 3. \)

g. \( \lim_{x \to 3^+} g(x) = 2. \)

h. \( \lim_{x \to 4^-} g(x) = 3. \)

i. \( \lim_{x \to 4^+} g(x) = 3. \)

Copyright © 2014 Pearson Education, Inc.
The limit in part (d) does not exist since the two one-sided limits are unequal.

2.2.23

a. \( f(1) = 3 \).

b. \( \lim_{x \to 1^-} f(x) = 2 \).

c. \( \lim_{x \to 1^+} f(x) = 2 \).

d. \( \lim_{x \to 3^-} f(x) = 1 \).

e. \( f(3) = 2 \).

f. \( \lim_{x \to 3^+} f(x) = 4 \).

g. \( \lim_{x \to 2^-} f(x) = 3 \).

h. \( \lim_{x \to 2^+} f(x) = 3 \).

i. \( f(3) = 2 \).

j. \( \lim_{x \to 3^-} f(x) = 4 \).

k. \( \lim_{x \to 3^+} f(x) = 1 \).

l. \( \lim_{x \to 2^+} f(x) = 3 \).

The limit in part (h) does not exist because the two one-sided limits are not equal.

2.2.24

a. \( g(-1) = 3 \).

b. \( \lim_{x \to -1^-} g(x) = 2 \).

c. \( \lim_{x \to -1^+} g(x) = 2 \).

d. \( \lim_{x \to 1^-} g(x) = 2 \).

e. \( g(1) = 2 \).

f. \( \lim_{x \to 1^+} g(x) = 2 \).

g. \( \lim_{x \to -3^-} g(x) = 4 \).

h. \( \lim_{x \to -3^+} g(x) = 4 \).

i. \( \lim_{x \to 5^-} g(x) = 5 \).

The limit in part (f) does not exist since the two one-sided limits are unequal.

2.2.25

a. \[
\begin{array}{|c|c|c|c|c|c|}
\hline
x & 2\pi & 2\frac{\pi}{3} & 2\frac{\pi}{5} & 2\frac{\pi}{7} & 2\frac{\pi}{9} & 2\frac{\pi}{11} \\
\hline
f(x) = \sin \frac{1}{x} & 1 & -1 & 1 & -1 & 1 & -1 \\
\hline
\end{array}
\]

If \( x_n = \frac{2}{(2n+1)\pi} \), then \( f(x_n) = (-1)^n \) where \( n \) is a non-negative integer.

b. As \( x \to 0 \), \( \frac{1}{x} \to \infty \). So the values of \( f(x) \) oscillate infinitely often between \(-1\) and 1.

c. \( \lim_{x \to 0} \frac{1}{x} \) does not exist.

2.2.26

a. \[
\begin{array}{|c|c|c|c|c|c|c|}
\hline
x & \frac{12\pi}{5} & \frac{12\pi}{7} & \frac{12\pi}{9} & \frac{12\pi}{11} \\
\hline
f(x) = \tan \frac{3}{x} & 1 & -1 & 1 & -1 \\
\hline
\end{array}
\]

We have alternating 1’s and \(-1\)’s.

tan3x alternates between 1 and \(-1\) infinitely many times on \((0, h)\) for any \( h > 0 \).

c. \( \lim_{x \to 0} \frac{3}{x} \) does not exist.
2.2.27

a. False. In fact \( \lim_{x \to 3} \frac{x^2 - 9}{x - 3} = \lim_{x \to 3} (x + 3) = 6. \)

b. False. For example, if \( f(x) = \begin{cases} 
  x^2 & \text{if } x \neq 0; \\
  5 & \text{if } x = 0
\end{cases} \) and if \( a = 0 \) then \( f(a) = 5 \) but \( \lim_{x \to a} f(x) = 0. \)

c. False. For example, the limit in part a of this problem exists, even though the corresponding function is undefined at \( a = 3. \)

d. False. Since \( \sqrt{x} \) is not defined for all \( x \) near 0 but unequal to 0, the limit does not exist. See the definition at the beginning of this section.

e. True. A graph of \( \cot x \) in the vicinity of \( x = \frac{\pi}{3} \) is

![Graph of cot x](image)

Alternatively, a table shows the following:

| \( x \) | \( \frac{\pi}{3} - 0.1 \) | \( \frac{\pi}{3} - 0.01 \) | \( \frac{\pi}{3} - 0.001 \) | \( \frac{\pi}{3} + 0.001 \) | \( \frac{\pi}{3} + 0.01 \) | \( \frac{\pi}{3} + 0.1 \) |
|---|---|---|---|---|---|
| \( f(x) = \cot x \) | 0.100 | 0.010 | 0.001 | -0.001 | -0.010 | -0.100 |

In either case, the limit certainly appears to be zero.

2.2.28

2.2.29

![Graph of function](image)
2.2. DEFINITION OF A LIMIT

2.2.30

\[
\lim_{h \to 0} (1 + 2h)^{1/h} \approx 7.39.
\]

2.2.31

\[
\begin{array}{cccccccc}
 h & 0.01 & 0.001 & 0.0001 & -0.0001 & -0.001 & -0.01 \\
\hline
(1 + 2h)^{1/h} & 7.245 & 7.374 & 7.388 & 7.391 & 7.404 & 7.540 \\
\end{array}
\]

2.2.32

\[
\lim_{h \to 0} (1 + 3h)^{2/h} \approx 403.4.
\]

2.2.33

\[
\begin{array}{cccccccc}
 h & 0.01 & 0.001 & 0.0001 & -0.0001 & -0.001 & -0.01 \\
\hline
(1 + 3h)^{2/h} & 369.356 & 399.821 & 403.066 & 403.792 & 407.083 & 442.235 \\
\end{array}
\]

2.2.34

\[
\lim_{h \to 0} \frac{2^h - 1}{h} \approx .693.
\]

2.2.35

\[
\begin{array}{cccccccc}
 h & 0.01 & 0.001 & 0.0001 & -0.0001 & -0.001 & -0.01 \\
\hline
\frac{\ln(1+h)}{h} & 0.995033 & 0.9995 & 0.99995 & 1.00005 & 1.0005 & 1.00503 \\
\end{array}
\]

2.2.36

\[a. \text{ Note that } f(x) = |x| \text{ is undefined at } 0, \text{ and } \\
\lim_{x \to 0^-} f(x) = -1 \text{ and } \lim_{x \to 0^+} f(x) = 1.
\]

\[b. \lim_{x \to 0} f(x) \text{ does not exist, since the two one-side limits aren’t equal.}\]

2.2.37

\[a. \lim_{x \to -1^-} |x| = -2, \lim_{x \to -1^+} |x| = -1, \lim_{x \to 2^-} |x| = 1, \lim_{x \to 2^+} |x| = 2.\]
b. \( \lim_{x \to 2.3^-} |x| = 2, \lim_{x \to 2.3^+} |x| = 2, \lim_{x \to 2.3} |x| = 2. \)

c. In general, for an integer \( a \), \( \lim_{x \to a^-} |x| = a - 1 \) and \( \lim_{x \to a^+} |x| = a. \)

d. In general, if \( a \) is not an integer, \( \lim_{x \to a^-} |x| = \lim_{x \to a^+} |x| = [a]. \)

e. \( \lim_{x \to a} |x| \) exists and is equal to \([a]\) for non-integers \( a \).

2.2.38

a. Note that the graph is piecewise constant.

b. \( \lim_{x \to 2^-} [x] = 2, \lim_{x \to 2^+} [x] = 2, \lim_{x \to 1.5} [x] = 2. \)

c. \( \lim [x] \) exists and is equal to \([a]\) for non-integers \( a \).

2.2.39

a. Note that the function is piecewise constant.

b. \( \lim_{w \to 3.3} f(w) = 0.95. \)

c. \( \lim_{w \to 1^+} f(w) = 0.61 \) corresponds to the fact that for any piece of mail that weighs slightly over 1 ounce, the postage will cost 61 cents. \( \lim_{w \to 1^-} f(w) = 0.44 \) corresponds to the fact that for any piece of mail that weighs slightly less than 1 ounce, the postage will cost 44 cents.

d. \( \lim_{w \to 4} f(w) \) does not exist because the two corresponding one-side limits don’t exist. (The limit from the left is $0.95, while the limit from the right is $1.12).$

2.2.40

a. Note that \( H \) is piecewise constant.

b. \( \lim_{x \to 0^-} H(x) = 0, \lim_{x \to 0^+} H(x) = 1. \) Thus \( \lim_{x \to 0} H(x) \) does not exist.

2.2.41

a. Because of the symmetry about the \( y \) axis, we must have \( \lim_{x \to -2^+} f(x) = 8. \)
b. Because of the symmetry about the y axis, we must have \( \lim_{x \to -2^-} f(x) = 5 \).

2.2.42
a. Because of the symmetry about the origin, we must have \( \lim_{x \to -2^+} g(x) = -8 \).

b. Because of the symmetry about the origin, we must have \( \lim_{x \to -2^-} g(x) = -5 \).

2.2.43 A plot of \( x \sin \frac{1}{x} \) near \( x = 0 \) at three different magnifications is below:

From the graphs, it is clear that \( \lim_{x \to 0} x \sin \frac{1}{x} = 0 \).

2.2.44 A plot of \( \frac{18(\sqrt{2} - 1)}{x^3 - 1} \) near \( x = 1 \) at three different magnifications is below:

From the graphs, it is clear that \( \lim_{x \to 1} \frac{18(\sqrt{2} - 1)}{x^3 - 1} = 2 \).

2.2.45 A plot of \( \frac{9(\sqrt{2x-x^3} - \sqrt{2})}{1-x^{3/4}} \) near \( x = 1 \) at three different magnifications is below:

From the graphs, it is clear that \( \lim_{x \to 1} \frac{9(\sqrt{2x-x^3} - \sqrt{2})}{1-x^{3/4}} = 16 \).

2.2.46 A plot of \( \frac{6x - 3^x}{x \ln 2} \) near \( x = 0 \) at three different magnifications is below:
From the graphs, it is clear that \( \lim_{x \to 0} \frac{6x^2 - 3x}{x \ln 2} = 1. \)

2.2.47 a. \( \lim_{x \to 0} \frac{\tan 2x}{\sin x} = 2. \)

\( \lim_{x \to 0} \frac{\tan 3x}{\sin x} = 3. \)

b. It appears that \( \lim_{x \to 0} \frac{\tan(px)}{\sin x} = p. \)

\( \lim_{x \to 0} \frac{\tan 4x}{\sin x} = 4. \)

2.2.48 a. \( \lim_{x \to 0} \frac{\sin x}{x} = 1. \)

\( \lim_{x \to 0} \frac{\sin 2x}{x} = 2. \)

\( \lim_{x \to 0} \frac{\sin 3x}{x} = 3. \)

\( \lim_{x \to 0} \frac{\sin 4x}{x} = 4. \)
2.2. DEFINITION OF A LIMIT

b. It appears that \( \lim_{x \to 0} \frac{\sin(px)}{x} = p \).

\[ 2.2.49 \]

For \( p = 8 \) and \( q = 2 \), it appears that the limit is 4.

For \( p = 12 \) and \( q = 3 \), it appears that the limit is 4.

For \( p = 4 \) and \( q = 16 \), it appears that the limit is 1/4.

For \( p = 100 \) and \( q = 50 \), it appears that the limit is 2.

Conjecture: \( \lim_{x \to 0} \frac{\sin(px)}{\sin(qx)} = \frac{p}{q} \).
2.3 Techniques of Computing Limits

2.3.1 If \( f(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0 \), then
\[
\lim_{x \to a} f(x) = \lim_{x \to a} (a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0) \\
= a_n \lim_{x \to a} x^n + a_{n-1} \lim_{x \to a} x^{n-1} + \cdots + a_1 \lim_{x \to a} x + \lim_{x \to a} a_0 \\
= a_n a^n + a_{n-1} a^{n-1} + \cdots + a_1 a + a_0.
\]

2.3.2 If \( f(x) \) is a polynomial, then \( \lim_{x \to a} f(x) = \lim_{x \to a} f(x) = f(a) \).

2.3.3 Since a rational function is a quotient of polynomials, it is continuous everywhere it is defined, so that \( \lim r(x) = r(a) \) everywhere in the domain of \( r \). The domain of \( r \) is all real numbers except those where the denominator is zero.

2.3.4 If \( f(x) = g(x) \) for \( x \neq 3 \), and \( \lim_{x \to 3} g(x) = 4 \), then \( \lim_{x \to 3} f(x) = 4 \) as well.

2.3.5 Because \( \frac{x^2 - 7x + 12}{x - 3} = \frac{(x-3)(x-4)}{x-3} = x - 4 \) (for \( x \neq 3 \)), we can see that the graphs of these two functions are the same except that one is undefined at \( x = 3 \) and the other is a straight line that is defined everywhere. Thus the function \( \frac{x^2 - 7x + 12}{x - 3} \) is a straight line except that it has a "hole" at \((3, -1)\). The two functions have the same limit as \( x \to 3 \), namely \( \lim_{x \to 3} \frac{x^2 - 7x + 12}{x - 3} = \lim_{x \to 3} (x - 4) = -1 \).

2.3.6 \( \lim_{x \to 2} f(x)^{2/3} = \left( \lim_{x \to 2} f(x) \right)^{2/3} = (-8)^{2/3} = (-2)^2 = 4 \).

2.3.7 If \( p \) and \( q \) are polynomials then \( \lim_{x \to 0} \frac{p(x)}{q(x)} = \frac{\lim_{x \to 0} p(x)}{\lim_{x \to 0} q(x)} = \frac{p(0)}{q(0)} \). But \( q(0) = 2 \), so \( 10 = \frac{p(0)}{q(0)} = \frac{p(0)}{2} \) and thus \( p(0) = 20 \).

2.3.8 By a direct application of the squeeze theorem, \( \lim_{x \to 2} g(x) = 5 \).

2.3.9 \( \lim_{x \to 5} \sqrt{x^2 - 9} = \sqrt{\lim_{x \to 5} (x^2 - 9)} = \sqrt{16} = 4 \).

2.3.10 \( \lim_{x \to 3^-} f(x) = \lim_{x \to 3^-} 4 = 4 \), and \( \lim_{x \to 3^+} f(x) = \lim_{x \to 3^+} (x + 2) = 5 \).

2.3.11 \( \lim_{x \to 4} (3x - 7) = 3 \lim_{x \to 4} x - 7 = 3 \cdot 4 - 7 = 5 \).

2.3.12 \( \lim_{x \to 4} (-2x + 5) = -2 \lim_{x \to 4} x + 5 = -2 \cdot 4 + 5 = 3 \).

2.3.13 \( \lim_{x \to -9} (5x) = 5 \lim_{x \to -9} x = 5 \cdot -9 = -45 \).

2.3.14 \( \lim_{x \to -2} (-3x) = -3 \lim_{x \to -2} x = -3 \cdot 2 = -6 \).

2.3.15 \( \lim_{x \to 4} 4 = 4 \).

2.3.16 \( \lim_{x \to -5} \pi = \pi \).

2.3.17 \( \lim_{x \to 1} 4f(x) = 4 \lim_{x \to 1} f(x) = 4 \cdot 8 = 32 \). This follows from the Constant Multiple Law.

2.3.18 \( \lim_{x \to 1} \frac{f(x)}{h(x)} = \frac{\lim_{x \to 1} f(x)}{\lim_{x \to 1} h(x)} = \frac{8}{2} = 4 \). This follows from the Quotient Law.
2.3.22 \[ \lim_{x \to 1} \frac{f(x)}{g(x) - h(x)} = \frac{\lim_{x \to 1} f(x)}{\lim_{x \to 1} [g(x) - h(x)]} = \frac{\lim_{x \to 1} f(x)}{\lim_{x \to 1} g(x) - \lim_{x \to 1} h(x)} = \frac{8}{3 - 2} = 8. \] This follows from the Quotient and Difference Laws.

2.3.23 \[ \lim_{x \to 1} (h(x))^5 = \left( \lim_{x \to 1} h(x) \right)^5 = (2)^5 = 32. \] This follows from the Power Law.

2.3.24 From the Root, Product, Sum, and Constant laws, we get
\[ \lim_{x \to 1} \sqrt[3]{f(x)g(x) + 3} = \sqrt[3]{\lim_{x \to 1} (f(x)g(x) + 3)} = \sqrt[3]{\lim_{x \to 1} f(x) \cdot \lim_{x \to 1} g(x) + \lim_{x \to 1} 3} = \sqrt[3]{8 \cdot 3 + 3} = \sqrt[3]{27} = 3. \]

2.3.25 Using the appropriate basic limit laws gives
\[ \lim_{x \to 1} (2x^3 - 3x^2 + 4x + 5) = \lim_{x \to 1} 2x^3 - \lim_{x \to 1} 3x^2 + \lim_{x \to 1} 4x + \lim_{x \to 1} 5 = 2(\lim_{x \to 1} x)^3 - 3(\lim_{x \to 1} x)^2 + 4(\lim_{x \to 1} x) + 5 = 2(1)^3 - 3(1)^2 + 4 \cdot 1 + 5 = 8. \]

2.3.26 \[ \lim_{t \to 2} (t^2 + 5t + 7) = \lim_{t \to 2} t^2 + \lim_{t \to 2} 5t + \lim_{t \to 2} 7 = \left( \lim_{t \to 2} t \right)^2 + 5 \lim_{t \to 2} t + 7 = (-2)^2 + 5 \cdot (-2) + 7 = 1. \]

2.3.27 \[ \lim_{x \to 1} \frac{5x^2 + 6x + 1}{8x - 4} = \frac{\lim_{x \to 1} (5x^2 + 6x + 1)}{\lim_{x \to 1} (8x - 4)} = \frac{5(\lim_{x \to 1} x)^2 + 6 \lim_{x \to 1} x + \lim_{x \to 1} 1}{8 \lim_{x \to 1} x - \lim_{x \to 1} 4} = \frac{5(1)^2 + 6 \cdot 1 + 1}{8 \cdot 1 - 4} = 3. \]

2.3.28 \[ \lim_{t \to 3} \sqrt[3]{t^2 - 10} = \sqrt[3]{\lim_{t \to 3} (t^2 - 10)} = \sqrt[3]{\lim_{t \to 3} t^2} - \lim_{t \to 3} 10 = \sqrt[3]{\lim_{t \to 3} t}^2 - 10 = \sqrt[3]{3}^2 - 10 = -1. \]

2.3.29 \[ \lim_{b \to 2} \frac{3b}{\sqrt{4b + 1} - 1} = \frac{\lim_{b \to 2} 3b}{\lim_{b \to 2} (\sqrt{4b + 1} - 1)} = \frac{3 \lim_{b \to 2} b}{\lim_{b \to 2} \sqrt{4b + 1} - \lim_{b \to 2} 1} = \frac{3 \cdot 2}{\sqrt{\lim_{b \to 2} (4b + 1)} - 1} = \frac{6}{3 - 1} = 3. \]

2.3.30 \[ \lim_{x \to 2} (x^3 - x) = \left( \lim_{x \to 2} (x^3 - x) \right)^5 = \left( \lim_{x \to 2} x^3 - \lim_{x \to 2} x \right)^5 = (4 - 2)^5 = 32. \]

2.3.31 \[ \lim_{x \to 3} \frac{-5x}{\sqrt{4x - 3}} = \frac{\lim_{x \to 3} -5x}{\lim_{x \to 3} \sqrt{4x - 3}} = \frac{-5 \lim_{x \to 3} x}{\sqrt{\lim_{x \to 3} (4x - 3)}} = \frac{-5 \cdot 3}{\sqrt{4 \lim_{x \to 3} x - \lim_{x \to 3} 3}} = \frac{-15}{\sqrt{4 \cdot 3 - 3}} = -5. \]

2.3.32 \[ \lim_{h \to 0} \frac{3}{\sqrt{16 + 3h} + 4} = \frac{\lim_{h \to 0} 3}{\lim_{h \to 0} (\sqrt{16 + 3h} + 4)} = \frac{3}{\sqrt{\lim_{h \to 0} (16 + 3h) + \lim_{h \to 0} 4}} = \frac{3}{\sqrt{16 + 3 \cdot 0 + 4}} = \frac{3}{\sqrt{16 + 3 \cdot 0 + 4}} = \frac{3}{\sqrt{16 + 3 \cdot 0 + 4}} = \frac{3}{4 + 4} = \frac{3}{8}. \]
2.3.33
a. \( \lim_{x \to -1^-} f(x) = \lim_{x \to -1^-} (x^2 + 1) = (-1)^2 + 1 = 2. \)

b. \( \lim_{x \to -1^+} f(x) = \lim_{x \to -1^+} \sqrt{x + 1} = \sqrt{-1 + 1} = 0. \)

c. \( \lim_{x \to -1} f(x) \) does not exist.

2.3.34
a. \( \lim_{x \to 5^-} f(x) = \lim_{x \to 5^-} 0 = 0. \)

b. \( \lim_{x \to 5^+} f(x) = \lim_{x \to 5^+} \sqrt{25 - x^2} = \sqrt{25 - 25} = 0. \)

c. \( \lim_{x \to 5^-} f(x) = 0. \)

d. \( \lim_{x \to 5^-} f(x) = \lim_{x \to 5^-} \sqrt{25 - x^2} = \sqrt{25 - 25} = 0. \)

e. \( \lim_{x \to 5^+} f(x) = \lim_{x \to 5^+} 3x = 15. \)

f. \( \lim_{x \to 5} f(x) \) does not exist.

2.3.35
a. \( \lim_{x \to 2} \frac{x^2 - 2}{x - 2} = \frac{2^2 - 2}{2 - 2} = 2. \)

b. The domain of \( f(x) = \sqrt{x - 2} \) is \([2, \infty)\), so the limit as \( x \to 2 \) from the left does not exist as \( f \) is not defined there.

2.3.36
a. Note that the domain of \( f(x) = \sqrt{x^2 - 3} \) is \((2, 3]\). \( \lim_{x \to 3} \frac{x - 3}{2 - x} = 0. \)

b. Because the numbers to the right of 3 aren’t in the domain of this function, the limit as \( x \to 3^+ \) of this function does not exist.

2.3.37 Using the definition of \(|x|\) given, we have \( \lim_{x \to 0^-} |x| = \lim_{x \to 0^-} (-x) = -0 = 0. \) Also, \( \lim_{x \to 0^+} |x| = \lim_{x \to 0^+} x = 0. \) Because the two one-sided limits are both 0, we also have \( \lim_{x \to 0} |x| = 0. \)

2.3.38
If \( a > 0 \), then for \( x \) near \( a, |x| = x. \) So in this case, \( \lim_{x \to a} |x| = \lim_{x \to a} x = a = |a|. \)

If \( a < 0 \), then for \( x \) near \( a, |x| = -x. \) So in this case, \( \lim_{x \to a} |x| = \lim_{x \to a} (-x) = -a = |a|, \) (because \( a < 0 \)).

If \( a = 0 \), we have already seen in a previous problem that \( \lim_{x \to 0} |x| = 0 = |0|. \)

Thus in all cases, \( \lim_{x \to a} |x| = |a|. \)

2.3.39 \( \lim_{x \to 1} \frac{x^2 - 1}{x - 1} = \lim_{x \to 1} \frac{(x + 1)(x - 1)}{x - 1} = \lim_{x \to 1} (x + 1) = 2. \)

2.3.40 \( \lim_{x \to 3} \frac{x^2 - 2x - 3}{x - 3} = \lim_{x \to 3} \frac{(x - 3)(x + 1)}{x - 3} = \lim_{x \to 3} (x + 1) = 4. \)

2.3.41 \( \lim_{x \to 4} \frac{x^2 - 16}{4 - x} = \lim_{x \to 4} \frac{(x + 4)(x - 4)}{- (x - 4)} = \lim_{x \to 4} [-(x + 4)] = -8. \)

2.3.42 \( \lim_{t \to 2} \frac{3t^2 - 7t + 2}{2 - t} = \lim_{t \to 2} \frac{(t - 2)(3t - 1)}{-(t - 2)} = \lim_{t \to 2} [-(3t - 1)] = -5. \)

2.3.43 \( \lim_{x \to b} \frac{(x - b)^{50} - x + b}{x - b} = \lim_{x \to b} \frac{(x - b)^{50} - (x - b)}{x - b} = \lim_{x \to b} \frac{(x - b)((x - b)^{49} - 1)}{x - b} = \lim_{x \to b} [(x - b)^{49} - 1] = -1. \)
2.3.44 \( \lim_{x \to -b} \frac{(x+b)^7 + (x+b)^{10}}{4(x+b)} = \lim_{x \to -b} \frac{(x+b)(x+b)^6 + (x+b)^9}{4(x+b)} = \lim_{x \to -b} \frac{(x+b)^6 + (x+b)^9}{4} = 0 \div 4 = 0. \)

2.3.45
\[
\lim_{x \to 1} \frac{(2x-1)^2 - 9}{x+1} = \lim_{x \to 1} \frac{(2x-1-3)(2x-1+3)}{x+1} = \lim_{x \to 1} \frac{2(x-2)(x+1)}{x+1} = \lim_{x \to 1} 4(x-2) = 4 \cdot (-3) = -12.
\]

2.3.46
\[
\lim_{h \to 0} \frac{\sqrt[5]{x} - \frac{1}{5}}{h} = \lim_{h \to 0} \frac{\left(\frac{1}{5} \sqrt[5]{x} - \frac{1}{5}\right) \cdot 5 \cdot (5+h)}{h \cdot 5 \cdot (5+h)} = \lim_{h \to 0} \frac{5 - (5+h)}{5h(5+h)} = \lim_{h \to 0} \frac{-h}{5h(5+h)} = \lim_{h \to 0} \frac{-1}{5(5+h)} = -\frac{1}{25}.
\]

2.3.47 \( \lim_{x \to 9} \frac{\sqrt{x} - 3}{x - 9} = \lim_{x \to 9} \frac{(\sqrt{x} - 3)(\sqrt{x} + 3)}{(x-9)(\sqrt{x}+3)} = \lim_{x \to 9} \frac{x - 9}{x-9} = \lim_{x \to 9} 1 = \frac{1}{6}. \)

2.3.48 Expanding gives
\[
\lim_{t \to 3} \left(4t - 2 \left(\frac{6+t-t^2}{t-3}\right)\right) = \lim_{t \to 3} \left(4t(6+t-t^2) - \frac{2(6+t-t^2)}{t-3}\right) = \lim_{t \to 3} \left(4t(6+t-t^2) - \frac{2(3-t)(2+t)}{t-3}\right).
\]

Since we are evaluating the limit as \( t \to 3 \), so ignoring the value of the function at \( t = 3 \), we know that \( 3 - t \neq 0 \), so we can cancel it to get
\[
\lim_{t \to 3} \left(4t(6+t-t^2) + 2(2+t)\right) = 4 \cdot 3(6+3-3^2) + 2(2+3) = 10.
\]

2.3.49 \( \lim_{x \to a} \frac{x - a}{\sqrt{x} - \sqrt{a}} = \lim_{x \to a} \frac{x - a}{\sqrt{x} - \sqrt{a}} \cdot \frac{\sqrt{x} + \sqrt{a}}{\sqrt{x} + \sqrt{a}} = \lim_{x \to a} \frac{(x-a)(\sqrt{x} + \sqrt{a})}{x-a} = \lim_{x \to a} (\sqrt{x} + \sqrt{a}) = 2\sqrt{a}. \)

2.3.50
\[
\lim_{x \to a} \frac{x^2 - a^2}{\sqrt{x} - \sqrt{a}} = \lim_{x \to a} \frac{x^2 - a^2}{\sqrt{x} - \sqrt{a}} \cdot \frac{\sqrt{x} + \sqrt{a}}{\sqrt{x} + \sqrt{a}} = \lim_{x \to a} \frac{(x-a)(x+a)(\sqrt{x} + \sqrt{a})}{x-a} = (a+a)(\sqrt{a} + \sqrt{a}) = 4a^{3/2}.
\]

2.3.51
\[
\lim_{h \to 0} \frac{\sqrt{16 + h - 4}}{h} = \lim_{h \to 0} \frac{(\sqrt{16 + h - 4})(\sqrt{16 + h + 4})}{h(\sqrt{16 + h + 4})} = \lim_{h \to 0} \frac{(16 + h) - 16}{h(\sqrt{16 + h + 4})} = \lim_{h \to 0} \frac{h}{h(\sqrt{16 + h + 4})} = \lim_{h \to 0} \frac{1}{\sqrt{16 + h + 4}} = \frac{1}{8}.
\]

2.3.52 Note that \( x^3 - a = (x-a)(x^2 + ax + a^2) \), so that as long as \( x \neq a \),
\[
\frac{x^3 - a}{x - a} = x^2 + ax + a^2.
\]

Since we are evaluating the limit as \( x \to a \), we may assume that \( x \neq a \), and then
\[
\lim_{x \to a} \frac{x^3 - a}{x - a} = \lim_{x \to a} (x^2 + ax + a^2) = 3a^2.
\]
2.3.53

a.\[\lim_{x \to 0} \frac{1}{x} = \infty\]

b. The slope of the secant line between \((0, 1)\) and \((x, 2^x)\) is \(\frac{2^x - 1}{x}\).

c.\[
\begin{array}{|c|c|c|c|c|c|c|c|}
\hline
x & -1 & -0.1 & -0.01 & -0.001 & -0.0001 & -0.00001 \\
\hline
\frac{2^x - 1}{x} & 0.5 & 0.670 & 0.691 & 0.693 & 0.693 & 0.693 \\
\hline
\end{array}
\]

It appears that \(\lim_{x \to 0} \frac{2^x - 1}{x} \approx 0.693\).

2.3.54

a.\[\lim_{x \to 0} \frac{3^x - 1}{x} = \infty\]

b. The slope of the secant line between \((0, 1)\) and \((x, 3^x)\) is \(\frac{3^x - 1}{x}\).

c.\[
\begin{array}{|c|c|c|c|c|c|c|c|}
\hline
x & -0.1 & -0.01 & -0.001 & -0.0001 & 0.001 & 0.01 & 0.1 \\
\hline
\frac{3^x - 1}{x} & 1.040 & 1.093 & 1.098 & 1.090 & 1.090 & 1.099 & 1.105 & 1.161 \\
\hline
\end{array}
\]

It appears that \(\lim_{x \to 0} \frac{3^x - 1}{x} \approx 1.099\).

2.3.55

a. The statement we are trying to prove can be stated in cases as follows: For \(x > 0\), \(-x \leq x \sin \frac{1}{x} \leq x\), and for \(x < 0\), \(x \leq x \sin \frac{1}{x} \leq -x\).

Now for all \(x \neq 0\), note that \(-1 \leq \sin \frac{1}{x} \leq 1\) (because the range of the sine function is \([-1, 1]\)). We will consider the two cases \(x > 0\) and \(x < 0\) separately, but in each case, we will multiply this inequality through by \(x\), switching the inequalities for the \(x < 0\) case.

For \(x > 0\) we have \(-x \leq x \sin \frac{1}{x} \leq x\), and for \(x < 0\) we have \(-x \geq x \sin \frac{1}{x} \geq x\), which are exactly the statements we are trying to prove.
2.3. TECHNIQUES OF COMPUTING LIMITS

b. 

c. Because \( \lim_{x \to 0} -|x| = \lim_{x \to 0} |x| = 0 \), and because \(-|x| \leq x \sin \frac{1}{x} \leq |x|\), the Squeeze Theorem assures us that \( \lim_{x \to 0} \left( x \sin \frac{1}{x} \right) = 0 \) as well.

2.3.56

a.

b. Note that \( \lim_{x \to 0} \left[ 1 - \frac{x^2}{2} \right] = 1 = \lim_{x \to 0} 1 \). So because \( 1 - \frac{x^2}{2} \leq \cos x \leq 1 \), the squeeze theorem assures us that \( \lim_{x \to 0} \cos x = 1 \) as well.

2.3.57

a.

b. Note that \( \lim_{x \to 0} \left[ 1 - \frac{x^2}{6} \right] = 1 = \lim_{x \to 0} 1 \). So because \( 1 - \frac{x^2}{6} \leq \sin x \leq 1 \), the squeeze theorem assures us that \( \lim_{x \to 0} \frac{\sin x}{x} = 1 \) as well.

2.3.58

a.

b. Note that \( \lim_{x \to 0} (-|x|) = 0 = \lim_{x \to 0} |x| \). So because \(-|x| \leq x^2 \ln x^2 \leq |x|\), the squeeze theorem assures us that \( \lim_{x \to 0} (x^2 \ln x^2) = 0 \) as well.

2.3.59

a. False. For example, if \( f(x) = \begin{cases} x & \text{if } x \neq 1; \\ 4 & \text{if } x = 1, \end{cases} \) then \( \lim_{x \to 1^-} f(x) = 1 \) but \( f(1) = 4 \).

b. False. For example, if \( f(x) = \begin{cases} x + 1 & \text{if } x \leq 1; \\ x - 6 & \text{if } x > 1, \end{cases} \) then \( \lim_{x \to 1^-} f(x) = 2 \) but \( \lim_{x \to 1^+} f(x) = -5 \).

Copyright © 2014 Pearson Education, Inc.
2.3.60 \( \lim_{h \to 0} \frac{100}{(10h - 1)^{11} + 2} = \frac{100}{(-1)^{11} + 2} = \frac{100}{1} = 100. \)

2.3.61 \( \lim_{x \to 2} (5x - 6)^{3/2} = (5 \cdot 2 - 6)^{3/2} = 4^{3/2} = 2^3 = 8. \)

2.3.62 We have, after a little algebra,
\[
\lim_{x \to 3} \frac{x^2 - 1}{x - 3} = \lim_{x \to 3} \frac{15 - (x^2 + 2x)}{15(x^2 + 2x)(x - 3)} = \lim_{x \to 3} \frac{(3 - x)(5 + x)}{15(x^2 + 2x)(x - 3)}.
\]

Since we are taking limits as \( x \to 3, \) we may assume that \( x \neq 3, \) so that we can cancel the factors of \( x - 3 \) in the numerator and denominator to get
\[
\lim_{x \to 3} \frac{-(5 + x)}{15(x^2 + 2x)} = \frac{-(5 + 3)}{15(3^2 + 2 \cdot 3)} = -\frac{8}{225}.
\]

2.3.63 Rationalize the numerator:
\[
\lim_{x \to 1} \frac{\sqrt{10x - 9} - 1}{x - 1} = \lim_{x \to 1} \left( \frac{\sqrt{10x - 9} - 1}{x - 1} \cdot \frac{\sqrt{10x - 9} + 1}{\sqrt{10x - 9} + 1} \right).
\]

\[
\frac{10x - 9}{(x - 1)(\sqrt{10x - 9} + 1)} = \frac{10(x - 1)}{(x - 1)(\sqrt{10x - 9} + 1)} = \frac{10}{\sqrt{10x - 9} + 1} = 5.
\]

2.3.64 \( \lim_{x \to 2} \left( \frac{1}{x - 2} - \frac{2}{x^2 - 2x} \right) = \lim_{x \to 2} \left( \frac{x}{x(x - 2)} - \frac{2}{x(x - 2)} \right) = \lim_{x \to 2} \left( \frac{x - 2}{x(x - 2)} \right) = \lim_{x \to 2} \frac{1}{x} = \frac{1}{2}. \)

2.3.65 \( \lim_{h \to 0} \frac{(5 + h)^2 - 25}{h} = \lim_{h \to 0} \frac{25 + 10h + h^2 - 25}{h} = \lim_{h \to 0} \frac{h(10 + h)}{h} = \lim_{h \to 0} (10 + h) = 10. \)

2.3.66 \( \lim_{x \to c} \frac{x^2 - 2cx + c^2}{x - c} = \lim_{x \to c} \frac{(x - c)^2}{x - c} = \lim_{x \to c} (x - c) = c - c = 0. \)

2.3.67 If \( k \neq 0 \) we have
\[
\lim_{w \to -k} \frac{w^2 + 5kw + 4k^2}{w^2 + kw} = \lim_{w \to -k} \frac{(w + 4k)(w + k)}{(w)(w + k)} = \lim_{w \to -k} \frac{w + 4k}{w} = \frac{-k + 4k}{-k} = -3.
\]

On the other hand, if \( k = 0, \) then
\[
\lim_{w \to -k} \frac{w^2 + 5kw + 4k^2}{w^2 + kw} = \lim_{w \to 0} \frac{w^2}{w^2} = 1.
\]
2.3.68 In order for \( \lim f(x) \) to exist, we need the two one-sided limits to exist and be equal. We have
\[
\lim_{x \to 2^-} f(x) = \lim_{x \to 2^-} (3x + b) = 6 + b, \quad \text{and} \quad \lim_{x \to 2^+} f(x) = \lim_{x \to 2^+} (x - 2) = 0.
\]
So we need \( 6 + b = 0 \), so we require that \( b = -6 \). Then \( \lim_{x \to 2} f(x) = 0 \).

2.3.69 In order for \( \lim g(x) \) to exist, we need the two one-sided limits to exist and be equal. We have
\[
\lim_{x \to -1^-} g(x) = \lim_{x \to -1^-} (x^2 - 5x) = 6, \quad \text{and} \quad \lim_{x \to -1^+} g(x) = \lim_{x \to -1^+} (ax^3 - 7) = -a - 7.
\]
So we need \(-a - 7 = 6\), so we require that \( a = -13 \). Then \( \lim_{x \to -1} f(x) = 6 \).

2.3.70
\[
\lim_{x \to 2} \frac{x^5 - 32}{x - 2} = \lim_{x \to 2} \frac{(x - 2)(x^4 + 2x^3 + 4x^2 + 8x + 16)}{x - 2} = \lim_{x \to 2} (x^4 + 2x^3 + 4x^2 + 8x + 16) = 16 + 16 + 16 + 16 + 16 = 80.
\]

2.3.71
\[
\lim_{x \to 1} \frac{x^6 - 1}{x - 1} = \lim_{x \to 1} \frac{(x - 1)(x^5 + x^4 + x^3 + x^2 + x + 1)}{x - 1} = \lim_{x \to 1} (x^5 + x^4 + x^3 + x^2 + x + 1) = 6.
\]

2.3.72
\[
\lim_{x \to -1} \frac{x^7 + 1}{x + 1} = \lim_{x \to -1} \frac{(x + 1)(x^6 - x^5 + x^4 - x^3 + x^2 - x + 1)}{x + 1} = \lim_{x \to -1} (x^6 - x^5 + x^4 - x^3 + x^2 - x + 1) = 7.
\]

2.3.73
\[
\lim_{x \to a} \frac{x^5 - a^5}{x - a} = \lim_{x \to a} \frac{(x - a)(x^4 + ax^3 + a^2x^2 + a^3x + a^4)}{x - a} = \lim_{x \to a} (x^4 + ax^3 + a^2x^2 + a^3x + a^4) = 5a^4.
\]

2.3.74
\[
\lim_{x \to a} \frac{x^n - a^n}{x - a} = \lim_{x \to a} \frac{(x - a)(x^{n-1} + ax^{n-2} + \cdots + a^{n-2}x + a^{n-1})}{x - a} = \lim_{x \to a} (x^{n-1} + ax^{n-2} + \cdots + a^{n-2}x + a^{n-1}) = na^{n-1}.
\]

2.3.75
\[
\lim_{x \to 1} \frac{\sqrt{x} - 1}{x - 1} = \lim_{x \to 1} \frac{\sqrt{x} - 1}{(\sqrt{x} - 1)(\sqrt{x} + 1)} = \lim_{x \to 1} \frac{1}{\sqrt{x} + 1} = \frac{1}{3}.
\]

2.3.76
\[
\lim_{x \to 16} \frac{\sqrt{x} - 2}{x - 16} = \lim_{x \to 16} \frac{\sqrt{x} - 2}{(\sqrt{x} - 2)(\sqrt{x} + 2\sqrt{x} + 4\sqrt{x} + 8)} = \lim_{x \to 16} \frac{1}{\sqrt{x} - 2 + 2\sqrt{x} + 4\sqrt{x} + 8} = \frac{1}{32}.
\]

2.3.77
\[
\lim_{x \to 1} \frac{x - 1}{\sqrt{x} - 1} = \lim_{x \to 1} \frac{(x - 1)(\sqrt{x} + 1)}{\sqrt{x} - 1} = \lim_{x \to 1} \frac{(x - 1)(\sqrt{x} + 1)}{x - 1} = \lim_{x \to 1} (\sqrt{x} + 1) = 2.
\]

2.3.78
\[
\lim_{x \to 1} \frac{x - 1}{\sqrt{4x + 5} - 3} = \lim_{x \to 1} \frac{(x - 1)(\sqrt{4x + 5} + 3)}{(\sqrt{4x + 5} - 3)(\sqrt{4x + 5} + 3)} = \lim_{x \to 1} \frac{x - 1}{4x + 5 - 9} = \lim_{x \to 1} \frac{(x - 1)(\sqrt{4x + 5} + 3)}{4(x - 1)} = \lim_{x \to 1} \frac{\sqrt{4x + 5} + 3}{4} = \frac{6}{4} = \frac{3}{2}.
\]
2.3.79

\[
\lim_{{x \to 4}} \frac{3(x - 4)\sqrt{x + 5}}{3 - \sqrt{x + 5}} = \lim_{{x \to 4}} \frac{3(x - 4)(\sqrt{x + 5})(3 + \sqrt{x + 5})}{(3 - \sqrt{x + 5})(3 + \sqrt{x + 5})} = \lim_{{x \to 4}} \frac{3(x - 4)(\sqrt{x + 5})(3 + \sqrt{x + 5})}{9 - (x + 5)} = \lim_{{x \to 4}} \frac{3(x - 4)(\sqrt{x + 5})(3 + \sqrt{x + 5})}{-(x - 4)} = \lim_{{x \to 4}} [-3(\sqrt{x + 5})(3 + \sqrt{x + 5})] = (-3)(3(3 + 3)) = -54.
\]

2.3.80 Note that since \( c \neq 0 \), the denominator of the given expression is not identically 0. Then

\[
\lim_{{x \to 0}} \frac{x}{\sqrt{cx + 1} - 1} = \lim_{{x \to 0}} \frac{x(\sqrt{cx + 1} + 1)}{\sqrt{cx + 1} - 1} = \lim_{{x \to 0}} \frac{x(\sqrt{cx + 1} + 1)}{cx} = \frac{2}{c}.
\]

2.3.81 Let \( f(x) = x - 1 \) and \( g(x) = \frac{5}{x - 1} \). Then \( \lim_{{x \to 1}} f(x) = 0 \), \( \lim_{{x \to 1}} f(x)g(x) = \lim_{{x \to 1}} \frac{5(x - 1)}{x - 1} = \lim_{{x \to 1}} 5 = 5 \).

2.3.82 Let \( f(x) = x^2 - 1 \). Then \( \lim_{{x \to 1}} \frac{f(x)}{x - 1} = \lim_{{x \to 1}} \frac{x^2 - 1}{x - 1} = \lim_{{x \to 1}} (x + 1) = 2 \).

2.3.83 Since the rational function \( p(x) \) has a limit as \( x \to 2 \), it must be the case that \( 2 \) is a root of \( p(x) \), otherwise \( x = 2 \) would be a vertical asymptote. Thus \( p(x) = (x - 2)g(x) \), and \( g(x) \) is a degree 1 polynomial with leading coefficient 1 (otherwise \( p \) would not have leading coefficient 1). Thus \( p(x) = (x - 2)(x + d) \), and

\[
\lim_{{x \to 2}} \frac{p(x)}{x - 2} = \lim_{{x \to 2}} \frac{(x - 2)(x + d)}{x - 2} = \lim_{{x \to 2}} (x + d) = d + 2 = 6.
\]

Thus \( d = 4 \) and \( p(x) = (x - 2)(x + 4) = x^2 + 2x - 8 \). So \( b = 2 \) and \( c = -8 \) are the only solutions.

2.3.84

a. \( L(c/2) = L_0 \sqrt{1 - \left(\frac{c/2}{c}\right)^2} = L_0 \sqrt{1 - \frac{1}{4}} = \frac{\sqrt{3}}{2}L_0 \).

b. \( L(3c/4) = L_0 \sqrt{1 - \left(\frac{3c/4}{c}\right)^2} = L_0 \sqrt{1 - \frac{9}{16}} = \frac{\sqrt{7}}{4}L_0 \).

c. It appears that that the observed length \( L \) of the ship decreases as the ship speed increases.

d. \( \lim_{{x \to c^-}} L_0 \sqrt{1 - \frac{\nu^2}{c^2}} = L_0 \cdot 0 = 0 \). As the speed of the ship approaches the speed of light, the observed length of the ship shrinks to 0.

2.3.85 \( \lim_{{S \to 0^+}} r(S) = \lim_{{S \to 0^+}} \frac{1}{2} \left( \sqrt{100 + \frac{2S}{\pi}} - 10 \right) = 0. \)

The radius of the circular cylinder approaches zero as the surface area approaches zero.

Copyright © 2014 Pearson Education, Inc.
2.3.86 \lim_{t \to 200^-} d(t) = \lim_{t \to 200^-} (3 - 0.015t)^2 = (3 - (0.015)(200))^2 = (3 - 3)^2 = 0. As time approaches 200 seconds, the depth of the water in the tank is approaching 0.

2.3.87 \lim_{x \to 10} E(x) = \lim_{x \to 10} \frac{4.35}{x\sqrt{x^2 + 0.01}} = \frac{4.35}{10\sqrt{100.01}} \approx 0.0435 \text{ N/C.}

2.3.88 Because \lim_{x \to -1} f(x) = 4, we know that \( f(x) \) is near 4 when \( x \) is near 1 (but not equal to 1). It follows that \( \lim_{x \to -1} f(x^2) = 4 \) as well, because when \( x \) is near but not equal to \(-1\), \( x^2 \) is near 1 but not equal to 1. Thus \( f(x^2) \) is near 4 when \( x \) is near \(-1\).

2.3.89

a. As \( x \to 0^+ \), \((1 - x) \to 1^-\). So \( \lim_{x \to 0^+} g(x) = \lim_{(1-x) \to 1^-} f(1-x) = \lim_{z \to 1^-} f(z) = 6 \). (Where \( z = 1 - x \).)

b. As \( x \to 0^- \), \((1 - x) \to 1^+\). So \( \lim_{x \to 0^-} g(x) = \lim_{(1-x) \to 1^+} f(1-x) = \lim_{z \to 1^+} f(z) = 4 \). (Where \( z = 1 - x \).)

2.3.90

a. Suppose \( 0 < \theta < \frac{\pi}{2} \). Note that \( \sin \theta > 0 \), so \( |\sin \theta| = \sin \theta \). Also, \( \sin \theta = \frac{|AC|}{\theta} \), so \( |AC| = |\sin \theta| \).

Now suppose that \(-\frac{\pi}{2} < \theta < 0\). Then \( \sin \theta \) is negative, so \( |\sin \theta| = -\sin \theta \). We have \( \sin \theta = -\frac{|AC|}{\theta} \), so \( |AC| = -\sin \theta = |\sin \theta| \).

b. Suppose \( 0 < \theta < \frac{\pi}{2} \). Because \( AB \) is the hypotenuse of triangle \( ABC \), we know that \( |AB| > |AC| \). We have \( |\sin \theta| = |AC| < |AB| \), the length of arc \( AB = \theta = |\theta| \).

If \(-\frac{\pi}{2} < \theta < 0\), we can make a similar argument. We have

\[ |\sin \theta| = |AC| < |AB| \text{ the length of arc } AB = -\theta = |\theta|. \]

c. If \( 0 < \theta < \frac{\pi}{2} \), we have \( \sin \theta = |\sin \theta| < |\theta| \), and because \( \sin \theta \) is positive, we have \( -|\theta| \leq 0 < \sin \theta \). Putting these together gives \( -|\theta| < \sin \theta < |\theta| \).

If \(-\frac{\pi}{2} < \theta < 0\), then \( |\sin \theta| = -\sin \theta \). From the previous part, we have \( |\sin \theta| = -\sin \theta < |\theta| \). Therefore, \( -|\theta| < \sin \theta \). Now because \( \sin \theta \) is negative on this interval, we have \( \sin \theta < 0 \leq |\theta| \). Putting these together gives \( -|\theta| < \sin \theta < |\theta| \).

d. If \( 0 < \theta < \frac{\pi}{2} \), we have

\[ 0 \leq 1 - \cos \theta = |OB| - |OC| = |BC| < |AB| \text{ the length of arc } AB = \theta = |\theta|. \]

For \(-\frac{\pi}{2} < \theta < 0\), we have

\[ 0 \leq 1 - \cos \theta = |OB| - |OC| = |BC| < |AB| \text{ the length of arc } AB = -\theta = |\theta|. \]

2.3.91

\[
\lim_{x \to a} p(x) = \lim_{x \to a} \left( a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0 \right)
= \lim_{x \to a} \left( a_n x^n \right) + \lim_{x \to a} \left( a_{n-1} x^{n-1} \right) + \cdots + \lim_{x \to a} \left( a_1 x \right) + \lim_{x \to a} a_0
= a_n \lim_{x \to a} x^n + a_{n-1} \lim_{x \to a} x^{n-1} + \cdots + a_1 \lim_{x \to a} x + a_0
= a_n (\lim_{x \to a} x)^n + a_{n-1} (\lim_{x \to a} x)^{n-1} + \cdots + a_1 (\lim_{x \to a} x) + a_0
= a_n a^n + a_{n-1} a^{n-1} + \cdots + a_1 a + a_0
= p(a).
\]
2.4 Infinite Limits

2.4.1

\[ \lim_{x \to a^+} f(x) = -\infty \]

means that as \( x \) approaches \( a \) from the right, the values of \( f(x) \) are negative numbers whose magnitude is arbitrarily large.

2.4.2

\[ \lim_{x \to a^-} f(x) = \infty \]

means that as \( x \) approaches \( a \), the values of \( f(x) \) are arbitrarily large positive numbers.

2.4.3 A vertical asymptote for a function \( f \) is a vertical line \( x = a \) so that one or more of the following are true: \( \lim_{x \to a^-} f(x) = \pm \infty \), \( \lim_{x \to a^+} f(x) = \pm \infty \).

2.4.4 No. For example, if \( f(x) = x^2 - 4 \) and \( g(x) = x - 2 \) and \( a = 2 \), we would have \( \lim_{x \to 2} \frac{f(x)}{g(x)} = 4 \), even though \( g(2) = 0 \).

2.4.5 Because the numerator is approaching a non-zero constant while the denominator is approaching zero, the quotient of these numbers is getting big – at least the absolute value of the quotient is getting big. The quotient is actually always negative, because a number near 100 divided by a negative number is always negative. Thus \( \lim_{x \to 2} \frac{f(x)}{g(x)} = -\infty \).

2.4.6 Using the same sort of reasoning as in the last problem – as \( x \to 3^- \) the numerator is fixed at 1, but the denominator is getting small, so the quotient is getting big. It remains to investigate the sign of the quotient. As \( x \to 3^- \), the quantity \( x - 3 \) is negative, so the quotient of the positive number 1 and this small negative number is negative. On the other hand, as \( x \to 3^+ \), the quantity \( x - 3 \) is positive, so the quotient of 1 and this number is positive. Thus: \( \lim_{x \to 3^-} \frac{1}{x - 3} = -\infty \), and \( \lim_{x \to 3^+} \frac{1}{x - 3} = \infty \).

2.4.7

From the data given, it appears that \( \lim_{x \to 1} f(x) = \infty \).
2.4.8 \( \lim_{x \to 3} f(x) = \infty \), and \( \lim_{x \to -1} f(x) = -\infty \).

2.4.9

a. \( \lim_{x \to 1^-} f(x) = \infty \).  
b. \( \lim_{x \to 1^+} f(x) = \infty \).  
c. \( \lim_{x \to 1^-} f(x) = \infty \).  
d. \( \lim_{x \to 2^-} f(x) = \infty \).  
e. \( \lim_{x \to 2^+} f(x) = -\infty \).  
f. \( \lim_{x \to 2^-} f(x) \) does not exist.

2.4.10

a. \( \lim_{x \to 2^-} g(x) = \infty \).  
b. \( \lim_{x \to 2^+} g(x) = -\infty \).  
c. \( \lim_{x \to 2^-} g(x) \) does not exist.

d. \( \lim_{x \to 4^-} g(x) = -\infty \).  
e. \( \lim_{x \to 4^+} g(x) = -\infty \).  
f. \( \lim_{x \to 4^-} g(x) = -\infty \).

2.4.11

a. \( \lim_{x \to -2^-} h(x) = -\infty \).  
b. \( \lim_{x \to -2^+} h(x) = -\infty \).  
c. \( \lim_{x \to -2^-} h(x) \) does not exist.

d. \( \lim_{x \to 3^-} h(x) = \infty \).  
e. \( \lim_{x \to 3^+} h(x) = -\infty \).  
f. \( \lim_{x \to 3^-} h(x) \) does not exist.

2.4.12

a. \( \lim_{x \to -2^-} p(x) = -\infty \).  
b. \( \lim_{x \to -2^+} p(x) = -\infty \).  
c. \( \lim_{x \to -2^-} p(x) \) does not exist.

d. \( \lim_{x \to 3^-} p(x) = -\infty \).  
e. \( \lim_{x \to 3^+} p(x) = -\infty \).  
f. \( \lim_{x \to 3^-} p(x) \) does not exist.

2.4.13

a. \( \lim_{x \to 0^-} \frac{1}{x^2 - x} = \infty \).  
b. \( \lim_{x \to 0^+} \frac{1}{x^2 - x} = -\infty \).  
c. \( \lim_{x \to 1^-} \frac{1}{x^2 - x} = -\infty \).  
d. \( \lim_{x \to 1^+} \frac{1}{x^2 - x} = \infty \).

2.4.14

a. \( \lim_{x \to -2^+} \frac{e^{-x}}{x(x + 2)^2} = -\infty \).  
b. \( \lim_{x \to -2^-} \frac{e^{-x}}{x(x + 2)^2} = -\infty \).  
c. \( \lim_{x \to 0^-} \frac{e^{-x}}{x(x + 2)^2} = -\infty \).  
d. \( \lim_{x \to 0^+} \frac{e^{-x}}{x(x + 2)^2} = \infty \).
2.4.15

\[ \lim_{x \to 2^+} \frac{1}{x - 2} = \infty. \quad \lim_{x \to 2^-} \frac{1}{x - 2} = -\infty. \quad \lim_{x \to 2} \frac{1}{x - 2} \text{ does not exist.} \]

2.4.16

\[ \lim_{x \to 2^+} \frac{2}{x - 3} = \infty. \quad \lim_{x \to 2^-} \frac{2}{x - 3} = -\infty. \quad \lim_{x \to 2} \frac{2}{(x - 3)^3} \text{ does not exist.} \]

2.4.17

a. \( \lim_{x \to 2^+} \frac{x - 5}{(x - 4)^2} = -\infty. \)  
   b. \( \lim_{x \to 2^-} \frac{x - 5}{(x - 4)^2} = -\infty. \)  
   c. \( \lim_{x \to 2} \frac{x - 5}{(x - 4)^2} = -\infty. \)

2.4.18

a. \( \lim_{x \to 1^+} \frac{x - 2}{x(x + 2)} = -\infty. \)  
   b. \( \lim_{x \to 1^-} \frac{x - 2}{x(x + 2)} = -\infty. \)  
   c. \( \lim_{x \to 1} \frac{x - 2}{x(x + 2)} \text{ does not exist.} \)

2.4.19

a. \( \lim_{x \to 3^+} \frac{x - 1(x - 2)}{(x - 3)} = \infty. \)  
   b. \( \lim_{x \to 3^-} \frac{x - 1(x - 2)}{(x - 3)} = -\infty. \)  
   c. \( \lim_{x \to 3} \frac{(x - 1)(x - 2)}{(x - 3)} \text{ does not exist.} \)

2.4.20

a. \( \lim_{x \to 1^+} \frac{x - 4}{x(x + 2)} = \infty. \)  
   b. \( \lim_{x \to 1^-} \frac{x - 4}{x(x + 2)} = -\infty. \)  
   c. \( \lim_{x \to 1} \frac{x - 4}{x(x + 2)} \text{ does not exist.} \)

2.4.21

a. \( \lim_{x \to 2^+} \frac{x^3 - 5x^2}{x - 2} = \frac{x^2(x - 5)}{x^2} = \lim_{x \to 2^-} (x - 5) = -5. \)

2.4.22

a. \( \lim_{x \to 2^+} \frac{x^3 - 5x^2}{x^2} = \lim_{x \to 2^-} \frac{x^2(x - 5)}{x^2} = \lim_{x \to 2} (x - 5) = -5. \)

2.4.23

\[ \lim_{t \to 5} \frac{4t^2 - 100}{t - 5} = \lim_{t \to 5} \frac{4(t - 5)(t + 5)}{t - 5} = \lim_{t \to 5} [4(t + 5)] = 40. \]

2.4.24

\[ \lim_{x \to 1^+} \frac{x^2 - 5x + 6}{x - 1} = \lim_{x \to 1^+} \frac{(x - 2)(x - 3)}{x - 1} = \infty. \] (Note that as \( x \to 1^+ \), the numerator is near 2, while the denominator is near zero, but is positive. So the quotient is positive and large).

2.4.25

\[ \lim_{z \to 4} \frac{z - 5}{(z^2 - 10z + 24)^2} = \lim_{z \to 4} \frac{z - 5}{(z - 4)^2(z - 6)^2} = -\infty. \] (Note that as \( z \to 4 \), the numerator is near \(-1\) while the denominator is near zero but is positive. So the quotient is negative with large absolute value).

Copyright © 2014 Pearson Education, Inc.
2.4.27

a. \( \lim_{x \to 2^+} \frac{x^2 - 4x + 3}{(x - 2)^2} = -\infty. \)

b. \( \lim_{x \to 2^-} \frac{x^2 - 4x + 3}{(x - 2)^2} = -\infty. \)

c. \( \lim_{x \to 2^-} \frac{x^2 - 4x + 3}{(x - 2)^2} = -\infty. \)

2.4.28

a. \( \lim_{x \to -2^+} \frac{x^3 - 5x^2 + 6x}{x^4 - 4x^2} = \lim_{x \to -2^+} \frac{x(x - 2)(x - 3)}{x^2(x - 2)(x + 2)} = \frac{x - 3}{x(x + 2)} = \infty. \)

b. \( \lim_{x \to -2^-} \frac{x^3 - 5x^2 + 6x}{x^4 - 4x^2} = \lim_{x \to -2^-} \frac{x(x - 2)(x - 3)}{x^2(x - 2)(x + 2)} = \frac{x - 3}{x(x + 2)} = -\infty. \)

c. Because the two one-sided limits differ, \( \lim_{x \to -2^-} \frac{x^3 - 5x^2 + 6x}{x^4 - 4x^2} \) does not exist.

d. \( \lim_{x \to 2^-} \frac{x^3 - 5x^2 + 6x}{x^4 - 4x^2} = \lim_{x \to 2^-} \frac{x - 3}{x(x + 2)} = \frac{1}{8}. \)

2.4.29

a. \( \lim_{x \to 5^-} \frac{x - 5}{x^2 - 25} = \lim_{x \to 5^-} \frac{1}{x + 5} = \frac{1}{10} \), so there isn’t a vertical asymptote at \( x = 5 \).

b. \( \lim_{x \to -5^-} \frac{x - 5}{x^2 - 25} = \lim_{x \to -5^-} \frac{1}{x + 5} = \infty \), so there is a vertical asymptote at \( x = -5 \).

c. \( \lim_{x \to -5^+} \frac{x - 5}{x^2 - 25} = \lim_{x \to -5^+} \frac{1}{x + 5} = \infty \). This also implies that \( x = -5 \) is a vertical asymptote, as we already noted in part b.

2.4.30

a. \( \lim_{x \to -7^-} \frac{x + 7}{x^2 - 49x^2} = \lim_{x \to -7^-} \frac{x + 7}{x^2(x + 7)(x - 7)} = \lim_{x \to -7^-} \frac{1}{x^2(x - 7)} = -\infty \), so there is a vertical asymptote at \( x = 7 \).

b. \( \lim_{x \to -7^+} \frac{x + 7}{x^2 - 49x^2} = \lim_{x \to -7^+} \frac{x + 7}{x^2(x + 7)(x - 7)} = \lim_{x \to -7^+} \frac{1}{x^2(x - 7)} = \infty \). This also implies that there is a vertical asymptote at \( x = 7 \), as we already noted in part a.

c. \( \lim_{x \to -7^-} \frac{x + 7}{x^2 - 49x^2} = \lim_{x \to -7^-} \frac{x + 7}{x^2(x + 7)(x - 7)} = \lim_{x \to -7^-} \frac{1}{x^2(x - 7)} = -\frac{1}{686} \). So there is not a vertical asymptote at \( x = 7 \).

d. \( \lim_{x \to 0^-} \frac{x + 7}{x^2 - 49x^2} = \lim_{x \to 0^-} \frac{x + 7}{x^2(x + 7)(x - 7)} = \lim_{x \to 0^-} \frac{1}{x^2(x - 7)} = -\infty \). So there is a vertical asymptote at \( x = 0 \).

2.4.31 \( f(x) = \frac{x^2 - 9x + 14}{x^2 - 5x + 6} = \frac{(x - 2)(x - 7)}{(x - 2)(x - 3)}. \) Note that \( x = 3 \) is a vertical asymptote, while \( x = 2 \) appears to be a candidate but isn’t one. We have \( \lim_{x \to 3^+} f(x) = \lim_{x \to 3^-} \frac{x - 7}{x - 3} = -\infty \) and \( \lim_{x \to 3^+} f(x) = \lim_{x \to 3^-} \frac{x - 7}{x - 3} = \infty \), and thus \( \lim_{x \to 3} f(x) \) doesn’t exist. Note that \( \lim_{x \to 2} f(x) = 5 \).

2.4.32 \( f(x) = \frac{\cos x}{x(x + 2)} \) has vertical asymptotes at \( x = 0 \) and at \( x = -2 \). Note that \( \cos x \) is near 1 when \( x \) is near 0, and \( \cos x \) is near -1 when \( x \) is near -2. Thus, \( \lim_{x \to 0^+} f(x) = +\infty, \lim_{x \to 0^-} f(x) = -\infty, \lim_{x \to -2^+} f(x) = \infty, \) and \( \lim_{x \to -2^-} f(x) = -\infty \).

2.4.33 \( f(x) = \frac{x + 1}{x^2 - 4x + 4} = \frac{x + 1}{x(x - 2)^2} \). There are vertical asymptotes at \( x = 0 \) and \( x = 2 \). We have \( \lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} \frac{x + 1}{x(x - 2)^2} = -\infty \), while \( \lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} \frac{x + 1}{x(x - 2)^2} = \infty \), and thus \( \lim_{x \to 0} f(x) \) doesn’t exist.

Copyright © 2014 Pearson Education, Inc.
Also we have \( \lim_{x \to 2^-} f(x) = \lim_{x \to 2^-} \frac{x + 1}{x(x - 2)^2} = \infty \), while \( \lim_{x \to 2^+} f(x) = \lim_{x \to 2^+} \frac{x + 1}{x(x - 2)^2} = \infty \), and thus \( \lim_{x \to 2} f(x) = \infty \) as well.

**2.4.34** \( g(x) = \frac{x^3 - 10x^2 + 16x}{x^2 - 8x} = \frac{x(x - 2)(x - 8)}{x(x - 8)} \). This function has no vertical asymptotes.

**2.4.35** \( \lim_{\theta \to 0^+} \csc \theta = \lim_{\theta \to 0^+} \frac{1}{\sin \theta} = \infty \).

**2.4.36** \( \lim_{x \to 0^-} \csc x = \lim_{x \to 0^-} \frac{1}{\sin x} = -\infty \).

**2.4.37** \( \lim_{x \to 0^+} -10 \cot x = \lim_{x \to 0^+} \frac{-10 \cos x}{\sin x} = -\infty \). (Note that as \( x \to 0^+ \), the numerator is near \(-10\) and the denominator is near zero, but is positive. Thus the quotient is a negative number whose absolute value is large).

**2.4.38** \( \lim_{\theta \to (\pi/2)^+} \frac{1}{3} \tan \theta = \lim_{\theta \to (\pi/2)^+} \frac{\sin \theta}{3 \cos \theta} = -\infty \). (Note that as \( \theta \to (\pi/2)^+ \), the numerator is near 1 and the denominator is near 0, but is positive. Thus the quotient is a negative number whose absolute value is large).

**2.4.39**

a. \( \lim_{x \to (\pi/2)^+} \tan x = -\infty \).

b. \( \lim_{x \to (\pi/2)^-} \tan x = \infty \).

c. \( \lim_{x \to (-\pi/2)^+} \tan x = -\infty \).

d. \( \lim_{x \to (-\pi/2)^-} \tan x = \infty \).

**2.4.40**

a. \( \lim_{x \to (\pi/2)^+} \sec x \tan x = \infty \).

b. \( \lim_{x \to (\pi/2)^-} \sec x \tan x = \infty \).

c. \( \lim_{x \to (-\pi/2)^+} \sec x \tan x = -\infty \).

d. \( \lim_{x \to (-\pi/2)^-} \sec x \tan x = -\infty \).

**2.4.41**

a. False. \( \lim_{x \to 1^-} f(x) = \lim_{x \to 1^+} f(x) = \lim_{x \to 1^-} f(x) = \lim_{x \to 1^+} \frac{(x - 1)(x - 6)}{(x - 1)(x + 1)} = \frac{-5}{2} \).

b. True. For example, \( \lim_{x \to 1^-} f(x) = \lim_{x \to 1^+} \frac{(x - 1)(x - 6)}{(x - 1)(x + 1)} = -\infty \).

c. False. For example \( g(x) = \frac{1}{x-1} \) has \( \lim_{x \to 1^+} g(x) = \infty \), but \( \lim_{x \to 1^-} g(x) = -\infty \).
2.4.42

One such function is
\[ f(x) = \frac{x^2 - 4x + 3}{x^2 - 3x + 2} = \frac{(x - 1)(x - 3)}{(x - 1)(x - 2)}. \]

2.4.43 One example is \( f(x) = \frac{1}{x-6} \).

2.4.44

<table>
<thead>
<tr>

<td>B</td>
<td>A</td>
<td>E</td>
</tr>
</tbody>
</table>

2.4.45

a. Note that the numerator of the given expression factors as \((x - 3)(x - 4)\). So if \( a = 3 \) or if \( a = 4 \) the limit would be a finite number. In fact, \( \lim_{x \to 3} \frac{(x - 3)(x - 4)}{x - 3} = -1 \) and \( \lim_{x \to 4} \frac{(x - 3)(x - 4)}{x - 4} = 1 \).

b. For any number other than 3 or 4, the limit would be either \( \pm \infty \). Because \( x - a \) is always positive as \( x \to a^+ \), the limit would be \( +\infty \) exactly when the numerator is positive, which is for \( a \) in the set \((\infty, 3) \cup (4, \infty)\).

c. The limit would be \( -\infty \) for \( a \) in the set \((3, 4)\).

2.4.46

a. The slope of the secant line is given by \( \frac{f(h) - f(0)}{h} = \frac{h^{1/3}}{h} = h^{-2/3} \).

b. \( \lim_{h \to 0} \frac{1}{\sqrt[3]{h^2}} = \infty \). This tells us that the slope of the tangent line is infinite – which means that the tangent line at \((0,0)\) is vertical.

2.4.47

a. The slope of the secant line is \( \frac{f(h) - f(0)}{h} = \frac{h^{2/3}}{h} = h^{-1/3} \).

b. \( \lim_{h \to 0^+} \frac{1}{h^{1/3}} = \infty \), and \( \lim_{h \to 0^-} \frac{1}{h^{1/3}} = -\infty \). The tangent line is infinitely steep at the origin (i.e., it is a vertical line).

2.4.48

a. This is a rational function whose denominator is never zero, so by Theorem 2.4(a),
\[ \lim_{x \to 0} f(x) = \frac{2000}{50 + 100 \cdot 0^2} = 40. \]

Then \( \lim_{x \to 0^+} f(x) = \lim_{x \to 0^-} f(x) = \lim_{x \to 0} f(x) = 40 \) as well.

b. The reason the graph in the problem statement looks like there is a vertical asymptote is that the vertical window is not large enough. Enlarging it gives the graph.

Copyright © 2014 Pearson Education, Inc.
2.4.49 \( f(x) = \frac{x^2 - 3x + 2}{x^{10} - x^9} = \frac{(x-2)(x-1)}{x^9(x-1)} \). As \( x \to 0^+ \) the numerator approaches 2 while the denominator gets closer and closer to zero (but is negative), so that \( \lim_{x \to 0^+} f(x) = -\infty \). As \( x \to 0^- \) the numerator again approaches 2, while the denominator gets closer and closer to zero, but is positive, so that \( \lim_{x \to 0^-} f(x) = \infty \). Thus \( f \) has a vertical asymptote at \( x = 0 \). Note that \( \lim_{x \to 1} f(x) = -1 \), since the \( x-1 \) in the numerator cancels that in the denominator, so there isn’t a vertical asymptote at \( x = 1 \).

2.4.50 Since \( \lim_{x \to 0^-} \ln x^2 = -\infty \), it follows that \( \lim_{x \to 0^-} (2 - \ln x^2) = \infty \), so that \( g(x) \) has a vertical asymptote at \( x = 0 \).

2.4.51 \( h(x) = \frac{e^x}{(x+1)^3} \) has a vertical asymptote at \( x = -1 \), because \( \lim_{x \to -1^+} \frac{e^x}{(x+1)^3} = \infty \) (and \( \lim_{x \to -1^-} h(x) = -\infty \)).

2.4.52 \( p(x) = \sec \left( \frac{\pi}{2} x \right) = \frac{1}{\cos \left( \frac{\pi}{2} x \right)} \) has a vertical asymptote on \((-2,2)\) at \( x = \pm 1 \), since as \( x \) approaches either of those points, \( \cos \left( \frac{\pi}{2} x \right) \to 0 \).

2.4.53 \( g(\theta) = \tan \left( \frac{\pi}{10} \theta \right) = \frac{\sin \left( \frac{\pi}{10} \theta \right)}{\cos \left( \frac{\pi}{10} \theta \right)} \) has a vertical asymptote at each \( \theta = 10n + 5 \) where \( n \) is an integer. This is due to the fact that \( \cos \left( \frac{\pi}{10} \theta \right) = 0 \) when \( \frac{\pi}{10} \theta = \frac{\pi}{2} + n\pi \) where \( n \) is an integer, which is the same as \( \{ \theta : \theta = 10n + 5, n \text{ an integer} \} \). Note that at all of these numbers which make the denominator zero, the numerator isn’t zero.

2.4.54 \( q(s) = \frac{\pi}{s\sin s} \) has a vertical asymptote at \( s = 0 \), since \( s = 0 \) is the only number where \( \sin s = s \).

2.4.55 \( f(x) = \frac{1}{\sqrt{x} \sec x} = \frac{\cos x}{\sqrt{x}} \) has a vertical asymptote at \( x = 0 \), since as \( x \to 0^+ \) the numerator approaches 1 while the denominator approaches zero. (Note that this function is not defined for \( x < 0 \), so that this is a one-sided limit).

2.4.56 \( g(x) = e^{1/x} \) has a vertical asymptote at \( x = 0 \), since as \( x \to 0^+ \), \( \frac{1}{x} \to \infty \), so \( e^{1/x} \to \infty \) as well.

2.4.57 A plot of \( f(x) \), together with the line \( x = 1 \) shown as a dotted line, is

Clearly the graph of \( f \) intersects this vertical line, since \( f(1) = 1 \) so that \( (1,1) \) is both on the graph of \( f \) and on the line \( x = 1 \). But also the line \( x = 1 \) is a vertical asymptote of \( f \), since as \( x \to 1 \) from the left, the function is given by \( \frac{4}{x-1} \); the numerator remains constant at 4 while the denominator is negative and gets closer and closer to zero. Thus the limit is \(-\infty\); i.e., \( x = -1 \) is a vertical asymptote.
2.5 Limits at Infinity

2.5.1

As $x < 0$ becomes large in absolute value, the corresponding values of $f$ level off near 10.

2.5.2 A horizontal asymptote is a horizontal line $y = L$ so that either $\lim_{x \to \infty} f(x) = L$ or $\lim_{x \to -\infty} f(x) = L$ (or both).

2.5.3 If $f(x) \to 100,000$ as $x \to \infty$ and $g(x) \to \infty$ as $x \to \infty$, then the ratio $\frac{f(x)}{g(x)} \to 0$ as $x \to \infty$. (Because eventually the values of $f$ are small compared to the values of $g$).

2.5.4 As $x \to \infty$, we note that $e^{-2x} \to 0$, while as $x \to -\infty$, we have $e^{-2x} \to \infty$.

2.5.5 $\lim_{x \to \infty} (-2x^3) = -\infty$, and $\lim_{x \to -\infty} (-2x^3) = \infty$.

2.5.6 Theorem 2.7 presents the possibilities in detail. In summary, the function may have a horizontal asymptote, or the limit at $\pm \infty$ may be $\pm \infty$. Which possibility occurs depends on the degrees of $p$ and $q$: if the degree of $p$ is less than or equal to the degree of $q$, then a horizontal asymptote will exist; otherwise, the limit at infinity will not exist.

2.5.7 $\lim_{x \to \infty} e^x = \infty$, $\lim_{x \to -\infty} e^x = 0$, and $\lim_{x \to \infty} e^{-x} = 0$.

2.5.8

As $x \to \infty$, $\ln x \to \infty$. (Albeit somewhat slowly).

2.5.9 $\lim_{x \to \infty} \left(3 + \frac{10}{x^2}\right) = 3 + \lim_{x \to \infty} \frac{10}{x^2} = 3 + 0 = 3$.

2.5.10 $\lim_{x \to \infty} \left(5 + \frac{1}{x} + \frac{10}{x^2}\right) = 5 + \lim_{x \to \infty} \frac{1}{x} + \lim_{x \to \infty} \frac{10}{x^2} = 5 + 0 + 0 = 5$.

2.5.11 $\lim_{\theta \to \infty} \frac{\cos \theta}{\theta^2} = 0$. Note that $-1 \leq \cos \theta \leq 1$, so $-\frac{1}{\theta^2} \leq \frac{\cos \theta}{\theta^2} \leq \frac{1}{\theta^2}$. The result now follows from the squeeze theorem.

2.5.12 $\lim_{x \to \infty} \frac{3 + 2x + 4x^2}{x^2} = \lim_{x \to \infty} \frac{3}{x^2} + \lim_{x \to \infty} \frac{2x}{x^2} + \lim_{x \to \infty} \frac{4x^2}{x^2} = 0 + \lim_{x \to \infty} \frac{2}{x} + \lim_{x \to \infty} 4 = 0 + 0 + 4 = 4$. 

Copyright © 2014 Pearson Education, Inc.
2.5.13 Note that $-1 \leq \cos x^5 \leq 1$, so $-1 \leq \frac{\cos x^5}{\sqrt{x}} \leq \frac{1}{\sqrt{x}}$. Because $\lim_{x \to \infty} \frac{1}{\sqrt{x}} = \lim_{x \to \infty} \frac{-1}{\sqrt{x}} = 0$, we have $\lim_{x \to \infty} \frac{\cos x^5}{\sqrt{x}} = 0$ by the squeeze theorem.

2.5.14

$$\lim_{x \to \infty} \left( 5 + \frac{100}{x} + \frac{\sin^4(x^3)}{x^2} \right) = \lim_{x \to \infty} 5 + \lim_{x \to \infty} \frac{100}{x} + \lim_{x \to \infty} \frac{\sin^4(x^3)}{x^2} = 5 + 0 + 0 = 5.$$ 

To see that the third term is in fact zero, note that $0 \leq \frac{\sin^4(x^3)}{x^2} \leq \frac{1}{x^2}$. The result now follows from the squeeze theorem.

2.5.15 $\lim_{x \to \infty} x^{12} = \infty$. Note that $x^{12}$ is positive when $x > 0$.

2.5.16 $\lim_{x \to \infty} 3x^{11} = -\infty$. Note that $x^{11}$ is negative when $x < 0$.

2.5.17 $\lim_{x \to \infty} x^{-6} = \lim_{x \to \infty} \frac{1}{x^6} = 0$.

2.5.18 $\lim_{x \to \infty} x^{-11} = \lim_{x \to \infty} \frac{1}{x^{11}} = 0$.

2.5.19 $\lim_{x \to \infty} (3x^{12} - 9x^7) = \infty$.

2.5.20 $\lim_{x \to \infty} (3x^7 + x^2) = -\infty$.

2.5.21 $\lim_{x \to \infty} (-3x^{16} + 2) = -\infty$.

2.5.22 $\lim_{x \to \infty} 2x^{-8} = \lim_{x \to \infty} \frac{2}{x^8} = 0$.

2.5.23 $\lim_{x \to \infty} (-12x^{-5}) = \lim_{x \to \infty} \left( -\frac{12}{x^5} \right) = 0$.

2.5.24 $\lim_{x \to \infty} (2x^{-8} + 4x^3) = 0 + \lim_{x \to \infty} 4x^3 = -\infty$.

2.5.25 $\lim_{x \to \infty} \frac{4x}{20x + 1} = \lim_{x \to \infty} \frac{4x}{20x + 1} \cdot \frac{1}{x} = \lim_{x \to \infty} \frac{4}{20 + 1/x} = \frac{4}{20} = \frac{1}{5}$. Thus, the line $y = \frac{1}{5}$ is a horizontal asymptote.

$$\lim_{x \to \infty} \frac{4x}{20x + 1} = \lim_{x \to \infty} \frac{4x}{20x + 1} \cdot \frac{1}{x} = \lim_{x \to \infty} \frac{4}{20 + 1/x} = \frac{4}{20} = \frac{1}{5}.$$ This shows that the curve is also asymptotic to the asymptote in the negative direction.

2.5.26 $\lim_{x \to \infty} \frac{3x^2 - 7}{x^2 + 5x} = \lim_{x \to \infty} \frac{3x^2 - 7}{x^2 + 5x} \cdot \frac{1}{x^2} = \lim_{x \to \infty} \frac{3 - (7/x^2)}{1 + (5/x)} = \frac{3 - 0}{1 + 0} = 3$. Thus, the line $y = 3$ is a horizontal asymptote.

$$\lim_{x \to \infty} \frac{3x^2 - 7}{x^2 + 5x} = \lim_{x \to \infty} \frac{3x^2 - 7}{x^2 + 5x} \cdot \frac{1}{x^2} = \lim_{x \to \infty} \frac{3 - (7/x^2)}{1 + (5/x)} = \frac{3 - 0}{1 + 0} = 3.$$ Thus, the curve is also asymptotic to the asymptote in the negative direction.

2.5.27 $\lim_{x \to \infty} \frac{(6x^2 - 9x + 8)}{(3x^2 + 2)} \cdot \frac{1/x^2}{1/x^2} = \lim_{x \to \infty} \frac{6 - 9/x + 8/x^2}{3 + 2/x^2} = \frac{6 - 0 + 0}{3 + 0} = 2$. Similarly $\lim_{x \to \infty} f(x) = 2$. The line $y = 2$ is a horizontal asymptote.
2.5.28 \( \lim_{x \to \infty} \frac{4x^2 - 7}{(8x^2 + 5x + 2)} \cdot \frac{1}{x^2} = \lim_{x \to \infty} \frac{4 - 7/x^2}{8 + 5/x + 2/x^2} = \frac{4 - 0}{8 + 0 + 0} = \frac{1}{2} \). Similarly \( \lim_{x \to -\infty} f(x) = \frac{1}{2} \). The line \( y = \frac{1}{2} \) is a horizontal asymptote.

2.5.29 \( \lim_{x \to \infty} \frac{3x^3 - 7}{x^4 + 5x^2} = \lim_{x \to \infty} \frac{3x^3 - 7}{x^4} \cdot \frac{1}{x^4} = \lim_{x \to \infty} \frac{1/x - (7/x^4)}{1 + (5/x^2)} = 0 - 0 \div 1 + 0 = 0 \). Thus, the line \( y = 0 \) (the \( x \)-axis) is a horizontal asymptote.

\[ \lim_{x \to \infty} \frac{3x^3 - 7}{x^4 + 5x^2} \cdot \frac{1}{x^4} = \lim_{x \to \infty} \frac{1/x - (7/x^4)}{1 + (5/x^2)} = 0 - 0 \div 1 + 0 = 0 \]. Thus, the curve is asymptotic to the \( x \)-axis in the negative direction as well.

2.5.30 \( \lim_{x \to \infty} \frac{x^4 + 7}{x^5 + x^2 - x} = \lim_{x \to \infty} \frac{x^4 + 7}{x^5} \cdot \frac{1/x^5}{1/x^5} = \lim_{x \to \infty} \frac{(1/x) + (7/x^5)}{1 + (1/x^3) - (1/x^4)} = 0 + 0 \div 1 + 0 - 0 = 0 \). Thus, the line \( y = 0 \) (the \( x \)-axis) is a horizontal asymptote.

\[ \lim_{x \to \infty} \frac{x^4 + 7}{x^5 + x^2 - x} = \lim_{x \to \infty} \frac{x^4 + 7}{x^5} \cdot \frac{1/x^5}{1/x^5} = \lim_{x \to \infty} \frac{(1/x) + (7/x^5)}{1 + (1/x^3) - (1/x^4)} = 0 + 0 \div 1 + 0 - 0 = 0 \). Thus, the curve is asymptotic to the \( x \)-axis in the negative direction as well.

2.5.31 \( \lim_{x \to \infty} \frac{(2x + 1)}{x^2 + 2 - x} = \lim_{x \to \infty} \frac{2 + 1/x}{3 - 2/x} = 0 + 0 \div 3 - 0 = 0 \). Similarly \( \lim_{x \to -\infty} f(x) = 0 \). The line \( y = 0 \) is a horizontal asymptote.

2.5.32 \( \lim_{x \to \infty} \frac{(12x^8 - 3)}{(3x^8 - 2x^7)} = \lim_{x \to \infty} \frac{12 - 3/x^8}{3 - 2/x^7} = 12 - 0 \div 3 - 0 = 4 \). Similarly \( \lim_{x \to -\infty} f(x) = 4 \). The line \( y = 4 \) is a horizontal asymptote.

2.5.33 \( \lim_{x \to \infty} \frac{(40x^5 + 5)}{(16x^4 - 2x)} = \lim_{x \to \infty} \frac{40x + 1/x^2}{16 - 2/x} = \infty \). Similarly \( \lim_{x \to -\infty} f(x) = -\infty \). There are no horizontal asymptotes.

2.5.34 \( \lim_{x \to \infty} \frac{(-x^3 + 1)}{(2x + 8)} = \lim_{x \to \infty} \frac{-x^2 + 1/x}{2 + 8/x} = -\infty \). Similarly \( \lim_{x \to -\infty} f(x) = -\infty \). There are no horizontal asymptotes.

2.5.35 First note that \( \sqrt{x^6} = x^3 \) if \( x > 0 \), but \( \sqrt{x^6} = -x^3 \) if \( x < 0 \). We have

\[ \lim_{x \to \infty} \frac{4x^3 + 1}{(2x^3 + 16x^6 + 1)} \cdot \frac{1}{x^3} = \lim_{x \to \infty} \frac{4 + 1/x^3}{2 \sqrt{16 + 1/x^6}} = \frac{4 + 0}{2 \sqrt{16 + 0}} = \frac{2}{3} \].

However,

\[ \lim_{x \to \infty} \frac{4x^3 + 1}{(2x^3 + 16x^6 + 1)} \cdot \frac{1}{x^3} = \lim_{x \to \infty} \frac{4 + 1/x^3}{2 - \sqrt{16 + 1/x^6}} = \frac{4 + 0}{2 - \sqrt{16 + 0}} = \frac{4 - 2}{2} = -2 \].

So \( y = \frac{2}{3} \) is a horizontal asymptote (as \( x \to \infty \)) and \( y = -2 \) is a horizontal asymptote (as \( x \to -\infty \)).

2.5.36 We have \( f(x) = \sqrt{\frac{x^2 + 1}{2x + 1}} \). Then

\[ \lim_{x \to \infty} \frac{\sqrt{x^2 + 1}}{2x + 1} = \lim_{x \to \infty} \frac{\frac{1}{2} \sqrt{x^2 + 1}}{\frac{2}{2} + \frac{1}{x}} = \lim_{x \to \infty} \sqrt{\frac{1 + 1/x^2}{2 + 1/x}} = \frac{1}{2} \].

In the other direction,

\[ \lim_{x \to \infty} \frac{\sqrt{x^2 + 1}}{2x + 1} = \lim_{x \to \infty} \frac{\frac{1}{2} \sqrt{x^2 + 1}}{\frac{2}{2} + \frac{1}{x}} = \lim_{x \to \infty} \sqrt{\frac{1 + 1/x^2}{2 + 1/x}} = \frac{1}{2} \].

Thus \( f \) has two horizontal asymptotes, one at \( y = \frac{1}{2} \) as \( x \to \infty \) and one at \( y = -\frac{1}{2} \) as \( x \to -\infty \).
2.5.37 First note that $\sqrt[3]{x^6} = x^2$ and $\sqrt[4]{x^4} = x$ for all $x$ (even when $x < 0$). We have

$$\lim_{x \to \infty} \frac{\sqrt[3]{x^6} + 8}{4x^2 + \sqrt{3x^4 + 1}} \cdot \frac{1}{x^2} = \lim_{x \to \infty} \frac{\sqrt[3]{1 + 8/x^6}}{4 + \sqrt{3 + 1/x^4}} = \frac{1}{4 + \sqrt{3}} = \frac{4 - \sqrt{3}}{13}.$$

The calculation as $x \to -\infty$ is similar. So $y = \frac{4 - \sqrt{3}}{13}$ is a horizontal asymptote.

2.5.38 First note that $\sqrt{x^2} = x$ for $x > 0$ and $\sqrt{x^2} = -x$ for $x < 0$.

We have

$$\lim_{x \to \infty} \frac{4x(3x - \sqrt{9x^2 + 1})}{3x + \sqrt{9x^2 + 1}} = \lim_{x \to \infty} \frac{4x(3x - \sqrt{9x^2 + 1})(3x + \sqrt{9x^2 + 1})}{(3x + \sqrt{9x^2 + 1})} = -4 \cdot \frac{1}{6} = -\frac{2}{3}.$$

However, as $x \to -\infty$ we have

We have

$$\lim_{x \to -\infty} \frac{4x(3x - \sqrt{9x^2 + 1})}{3x + \sqrt{9x^2 + 1}} = \lim_{x \to -\infty} \frac{4x(3x - \sqrt{9x^2 + 1})(3x + \sqrt{9x^2 + 1})}{(3x + \sqrt{9x^2 + 1})} = -4 \cdot \frac{1}{3} = -\frac{4}{3}.$$

Note that this last equality is due to the fact that the numerator is the constant $-4$ and the denominator is approaching zero (from the left) so the quotient is positive and is getting large. So $y = -\frac{2}{3}$ is the only horizontal asymptote.

2.5.39

$$\lim_{x \to \infty} (-3e^{-x}) = -3 \cdot 0 = 0. \quad \lim_{x \to -\infty} (-3e^{-x}) = -\infty.$$

2.5.40

$$\lim_{x \to \infty} 2^x = \infty. \quad \lim_{x \to -\infty} 2^x = 0.$$
2.5.41

\[ \lim_{x \to \infty} (1 - \ln x) = -\infty. \; \lim_{x \to 0^+} (1 - \ln x) = \infty. \]

2.5.42

\[ \lim_{x \to \infty} |\ln x| = \infty. \; \lim_{x \to 0^+} |\ln x| = \infty. \]

2.5.43

\[ y = \sin x \] has no asymptotes. \; \lim_{x \to \infty} \sin x \] and \; \lim_{x \to -\infty} \sin x \] do not exist.

2.5.44

\[ \lim_{x \to \infty} \frac{50}{e^{2x}} = 0. \; \lim_{x \to -\infty} \frac{50}{e^{2x}} = \infty. \]
2.5.45

a. False. For example, the function \( y = \frac{\sin x}{x} \) on the domain \([1, \infty)\) has a horizontal asymptote of \( y = 0 \), and it crosses the x-axis infinitely many times.

b. False. If \( f \) is a rational function, and if \( \lim_{x \to \infty} f(x) = L \) then the degree of the polynomial in the numerator must equal the degree of the polynomial in the denominator. In this case, both \( \lim_{x \to \infty} f(x) \) and \( \lim_{x \to \infty} f(x) = \frac{a_n}{b_n} \) where \( a_n \) is the leading coefficient of the polynomial in the numerator and \( b_n \) is the leading coefficient of the polynomial in the denominator.

c. True. There are only two directions which might lead to horizontal asymptotes: there could be one as \( x \to \infty \) and there could be one as \( x \to -\infty \), and those are the only possibilities.

2.5.46

a. \( \lim_{x \to \infty} \frac{x^2 - 4x + 3}{x - 1} = \infty \), and \( \lim_{x \to -\infty} \frac{x^2 - 4x + 3}{x - 1} = -\infty \). There are no horizontal asymptotes.

b. It appears that \( x = 1 \) is a candidate to be a vertical asymptote, but note that \( f(x) = \frac{x^2-4x+3}{x-1} = \frac{(x-1)(x-3)}{x-1} \). Thus \( \lim_{x \to 1} f(x) = \lim_{x \to 1} (x-3) = -2 \). So \( f \) has no vertical asymptotes.

2.5.47

a. \( \lim_{x \to \infty} \frac{2x^3 + 10x^2 + 12x}{x^3 + 2x^2} \cdot \frac{(1/x^3)}{1/x} = \lim_{x \to \infty} \frac{2 + 10/x + 12/x^2}{1 + 2/x} = 2 \). Similarly, \( \lim_{x \to -\infty} f(x) = 2 \). Thus, \( y = 2 \) is a horizontal asymptote.

b. Note that \( f(x) = \frac{2x^2(2x+3)}{x(x+2)} \). So \( \lim_{x \to 0^+} f(x) = \lim_{x \to 0} \frac{2(x+3)}{x} = \infty \), and similarly, \( \lim_{x \to 0^-} f(x) = -\infty \). There is a vertical asymptote at \( x = 0 \). Note that there is no asymptote at \( x = 2 \) because \( \lim_{x \to 2} f(x) = -1 \).

2.5.48

a. We have \( \lim_{x \to \infty} \frac{\sqrt{16x^4 + 64x^2} + x^2}{2x^2 - 4} \cdot \frac{(1/x^2)}{(1/x^2)} = \lim_{x \to \infty} \frac{\sqrt{16 + 64/x^2} + 1}{2 - 4/x^2} = \frac{5}{2} \). Similarly, \( \lim_{x \to -\infty} f(x) = \frac{5}{2} \). So \( y = \frac{5}{2} \) is a horizontal asymptote.

b. \( \lim_{x \to \sqrt{2}^+} f(x) = \lim_{x \to \sqrt{2}} f(x) = \infty \), and \( \lim_{x \to \sqrt{2}^-} f(x) = \lim_{x \to \sqrt{2}} f(x) = -\infty \) so there are vertical asymptotes at \( x = \pm \sqrt{2} \).

2.5.49

a. We have \( \lim_{x \to \infty} \frac{3x^3 + 3x^2 - 36x^2}{x^4 - 25x^2 + 144} \cdot \frac{(1/x^4)}{(1/x^4)} = \lim_{x \to \infty} \frac{3 + 3/x - 36/x^2}{1 - 25/x^2 + 144/x^4} = 3 \). Similarly, \( \lim_{x \to -\infty} f(x) = 3 \). So \( y = 3 \) is a horizontal asymptote.

b. Note that \( f(x) = \frac{3x^2(x+4)(x-3)}{(x+4)(x-4)(x+3)(x-3)} \). Thus, \( \lim_{x \to -3^+} f(x) = -\infty \) and \( \lim_{x \to -3^-} f(x) = \infty \). Also, \( \lim_{x \to 4^+} f(x) = -\infty \) and \( \lim_{x \to 4^-} f(x) = \infty \). Thus there are vertical asymptotes at \( x = -3 \) and \( x = 4 \).

Copyright © 2014 Pearson Education, Inc.
2.5. LIMITS AT INFINITY

2.5.50
a. First note that

\[ f(x) = 16x^2(4x^2 - \sqrt{16x^4 + 1}) \cdot \frac{4x^2 + \sqrt{16x^4 + 1}}{4x^2 + \sqrt{16x^4 + 1}} = \frac{-16x^2}{4x^2 + \sqrt{16x^4 + 1}}. \]

We have \( \lim_{x \to -\infty} \frac{-16x^2}{4x^2 + \sqrt{16x^4 + 1}} = \lim_{x \to -\infty} \frac{(1/x^2)}{4 + \sqrt{1/x^4 + 1/x^2}} = -2. \) Similarly, the limit as \( x \to -\infty \) of \( f(x) \) is \(-2\) as well, so \( y = -2 \) is a horizontal asymptote.

b. \( f \) has no vertical asymptotes.

2.5.51
a. \( \lim_{x \to \infty} \frac{x^2 - 9}{x^2 - 3x} \cdot \frac{1/x^2}{1/x^2} = \lim_{x \to \infty} \frac{1 - 9/x^2}{1 - 3/x} = 1. \) A similar result holds as \( x \to -\infty. \) So \( y = 1 \) is a horizontal asymptote.

b. Because \( \lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} \frac{x + 3}{x} = \infty \) and \( \lim_{x \to 0^-} f(x) = -\infty, \) there is a vertical asymptote at \( x = 0. \)

2.5.52
a. \( \lim_{x \to \infty} \frac{x - 1}{x^{2/3} - 1} \cdot \frac{1/x^{2/3}}{1/x^{2/3}} = \lim_{x \to \infty} \frac{x^{1/3} - 1/x^{2/3}}{1 - 1/x^{2/3}} = \infty. \) Similarly, \( \lim_{x \to -\infty} f(x) = -\infty. \) So there are no horizontal asymptotes.

b. There is a vertical asymptote at \( x = -1. \) The easiest way to see this is to factor the denominator as the difference of squares, and the numerator as the difference of cubes. We have

\[ f(x) = \frac{x - 1}{x^{2/3} - 1} = \frac{(x^{1/3} - 1)(x^{2/3} + x^{1/3} + 1)}{(x^{1/3} + 1)(x^{1/3} - 1)}. \]

Thus,

\[ \lim_{x \to -1^+} f(x) = \lim_{x \to -1^+} \frac{x^{2/3} + x^{1/3} + 1}{x^{1/3} + 1} = \infty. \]

Similarly, \( \lim_{x \to -1^-} f(x) = -\infty. \)

2.5.53
a. First note that

\[ f(x) = \frac{\sqrt{x^2 + 2x + 6} - 3}{x - 1} \cdot \frac{\sqrt{x^2 + 2x + 6} + 3}{\sqrt{x^2 + 2x + 6} + 3} = \frac{x^2 + 2x + 6 - 9}{(x - 1)(\sqrt{x^2 + 2x + 6} + 3)} = \frac{(x - 1)(x + 3)}{(x - 1)(\sqrt{x^2 + 2x + 6} + 3)}. \]

Thus

\[ \lim_{x \to \infty} f(x) = \lim_{x \to -\infty} \frac{x + 3}{\sqrt{x^2 + 2x + 6} + 3} = \lim_{x \to -\infty} \frac{1/x}{\sqrt{1 + 2/x + 6/x^2 + 3/x}} = 1. \]

Using the fact that \( \sqrt{x^2} = -x \) for \( x < 0, \) we have \( \lim_{x \to -\infty} f(x) = -1. \) Thus the lines \( y = 1 \) and \( y = -1 \) are horizontal asymptotes.

b. \( f \) has no vertical asymptotes.

2.5.54
a. Note that when \( x \) is large \( |1 - x^2| = x^2 - 1. \) We have \( \lim_{x \to \infty} \frac{|1 - x^2|}{x^2 + x} = \lim_{x \to \infty} \frac{x^2 - 1}{x^2 + x} = 1. \) Likewise \( \lim_{x \to -\infty} \frac{|1 - x^2|}{x^2 + x} = \lim_{x \to -\infty} \frac{x^2 - 1}{x^2 + x} = 1. \) So there is a horizontal asymptote at \( y = 1. \)
b. Note that when $x$ is near 0, we have $|1 - x^2| = 1 - x^2 = (1 - x)(1 + x)$. So $\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} \frac{1 - x}{x} = \infty$.

Similarly, $\lim_{x \to 0^-} f(x) = -\infty$. There is a vertical asymptote at $x = 0$.

2.5.55

a. Note that when $x > 1$, we have $|x| = x$ and $|x - 1| = x - 1$. Thus

$$f(x) = (\sqrt{x} - \sqrt{x - 1}) \cdot \frac{\sqrt{x} + \sqrt{x - 1}}{\sqrt{x} + \sqrt{x - 1}} = \frac{1}{\sqrt{x} + \sqrt{x - 1}}.$$ 

Thus $\lim_{x \to \infty} f(x) = 0$.

When $x < 0$, we have $|x| = -x$ and $|x - 1| = 1 - x$. Thus

$$f(x) = (\sqrt{-x} - \sqrt{1 - x}) \cdot \frac{\sqrt{-x} + \sqrt{1 - x}}{\sqrt{-x} + \sqrt{1 - x}} = -\frac{1}{\sqrt{-x} + \sqrt{1 - x}}.$$ 

Thus, $\lim_{x \to -\infty} f(x) = 0$. There is a horizontal asymptote at $y = 0$.

b. $f$ has no vertical asymptotes.

2.5.56

a. $\lim_{x \to \pi/2^-} \tan x = \infty$ and $\lim_{x \to -\pi/2^+} \tan x = -\infty$. These are infinite limits.

b. $\lim_{x \to \infty} \tan^{-1} x = \frac{\pi}{2}$, $\lim_{x \to -\infty} \tan^{-1} x = -\frac{\pi}{2}$.

2.5.57

a. $\lim_{x \to \infty} \sec^{-1} x = \frac{\pi}{2}$

b. $\lim_{x \to -\infty} \sec^{-1} x = \frac{\pi}{2}$.

2.5.58

a. $\lim_{x \to \infty} \frac{e^x + e^{-x}}{2} = \infty$.

b. $\lim_{x \to -\infty} \frac{e^x + e^{-x}}{2} = \infty$. 

Copyright © 2014 Pearson Education, Inc.
b. \( \cosh 0 = \frac{e^0 + e^0}{2} = \frac{1+1}{2} = 1. \)

2.5.59

a. \( \lim_{x \to \infty} \frac{e^x - e^{-x}}{2} = \infty. \)

\( \lim_{x \to -\infty} \frac{e^x - e^{-x}}{2} = -\infty. \)

b. \( \sinh 0 = \frac{e^0 - e^0}{2} = \frac{1-1}{2} = 0. \)

2.5.60

One possible such graph is:

2.5.61

One possible such graph is:

2.5.62 \( \lim_{x \to 0^+} e^{1/x} = \infty. \) \( \lim_{x \to \infty} e^{1/x} = 1. \) \( \lim_{x \to -\infty} e^{1/x} = 1. \)

There is a vertical asymptote at \( x = 0 \) and a horizontal asymptote at \( y = 1. \)
2.5.63 \( \lim_{x \to 0^+} \frac{\cos x + 2\sqrt{x}}{x^2} = \infty \), and \( \lim_{x \to \infty} \frac{\cos x + 2\sqrt{x}}{x^2} = 2 \). Thus there is a vertical asymptote at \( x = 0 \) and a horizontal asymptote at \( y = 2 \).

2.5.64 \( \lim_{t \to \infty} p(t) = \lim_{t \to \infty} \frac{2500}{t + 1} = 0 \). The steady state exists. The steady state value is 0.

2.5.65 \( \lim_{t \to \infty} p(t) = \lim_{t \to \infty} \frac{3500}{t + 1} = 3500 \). The steady state exists. The steady state value is 3500.

2.5.66 \( \lim_{t \to \infty} m(t) = \lim_{t \to \infty} 200(1 - 2^{-t}) = 200 \). The steady state exists. The steady state value is 200.

2.5.67 \( \lim_{t \to \infty} v(t) = \lim_{t \to \infty} 1000e^{0.065t} = \infty \). The steady state does not exist.

2.5.68 \( \lim_{t \to \infty} p(t) = \lim_{t \to \infty} \frac{1500}{3 + 2e^{-1t}} = \frac{1500}{3} = 500 \). The steady state exists. The steady state value is 500.

2.5.69 \( \lim_{t \to \infty} a(t) = \lim_{t \to \infty} 2 \left( \frac{t + \sin t}{t} \right) = \lim_{t \to \infty} 2 \left( 1 + \frac{\sin t}{t} \right) = 2 \). The steady state exists. The steady state value is 2.

2.5.70 \( \lim_{n \to \infty} f(n) = \lim_{n \to \infty} \frac{4}{n} = 0 \).

2.5.71 \( \lim_{n \to \infty} f(n) = \lim_{n \to \infty} \frac{n - 1}{n} = \lim_{n \to \infty} [1 - (1/n)] = 1 \).

2.5.72 \( \lim_{n \to \infty} f(n) = \lim_{n \to \infty} \frac{n^2}{n + 1} = \lim_{n \to \infty} \frac{n}{1 + 1/n} = \infty \), so the limit does not exist.

2.5.73 \( \lim_{n \to \infty} f(n) = \lim_{n \to \infty} \frac{n + 1}{n^2} = \lim_{n \to \infty} \left[ 1/n + 1/n^2 \right] = 0 \).

2.5.74

a. Suppose \( m \geq n \).

\[
\lim_{x \to \pm \infty} f(x) = \lim_{x \to \pm \infty} \frac{p(x)}{q(x)} \cdot \frac{1/x^n}{1/x^n} = \lim_{x \to \pm \infty} \frac{a_n + a_{n-1}/x + \cdots + a_1/x^{n-1} + a_0/x^n}{b_n + b_{n-1}/x + \cdots + b_1/x^{n-1} + b_0/x^n} = \frac{a_n}{b_n}.
\]

b. Suppose \( m < n \).

\[
\lim_{x \to \pm \infty} f(x) = \lim_{x \to \pm \infty} \frac{p(x)}{q(x)} \cdot \frac{1/x^n}{1/x^n} = \lim_{x \to \pm \infty} \frac{a_n/x^{n-m} + a_{n-1}/x^{n-m+1} + \cdots + a_1/x^{n-1} + a_0/x^n}{b_n + b_{n-1}/x + \cdots + b_1/x^{n-1} + b_0/x^n} = 0 = \frac{0}{b_n}.
\]

2.5.75 \( \lim_{x \to \infty} \frac{2e^x + 3e^{2x}}{e^{2x} + e^{3x}} = \lim_{x \to \infty} \frac{2e^x + 3e^{2x}}{e^{2x} + e^{3x}} \cdot \frac{1/e^{2x}}{1/e^{2x}} = \lim_{x \to \infty} \frac{2/e^x + 3/e^x}{1} = \frac{0 + 0}{0 + 1} = 0 \). Thus the line \( y = 0 \) is a horizontal asymptote.

\[
\lim_{x \to -\infty} \frac{2e^x + 3e^{2x}}{e^{2x} + e^{3x}} = \lim_{x \to -\infty} \frac{2e^x + 3e^{2x}}{e^{2x} + e^{3x}} \cdot \frac{1/e^{2x}}{1/e^{2x}} = \lim_{x \to -\infty} \frac{2e^{-x} + 3}{1 + e^x} = \infty.
\]
2.5.76 \[ \lim_{x \to \infty} \frac{3e^x + e^{-x}}{e^x + e^{-x}} = \lim_{x \to \infty} \frac{3e^x + e^{-x}}{e^x + e^{-x}} \cdot \frac{1/e^x}{1/e^x} = \lim_{x \to \infty} \frac{3 + e^{-2x}}{1 + e^{-2x}} = \frac{3 + 0}{1 + 0} = 3. \] Thus the line \( y = 3 \) is a horizontal asymptote.

\[ \lim_{x \to -\infty} \frac{3e^x + e^{-x}}{e^x + e^{-x}} = \lim_{x \to -\infty} \frac{3e^x + e^{-x}}{e^x + e^{-x}} \cdot \frac{e^x}{e^x} = \lim_{x \to -\infty} \frac{3e^{2x} + 1}{e^{2x} + 1} = \frac{0 + 1}{0 + 1} = 1. \] Thus the line \( y = 1 \) is a horizontal asymptote.

2.5.77 The numerator of \( f \) is defined for \(-3 < x < 3\). The denominator is defined everywhere, but is zero when \( 2e^x = e^{-x} \). Simplifying gives \( 2e^{2x} = 1 \), or \( e^{2x} = \frac{1}{2} \). This has the solution \( x = -\frac{1}{2} \ln 2 \approx -0.347 \), which lies in the domain of the numerator. So the domain of \( f \) is \( \{ x : -3 < x < 3, x \neq -\frac{1}{2} \ln 2 \} \).

Now, as \( x \to 3^- \) or as \( x \to 3^+ \), the numerator approaches \(-\infty\), since \( \lim_{t \to 0^+} \ln t = -\infty \). At those points, the denominator remains nonzero, so that there are vertical asymptotes at \( x = \pm 3 \). As \( x \to -\frac{1}{2} \ln 2 \), the numerator is nonzero since \( 9 - \left(-\frac{1}{2} \ln 2\right)^2 \neq 1 \), while the denominator approaches zero, so that there is a vertical asymptote at \( x = -\frac{1}{2} \ln 2 \). (Note that for all these asymptotes, we could analyze the situation further to figure out whether each one-sided limit is \( \infty \) or \(-\infty \), but this is not necessary here). A graph of the function, with the asymptotes above in gray, verifies the above analysis:

2.6 Continuity

2.6.1

a. \( a(t) \) is a continuous function during the time period from when she jumps from the plane and when she touches down on the ground, because her position is changing continuously with time.

b. \( n(t) \) is not a continuous function of time. The function “jumps” at the times when a quarter must be added.

c. \( T(t) \) is a continuous function, because temperature varies continuously with time.
d. \( p(t) \) is not continuous – it jumps by whole numbers when a player scores points.

**2.6.2** In order for \( f \) to be continuous at \( x = a \), the following conditions must hold:

- \( f \) must be defined at \( a \) (i.e. \( a \) must be in the domain of \( f \)),
- \( \lim_{x \to a^{-}} f(x) \) must exist, and
- \( \lim_{x \to a^{+}} f(x) \) must equal \( f(a) \).

**2.6.3** A function \( f \) is continuous on an interval \( I \) if it is continuous at all points in the interior of \( I \), and it must be continuous from the right at the left endpoint (if the left endpoint is included in \( I \)) and it must be continuous from the left at the right endpoint (if the right endpoint is included in \( I \)).

**2.6.4** The words “hole” and “break” are not mathematically precise, so a strict mathematical definition cannot be based on them.

**2.6.5**

a. A function \( f \) is continuous from the left at \( x = a \) if \( a \) is in the domain of \( f \), and \( \lim_{x \to a^{-}} f(x) = f(a) \).

b. A function \( f \) is continuous from the right at \( x = a \) if \( a \) is in the domain of \( f \), and \( \lim_{x \to a^{+}} f(x) = f(a) \).

**2.6.6** A rational function is discontinuous at each point not in its domain.

**2.6.7** The domain of \( f(x) = \frac{x^5}{x^2} \) is \((-\infty, 0) \cup (0, \infty) \), and \( f \) is continuous everywhere on this domain.

**2.6.8** The Intermediate Value Theorem says that if \( f \) is continuous on \([a, b]\) and if \( f(a) < L < f(b) \), then there must be a domain value \( c \in (a, b) \) with \( f(c) = L \). This means that a continuous function assumes all the intermediate values between the values at the endpoints of an interval.

**2.6.9** \( f \) is discontinuous at \( x = 1 \), at \( x = 2 \), and at \( x = 3 \). Since \( f(1) \) does not exist, the first condition is violated at \( x = 1 \). At \( x = 2 \), \( f(2) \) exists and \( \lim_{x \to 2} f(x) \) exists, but \( \lim_{x \to 2} f(x) \neq f(2) \) so that condition 3 is violated. At \( x = 3 \), \( \lim_{x \to 3} f(x) \) does not exist, so condition 2 is violated.

**2.6.10** \( f \) is discontinuous at \( x = 1 \), at \( x = 2 \), and at \( x = 3 \). At \( x = 1 \), \( \lim_{x \to 1} f(x) \neq f(1) \) (so condition 3 is violated). At \( x = 2 \), \( \lim_{x \to 2} f(x) \) does not exist (so condition 2 is violated). Finally, \( f(3) \) does not exist (so condition 1 is violated at \( x = 3 \)).

**2.6.11** \( f \) is discontinuous at \( x = 1 \), at \( x = 2 \), and at \( x = 3 \). At \( x = 1 \), \( \lim_{x \to 1} f(x) \) does not exist, and \( f \) does not exist (so conditions 1 and 2 are violated). At \( x = 2 \), \( \lim_{x \to 2} f(x) \) does not exist (so condition 2 is violated). Finally, \( f(3) \) does not exist (so condition 1 is violated at \( x = 3 \)).

**2.6.12** \( f \) is discontinuous at \( x = 2 \), at \( x = 3 \), and at \( x = 4 \). At \( x = 2 \), \( \lim_{x \to 2} f(x) \) does not exist (so condition 2 is violated). Since \( f(3) \) does not exist and \( \lim_{x \to 3} f(x) \) does not exist, conditions 1 and 2 are violated at \( x = 3 \). At \( x = 4 \), \( \lim_{x \to 4} f(x) \neq f(4) \) (so condition 3 is violated).

**2.6.13** The function is defined at \( 5 \), in fact \( f(5) = \frac{50 + 15 + 1}{25 + 25} = \frac{66}{50} = \frac{33}{25} \). Also, \( \lim_{x \to 5} f(x) = \lim_{x \to 5} \frac{2x^2 + 3x + 1}{x^2 + 5x} = \frac{33}{25} = f(5) \). The function is continuous at \( a = 5 \) since all three items on the continuity checklist are satisfied.

**2.6.14** The number \(-5\) is not in the domain of \( f \), because the denominator is equal to 0 when \( x = -5 \). Thus, the function is not continuous at \(-5\) since item 1 on the continuity checklist fails.

**2.6.15** \( f \) is discontinuous at \( 1 \), because \( 1 \) is not in the domain of \( f \) (item 1 on the continuity checklist).
2.6.16 \( g \) is discontinuous at 3 because 3 is not in the domain of \( g \) (item 1 on the continuity checklist).

2.6.17 \( f \) is discontinuous at 1, because \( \lim_{x \to 1} f(x) \neq f(1) \). In fact, \( f(1) = 3 \), but \( \lim_{x \to 1} f(x) = 2 \) (items 1 and 2 on the continuity checklist are satisfied, but item 3 fails).

2.6.18 \( f \) is continuous at 3, because \( \lim_{x \to 3} f(x) = f(3) \). In fact, \( f(3) = 2 \) and \( \lim_{x \to 3} f(x) = \lim_{x \to 3} \frac{(x-3)(x-1)}{x-3} = \lim_{x \to 3} (x-1) = 2 \), so all three items on the continuity checklist are satisfied.

2.6.19 \( f \) is discontinuous at 4, because 4 is not in the domain of \( f \) (item 1 on the continuity checklist).

2.6.20 \( f \) is discontinuous at -1 because \( \lim_{x \to -1} f(x) = \lim_{x \to -1} \frac{x(x+1)}{x+1} = \lim_{x \to -1} x = -1 \neq f(-1) = 2 \). So items 1 and 2 on the continuity checklist are satisfied, but item 3 fails.

2.6.21 Because \( f \) is a polynomial, it is continuous on all of \( \mathbb{R} \) (Theorem 2.10(a)).

2.6.22 Because \( g \) is a rational function, it is continuous on its domain, which is all of \( \mathbb{R} \) since \( x^2 + x + 1 \) has no real roots. (Theorem 2.10(b)).

2.6.23 Because \( f \) is a rational function, it is continuous on its domain. Its domain is \( \{ x : x \neq \pm 3 \} \), since the denominator vanishes at \( x = \pm 3 \) (Theorem 2.10(b)).

2.6.24 Because \( s \) is a rational function, it is continuous on its domain. Its domain is \( \{ x : x \neq \pm 1 \} \) since \( x^2 - 1 \) vanishes at \( x = \pm 1 \) (Theorem 2.10(b)).

2.6.25 Because \( f \) is a rational function, it is continuous on its domain. Its domain is \( \{ x : x \neq \pm 2 \} \) since \( x^2 - 4 \) vanishes at \( x = \pm 2 \) (Theorem 2.10(b)).

2.6.26 Because \( f \) is a rational function, it is continuous on its domain. Its domain is \( \{ t : t \neq \pm 2 \} \) since \( t^2 - 4 \) vanishes at \( t = \pm 2 \) (Theorem 2.10(b)).

2.6.27 Because \( f(x) = (x^8 - 3x^6 - 1)^{40} \) is a polynomial, it is continuous everywhere, including at 0. Thus \( \lim_{x \to 0} f(x) = f(0) = (-1)^{40} = 1 \).

2.6.28 Because \( f(x) = \left( \frac{3}{x^2 - 4x - 30} \right)^4 \) is a rational function, it is continuous at all points in its domain, including at \( x = 2 \). So \( \lim_{x \to 2} f(x) = f(2) = \frac{81}{16} \).

2.6.29 Because \( f(x) = \left( \frac{x+5}{x+2} \right)^4 \) is a rational function, it is continuous at all points in its domain, including at \( x = 1 \). Thus \( \lim_{x \to 1} f(x) = f(1) = 16 \).

2.6.30 \( \lim_{x \to \infty} \left( \frac{2x+1}{x} \right)^3 = \lim_{x \to \infty} \left( 2 + \frac{1}{x} \right)^3 = 2^3 = 8 \).

2.6.31 Since \( x^3 - 2x^2 - 8x = x(x^2 - 2x - 8) = x(x-4)(x+2) \), as long as \( x \neq 4 \), we have
\[
\sqrt{\frac{x^3 - 2x^2 - 8x}{x-4}} = \sqrt{\frac{x(x-4)(x+2)}{x-4}} = \sqrt{x(x+2)}.
\]
Taking limits as \( x \to 4 \), we may assume \( x \neq 4 \). Then
\[
\lim_{x \to 4} \frac{x^3 - 2x^2 - 8x}{x-4} = \lim_{x \to 4} x(x+2) = 4 \cdot 6 = 24
\]
Finally, by part 2 of Theorem 2.12, with \( f(x) = \sqrt{x} \) and \( g(x) = \frac{x^3 - 2x^2 - 8x}{x-4} \), we see that
\[
\lim_{x \to 4} \sqrt{\frac{x^3 - 2x^2 - 8x}{x-4}} = \sqrt{24} = 2\sqrt{6}.
\]

Copyright © 2014 Pearson Education, Inc.
2.6.32 Since \( t - 4 = (\sqrt{t} - 2)(\sqrt{t} + 2) \), whenever \( t \neq 4 \) we have
\[
\frac{t - 4}{\sqrt{t} - 2} = \sqrt{t} + 2.
\]
Since we are taking limits as \( t \to 4 \), we may assume \( t \neq 4 \); then
\[
\lim_{t \to 4} \frac{t - 4}{\sqrt{t} - 2} = \lim_{t \to 4} \left( \sqrt{t} + 2 \right) = \sqrt{4} + 2 = 4.
\]
Now let \( f(x) = \tan x \) and \( g(t) = \frac{t - 4}{\sqrt{t} - 2} \). Part 2 of Theorem 12.2 gives us
\[
\lim_{t \to 4} \tan \left( \frac{t - 4}{\sqrt{t} - 2} \right) = \lim_{t \to 4} f(g(t)) = f \left( \lim_{t \to 4} g(t) \right) = f(4) = \tan 4.
\]
2.6.33 Let \( f(x) = \ln 2x \) and \( g(x) = \frac{\sin x}{x} \). Since \( \lim_{x \to 0} g(x) = 1 \), we have by Theorem 2.12, part 2, that
\[
\lim_{x \to 0} \ln \left( \frac{2\sin x}{x} \right) = \lim_{x \to 0} f(g(x)) = f \left( \lim_{x \to 0} g(x) \right) = f(1) = \ln 2.
\]
2.6.34 Let \( f(x) = x^{1/3} \), and
\[
g(x) = \frac{x}{\sqrt{16x + 1} - 1} = \frac{x}{\sqrt{16x + 1} + 1} \cdot \frac{\sqrt{16x + 1} + 1}{x (\sqrt{16x + 1} + 1)} = \frac{1}{16} \frac{16x}{\sqrt{16x + 1} + 1}.
\]
Then by part 2 of Theorem 2.12,
\[
\lim_{x \to 0} \left( \frac{x}{\sqrt{16x + 1} - 1} \right)^{1/3} = \lim_{x \to 0} f(g(x)) = f \left( \lim_{x \to 0} g(x) \right) = f \left( \frac{1}{16} (\sqrt{16x + 1} + 1) \right)^{1/3} = f \left( \frac{1}{16} (1) \right)^{1/3} = \frac{1}{2}.
\]
2.6.35 \( f \) is continuous on \([0, 1)\), on \((1, 2)\), on \((2, 3)\), and on \((3, 4)\).
2.6.36 \( f \) is continuous on \([0, 1)\), on \((1, 2)\), on \((2, 3)\), and on \((3, 4)\).
2.6.37 \( f \) is continuous on \([0, 1)\), on \((1, 2)\), on \([2, 3)\), and on \((3, 5)\).
2.6.38 \( f \) is continuous on \([0, 2)\), on \((2, 3)\), on \((3, 4)\), and on \((4, 5)\).
2.6.39 a. \( f \) is defined at 1. We have \( f(1) = 1^2 + 3(1) = 4 \). To see whether or not \( \lim_{x \to 1} f(x) \) exists, we investigate the two one-sided limits. \( \lim_{x \to 1^-} f(x) = \lim_{x \to 1^-} 2x = 2 \), and \( \lim_{x \to 1^+} f(x) = \lim_{x \to 1^+} (x^2 + 3x) = 4 \), so \( \lim_{x \to 1} f(x) \) does not exist. Thus \( f \) is discontinuous at \( x = 1 \).
b. $f$ is continuous from the right, because $\lim_{x \to 1^+} f(x) = 4 = f(1)$.

c. $f$ is continuous on $(-\infty, 1)$ and on $[1, \infty)$.

2.6.40

a. $f$ is defined at 0, in fact $f(0) = 1$. However, $\lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} (x^3 + 4x + 1) = 1$, while $\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} 2x^2 = 0$. So $\lim_{x \to 0} f(x)$ does not exist.

b. $f$ is continuous from the left at 0, because $\lim_{x \to 0^-} f(x) = f(0) = 1$.

c. $f$ is continuous on $(-\infty, 0]$ and on $[1, \infty)$.

2.6.41  $f$ is continuous on $(-\infty, -\sqrt{8}]$ and on $[\sqrt{8}, \infty)$.

2.6.42  $g$ is continuous on $(-\infty, -1]$ and on $[1, \infty)$.

2.6.43  Because $f$ is the composition of two functions which are continuous everywhere, it is continuous everywhere.

2.6.44  $f$ is continuous on $(-\infty, -1]$ and on $[1, \infty)$.

2.6.45  Because $f$ is the composition of two functions which are continuous everywhere, it is continuous everywhere.

2.6.46  $f$ is continuous on $[1, \infty)$.

2.6.47  $\lim_{x \to 2} \sqrt{\frac{4x+10}{2x-2}} = \sqrt{\frac{18}{2}} = 3$.

2.6.48  $\lim_{x \to -1} \left( x^2 - 4 + \sqrt[3]{x^2 - 9} \right) = (-1)^2 - 4 + \sqrt[3]{(-1)^2 - 9} = -3 + \sqrt[3]{-8} = -3 - 2 = -5$.

2.6.49  $\lim_{x \to 3} \sqrt{x^2 + 7} = \sqrt{9 + 7} = 4$.

2.6.50  $\lim_{t \to 2} \frac{t^2 + 5}{1 + \sqrt{t^2 + 5}} = \frac{9}{1 + \sqrt{9}} = \frac{9}{4}$.

2.6.51  $f(x) = \csc x$ isn’t defined at $x = k\pi$ where $k$ is an integer, so it isn’t continuous at those points. So it is continuous on intervals of the form $(k\pi, (k+1)\pi)$ where $k$ is an integer. $\lim_{x \to \pi/4} \csc x = \sqrt{2}$. $\lim_{x \to 2\pi^-} \csc x = -\infty$.

2.6.52  $f$ is defined on $[0, \infty)$, and it is continuous there, because it is the composition of continuous functions defined on that interval. $\lim_{x \to 1} f(x) = e^2$. $\lim_{x \to 0} f(x)$ does not exist — but $\lim_{x \to 0^+} f(x) = e^0 = 1$, because $f$ is continuous from the right.

2.6.53  $f$ isn’t defined for any number of the form $\frac{n\pi}{2} + k\pi$ where $k$ is an integer, so it isn’t continuous there. It is continuous on intervals of the form $(\frac{n\pi}{2} + k\pi, \frac{n\pi}{2} + (k + 1)\pi)$, where $k$ is an integer.

$$\lim_{x \to \pi/2^-} f(x) = \infty, \quad \lim_{x \to 4\pi/3} f(x) = \frac{1 - \sqrt[3]{\frac{3}{2}}}{-1/2} = \sqrt{3} - 2.$$  

2.6.54  The domain of $f$ is $(0, 1]$, and $f$ is continuous on this interval because it is the quotient of two continuous functions and the function in the denominator isn’t zero on that interval. $\lim_{x \to 1^-} f(x) = \lim_{x \to 1^-} \frac{\ln x}{\sin^{-1} x} = \frac{\ln 1}{\sin^{-1} 1} = \frac{0}{\pi/2} = 0$.

Copyright © 2014 Pearson Education, Inc.
2.6.55 Since the denominator vanishes at $x = 0$, the domain of $f$ is \{ $x : x \neq 0$ \}. The function is continuous on its domain.

$$\lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} \frac{e^x}{1 - e^x} = \infty,$$

while

$$\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} \frac{e^x}{1 - e^x} = -\infty.$$

2.6.56 Since the denominator vanishes at $x = 0$, the domain of $f$ is \{ $x : x \neq 0$ \}. The function is continuous on its domain.

$$\lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} \frac{e^{2x} - 1}{e^x - 1} = \lim_{x \to 0} \frac{(e^x + 1)(e^x - 1)}{e^x - 1} = \lim_{x \to 0} (e^x + 1) = 2.$$

2.6.57

a. Because $A$ is a continuous function of $r$ on $[0, 0.08]$, and because $A(0) = 5000$ and $A(0.08) \approx 11098.2$, (and 7000 is an intermediate value between these two numbers) the Intermediate Value Theorem guarantees a value of $r$ between 0 and 0.08 where $A(r) = 7000$.

b.

Solving $5000 \left(1 + \frac{r}{12}\right)^{120} = 7000$ for $r$, we see that \( \left(1 + \frac{r}{12}\right)^{120} = \frac{7}{5} \), so $1 + \frac{r}{12} = \sqrt[120]{\frac{7}{5}}$, so

\[ r = 12 \left( \sqrt[120]{\frac{7}{5}} - 1 \right) \approx 0.0337. \]

2.6.58

a. Because $m$ is a continuous function of $r$ on $[0.06, 0.08]$, and because $m(0.06) \approx 899.33$ and $m(0.08) \approx 1100.65$, (and 1000 is an intermediate value between these two numbers) the Intermediate Value Theorem guarantees a value of $r$ between 0.06 and 0.08 where $m(r) = 1000$.

b.

Using a computer algebra system, we see that the required interest rate is about 0.0702.

2.6.59

a. Note that $f(x) = 2x^3 + x - 2$ is continuous everywhere, so in particular it is continuous on $[-1, 1]$. Note that $f(-1) = -5 < 0$ and $f(1) = 1 > 0$. Because 0 is an intermediate value between $f(-1)$ and $f(1)$, the Intermediate Value Theorem guarantees a number $c$ between $-1$ and 1 where $f(c) = 0$. 

Copyright © 2014 Pearson Education, Inc.
Using a graphing calculator and a computer algebra system, we see that the root of \( f \) is about 0.835.

### 2.6.60

a. Note that \( f(x) = \sqrt{x^4 + 25x^3 + 10} - 5 \) is continuous on its domain, so in particular it is continuous on \([0, 1]\). Note that \( f(0) = \sqrt{10} - 5 < 0 \) and \( f(1) = 6 - 5 = 1 > 0 \). Because 0 is an intermediate value between \( f(0) \) and \( f(1) \), the Intermediate Value Theorem guarantees a number \( c \) between 0 and 1 where \( f(c) = 0 \).

b. Using a graphing calculator and a computer algebra system, we see the root of \( f(x) \) is at about 0.834.

c. **Graph**

### 2.6.61

a. Note that \( f(x) = x^3 - 5x^2 + 2x \) is continuous everywhere, so in particular it is continuous on \([-1, 5]\). Note that \( f(-1) = -8 < -1 \) and \( f(5) = 10 > -1 \). Because -1 is an intermediate value between \( f(-1) \) and \( f(5) \), the Intermediate Value Theorem guarantees a number \( c \) between -1 and 5 where \( f(c) = -1 \).

b. Using a graphing calculator and a computer algebra system, we see that there are actually three different values of \( c \) between -1 and 5 for which \( f(c) = -1 \). They are \( c \approx -0.285 \), \( c \approx 0.778 \), and \( c \approx 4.507 \).

c. **Graph**

### 2.6.62

a. Note that \( f(x) = -x^5 - 4x^2 + 2\sqrt{x} + 5 \) is continuous on its domain, so in particular it is continuous on \([0, 3]\). Note that \( f(0) = 5 > 0 \) and \( f(3) \approx -270.5 < 0 \). Because 0 is an intermediate value between \( f(0) \) and \( f(3) \), the Intermediate Value Theorem guarantees a number \( c \) between 0 and 3 where \( f(c) = 0 \).

Copyright © 2014 Pearson Education, Inc.
b.

Using a graphing calculator and a computer algebra system, we see that the value of $c$ guaranteed by the theorem is about 1.141.

2.6.63

a. Note that $f(x) = e^x + x$ is continuous on its domain, so in particular it is continuous on $[-1, 0]$. Note that $f(-1) = \frac{1}{e} - 1 < 0$ and $f(0) = 1 > 0$. Because 0 is an intermediate value between $f(-1)$ and $f(0)$, the Intermediate Value Theorem guarantees a number $c$ between $-1$ and 0 where $f(c) = 0$.

b.

Using a graphing calculator and a computer algebra system, we see that the value of $c$ guaranteed by the theorem is about $-0.567$.

c.

2.6.64

a. Note that $f(x) = x \ln x - 1$ is continuous on its domain, so in particular it is continuous on $[1, e]$. Note that $f(1) = \ln 1 - 1 = -1 < 0$ and $f(e) = e - 1 > 0$. Because 0 is an intermediate value between $f(1)$ and $f(e)$, the Intermediate Value Theorem guarantees a number $c$ between 1 and $e$ where $f(c) = 0$.

b.

Using a graphing calculator and a computer algebra system, we see that the value of $c$ guaranteed by the theorem is about 1.763.

c.

2.6.65

a. True. If $f$ is right continuous at $a$, then $f(a)$ exists and the limit from the right at $a$ exists and is equal to $f(a)$. Because it is left continuous, the limit from the left exists — so we now know that the limit as $x \to a$ of $f(x)$ exists, because the two one-sided limits are both equal to $f(a)$.

b. True. If $\lim_{x \to a} f(x) = f(a)$, then $\lim_{x \to a^+} f(x) = f(a)$ and $\lim_{x \to a^-} f(x) = f(a)$.

c. False. The statement would be true if $f$ were continuous. However, if $f$ isn’t continuous, then the statement doesn’t hold. For example, suppose that $f(x) = \begin{cases} 0 & \text{if } 0 \leq x < 1; \\ 1 & \text{if } 1 \leq x \leq 2, \end{cases}$ Note that $f(0) = 0$ and $f(2) = 1$, but there is no number $c$ between 0 and 2 where $f(c) = \frac{1}{2}$. 

Copyright © 2014 Pearson Education, Inc.
d. False. Consider \( f(x) = x^2 \) and \( a = -1 \) and \( b = 1 \). Then \( f \) is continuous on \([a, b]\), but \( \frac{f(1) + f(-1)}{2} = 1 \), and there is no \( c \) on \((a, b)\) with \( f(c) = 1 \).

2.6.66 Let \( f(x) = |x| \). For values of \( a \) other than 0, it is clear that \( \lim_{x \to a} |x| = |a| \) because \( f \) is defined to be either the polynomial \( x \) (for values greater than 0) or the polynomial \(-x\) (for values less than 0). For the value of \( a = 0 \), we have \( \lim_{x \to 0^+} f(x) = \lim_{x \to 0} x = 0 = f(0) \). Also, \( \lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} (-x) = 0 = 0. \) Thus \( \lim_{x \to 0} f(x) = f(0) \), so \( f \) is continuous at 0.

2.6.67 Because \( f(x) = x^3 + 3x - 18 \) is a polynomial, it is continuous on \((-\infty, \infty)\), and because the absolute value function is continuous everywhere, \(|f(x)|\) is continuous everywhere.

2.6.68 Let \( f(x) = \frac{x + 4}{x^2 - 4} \). Then the denominator vanishes at \( x = \pm 2 \), so the domain of \( f \) is \( \{x : x \neq \pm 2\} \) and \( f \) is continuous on its domain. Thus \( g(x) = |f(x)| \) is also continuous on this set.

2.6.69 Let \( f(x) = \frac{1}{\sqrt{x - 4}} \). Then the denominator vanishes at \( x = 16 \) and is defined for \( x \geq 0 \), so the domain of \( f \) is \( \{x : x > 0, x \neq 16\} \) and \( f \) is continuous on its domain. So \( h(x) = |f(x)| \) is continuous on this set as well.

2.6.70 Because \( x^2 + 2x + 5 \) is a polynomial, it is continuous everywhere, as is \( |x^2 + 2x + 5| \). So \( h(x) = |x^2 + 2x + 5| + \sqrt{x} \) is continuous on its domain, namely \([0, \infty)\).

2.6.71 \[ \lim_{x \to \pi} \frac{\cos^2 x + 3 \cos x + 2}{\cos x + 1} = \lim_{x \to \pi} \frac{(\cos x + 1)(\cos x + 2)}{\cos x + 1} = \lim_{x \to \pi} (\cos x + 2) = 1. \]

2.6.72 \[ \lim_{x \to \pi/2} \frac{\sin^2 x + 6 \sin x + 5}{\sin^2 x - 1} = \lim_{x \to \pi/2} \frac{(\sin x + 5)(\sin x + 1)}{(\sin x - 1)(\sin x + 1)} = \lim_{x \to \pi/2} \frac{\sin x + 5}{\sin x - 1} = \frac{4}{-2} = -2. \]

2.6.73 \[ \lim_{x \to \pi/2} \frac{\sin x - 1}{\sqrt{\sin x - 1}} = \lim_{x \to \pi/2} (\sqrt{\sin x + 1}) = 2. \]

2.6.74 \[ \lim_{\theta \to 0} \frac{\tan \theta - \frac{1}{2} \theta}{\sin \theta} = \frac{(2)(2 + \sin \theta) - (2)(2 + \sin \theta)}{(2)(2 + \sin \theta)} = \lim_{\theta \to 0} \frac{2 - (2 + \sin \theta)}{2(2 + \sin \theta)} = \lim_{\theta \to 0} \frac{-1}{2(2 + \sin \theta)} = -\frac{1}{4}. \]

2.6.75 \[ \lim_{x \to 0} \frac{\cos x - 1}{\sin^2 x} = \lim_{x \to 0} \frac{\cos x - 1}{1 - \cos^2 x} = \lim_{x \to 0} \frac{\cos x - 1}{\sin x(1 + \cos x)} = \lim_{x \to 0} \frac{-1}{1 + \cos x} = -\frac{1}{2}. \]

2.6.76 \[ \lim_{x \to 0^+} \frac{1 - \cos^2 x}{\sin x} = \lim_{x \to 0^+} \frac{\sin^2 x}{\sin x} = \lim_{x \to 0^+} \sin x = 0. \]

2.6.77 Recall that \(-\frac{\pi}{2} \leq \tan^{-1} x \leq \frac{\pi}{2}\). Thus for \( x > 0 \), \(-\frac{\pi}{2} \leq \frac{\tan^{-1} x}{x} \leq \frac{\pi}{2} \). Thus \( \lim_{x \to \infty} \frac{\tan^{-1}(x)}{x} = 0 \) by the Squeeze Theorem.

2.6.78 Recall that \(-1 \leq \cos t \leq 1\), and that \( e^{3t} > 0 \) for all \( t \). Thus \(-\frac{1}{e^{3\pi}} \leq \frac{\cos t}{e^{3t}} \leq \frac{1}{e^{3\pi}} \). Thus \( \lim_{t \to \infty} \frac{\cos t}{e^{3t}} = 0 \) by the Squeeze Theorem.

2.6.79 \[ \lim_{x \to 1^-} \frac{x}{\ln x} = -\infty. \]

2.6.80 \[ \lim_{x \to 0^+} \frac{x}{\ln x} = 0. \]
2.6.81

The graph shown isn’t drawn correctly at the integers. At an integer $a$, the value of the function is 0, whereas the graph shown appears to take on all the values from 0 to 1. Note that in the correct graph, $\lim_{x \to a^-} f(x) = 1$ and $\lim_{x \to a^+} f(x) = 0$ for every integer $a$.

2.6.82

The graph as drawn on most graphing calculators appears to be continuous at $x = 0$, but it isn’t, of course (because the function isn’t defined at $x = 0$). A better drawing would show the “hole” in the graph at $(0, 1)$.

c. It appears that $\lim_{x \to 0} \frac{\sin x}{x} = 1$.

2.6.83 With slight modifications, we can use the examples from the previous two problems.

a. The function $y = x - \lfloor x \rfloor$ is defined at $x = 1$ but isn’t continuous there.

b. The function $y = \frac{\sin(x-1)}{x-1}$ has a limit at $x = 1$, but isn’t defined there, so isn’t continuous there.
2.6.84 In order for this function to be continuous at \( x = -1 \), we require \( \lim_{x \to -1} f(x) = f(-1) = a \). So the value of \( a \) must be equal to the value of \( \lim_{x \to -1} \frac{x^2 + 3x + 2}{x + 1} = \lim_{x \to -1} \frac{(x + 2)(x + 1)}{x + 1} = \lim_{x \to -1} (x + 2) = 1 \). Thus we must have \( a = 1 \).

2.6.85 a. In order for \( g \) to be continuous from the left at \( x = 1 \), we must have \( \lim_{x \to 1^-} g(x) = g(1) = a \). We have \( \lim_{x \to 1^-} g(x) = \lim_{x \to 1^-} (x^2 + x) = 2 \). So we must have \( a = 2 \).

b. In order for \( g \) to be continuous from the right at \( x = 1 \), we must have \( \lim_{x \to 1^+} g(x) = g(1) = a \). We have \( \lim_{x \to 1^+} g(x) = \lim_{x \to 1^+} (3x + 5) = 8 \). So we must have \( a = 8 \).

c. Because the limit from the left and the limit from the right at \( x = 1 \) don’t agree, there is no value of \( a \) which will make the function continuous at \( x = 1 \).

2.6.86 \( \lim_{x \to 0^-} \frac{2e^x + 5e^{3x}}{e^{2x} - e^{3x}} = \lim_{x \to 0^-} \frac{2e^x + 5e^{3x}}{e^{2x}(1 - e^x)} = \infty. \)

\( \lim_{x \to 0^+} \frac{2e^x + 5e^{3x}}{e^{2x} - e^{3x}} = \lim_{x \to 0^+} \frac{2e^x + 5e^{3x}}{e^{2x}(1 - e^x)} = -\infty. \)

\( \lim_{x \to -\infty} \frac{2e^x + 5e^{3x}}{e^{2x} - e^{3x}} = \lim_{x \to -\infty} \frac{2e^x + 5e^{3x}}{e^{2x} - e^{3x}} = e^{-2x} = \lim_{x \to -\infty} \frac{2e^x + 5e^x}{1 - e^x} = \infty. \)

\( \lim_{x \to -\infty} \frac{2e^x + 5e^{3x}}{e^{2x} - e^{3x}} = \lim_{x \to -\infty} \frac{2e^x + 5e^{3x}}{e^{2x} - e^{3x}} \cdot \frac{e^{-3x}}{e^{-3x}} = \lim_{x \to -\infty} \frac{2e^{-2x} + 5}{e^{-x} - 1} = -5. \)

There is a vertical asymptote at \( x = 0 \), and the line \( y = -5 \) is a horizontal asymptote.

2.6.87 \( \lim_{x \to -\infty} \frac{2e^x + 10e^{-x}}{e^x + e^{-x}} = \frac{12}{2} = 6. \)

\( \lim_{x \to -\infty} \frac{2e^x + 10e^{-x}}{e^x + e^{-x}} = \lim_{x \to -\infty} \frac{2e^x + 10e^{-x}}{e^x + e^{-x}} \cdot e^x = \lim_{x \to -\infty} \frac{2e^{2x} + 10}{e^{2x} + 1} = \frac{10}{1} = 10. \)

\( \lim_{x \to -\infty} \frac{2e^x + 10e^{-x}}{e^x + e^{-x}} = \lim_{x \to -\infty} \frac{2e^x + 10e^{-x}}{e^x + e^{-x}} \cdot e^{-x} = \lim_{x \to -\infty} \frac{2 + 10e^{-x}}{1 + e^{-x}} = \frac{2}{1} = 2. \)

There are no vertical asymptotes. The lines \( y = 2 \) and \( y = 10 \) are horizontal asymptotes.

2.6.88 Let \( f(x) = x^3 + 10x^2 - 100x + 50 \). Note that \( f(-20) < 0 \), \( f(-5) > 0 \), \( f(5) < 0 \), and \( f(10) > 0 \). Because the given polynomial is continuous everywhere, the Intermediate Value Theorem guarantees us a root on \((-20, -5)\), at least one on \((-5, 5)\), and at least one on \((5, 10)\). Because there can be at most 3 roots and there are at least 3 roots, there must be exactly 3 roots. The roots are \( x_1 \approx -16.32 \), \( x_2 \approx 0.53 \) and \( x_3 \approx 5.79 \).
2.6.89 Let \( f(x) = 70x^3 - 87x^2 + 32x - 3 \). Note that \( f(0) < 0 \), \( f(0.2) > 0 \), \( f(0.55) < 0 \), and \( f(1) > 0 \). Because the given polynomial is continuous everywhere, the Intermediate Value Theorem guarantees us a root on \((0, 0.2)\), at least one on \((0.2, 0.55)\), and at least one on \((0.55, 1)\). Because there can be at most 3 roots and there are at least 3 roots, there must be exactly 3 roots. The roots are \( x_1 = \frac{1}{2} \), \( x_2 = \frac{1}{2} \) and \( x_3 = \frac{3}{5} \).

2.6.90 The function is continuous on \((0, 15]\), on \((15, 30]\), on \((30, 45]\), and on \((45, 60]\).

2.6.91
a. Note that \( A(0.01) \approx 2615.55 \) and \( A(0.1) \approx 3984.36 \). By the Intermediate Value Theorem, there must be a number \( r_0 \) between 0.01 and 0.1 so that \( A(r_0) = 3500 \).

b. The desired value is \( r_0 \approx 0.0728 \), or 7.28%.

2.6.92
a. We have \( f(0) = 0 \), \( f(2) = 3 \), \( g(0) = 3 \) and \( g(2) = 0 \).

b. \( h(t) = f(t) - g(t) \), \( h(0) = -3 \) and \( h(2) = 3 \).

c. By the Intermediate Value Theorem, because \( h \) is a continuous function and 0 is an intermediate value between \(-3 \) and 3, there must be a time \( c \) between 0 and 2 where \( h(c) = 0 \). At this point \( f(c) = g(c) \), and at that time, the distance from the car is the same on both days, so the hiker is passing over the exact same point at that time.

2.6.93 We can argue essentially like the previous problem, or we can imagine an identical twin to the original monk, who takes an identical version of the original monk’s journey up the winding path while the monk is taking the return journey down. Because they must pass somewhere on the path, that point is the one we are looking for.

2.6.94
a. Because \(|-1| = 1\), \(|g(x)| = 1\), for all \( x \).

b. The function \( g \) isn’t continuous at \( x = 0 \), because \( \lim_{x \to 0^+} g(x) = 1 \neq -1 = \lim_{x \to 0^-} g(x) \).

c. This constant function is continuous everywhere, in particular at \( x = 0 \).

d. This example shows that in general, the continuity of \( |g| \) does not imply the continuity of \( g \).

2.6.95 The discontinuity is not removable, because \( \lim_{x \to 0} f(x) \) does not exist. The discontinuity pictured is a jump discontinuity.

2.6.96 The discontinuity is not removable, because \( \lim_{x \to a} f(x) \) does not exist. The discontinuity pictured is an infinite discontinuity.

2.6.97 Note that \( \lim_{x \to 2} \frac{x^2 - 7x + 10}{x - 2} = \lim_{x \to 2} \frac{(x - 2)(x - 5)}{x - 2} = \lim_{x \to 2} (x - 5) = -3 \). Because this limit exists, the discontinuity is removable.

2.6.98 Note that \( \lim_{x \to 1} \frac{x^2 - 1}{1 - x} = \lim_{x \to 1} \frac{(x - 1)(x + 1)}{1 - x} = \lim_{x \to 1} |-(x + 1)| = -2 \). Because this limit exists, the discontinuity is removable.

2.6.99
a. Note that \(-1 \leq \sin \frac{x}{x} \leq 1 \) for all \( x \neq 0 \), so \(-x \leq x \sin \frac{1}{x} \leq x \) (for \( x > 0 \)). For \( x < 0 \) we would have \( x \leq x \sin \frac{1}{x} \leq -x \). Because both \( x \to 0 \) and \(-x \to 0 \) as \( x \to 0 \), the Squeeze Theorem tells us that \( \lim_{x \to 0} x \sin \frac{1}{x} = 0 \) as well. Because this limit exists, the discontinuity is removable.

b. Note that as \( x \to 0^+ \), \( \frac{1}{x} \to \infty \), and thus \( \lim_{x \to 0^+} \sin \frac{1}{x} \) does not exist. So the discontinuity is not removable.
2.6.100 This is a jump discontinuity, because \( \lim_{x \to 2^+} f(x) = 1 \) and \( \lim_{x \to 2^-} f(x) = -1 \).

2.6.101 Note that \( h(x) = \frac{x^3 - 4x^2 + 4x}{x(x - 1)} = \frac{x(x-2)^2}{x(x-1)} \). Thus \( \lim_{x \to 1} h(x) = -4 \), and the discontinuity at \( x = 0 \) is removable. However, \( \lim_{x \to 1} h(x) \) does not exist, and the discontinuity at \( x = 1 \) is not removable (it is infinite).

2.6.102 Because \( g \) is continuous at \( a \), as \( x \to a \), \( g(x) \to g(a) \). Because \( f \) is continuous at \( g(a) \), as \( z \to g(a) \), \( f(z) \to f(g(a)) \). Let \( z = g(x) \), and suppose \( x \to a \). Then \( g(x) = z \to g(a) \), so \( f(z) = f(g(x)) \to f(g(a)) \), as desired.

2.6.103
a. Consider \( g(x) = x + 1 \) and \( f(x) = \frac{|x-1|}{x-1} \). Note that both \( g \) and \( f \) are continuous at \( x = 0 \). However \( f(g(x)) = f(x+1) = \frac{|x|}{2} \) is not continuous at 0.

b. The previous theorem says that the composition of \( f \) and \( g \) is continuous at \( a \) if \( g \) is continuous at \( a \) and \( f \) is continuous at \( g(a) \). It does not say that if \( g \) and \( f \) are both continuous at \( a \) that the composition is continuous at \( a \).

2.6.104 The Intermediate Value Theorem requires that our function be continuous on the given interval. In this example, the function \( f \) is not continuous on \([-2, 2]\) because it isn’t continuous at 0.

2.6.105
a. Using the hint, we have
\[
\sin x = \sin(a + (x-a)) = \sin a \cos(x-a) + \sin(x-a) \cos a.
\]
Note that as \( x \to a \), we have that \( \cos(x-a) \to 1 \) and \( \sin(x-a) \to 0 \).

So, \( \lim_{x \to a} \sin x = \lim_{x \to a} \sin(a + (x-a)) = \lim_{x \to a} \sin a \cos(x-a) + \sin(x-a) \cos a = (\sin a) \cdot 1 + 0 \cdot \cos a = \sin a \).

b. Using the hint, we have
\[
\cos x = \cos(a + (x-a)) = \cos a \cos(x-a) - \sin a \sin(x-a).
\]
So, \( \lim_{x \to a} \cos x = \lim_{x \to a} \cos(a + (x-a)) = \lim_{x \to a} \cos a \cos(x-a) - \sin a \sin(x-a) = (\cos a) \cdot 1 - (\sin a) \cdot 0 = \cos a \).

2.7 Precise Definitions of Limits

2.7.1 Note that all the numbers in the interval \((1, 3)\) are within 1 unit of the number 2. So \(|x - 2| < 1\) is true for all numbers in that interval. In fact, \(\{x: 0 < |x - 2| < 1\}\) is exactly the set \((1, 3)\) with \(x \neq 2\).

2.7.2 Note that all the numbers in the interval \((2, 6)\) are within 2 units of the number 4. So \(|f(x) - 4| < \epsilon\) for \(\epsilon = 2\) (or any number greater than 2).

2.7.3 \((3, 8)\) has center 5.5, so it is not symmetric about the number 5. However, \((1, 9)\) and \((4, 6)\) and \((4.5, 5.5)\) are symmetric about the number 5, since the center of each of these intervals is 5: \(\frac{1+9}{2} = \frac{4+6}{2} = \frac{4.5+5.5}{2} = 5\).

2.7.4 No. At \(x = a\), we would have \(|x - a| = 0\), not \(|x - a| > 0\), so \(a\) is not included in the given set.

2.7.5 \( \lim_{x \to a} f(x) = L \) if for any arbitrarily small positive number \(\epsilon\), there exists a number \(\delta\), so that \(f(x)\) is within \(\epsilon\) units of \(L\) for any number \(x\) within \(\delta\) units of \(a\) (but not including \(a\) itself).

2.7.6 The set of all \(x\) for which \(|f(x) - L| < \epsilon\) is the set of numbers so that the value of the function \(f\) at those numbers is within \(\epsilon\) units of \(L\).
2.7.7 We are given that \(|f(x) - 5| < 0.1\) for values of \(x\) in the interval \((0, 5)\), so we need to ensure that the set of \(x\) values we are allowing fall in this interval. We want something of the form \(0 < |x - 2| < \delta\), so we want an interval centered at 2. The largest interval centered at 2 contained in \((0, 5)\) is \((0, 4)\), so that \(\delta = 2\), or any positive number \(0 < \delta \leq 2\) suffices, since then \(0 < |x - 2| < \delta\) will imply that \(x \in (0, 4) \subset (0, 5)\). If we were to allow \(\delta\) to be any number greater than 2, then the set of all \(x\) so that \(|x - 2| < \delta\) would include numbers less than 0, and those numbers aren’t in the interval \((0, 5)\).

2.7.8

\[
\lim_{x \to a} f(x) = \infty \quad \text{if for any } N > 0, \text{ there exists } \delta > 0 \text{ so that if } 0 < |x - a| < \delta \text{ then } f(x) > N.
\]

2.7.9

a. In order for \(f\) to be within 2 units of 5, it appears that we need \(x\) to be within 1 unit of 2. So \(\delta = 1\).

b. In order for \(f\) to be within 1 unit of 5, it appears that we would need \(x\) to be within \(\frac{1}{2}\) unit of 2. So \(\delta = \frac{1}{2}\).

2.7.10

a. In order for \(f\) to be within 1 unit of 4, it appears that we would need \(x\) to be within 1 unit of 2. So \(\delta = 1\).

b. In order for \(f\) to be within \(\frac{1}{2}\) unit of 4, it appears that we would need \(x\) to be within \(\frac{1}{2}\) unit of 2. So \(\delta = \frac{1}{2}\).

2.7.11

a. In order for \(f\) to be within 3 units of 6, it appears that we would need \(x\) to be within 2 units of 3. So \(\delta = 2\).

b. In order for \(f\) to be within 1 unit of 6, it appears that we would need \(x\) to be within \(\frac{1}{2}\) unit of 3. So \(\delta = \frac{1}{2}\).

2.7.12

a. In order for \(f\) to be within 1 unit of 5, it appears that we would need \(x\) to be within 3 units of 4. So \(\delta = 3\).

b. In order for \(f\) to be within \(\frac{1}{2}\) unit of 5, it appears that we would need \(x\) to be within 2 units of 4. So \(\delta = 2\).

2.7.13

a.

If \(\epsilon = 1\), we need \(|x^3 + 3 - 3| < 1\). So we need \(|x| < \sqrt[3]{1} = 1\) in order for this to happen. Thus \(\delta = 1\) will suffice.
2.7. PRECISE DEFINITIONS OF LIMITS

b.

If $\epsilon = 0.5$, we need $|x^3 + 3 - 3| < 0.5$. So we need $|x| < \sqrt[3]{0.5}$ in order for this to happen. Thus $\delta = \sqrt[3]{0.5} \approx 0.79$ will suffice.

2.7.14

a.

By looking at the graph, it appears that for $\epsilon = 1$, we would need $\delta$ to be about 0.4 or less.

b.

By looking at the graph, it appears that for $\epsilon = 0.5$, we would need $\delta$ to be about 0.2 or less.

2.7.15

a. For $\epsilon = 1$, the required value of $\delta$ would also be 1. A larger value of $\delta$ would work to the right of 2, but this is the largest one that would work to the left of 2.

b. For $\epsilon = \frac{1}{2}$, the required value of $\delta$ would also be $\frac{1}{2}$.

c. It appears that for a given value of $\epsilon$, it would be wise to take $\delta = \min(\epsilon, 2)$. This assures that the desired inequality is met on both sides of 2. (Note that we must have $\delta \leq 2$ since the function is not defined for $x < 0$).

2.7.16

a. For $\epsilon = 2$, the required value of $\delta$ would be 1 (or smaller). This is the largest value of $\delta$ that works on either side.

b. For $\epsilon = 1$, the required value of $\delta$ would be $\frac{1}{2}$ (or smaller). This is the largest value of $\delta$ that works on the right of 4.

c. It appears that for a given value of $\epsilon$, the corresponding value of $\delta = \min \left( \frac{\epsilon}{2}, \frac{\epsilon}{2} \right)$. 
2.7.17
a. For $\epsilon = 2$, it appears that a value of $\delta = 1$ (or smaller) would work.
b. For $\epsilon = 1$, it appears that a value of $\delta = \frac{1}{2}$ (or smaller) would work.
c. For an arbitrary $\epsilon$, a value of $\delta = \frac{\epsilon}{2}$ or smaller appears to suffice.

2.7.18
a. For $\epsilon = \frac{1}{2}$, it appears that a value of $\delta = 1$ (or smaller) would work.
b. For $\epsilon = \frac{1}{4}$, it appears that a value of $\delta = \frac{1}{2}$ (or smaller) would work.
c. For an arbitrary $\epsilon$, a value of $2\epsilon$ or smaller appears to suffice.

2.7.19 For any $\epsilon > 0$, let $\delta = \frac{\epsilon}{2}$. Then if $0 < |x - 1| < \delta$, we would have $|x - 1| < \frac{\epsilon}{2}$. Then $|8x - 8| < \epsilon$, so $|(8x + 5) - 13| < \epsilon$. This last inequality has the form $|f(x) - L| < \epsilon$, which is what we were attempting to show. Thus, $\lim_{x \to 1} (8x + 5) = 13$.

2.7.20 For any $\epsilon > 0$, let $\delta = \frac{\epsilon}{2}$. Then if $0 < |x - 3| < \delta$, we would have $|x - 3| < \frac{\epsilon}{2}$. Then $|2x - 6| < \epsilon$, so $|-(2x + 6)| < \epsilon$, so $|(2x + 6) - 2| < \epsilon$. This last inequality has the form $|f(x) - L| < \epsilon$, which is what we were attempting to show. Thus, $\lim_{x \to 3} (-2x + 8) = 2$.

2.7.21 First note that if $x \neq 4$, $f(x) = \frac{x^2 - 16}{x - 4} = x + 4$. Now if $\epsilon > 0$ is given, let $\delta = \epsilon$. Now suppose $0 < |x - 4| < \delta$. Then $x \neq 4$, so the function $f(x)$ can be described by $x + 4$. Also, because $|x - 4| < \delta$, we have $|x - 4| < \epsilon$. Thus $|(x + 4) - 8| < \epsilon$. This last inequality has the form $|f(x) - L| < \epsilon$, which is what we were attempting to show. Thus, $\lim_{x \to 4} f(x) = 0$.

2.7.22 First note that if $x \neq 3$, $f(x) = \frac{x^2 - 7x + 12}{x - 3} = \frac{(x-4)(x-3)}{x-3} = x - 4$. Now if $\epsilon > 0$ is given, let $\delta = \epsilon$. Now suppose $0 < |x - 3| < \delta$. Then $x \neq 3$, so the function $f(x)$ can be described by $x - 4$. Also, because $|x - 3| < \delta$, we have $|x - 3| < \epsilon$. Thus $|(x - 4) - (-1)| < \epsilon$. This last inequality has the form $|f(x) - L| < \epsilon$, which is what we were attempting to show. Thus, $\lim_{x \to 3} f(x) = -1$.

2.7.23 Let $\epsilon > 0$ be given. Let $\delta = \sqrt{\epsilon}$. Then if $0 < |x - 0| < \delta$, we would have $|x| < \sqrt{\epsilon}$. But then $|x^2| < \epsilon$, which has the form $|f(x) - L| < \epsilon$. Thus, $\lim_{x \to 0} f(x) = 0$.

2.7.24 Let $\epsilon > 0$ be given. Let $\delta = \sqrt{\epsilon}$. Then if $0 < |x - 3| < \delta$, we would have $|x - 3| < \sqrt{\epsilon}$. But then $|(x - 3)^2| < \epsilon$, which has the form $|f(x) - L| < \epsilon$. Thus, $\lim_{x \to 3} f(x) = 0$.

2.7.25 Let $\epsilon > 0$ be given. Because $\lim_{x \to a} f(x) = L$, we know that there exists a $\delta_1 > 0$ so that $|f(x) - L| < \frac{\epsilon}{2}$ when $0 < |x - a| < \delta_1$. Also, because $\lim_{x \to a} g(x) = M$, there exists a $\delta_2 > 0$ so that $|g(x) - M| < \frac{\epsilon}{2}$ when $0 < |x - a| < \delta_2$. Now let $\delta = \min(\delta_1, \delta_2)$. Then if $0 < |x - a| < \delta$, we would have

$$|f(x) - g(x) - (L - M)| = |(f(x) - L) + (M - g(x))| \leq |f(x) - L| + |M - g(x)|$$

$$= |f(x) - L| + |g(x) - M| \leq \frac{\epsilon}{2} + \frac{\epsilon}{2} = \epsilon.$$

Note that the key inequality in this string of equations follows from the triangle inequality.

2.7.26 First note that the theorem is trivially true if $c = 0$. So assume $c \neq 0$. Let $\epsilon > 0$ be given. Because $\lim_{x \to a} f(x) = L$, there exists a $\delta > 0$ so that if $0 < |x - a| < \delta$, we have $|f(x) - L| < \frac{\epsilon}{|c|}$. But then $|c||f(x) - L| = |cf(x) - cL| < \epsilon$, as desired. Thus, $\lim_{x \to a} cf(x) = cL$.

2.7.27
a. Let $\epsilon > 0$ be given. It won’t end up mattering what $\delta$ is, so let $\delta = 1$. Note that the statement $|f(x) - L| < \epsilon$ amounts to $|c - c| < \epsilon$, which is true for any positive number $\epsilon$, without any restrictions on $x$. So $\lim_{x \to a} c = c$. 

Copyright © 2014 Pearson Education, Inc.
2.7.28 First note that if \( m = 0 \), this follows from exercise 27a. So assume \( m \neq 0 \). Let \( \epsilon > 0 \) be given. Let \( \delta = \frac{\epsilon}{|m|} \). Now if \( 0 < |x - a| < \delta \), we would have \( |x - a| < \frac{\epsilon}{|m|} \), so \( |mx - ma| < \epsilon \). This can be written as \( |(mx + b) - (ma + b)| < \epsilon \), which has the form \( |f(x) - L| < \epsilon \). Thus, \( \lim_{x \to a} f(x) = f(a) \), which implies that \( f \) is continuous at \( x = a \) by the definition of continuity at a point. Because \( a \) is an arbitrary number, \( f \) must be continuous at all real numbers.

2.7.29 Let \( N > 0 \) be given. Let \( \delta = \frac{\epsilon}{\sqrt{N}} \). Then if \( 0 < |x - 4| < \delta \), we have \( |x - 4| < \frac{\epsilon}{\sqrt{N}} \). Taking the reciprocal of both sides, we have \( \frac{1}{|x - 4|} > \sqrt{N} \), and squaring both sides of this inequality yields \( \frac{1}{(x - 4)^2} > N \). Thus \( \lim_{x \to 4} f(x) = \infty \).

2.7.30 Let \( N > 0 \) be given. Let \( \delta = \frac{\epsilon}{\sqrt{N}} \). Then if \( 0 < |x - (-1)| < \delta \), we have \( |x + 1| < \frac{\epsilon}{\sqrt{N}} \). Taking the reciprocal of both sides, we have \( \frac{1}{|x + 1|} > \sqrt{N} \), and raising both sides to the 4th power yields \( \frac{1}{(x + 1)^4} > N \). Thus \( \lim_{x \to -1} f(x) = \infty \).

2.7.31 Let \( N > 1 \) be given. Let \( \delta = \frac{1}{\sqrt{N-1}} \). Suppose that \( 0 < |x - 0| < \delta \). Then \( |x| < \frac{1}{\sqrt{N-1}} \), and taking the reciprocal of both sides, we see that \( \frac{1}{|x|} > \sqrt{N-1} \). Then squaring both sides yields \( \frac{1}{x^2} > N - 1 \), so \( \frac{1}{x^2} + 1 > N \). Thus \( \lim_{x \to 0} f(x) = \infty \).

2.7.32 Let \( N > 0 \) be given. Let \( \delta = \frac{1}{\sqrt{N+1}} \). Then if \( 0 < |x - 0| < \delta \), we would have \( |x| < \frac{1}{\sqrt{N+1}} \). Taking the reciprocal of both sides yields \( \frac{1}{|x|} > \sqrt{N+1} \), and then raising both sides to the 4th power gives \( \frac{1}{x^4} > N + 1 \). Then \( \frac{1}{x^4} = \sin x > N + 1 - \sin x \geq N \), since \( -1 \leq \sin x \leq 1 \) for all \( x \). Thus \( \frac{1}{x^4} - \sin x > N \) and hence \( \lim_{x \to 0} \left( \frac{1}{x^4} - \sin x \right) = \infty \).

2.7.33
a. False. In fact, if the statement is true for a specific value of \( \delta_1 \), then it would be true for any value of \( \delta < \delta_1 \). This is because if \( 0 < |x - a| < \delta \), it would automatically follow that \( 0 < |x - a| < \delta_1 \).

b. False. This statement is not equivalent to the definition – note that it says “for an arbitrary \( \delta \) there exists an \( \epsilon \)” rather than “for an arbitrary \( \epsilon \) there exists a \( \delta \).”

c. True. This is the definition of \( \lim_{x \to a} f(x) = L \).

d. True. Both inequalities describe the set of \( x \)'s which are within \( \delta \) units of \( a \).

2.7.34
a. We want it to be true that \( |f(x) - 2| < 0.25 \). So we need \( |x^2 - 2x + 3 - 2| = |x^2 - 2x + 1| = (x - 1)^2 < 0.25 \). Therefore we need \( |x - 1| < \sqrt{0.25} = 0.5 \). Thus we should let \( \delta = 0.5 \).

b. We want it to be true that \( |f(x) - 2| < \epsilon \). So we need \( |x^2 - 2x + 3 - 2| = |x^2 - 2x + 1| = (x - 1)^2 < \epsilon \). Therefore we need \( |x - 1| < \sqrt{\epsilon} \). Thus we should let \( \delta = \sqrt{\epsilon} \).

2.7.35 Assume \( |x - 3| < 1 \), as indicated in the hint. Then \( 2 < x < 4 \), so \( \frac{1}{2} < \frac{1}{x} < \frac{1}{3} \), and thus \( \left| \frac{1}{x} \right| < \frac{1}{2} \). Also note that \( \left| \frac{1}{2} - \frac{1}{3} \right| = \left| \frac{x - 3}{3x} \right| \). Now, let \( \epsilon > 0 \) be given, and let \( \delta = \min(6\epsilon, 1) \). Now assume that \( 0 < |x - 3| < \delta \). Then

\[
|f(x) - L| = \left| \frac{x - 3}{3x} \right| < \frac{6\epsilon}{6} = \epsilon.
\]

Thus we have established that \( \left| \frac{1}{2} - \frac{1}{3} \right| < \epsilon \) whenever \( 0 < |x - 3| < \delta \).
2.7.36 Note that for $x \neq 4$, the expression \( \frac{x-4}{\sqrt{x+2}} = \frac{x-2^2}{\sqrt{x+2}} = \sqrt{x+2} \). Also note that if $|x-4| < 1$, then $x$ is between 3 and 5, so $\sqrt{x} > 0$. Then it follows that $\sqrt{x} + 2 > 2$, and therefore $\frac{1}{\sqrt{x+2}} < \frac{1}{2}$. We will use this fact in what follows. Let $\epsilon > 0$ be given, and let $\delta = \min(2\epsilon, 1)$. Suppose that $0 < |x-4| < \delta$. We have

\[
|f(x) - L| = |\sqrt{x} + 2 - 4| = |\sqrt{x} - 2| = \left| \frac{x-4}{\sqrt{x}+2} \right| < \frac{|x-4|}{2} < \frac{2\epsilon}{2} = \epsilon.
\]

2.7.37 Assume $|x - \frac{1}{10}| < \frac{1}{20}$, as indicated in the hint. Then $\frac{1}{20} < x < \frac{3}{20}$, so $\frac{20}{3} < \frac{1}{2} < \frac{20}{1}$, and thus $|x-10| = \left| \frac{10x-1}{x} \right|$. Now let $\epsilon > 0$ be given, and let $\delta = \min \left( \frac{\epsilon}{200}, \frac{1}{10} \right)$. Now assume that $0 < |x - \frac{1}{10}| < \delta$. Then

\[
|f(x) - L| = \left| \frac{10x-1}{x} \right| < |(10x-1)| \leq |x - \frac{1}{10}| \cdot 200 < \frac{\epsilon}{200} \cdot 200 = \epsilon.
\]

Thus we have established that $|x - \frac{1}{10}| < \epsilon$ whenever $0 < |x - (1/10)| < \delta$.

2.7.38 Note that if $|x - 5| < 1$, then $4 < x < 6$, so that $9 < x + 5 < 11$, and $|x + 5| < 11$. Note also that $16 < x^2 < 36$, so $\frac{1}{2x} < \frac{1}{16}$. Let $\epsilon > 0$ be given, and let $\delta = \min(1, \frac{400}{11} \epsilon)$. Assume that $0 < |x-5| < \delta$. Then

\[
|f(x) - L| = \left| \frac{1}{x^2} - \frac{1}{25} \right| = \left| \frac{x+5|x-5|}{25x^2} \right| < \frac{11|x-5|}{25x^2} < \frac{11}{25} \cdot \frac{16}{11} |x-5| < 11 \cdot \frac{400\epsilon}{200} = \epsilon.
\]

2.7.39 Because we are approaching $a$ from the right, we are only considering values of $x$ which are close to, but a little larger than $a$. The numbers $x$ to the right of $a$ which are within $\delta$ units of $a$ satisfy $0 < x - a < \delta$.

2.7.40 Because we are approaching $a$ from the left, we are only considering values of $x$ which are close to, but a little smaller than $a$. The numbers $x$ to the left of $a$ which are within $\delta$ units of $a$ satisfy $0 < a - x < \delta$.

2.7.41

a. Let $\epsilon > 0$ be given. Let $\delta = \frac{\epsilon}{2}$. Suppose that $0 < x < \delta$. Then $0 < x < \delta$ and

\[
|f(x) - L| = |2x - 4 - (-4)| = |2x| = 2|x| = 2x < \epsilon.
\]

b. Let $\epsilon > 0$ be given. Let $\delta = \frac{\epsilon}{3}$. Suppose that $0 < 0 - x < \delta$. Then $-\delta < x < 0$ and $-\frac{\epsilon}{3} < x < 0$, so $\epsilon > -3x$. We have

\[
|f(x) - L| = |3x - 4 - (-4)| = |3x| = 3|x| = -3x < \epsilon.
\]

c. Let $\epsilon > 0$ be given. Let $\delta = \frac{\epsilon}{3}$. Because $\frac{\epsilon}{3} < \frac{\epsilon}{2}$, we can argue that $|f(x) - L| < \epsilon$ whenever $0 < |x| < \delta$ exactly as in the previous two parts of this problem.

2.7.42

a. This statement holds for $\delta = 2$ (or any number less than 2).

b. This statement holds for $\delta = 2$ (or any number less than 2).

c. This statement holds for $\delta = 1$ (or any number less than 1).

d. This statement holds for $\delta = 0.5$ (or any number less than 0.5).

2.7.43 Let $\epsilon > 0$ be given, and let $\delta = \epsilon^2$. Suppose that $0 < x < \delta$, which means that $x < \epsilon^2$, so that $\sqrt{x} < \epsilon$. Then we have

\[
|f(x) - L| = |\sqrt{x} - 0| = \sqrt{x} < \epsilon.
\]

as desired.
2.7.44
a. Suppose that \( \lim_{x \to a^-} f(x) = L \) and \( \lim_{x \to a^+} f(x) = L \). Let \( \epsilon > 0 \) be given. There exists a number \( \delta_1 \) so that \( |f(x) - L| < \epsilon \) whenever \( 0 < x - a < \delta_1 \), and there exists a number \( \delta_2 \) so that \( |f(x) - L| < \epsilon \) whenever \( 0 < a - x < \delta_2 \). Let \( \delta = \min(\delta_1, \delta_2) \). It immediately follows that \( |f(x) - L| < \epsilon \) whenever \( 0 < |x - a| < \delta \), as desired.

b. Suppose \( \lim_{x \to a} f(x) = L \), and let \( \epsilon > 0 \) be given. We know that a \( \delta \) exists so that \( |f(x) - L| < \epsilon \) whenever \( 0 < |x - a| < \delta \). In particular, it must be the case that \( |f(x) - L| < \epsilon \) whenever \( 0 < x - a < \delta \) and also that \( |f(x) - L| < \epsilon \) whenever \( 0 < a - x < \delta \). Thus \( \lim_{x \to a^-} f(x) = L \) and \( \lim_{x \to a^+} f(x) = L \).

2.7.45
a. We say that \( \lim_{x \to a^-} f(x) = \infty \) if for each positive number \( N \), there exists \( \delta > 0 \) such that

\[
    f(x) > N \quad \text{whenever} \quad a < x < a + \delta.
\]

b. We say that \( \lim_{x \to a^+} f(x) = -\infty \) if for each negative number \( N \), there exists \( \delta > 0 \) such that

\[
    f(x) < N \quad \text{whenever} \quad a - \delta < x < a.
\]

c. We say that \( \lim_{x \to a^-} f(x) = \infty \) if for each positive number \( N \), there exists \( \delta > 0 \) such that

\[
    f(x) > N \quad \text{whenever} \quad a - \delta < x < a.
\]

2.7.46 Let \( N < 0 \) be given. Let \( \delta = -\frac{1}{N} \), and suppose that \( 1 < x < 1 + \delta \). Then \( 1 < x < \frac{N+1}{N} \), so \( \frac{1-N}{N} < x < \frac{1}{N} \), and therefore \( 1 + \frac{1-N}{N} < 1 - x < 0 \), which can be written as \( \frac{1}{1-x} < N \). Taking reciprocals yields the inequality \( N > \frac{1}{1-x} \), as desired.

2.7.47 Let \( N > 0 \) be given. Let \( \delta = \frac{1}{N} \), and suppose that \( 1 - \delta < x < 1 \). Then \( \frac{N-1}{N} < x < 1 \), so \( \frac{1-N}{N} > x > \frac{1}{N} \), and therefore \( 1 + \frac{1-N}{N} > 1 - x > 0 \), which can be written as \( \frac{1}{1-x} > N \). Taking reciprocals yields the inequality \( N < \frac{1}{1-x} \), as desired.

2.7.48 Let \( M < 0 \) be given. Let \( \delta = \sqrt{-\frac{2}{M}} \). Suppose that \( 0 < |x - 1| < \delta \). Then \( (x-1)^2 < -\frac{2}{M} \), so \( \frac{1}{(x-1)^2} > \frac{M}{2} \), and \( -\frac{2}{(x-1)^2} < M \), as desired.

2.7.49 Let \( M < 0 \) be given. Let \( \delta = \sqrt{-\frac{10}{M}} \). Suppose that \( 0 < |x + 2| < \delta \). Then \( (x+2)^2 < \frac{10}{M} \), so \( \frac{1}{(x+2)^2} > \frac{M}{10} \), and \( -\frac{10}{(x+2)^2} < M \), as desired.

2.7.50 Let \( \epsilon > 0 \) be given. Let \( N = \frac{10}{\epsilon} \). Suppose that \( x > N \). Then \( x > \frac{10}{\epsilon} \) so \( 0 < \frac{10}{x} < \epsilon \). Thus, \( |\frac{10}{x} - 0| < \epsilon \), as desired.

2.7.51 Let \( \epsilon > 0 \) be given. Let \( N = \frac{1}{\epsilon} \). Suppose that \( x > N \). Then \( \frac{1}{x} < \epsilon \), and so \( |f(x) - L| = |2 + \frac{1}{x} - 2| < \epsilon \).

2.7.52 Let \( M > 0 \) be given. Let \( N = 100M \). Suppose that \( x > N \). Then \( x > 100M \), so \( \frac{1}{100} > M \), as desired.

2.7.53 Let \( M > 0 \) be given. Let \( N = M - 1 \). Suppose that \( x > N \). Then \( x > M - 1 \), so \( x + 1 > M \), and thus \( \frac{x^2 + x}{x} > M \), as desired.

2.7.54 Let \( \epsilon > 0 \) be given. Because \( \lim_{x \to a^-} f(x) = L \), there exists a number \( \delta_1 \) so that \( |f(x) - L| < \epsilon \) whenever \( 0 < |x - a| < \delta_1 \). And because \( \lim_{x \to a^+} h(x) = L \), there exists a number \( \delta_2 \) so that \( |h(x) - L| < \epsilon \) whenever \( 0 < |x - a| < \delta_2 \). Let \( \delta = \min(\delta_1, \delta_2) \), and suppose that \( 0 < |x - a| < \delta \). Because \( f(x) \leq g(x) \leq h(x) \) for \( x \) near \( a \), we also have that \( f(x) - L \leq g(x) - L \leq h(x) - L \). Now whenever \( x \) is within \( \delta \) units of \( a \) but unequal to \( a \), we see that \( -\epsilon < f(x) - L \leq g(x) - L \leq h(x) - L < \epsilon \). Therefore \( |g(x) - L| < \epsilon \), as desired.
2.7.55 Let $\epsilon > 0$ be given. Let $N = \lfloor \frac{1}{\epsilon} \rfloor + 1$. By assumption, there exists an integer $M > 0$ so that $|f(x) - L| < \frac{1}{M}$ whenever $|x - a| < \frac{1}{M}$. Let $\delta = \frac{1}{2M}$, and assume $0 < |x - a| < \delta$. Then $|x - a| < \frac{1}{M}$, and thus $|f(x) - L| < \frac{1}{N}$. But then
\[
|f(x) - L| < \frac{1}{\lfloor 1/\epsilon \rfloor + 1} < \epsilon,
\]
as desired.

2.7.56 Suppose that $\epsilon = 1$. Then no matter what $\delta$ is, there are numbers in the set $0 < |x - 2| < \delta$ so that $|f(x) - 2| > \epsilon$. For example, when $x$ is only slightly greater than 2, the value of $|f(x) - 2|$ will be 2 or more.

2.7.57 Let $f(x) = \frac{|x|}{x}$ and suppose $\lim_{x \to 0} f(x)$ exists and is equal to $L$. Let $\epsilon = \frac{1}{2}$. There must be a value of $\delta$ so that when $0 < |x| < \delta$, $|f(x) - L| < \frac{1}{2}$. Now consider the numbers $\frac{2}{3}$ and $-\frac{2}{3}$, both of which are within $\delta$ of 0. We have $f\left(\frac{2}{3}\right) = 1$ and $f\left(-\frac{2}{3}\right) = -1$. However, it is impossible for both $|1 - L| < \frac{1}{2}$ and $|-1 - L| < \frac{1}{2}$, because the former implies that $\frac{2}{3} < L < \frac{3}{2}$ and the latter implies that $-\frac{2}{3} < L < -\frac{1}{2}$. Thus $\lim_{x \to 0} f(x)$ does not exist.

2.7.58 Suppose that $\lim_{x \to a} f(x)$ exists and is equal to $L$. Let $\epsilon = \frac{1}{2}$. By the definition of limit, there must be a number $\delta$ so that $|f(x) - L| < \frac{1}{2}$ whenever $0 < |x - a| < \delta$. Now in every set of the form $(a, a + \delta)$ there are both rational and irrational numbers, so there will be value of $f$ equal to both 0 and 1. Thus we have $|0 - L| < \frac{1}{2}$, which means that $L$ lies in the interval $(-\frac{1}{2}, \frac{1}{2})$, and we have $|1 - L| < \frac{1}{2}$, which means that $L$ lies in the interval $(\frac{1}{2}, \frac{3}{2})$. Because these both can’t be true, we have a contradiction.

2.7.59 Because $f$ is continuous at $a$, we know that $\lim_{x \to a} f(x)$ exists and is equal to $f(a) > 0$. Let $\epsilon = \frac{f(a)}{2}$. Then there is a number $\delta > 0$ so that $|f(x) - f(a)| < \frac{f(a)}{2}$ whenever $|x - a| < \delta$ (we do not need the added condition $x \neq a$ since $f$ is continuous at $a$). Thus whenever $x$ lies in the interval $(a - \delta, a + \delta)$ we have $-\frac{f(a)}{2} < f(x) - f(a) \leq \frac{f(a)}{2}$, so $\frac{f(a)}{2} < f(x) \leq \frac{3f(a)}{2}$, so $f$ is positive in this interval since $\frac{f(a)}{2} > 0$.

Chapter Review

1. a. False. Because $\lim_{x \to 1} \frac{x - 1}{x^2 - 1} = \lim_{x \to 1} \frac{1}{x + 1} = \frac{1}{2}$, $f$ doesn’t have a vertical asymptote at $x = 1$.

b. False. In general, these methods are too imprecise to produce accurate results.

c. False. For example, the function $f(x) = \begin{cases} 2x & \text{if } x < 0; \\ 1 & \text{if } x = 0; \\ 4x & \text{if } x > 0 \end{cases}$ has a limit of 0 as $x \to 0$, but $f(0) = 1$.

d. True. When we say that a limit exists, we are saying that there is a real number $L$ that the function is approaching. If the limit of the function is $\infty$, it is still the case that there is no real number that the function is approaching. (There is no real number called “infinity.”)

e. False. It could be the case that $\lim_{x \to a^-} f(x) = 1$ and $\lim_{x \to a^+} f(x) = 2$.

f. False. For example, the function $f(x) = \begin{cases} 2 & \text{if } 0 < x < 1; \\ \text{is continuous on (0, 1), and on [1, 2), but} \\ 3 & \text{if } 1 \leq x < 2, \\ \text{isn’t continuous on (0, 2).} \end{cases}$

g. True. $\lim_{x \to a} f(x) = f(a)$ if and only if $f$ is continuous at $a$.

2.

a. \( f(-1) = 1 \)

d. \( \lim_{x \to -1} f(x) \) does not exist.

g. \( \lim_{x \to -2} f(x) = 4 \)

j. \( \lim_{x \to 3} f(x) \) does not exist.

b. \( \lim_{x \to -1^-} f(x) = 3 \)

e. \( f(1) = 5 \)

h. \( \lim_{x \to 3^-} f(x) = 3 \)

b. \( \lim_{x \to -1^+} f(x) = 1 \)

f. \( \lim_{x \to 1} f(x) = 5 \)

i. \( \lim_{x \to 3^+} f(x) = 5 \)

3. This function is discontinuous at \( x = -1 \), at \( x = 1 \), and at \( x = 3 \). At \( x = -1 \) it is discontinuous because \( \lim_{x \to -1} f(x) \) does not exist. At \( x = 1 \), it is discontinuous because \( \lim_{x \to 1} f(x) \neq f(1) \). At \( x = 3 \), it is discontinuous because \( f(3) \) does not exist, and because \( \lim_{x \to 3} f(x) \) does not exist.

4.

a. The graph drawn by most graphing calculators and computer algebra systems doesn’t show the discontinuities where \( \sin \theta = 0 \).

b. It appears to be equal to 2

c. Using a trigonometric identity, \( \lim_{\theta \to 0} \frac{\sin 2\theta}{\sin \theta} = \frac{\lim_{\theta \to 0} 2\sin \theta \cos \theta}{\sin \theta} \). This can then be seen to be \( \lim_{\theta \to 0} 2 \cos \theta = 2 \).

5.

6.  
   a. \[ f(x) = \begin{cases} 
   1 & x < 2 \\
   2 & x = 2 \\
   3 & x > 2 
   \end{cases} \]
   b. \( \lim_{t \to 2.9} f(t) = 0.95 \).
   c. \( \lim_{t \to 3^-} f(t) = 0.95 \) and \( \lim_{t \to 3^+} f(t) = 1.05 \).
   d. The cost of the phone call jumps by 10 cents exactly at \( t = 3 \). Calls lasting slightly less than 3 minutes cost $0.95 and calls lasting slightly more than 3 minutes cost $1.05.
   e. The function \( f \) is continuous everywhere except at the integers. The cost of the call jumps by 10 cents at each integer.

7. 
   There are infinitely many different correct functions that you could draw. One of them is:

8. \( \lim_{x \to 1000} 18\pi^2 = 18\pi^2 \).

9. \( \lim_{x \to 1} \sqrt{5x + 6} = \sqrt{11} \).

10. \[
\lim_{h \to 0} \frac{\sqrt{5x + 5h} - \sqrt{5x}}{h} = \frac{\sqrt{5x + 5h} + \sqrt{5x}}{2\sqrt{5x + 5h} + \sqrt{5x}} = \lim_{h \to 0} \frac{(5x + 5h) - 5x}{h(\sqrt{5x + 5h} + \sqrt{5x})} = \lim_{h \to 0} \frac{5}{h(\sqrt{5x + 5h} + \sqrt{5x})} = \frac{5}{2\sqrt{5x}}.
\]

11. \( \lim_{x \to 1} \frac{x^3 - 7x^2 + 12x}{4 - x} = 1 - 7 + 12 = \frac{6}{3} = 2 \).

12. \( \lim_{x \to 4} \frac{x^3 - 7x^2 + 12x}{4 - x} = \lim_{x \to 4} \frac{x(x - 3)(x - 4)}{4 - x} = \lim_{x \to 4} x(3 - x) = -4 \).

13. \( \lim_{x \to 1} \frac{1 - x^2}{x^2 - 8x + 7} = \lim_{x \to 1} \frac{(1 - x)(1 + x)}{(x - 7)(x - 1)} = \lim_{x \to 1} \frac{-(x + 1)}{x - 7} = 1 \).

14. \( \lim_{x \to 3} \frac{\sqrt{3x + 16} - 5}{x - 3} = \lim_{x \to 3} \frac{3(x - 3)}{(x - 3)(\sqrt{3x + 16} + 5)} = \lim_{x \to 3} \frac{3}{\sqrt{3x + 16} + 5} = \frac{3}{10} \).

Copyright © 2014 Pearson Education, Inc.
15. \[
\lim_{x \to 3} \frac{1}{x-3} \left( \frac{1}{\sqrt{x+1}} - \frac{1}{2} \right) = \lim_{x \to 3} \frac{2 - \sqrt{x+1}}{2(x-3)\sqrt{x+1}} \cdot \frac{(2 + \sqrt{x+1})}{(2 + \sqrt{x+1})} = \lim_{x \to 3} \frac{4 - (x+1)}{2(x-3)(\sqrt{x+1})(2 + \sqrt{x+1})} = \lim_{x \to 3} \frac{-(x-3)}{2(x-3)(\sqrt{x+1})(2 + \sqrt{x+1})} = \lim_{x \to 3} \left( -\frac{1}{2\sqrt{x+1}(2 + \sqrt{x+1})} \right) = \frac{-1}{16}.
\]

16. \[
\lim_{t \to 1/3} \frac{t - \frac{1}{3}}{(3t-1)^2} = \lim_{t \to 1/3} \frac{3t-1}{3(3t-1)^2} = \lim_{t \to 1/3} \frac{1}{3(3t-1)},
\]
which does not exist.

17. \[
\lim_{x \to 3} \frac{x^4 - 81}{x - 3} = \lim_{x \to 3} \frac{(x-3)(x+3)(x^2+9)}{x-3} = \lim_{x \to 3} (x+3)(x^2+9) = 108.
\]

18. Note that \( p^5 - 1 \) = \( p^4 + p^3 + p^2 + p + 1 \). (Use long division). Then
\[
\lim_{p \to 1} \frac{p^5 - 1}{p - 1} = \lim_{p \to 1} (p^4 + p^3 + p^2 + p + 1) = 5.
\]

19. \[
\lim_{x \to \infty} \frac{\sqrt{x} - 3}{x - 81} = \lim_{x \to \infty} \frac{\sqrt{x} - 3}{(\sqrt{x}+9)(\sqrt{x}+3)(\sqrt{x}-3)} = \lim_{x \to \infty} \frac{1}{(\sqrt{x}+9)(\sqrt{x}+3)} = \frac{1}{108}.
\]

20. \[
\lim_{\theta \to \pi/4} \frac{\sin^2 \theta - \cos^2 \theta}{\sin \theta - \cos \theta} = \lim_{\theta \to \pi/4} \frac{(\sin \theta - \cos \theta)(\sin \theta + \cos \theta)}{\sin \theta - \cos \theta} = \lim_{\theta \to \pi/4} (\sin \theta + \cos \theta) = \sqrt{2}.
\]

21. \[
\lim_{x \to \pi/2} \frac{\sin x - 1}{x - \pi/2} = 0 = 0.
\]

22. The domain of \( f(x) = \sqrt{\frac{1}{x^2}} \) is \((-\infty, 1] \) and \((3, \infty) \), so \( \lim_{x \to 1^+} f(x) \) doesn’t exist. However, we have \( \lim_{x \to 1^{-}} f(x) = 0 \).

23.

a. Note first that \(-1 \leq \sin \frac{1}{x} \leq 1\) for all \( x \neq 0 \). Now, \( x^2 \geq 0 \), so multiplying the inequality through by \( x^2 \) preserves the inequality, giving
\[
-x^2 \leq x^2 \sin \frac{1}{x} \leq x^2.
\]
A plot of all three functions in two different windows, with \( \pm x^2 \) in gray, shows the inequalities clearly:
b. Because \(\lim_{x \to 0} (-x^2) = \lim_{x \to 0} x^2 = 0\), the squeeze theorem gives

\[
0 = \lim_{x \to 0} (-x^2) \leq \lim_{x \to 0} \left(x^2 \sin \frac{1}{x}\right) \leq \lim_{x \to 0} x^2 = 0,
\]

so that \(\lim_{x \to 0} (x^2 \sin \frac{1}{x}) = 0\) as well.

24. Note that \(\lim_{x \to 0} (\sin^2 x + 1) = 1\). Thus if \(1 \leq g(x) \leq \sin^2 x + 1\), the squeeze theorem assures us that \(\lim_{x \to 0} g(x) = 1\) as well.

25. \(\lim_{x \to 5} \frac{x - 7}{x(x - 5)^2} = -\infty\).

26. \(\lim_{x \to -5} \frac{x - 5}{x + 5} = -\infty\).

27. \(\lim_{x \to 3^-} \frac{x - 4}{x^2 - 3x} = \lim_{x \to 3^-} \frac{x - 4}{x(x - 3)} = \infty\).

28. \(\lim_{x \to 0^+} \frac{u - 1}{\sin u} = -\infty\).

29. \(\lim_{x \to 0^-} \frac{2}{\tan x} = -\infty\).

30. First note that \(f(x) = \frac{x^2 - 5x + 6}{x^2 - 2x} = \frac{(x - 3)(x - 2)}{x(x - 2)}\).

a. \(\lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} \frac{(x - 3)(x - 2)}{x(x - 2)} = \infty\).

\[
\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} \frac{(x - 3)(x - 2)}{x(x - 2)} = -\infty.
\]

\[
\lim_{x \to 2^-} f(x) = \lim_{x \to 2^-} \frac{x - 3}{x} = -\frac{1}{2}.
\]

\[
\lim_{x \to 2^+} f(x) = \lim_{x \to 2^+} \frac{x - 3}{x} = -\frac{1}{2}.
\]

b. By the above calculations and the definition of vertical asymptote, \(f\) has a vertical asymptote at \(x = 0\).

c. Note that the actual graph has a “hole” at the point \((2, -\frac{1}{2})\), because \(x = 2\) isn’t in the domain, but \(\lim_{x \to 2^-} f(x) = -\frac{1}{2}\).

31. \(\lim_{x \to \infty} \frac{2x - 3}{4x + 10} = \lim_{x \to \infty} \frac{2 - (3/x)}{4 + (10/x)} = \frac{2}{4} = \frac{1}{2}\).

32. \(\lim_{x \to \infty} \frac{x^4 - 1}{x^5 + 2} = \lim_{x \to \infty} \frac{(1/x) - (1/x^5)}{1 + (2/x^5)} = \frac{0 - 0}{1 + 0} = 0\).

33. \(\lim_{x \to \infty} (-3x^3 + 5) = \infty\).

34. \(\lim_{z \to \infty} \left(e^{-2z} + \frac{2}{z}\right) = 0 + 0 = 0\).
35. \( \lim_{x \to \infty} (3 \tan^{-1} x + 2) = \frac{3\pi}{2} + 2. \)

36. \( \lim_{r \to \infty} \frac{1}{\ln r + 1} = 0. \)

37. \( \lim_{x \to \infty} \frac{4x^3 + 1}{x - x^3} = \lim_{x \to \infty} \left( \frac{4 + (1/x^3)}{1/x^3 - 1} \right) = 4 + 0 = -4. \) A similar result holds as \( x \to -\infty. \) Thus, \( y = -4 \) is a horizontal asymptote as \( x \to \infty \) and as \( x \to -\infty. \)

38. First note that \( \sqrt{x} = |\frac{1}{x}| = \begin{cases} \frac{1}{x} & \text{if } x > 0; \\ -\frac{1}{x} & \text{if } x < 0. \end{cases} \) Then, \( \lim_{x \to \infty} \frac{x + 1}{\sqrt{9x^2 + x}} = \lim_{x \to \infty} \frac{1 + (1/x)}{\sqrt{9 + 1/x}} = \frac{1}{3}. \)

On the other hand, \( \lim_{x \to \infty} \frac{x + 1}{\sqrt{9x^2 + x}} = \lim_{x \to \infty} \frac{1 + (1/x)}{\sqrt{9 + 1/x}} = \frac{1}{3}. \)

So \( y = \frac{1}{3} \) is a horizontal asymptote as \( x \to \infty, \) and \( y = -\frac{1}{3} \) is a horizontal asymptote as \( x \to -\infty. \)

39. \( \lim_{x \to -\infty} (1 - e^{-2x}) = 1, \) while \( \lim_{x \to -\infty} (1 - e^{-2x}) = -\infty. \)

\( y = 1 \) is a horizontal asymptote as \( x \to \infty. \)

40. \( \lim_{x \to \infty} \frac{1}{\ln x^2} = 0, \) and \( \lim_{x \to -\infty} \frac{1}{\ln x^2} = 0, \) so \( y = 0 \) is a horizontal asymptote as \( x \to \infty \) and as \( x \to -\infty. \)

41. Recall that \( \tan^{-1} x = 0 \) only for \( x = 0. \) The only vertical asymptote is \( x = 0. \) Also,

\[
\lim_{x \to \infty} \frac{1}{\tan^{-1} x} = \frac{1}{\pi/2} = \frac{2}{\pi}, \quad \lim_{x \to -\infty} \frac{1}{\tan^{-1} x} = \frac{1}{-\pi/2} = -\frac{2}{\pi}.
\]

So \( y = \frac{2}{\pi} \) is a horizontal asymptote as \( x \to \infty \) and \( y = -\frac{2}{\pi} \) is a horizontal asymptote as \( x \to -\infty. \)

42. Note that \( f(x) = \frac{2x^2 + 6}{2x^2 + 3x - 2} = \frac{2(x^2 + 3)}{(2x - 1)(x + 2)}. \)

We have \( \lim_{x \to \infty} f(x) = \lim_{x \to \infty} \frac{2 + 6/x^2}{2 + 3/x - 2/x^2} = 1. \) A similar result holds as \( x \to -\infty. \) Also,

\[
\lim_{x \to 1/2^-} f(x) = -\infty, \quad \lim_{x \to 1/2^+} f(x) = \infty, \quad \lim_{x \to -2^-} f(x) = \infty, \quad \lim_{x \to -2^+} f(x) = -\infty.
\]

Thus, \( y = 1 \) is a horizontal asymptote as \( x \to \infty \) and as \( x \to -\infty. \) Also, \( x = \frac{1}{2} \) and \( x = -2 \) are vertical asymptotes.

43. \( f \) is discontinuous at 5, because \( f(5) \) does not exist, and also because \( \lim_{x \to 5^-} f(x) \) does not exist.

44. \( g \) is discontinuous at 4 because \( \lim_{x \to 4} g(x) = \lim_{x \to 4} \frac{(x + 4)(x - 4)}{x - 4} = 8 \neq g(4). \)

45. \( h \) is continuous from the right at 3.01 because \( h(3.01) \) exists, \( \lim_{x \to 3.01^-} h(x) \) exists, and the two are equal.

46. \( g \) is continuous at 4 because \( \lim_{x \to 4} g(x) = \lim_{x \to 4} \frac{(x + 4)(x - 4)}{x - 4} = 8 = g(4). \)

47. The domain of \( f \) is \((-\infty, -\sqrt{5}] \) and \([\sqrt{5}, \infty). \) Since \( \lim_{x \to -\sqrt{5}^-} f(x) = 0 = f(-\sqrt{5}) \) and \( \lim_{x \to \sqrt{5}^+} f(x) = 0 = f(\sqrt{5}), \) it follows that \( f \) is left-continuous at \(-\sqrt{5}\) and right-continuous at \( \sqrt{5}. \)
48. The domain of \( g \) is \([2, \infty)\), and it is continuous from the right at \( x = 2 \).

49. The domain of \( h \) is \((-\infty, -5), (-5, 0), (0, 5), (5, \infty)\), and like all rational functions, it is continuous on its domain.

50. \( g \) is the composition of two functions which are defined and continuous on \((-\infty, \infty)\), so \( g \) is continuous on that interval as well.

51. In order for \( g \) to be left continuous at 1, it is necessary that \( \lim_{x \to 1^-} g(x) = g(1) \), which means that \( a = 3 \). In order for \( g \) to be right continuous at 1, it is necessary that \( \lim_{x \to 1^+} g(x) = g(1) \), which means that \( a + b = 3 + b = 3 \), so \( b = 0 \).

52. a. Because the domain of \( h \) is \((-\infty, -3] \) and \([3, \infty)\), there is no way that \( h \) can be left continuous at 3.
   b. \( h \) is right continuous at 3, because \( \lim_{x \to 3^+} h(x) = 0 = h(3) \).

53. One such possible graph is pictured to the right.

54. a. Consider the function \( f(x) = x^5 + 7x + 5 \). \( f \) is continuous everywhere, and \( f(-1) = -3 < 0 \) while \( f(0) = 5 > 0 \). Therefore, 0 is an intermediate value between \( f(-1) \) and \( f(0) \). By the IVT, there must be a number \( c \) between 0 and 1 so that \( f(c) = 0 \).
   b. Using a computer algebra system, one can find that \( c \approx -0.691671 \) is a root.

55. a. Note that \( m(0) = 0 \) and \( m(5) \approx 38.34 \) and \( m(15) \approx 21.2 \). Thus, 30 is an intermediate value between both \( m(0) \) and \( m(5) \), and \( m(5) \) and \( m(15) \). Note also that \( m \) is a continuous function. By the IVT, there must be a number \( c_1 \) between 0 and 5 with \( m(c_1) = 30 \), and a number \( c_2 \) between 5 and 15 with \( m(c_2) = 30 \).
   b. A little trial and error leads to \( c_1 \approx 2.4 \) and \( c_2 \approx 10.8 \).
   c. No. The graph of the function on a graphing calculator suggests that it peaks at a little less than 39.

56. Let \( \epsilon > 0 \) be given. Let \( \delta = \frac{\epsilon}{5} \). Now suppose that \( 0 < |x - 1| < \delta \). Then
   \[
   |f(x) - L| = |(5x - 2) - 3| = |5x - 5| = 5|x - 1| < 5 \cdot \frac{\epsilon}{5} = \epsilon.
   \]

57. Let \( \epsilon > 0 \) be given. Let \( \delta = \epsilon \). Now suppose that \( 0 < |x - 5| < \delta \). Then
   \[
   |f(x) - L| = \left| \frac{x^2 - 25}{x - 5} - 10 \right| = \left| \frac{(x - 5)(x + 5)}{x - 5} - 10 \right| = |x + 5 - 10| = |x - 5| < \epsilon.
   \]
58.

a. Assume $L > 0$. (If $L = 0$, the result follows immediately because that would imply that the function $f$ is the constant function 0, and then $f(x)g(x)$ is also the constant function 0). Assume that $\delta_1$ is a number so that $|f(x)| \leq L$ for $|x - a| < \delta_1$.

Let $\epsilon > 0$ be given. Because $\lim_{x \to a} g(x) = 0$, we know that there exists a number $\delta_2 > 0$ so that $|g(x)| < \epsilon / L$ whenever $0 < |x - a| < \delta_2$. Let $\delta = \min(\delta_1, \delta_2)$.

Then

$$|f(x)g(x) - 0| = |f(x)||g(x)| < L \cdot \frac{\epsilon}{L} = \epsilon,$$

whenever $0 < |x - a| < \delta$.

b. Let $f(x) = \frac{x^2}{x^2 - 2}$. Then

$$\lim_{x \to 2} f(x)(x - 2) = \lim_{x \to 2} \frac{x^2(x - 2)}{x^2 - 2} = \lim_{x \to 2} x^2 = 4 \neq 0.$$

This doesn’t violate the previous result because the given function $f$ is not bounded near $x = 2$.

c. Because $|H(x)| \leq 1$ for all $x$, the result follows directly from part a) of this problem (using $L = 1$, $a = 0$, $f(x) = H(x)$, and $g(x) = x$).

59. Let $N > 0$ be given. Let $\delta = \frac{1}{\sqrt{N}}$. Suppose that $0 < |x - 2| < \delta$. Then $|x - 2| < \frac{1}{\sqrt{N}}$, so $\frac{1}{|x - 2|} > \sqrt{N}$, and $\frac{1}{(x-2)^2} > N$, as desired.

AP Practice Questions

Multiple Choice

1. Statement II is true, but statements I and III are false, so (D) is correct. Statement I is false since $f(-1) = 1$. Statement II is true since the graph of $f$ approaches $y = \frac{1}{2}$ as $x$ approaches $-1$. Statement III is false since $\lim_{x \to -1} f(x) = \frac{1}{2} \neq f(-1) = 1$.

2. A is correct. Since the limit from the left is $\lim_{x \to 1^-} f(x) = \frac{1}{2}$ but $\lim_{x \to 1^+} f(x) = 0$, the two one sided limits are unequal, so the limit does not exist.

3. C is correct. The average rate of change of $f(x)$ on $[2, x]$ is

$$\frac{f(x) - f(2)}{x - 2} = \frac{x^2 - 3x + 2}{x - 2} = x - 1.$$

For the average rate of change to be 3, we must have $x - 1 = 3$ so that $x = 4$.

4. Only A must hold. A must be true since the limit exists if and only if the two one-sided limits exist and are equal. B need not hold unless $f$ is also continuous at $x = a$. C need not hold since the definition of continuity involves the value of the function at the given point, and we are given no data about $f(a)$. D is definitely false, since for the limit to exist, the two one-sided limits must exist and be equal, and then the limit is equal to their common value. Thus in this case $\lim_{x \to a^+} f(x) = \lim_{x \to a^-} f(x) = A$. Finally, E will not hold unless $f$ is the constant function $f(x) = A$ for all $x$ in the domain of $f$.

5. D is correct. Since the denominator evaluated at $x = 2$ is $\sin(2\pi) + \cos(4\pi) = 1$, the denominator is nonzero at $x = 2$. Further, $x = 2$ is in the domain of the numerator. Thus

$$\lim_{x \to 2} \frac{\sqrt{3x^2 - x + 6}}{\sin \pi x + \cos 2\pi x} = \frac{\sqrt{3 \cdot 2^2 - 2 + 6}}{\sin 2\pi + \cos 4\pi} = \frac{\sqrt{16}}{1} = 4.$$
6. B is correct. Note that
\[
\frac{2(x^2 - 1)}{x^2 + x - 2} = \frac{2(x - 1)(x + 1)}{(x - 1)(x + 2)}.
\]
The possible vertical asymptotes are the zeros of the denominator, which are \(x = 1\) and \(x = -2\). But
\[
\lim_{x \to 1} \frac{2(x - 1)(x + 1)}{(x - 1)(x + 2)} = \lim_{x \to 1} \frac{2(x + 1)}{x + 2} = \frac{4}{3},
\]
so that \(x = 1\) is not a vertical asymptote. However, \(x = -2\) is, since near \(x = -2\) the numerator is close to 6 while the denominator approaches zero, so \(f(x)\) gets arbitrarily large in magnitude.

7. C is correct. We have
\[
\lim_{x \to 0} \frac{\sin^2 x}{1 - \cos x} = \lim_{x \to 0} \frac{1 - \cos^2 x}{1 - \cos x} = \lim_{x \to 0} \frac{(1 - \cos x)(1 + \cos x)}{1 - \cos x}.
\]
But for \(x\) near zero but unequal to zero, \(1 - \cos x \neq 0\), so we can cancel it to get
\[
\lim_{x \to 0} \frac{(1 - \cos x)(1 + \cos x)}{1 - \cos x} = \lim_{x \to 0} (1 + \cos x) = 2.
\]

8. C is correct. We have
\[
\lim_{x \to \infty} \frac{4x^4 - 3x + 2}{3x^4 + x^2 - 1} = \lim_{x \to \infty} \frac{4 - \frac{3}{x^3} + \frac{2}{x^4}}{3 + \frac{1}{x^2} - \frac{1}{x^4}} = \frac{4}{3},
\]
since terms with denominators a power of \(x\) go to zero as \(x \to \infty\).

9. A is correct. Recall that \(\lim_{x \to -\infty} e^x = 0\) and \(\lim_{x \to -\infty} e^{-x} = \infty\). Then
\[
\lim_{x \to -\infty} \frac{2e^{2x} - e^{-x}}{3e^{-x} + 4e^{2x}} = \lim_{x \to -\infty} \frac{e^x(2e^{2x} - e^{-x})}{e^x(3e^{-x} + 4e^{2x})}
= \lim_{x \to -\infty} \frac{2e^{3x} - 1}{3 + 4e^{3x}}
= \frac{2 \cdot 0 - 1}{3 + 4 \cdot 0}
= \frac{-1}{3}.
\]

10. B is correct. Since the denominator of \(f(x)\) does not vanish at \(x = 0\), we know that
\[
\lim_{x \to 0} f(x) = \frac{20}{1 + 0^2} = 20.
\]

11. B is correct. We have
\[
\lim_{x \to 2} \frac{x^3 - 6x^2 + 8x}{x - 2} = \lim_{x \to 2} \frac{x(x - 2)(x - 4)}{x - 2} = \lim_{x \to 2} x(x - 4) = -4.
\]
Now, for \(f\) to be continuous at \(x = 2\), we must have \(f(2) = \lim_{x \to 2} f(x)\), so that \(f(2)\) must be \(-4\).

12. C is correct. After some algebra,
\[
\sqrt{x^2 + 8x - x} = \frac{(\sqrt{x^2 + 8x} - x)(\sqrt{x^2 + 8x} + x)}{\sqrt{x^2 + 8x} + x} = \frac{x^2 + 8x - x^2}{\sqrt{x^2 + 8x} + x} = \frac{8x}{\sqrt{x^2 + 8x} + x}.
\]

Copyright © 2014 Pearson Education, Inc.
Then
\[
\lim_{x \to \infty} \left( \sqrt{x^2 + 8x} - x \right) = \lim_{x \to \infty} \frac{8x}{\sqrt{x^2 + 8x + x}} \\
= \lim_{x \to \infty} \frac{8}{\frac{1}{x} \sqrt{x^2 + 8x + x}} \\
= \lim_{x \to \infty} \frac{8}{\sqrt{\frac{1}{x^2}(x^2 + 8x) + 1}} \\
= \lim_{x \to \infty} \frac{8}{\sqrt{1 + \frac{8}{x} + 1}} \\
= \frac{8}{2} = 4.
\]

13. A is correct. We have
\[
\lim_{x \to -\infty} \frac{x}{\sqrt{x^2 + 1}} = \lim_{x \to -\infty} \frac{\frac{1}{x} \sqrt{x^2}}{\sqrt{x^2 + 1}} = \lim_{x \to -\infty} \frac{x}{\sqrt{1 + \frac{1}{x^2}}}.
\]
But as \( x \to -\infty \), we have \( x < 0 \), so that the numerator is \(-1\), and so
\[
\lim_{x \to -\infty} \frac{x}{\sqrt{1 + \frac{1}{x^2}}} = \lim_{x \to -\infty} \frac{-1}{\sqrt{1 + \frac{1}{x^2}}} = \frac{1}{1} = -1
\]
since \( \frac{1}{x^2} \to 0 \) as \( x \to -\infty \).

14. Statement I and II are correct, while statement III is false, so A is correct. Statement I is true since
\[
h(1) = f(g(1)) + 4 = f(4) + 4 = 20 + 4 = 24.
\]
Statement II is true, since
\[
h(3) = f(g(3)) + 4 = f(3) + 4 = 15 + 4 = 19, \quad h(4) = f(g(4)) + 4 = f(1) + 4 = 8 + 4 = 12.
\]
Since \( f \) and \( g \) are continuous, so is \( h \), so by the Intermediate Value Theorem, since \( 12 < 13 < 19 \), there is some \( c \) with \( 3 < c < 4 \) and \( h(c) = 13 \). Statement III is false since
\[
h(2) = f(g(2)) + 4 = f(2) + 4 = 12 + 4 = 16.
\]

15. B is correct. A graph of \( x^{-x} \) near \( x = 0 \) is (note that \( f(x) \) is not defined for \( x < 0 \))

It appears that the limit is 1.

16. C is correct. A graph of \( \frac{\sin 3x}{\tan 2x} \) near \( x = 0 \) is
It appears that the limit is $\frac{3}{2}$.

17. C is correct. As $x$ gets large and positive, we want the limit $\lim_{x \to \infty} f(x)$:

$$\lim_{x \to \infty} f(x) = \lim_{x \to \infty} \frac{\sqrt{9x^6 - 1}}{2x^3 + 1}$$
$$= \lim_{x \to \infty} \frac{\frac{1}{x^3} \sqrt{9x^6 - 1}}{2 + \frac{1}{x^3}}$$
$$= \lim_{x \to \infty} \frac{\sqrt{9 - \frac{1}{x^6}}}{2 + \frac{1}{x^3}}$$
$$= \frac{\sqrt{9}}{2} = \frac{3}{2}.$$ 

18. D is correct. As $x$ approaches zero from the right, the exponent, $-\frac{1}{x}$, approaches $-\infty$, and Theorem 2.8 tells us that $\lim_{t \to -\infty} e^t = 0$. Thus $\lim_{x \to 0^+} e^{-1/x} = 0$. As $x$ approaches zero from the left, the exponent, $-\frac{1}{x}$, approaches $\infty$, and Theorem 2.8 tells us that $\lim_{t \to \infty} e^t = \infty$. Thus $\lim_{x \to 0^-} e^{-1/x} = \infty$.

19. All three statements are true, so E is correct. For $x$ close to 3, certainly $x \neq 0$, so we may divide the given inequality through by $x^2$ to get

$$f(x) - g(x) \leq h(x) \leq f(x) + g(x).$$

Since the denominators do not vanish at $x = 3$, we can use the Squeeze Theorem to get

$$\lim_{x \to 3} \frac{f(x)}{x^2} \leq \lim_{x \to 3} \frac{g(x)}{x^2} \leq \lim_{x \to 3} \frac{h(x)}{x^2}.$$

Thus $\lim_{x \to 3} g(x) = \frac{18}{9} = 2$. Then

$$\lim_{x \to 3} x^2 g(x) = \left( \lim_{x \to 3} x^2 \right) \left( \lim_{x \to 3} g(x) \right) = 9 \cdot 2 = 18$$
$$\lim_{x \to 3} x g(x) = \left( \lim_{x \to 3} x \right) \left( \lim_{x \to 3} g(x) \right) = 3 \cdot 2 = 6.$$

Free Response

1. a. From the graph below, it appears that $\lim_{x \to 0} \frac{e^x - e^{-x}}{x} = 1$. 

Copyright © 2014 Pearson Education, Inc.
b. From the graph below, it appears that \( \lim_{x \to 0} \frac{e^{4x} - e^{2x}}{x} = 2. \)

\[-10\quad -5\quad 0\quad 5\quad 10\]
\[-5\quad -3\quad -1\quad 1\quad 3\]

\[\begin{align*}
\text{Copyright } &\text{© } 2014 \text{ Pearson Education, Inc.}
\end{align*}\]
3. a. This is a rational function, so its domain is all real numbers except where the denominator is zero. The denominator is \(x^2 + 2x - 8 = (x - 2)(x + 4)\), so the domain is all real numbers except 2 and -4.

b. The roots of \(f\) are the points where the numerator vanishes but the denominator does not. The numerator is \(5(x^2 - 4) = 5(x - 2)(x + 2)\), so it vanishes at \(x = 2\) and \(x = -2\). At \(x = 2\), the denominator vanishes as well, so \(f(2)\) is undefined. However, \(f\) does have a root at \(x = -2\).

c. We have
\[
\lim_{x \to \infty} \frac{5(x^2 - 4)}{x^2 + 2x - 8} = \lim_{x \to \infty} \frac{5 - \frac{20}{x^2}}{1 + \frac{2}{x} - \frac{8}{x^2}} = \frac{5}{1} = 5
\]
\[
\lim_{x \to -\infty} \frac{5(x^2 - 4)}{x^2 + 2x - 8} = \lim_{x \to -\infty} \frac{5 - \frac{20}{x^2}}{1 + \frac{2}{x} - \frac{8}{x^2}} = \frac{5}{1} = 5.
\]
Thus \(y = 5\) is the only horizontal asymptote, and it is an asymptote as \(x \to \infty\) and as \(x \to -\infty\).

d. The vertical asymptotes of \(f\) must occur at points where the denominator vanishes which, from part (a), are \(x = 2\) and \(x = -4\). However, the numerator vanishes at \(x = 2\) as well, and
\[
\lim_{x \to 2} \frac{5(x^2 - 4)}{x^2 + 2x - 8} = \lim_{x \to 2} \frac{5(x - 2)(x + 2)}{(x - 2)(x + 4)} = \lim_{x \to 2} \frac{5(x + 2)}{x + 4} = \frac{20}{6} = \frac{10}{3}.
\]
Thus \(x = 2\) is not a vertical asymptote. However, since the denominator approaches zero as \(x \to -4\) while the numerator does not, \(x = -4\) is in fact the only vertical asymptote.

e. From part (d), \(x = 2\), the other excluded point of the domain, is not a vertical asymptote since the limit there is finite. The reason that occurs is that the numerator vanishes there as well.

4. Many answers are possible for all parts of this question.
Chapter 3

Derivatives

3.1 Introducing the Derivative

3.1.1 The secant line through the points \((a, f(a))\) and \((x, f(x))\) for \(x\) near \(a\), of the graph of \(f\), is given by

\[ m_{\text{sec}} = \frac{f(x) - f(a)}{x - a}. \]

As \(x\) approaches \(a\), we obtain the limit

\[ m_{\tan} = \lim_{x \to a} \frac{f(x) - f(a)}{x - a} = \lim_{x \to a} m_{\text{sec}}. \]

3.1.2 The slope of the secant line through the points \((a, f(a))\) and \((x, f(x))\) for \(x\) near \(a\), of the graph of \(f\), is given by

\[ m_{\text{sec}} = f(x) - f(a) \]

\[ x - a. \]

So the slope is the change of \(f\) divided by the length of the interval \([a, x]\) over which the change occurs, that is, the average rate of change of \(f\) over \([a, x]\).

3.1.3 The average rate of change of \(f\) over \([a, x]\) is the slope of the secant line \(m_{\text{sec}} = \frac{f(x) - f(a)}{x - a}\). As \(x\) approaches \(a\), the length of the interval \(x - a\) goes to zero, and in the limit we obtain the instantaneous rate of change of \(f\) at \(a\) given by

\[ m_{\tan} = \lim_{x \to a} \frac{f(x) - f(a)}{x - a}. \]

3.1.4 \(f'\) is the derivative of \(f\). It represents the slope function of \(f\); that is, its value at any point is the slope of the graph of \(f\) at that point.

3.1.5 \(f'(a)\) is the value of the derivative of \(f\) at \(a\). Also, \(f'(a)\) is the slope of the tangent line to the graph of \(f\) at \((a, f(a))\). Furthermore, \(f'(a)\) is the instantaneous rate of change of \(f\) at \(a\).

3.1.6 The slope of the tangent line, the instantaneous rate of change, and the value of the derivative of a function at a given point are all the same.

3.1.7 \(dy \over dx\) is the limit of \(\Delta y \over \Delta x\) and is the rate of change of \(y\) with respect to \(x\).

3.1.8 The derivative of \(f\) with respect to \(x\) can be written as \(f'(x)\) or \(dy \over dx\) or \(D_x(f)\) or \(d \over dx\) (\(f\)).

3.1.9

a. \[ m_{\tan} = \lim_{x \to 3} \frac{x^2 - 5 - 4}{x - 3} = \lim_{x \to 3} \frac{x^2 - 9}{x - 3} = \lim_{x \to 3} \frac{(x-3)(x+3)}{x - 3} = \lim_{x \to 3} (x + 3) = 6. \]

c.

b. Using the point-slope form of the equation of a line, we obtain \(y - 4 = 6(x - 3)\), or \(y = 6x - 14\).

Copyright © 2014 Pearson Education, Inc.
3.1.10

a. \( m_{\text{tan}} = \lim_{x \to 1} \frac{-3x^2 - 5x + 1 - (-7)}{x - 1} = \lim_{x \to 1} \frac{-3x^2 - 5x + 8}{x - 1} = \lim_{x \to 1} \frac{-(3x+8)(x-1)}{x-1} = \lim_{x \to 1} (-3x - 8) = -11. \)

b. Using the point-slope form of the equation of a line, we get \( y + 7 = -11(x - 1), \) or \( y = -11x + 4. \)

3.1.11

a. \( m_{\text{tan}} = \lim_{x \to 1} \frac{-5x+1+4}{x-1} = \lim_{x \to 1} \frac{-5x+5}{x-1} = \lim_{x \to 1} \left( -5 \cdot \frac{x-1}{x-1} \right) = -5. \)

b. Using the point-slope form of the equation of a line, we get \( y + 4 = -5(x - 1), \) which equals \( y = -5x + 1, \) the function itself.

3.1.12

a. \( m_{\text{tan}} = \lim_{x \to 1} \frac{5-5}{x-1} = 0. \)

b. \( y - 5 = 0(x - 1), \) or \( y = 5. \)

3.1.13

a. \( m_{\text{tan}} = \lim_{x \to -1} \frac{1+1}{x+1} = \lim_{x \to -1} \frac{1+x}{x+1} = \lim_{x \to -1} \frac{1}{x} = -1. \)

b. \( y - (-1) = -1(x + 1), \) or \( y = -x - 2. \)

Copyright © 2014 Pearson Education, Inc.
3.1.14

a. \[ m_{\tan} = \lim_{x \to -1} \frac{4 - 4}{x + 1} = \lim_{x \to -1} \frac{4(1-x)(x+1)}{x^2(x+1)} = \lim_{x \to -1} \frac{4(1-x)}{x^2} = 8. \]

b. \[ y - 4 = 8(x + 1), \text{ or } y = 8x + 12. \]

c.

3.1.15

a. One method is to compute the average change from September 2011 to December 2011. This is
\[ \frac{f(12) - f(9)}{12 - 9} = \frac{483 - 457}{3} = \frac{26}{3} \approx 8.667. \]

Another method is to compute the average change from June 2011 to September 2011. This is
\[ \frac{f(9) - f(6)}{9 - 6} = \frac{457 - 417}{3} = \frac{40}{3} \approx 13.333. \]

A third method is to use an interval centered on September 2011, and compute the average change from June 2011 to December 2011. This is
\[ \frac{f(12) - f(6)}{12 - 6} = \frac{483 - 417}{6} = \frac{66}{6} = 11. \]

b. One method is to compute the average change from March 2011 to June 2011. This is
\[ \frac{f(6) - f(3)}{6 - 3} = \frac{417 - 372}{3} = \frac{45}{3} = 15. \]

Another method is to compute the average change from December 2010 to Mar 2011. This is
\[ \frac{f(3) - f(0)}{3 - 0} = \frac{372 - 327}{3} = \frac{45}{3} = 15. \]

A third method is to use an interval centered on Mar 2011, and compute the average change from December 2010 to June 2011. This is
\[ \frac{f(6) - f(0)}{6 - 0} = \frac{417 - 327}{6} = \frac{90}{6} = 15. \]

c. Since this describes the rate of change of daily users, and the table is in terms of millions of users, the units are millions of daily users per month.

d. Since the rate of change in March is approximately 15, the rate of change in June (from Example 2) is between 13 and 15, and the rate of change in September is between 8 and 13, the rate of change of daily users seems to be decreasing.

3.1.16

a. Using the interval from 10:00 to 10:30 gives
\[ \frac{f(10:30) - f(10:00)}{10:30 - 10:00} = \frac{34 - 30}{0.5} = 8. \]
Using the interval from 9:30 to 10:00 gives

\[
f(10:00) - f(9:30) \quad \frac{30 - 27}{0.5} = 6.
\]

Using the interval from 9:30 to 10:30 that is centered on 10:00 gives

\[
f(10:30) - f(9:30) \quad \frac{34 - 27}{1} = 7.
\]

b. Since we measured the denominator in hours, and the numerator is degrees, the units are degrees per hour. (We could also have used minutes in the denominator, in which case the answers would have been \(\frac{1}{60}\)th as large and the units would have been degrees per minute).

c. The corresponding three estimates at 9:30 are

\[
f(10:00) - f(9:30) \quad \frac{30 - 27}{0.5} = 6
\]

\[
f(9:30) - f(9:00) \quad \frac{27 - 25}{0.5} = 4
\]

\[
f(10:00) - f(9:00) \quad \frac{30 - 25}{1} = 5
\]

Since the estimates at 10:00 are around 7 degrees per hour while the estimates at 9:30 are around 5 degree per hour, the temperature is increasing more rapidly at 10:00.

3.1.17
a. \(m_{\tan} = \lim_{h \to 0} \frac{2(0 + h) + 1 - 1}{h} = \lim_{h \to 0} \frac{2h}{h} = 2\).

b. \(y - 1 = 2x\), or \(y = 2x + 1\).

3.1.18
a. \(m_{\tan} = \lim_{h \to 0} \frac{3(1 + h)^2 - 4(1 + h) + 1}{h} = \lim_{h \to 0} \frac{3 + 6h + 3h^2 - 4 - 4h + 1}{h} = \lim_{h \to 0} \frac{3h^2 + 2h}{h} = \lim_{h \to 0} (3h + 2) = 2\).

b. \(y + 1 = 2(x - 1)\), or \(y = 2x - 3\).

3.1.19
a. \(m_{\tan} = \lim_{h \to 0} \frac{(2 + h)^2 - 4 - 0}{h} = \lim_{h \to 0} \frac{4 + 4h + h^2 - 4}{h} = \lim_{h \to 0} (4 + h) = 4\).

b. \(y - 0 = 4(x - 2)\), or \(y = 4x - 8\).

3.1.20
a. \(m_{\tan} = \lim_{h \to 0} \frac{1 + h - 1}{h} = \lim_{h \to 0} \frac{1 - (1 + h)}{(1 + h)h} = \lim_{h \to 0} \frac{-1}{1 + h} = -1\).

b. \(y - 1 = -1(x - 1)\), or \(y = -x + 2\).

3.1.21
a. \(m_{\tan} = \lim_{h \to 0} \frac{(1 + h)^3 - 1}{h} = \lim_{h \to 0} \frac{1 + 3h + 3h^2 + h^3 - 1}{h} = \lim_{h \to 0} \frac{h(3 + 3h + h^2)}{h} = \lim_{h \to 0} (3 + 3h + h^2) = 3\).

b. \(y - 1 = 3(x - 1)\), or \(y = 3x - 2\).

3.1.22
a. \(m_{\tan} = \lim_{h \to 0} \frac{\frac{1}{2h+1} - 1}{h} = \lim_{h \to 0} \frac{\frac{1 - 2h}{2h+1}}{h} = \lim_{h \to 0} \frac{-2h}{h(2h + 1)} = \lim_{h \to 0} \frac{-2}{2h + 1} = -2\).
3.1. INTRODUCING THE DERIVATIVE

b. \( y - 1 = -2x \), or \( y = -2x + 1 \).

3.1.23

a. \( m_{\tan} = \lim_{h \to 0} \frac{\frac{3 - 2(x + h)}{h} - \frac{3 - 2x}{h}}{h} = \lim_{h \to 0} \frac{5 - (3 - 2h + 2)}{15 - 10(h - 1)} = \lim_{h \to 0} \frac{2}{15 - 10(h - 1)} = \frac{2}{25} \).

b. \( y - \frac{1}{5} = \frac{2}{25}(x + 1) \), or \( y = \frac{2}{25}x + \frac{7}{25} \).

3.1.24

a. \( m_{\tan} = \lim_{h \to 0} \frac{\sqrt{h + 2} - 1}{h} = \lim_{h \to 0} \frac{\sqrt{h + 2} - 1}{h(\sqrt{h + 1 + 1})} = \lim_{h \to 0} \frac{h + 1}{h(\sqrt{h + 1} + 1)} = \lim_{h \to 0} \frac{1}{\sqrt{h + 1} + 1} = \frac{1}{7} \).

b. \( y - 1 = \frac{1}{7}(x - 2) \), or \( y = \frac{1}{7}x \).

3.1.25

a. \( m_{\tan} = \lim_{h \to 0} \frac{\sqrt{h + h + 3} - 2}{h} = \lim_{h \to 0} \frac{\sqrt{h + h + 3} - 2}{h(\sqrt{h + 1} + 2)} = \lim_{h \to 0} \frac{4 + 3}{h(\sqrt{h + 1} + 2)} = \lim_{h \to 0} \frac{1}{\sqrt{h + 1} + 2} = \frac{1}{4} \).

b. \( y - 2 = \frac{1}{4}(x - 1) \), or \( y = \frac{1}{4}x + \frac{7}{4} \).

3.1.26

a. \( m_{\tan} = \lim_{h \to 0} \frac{-\frac{2 + h}{2 + h + 1} - 2}{h} = \lim_{h \to 0} \frac{-2 + h - 2(-2 + h + 1)}{(h)(-2 + h + 1)} = \lim_{h \to 0} \frac{-1}{-2 + h + 1} = 1 \).

b. \( y - 2 = (x - 2) \) or \( y = x + 4 \).

3.1.27

a. \( f'(3) = \lim_{h \to 0} \frac{8(-3 + h) + 24}{h} = \lim_{h \to 0} \frac{8h}{h} = 8 \).

b. \( y - (-24) = 8(x + 3) \), or \( y = 8x \).

3.1.28

a. \( f'(3) = \lim_{h \to 0} \frac{(3 + h)^{2} - 9}{h} = \lim_{h \to 0} \frac{(9 + 6h + h^{2}) - 9}{h} = \lim_{h \to 0} \frac{6h + h^{2}}{h} = 6 \).

b. \( y - 9 = 6(x - 3) \), or \( y = 6x - 9 \).

3.1.29

a. \( f'(-2) = \lim_{h \to 0} \frac{4(-2 + h)^{2} + 2(-2 + h) - 12}{h} = \lim_{h \to 0} \frac{16 - 16h + 4h^{2} - 4 + 2h - 12}{h} = \lim_{h \to 0} \frac{-14h + 4h^{2}}{h} = -14 \).

b. \( y - 12 = -14(x + 2) \), or \( y = -14x - 16 \).

3.1.30

a. \( f'(10) = \lim_{h \to 0} \frac{2(10 + h)^{3} - 2000}{h} = \lim_{h \to 0} \frac{2(1000 + 300h + 30h^{2} + h^{3}) - 2000}{h} = \lim_{h \to 0} \frac{600 + 60h + 2h^{2}}{h} = 600 \).

b. \( y - 2000 = 600(x - 10) \), or \( y = 600x - 4000 \).

Copyright © 2014 Pearson Education, Inc.
3.1.31

\[ f'(\frac{1}{4}) = \lim_{h \to 0} \frac{\sqrt{\frac{1}{4} + h} - 2}{h} \]
\[ = \lim_{h \to 0} \frac{1 - 2\sqrt{\frac{1}{4} + h}}{h\sqrt{\frac{1}{4} + h}} \]
\[ = \lim_{h \to 0} \frac{(1 - 2\sqrt{\frac{1}{4} + h})(1 + 2\sqrt{\frac{1}{4} + h})}{h\sqrt{\frac{1}{4} + h}(1 + 2\sqrt{\frac{1}{4} + h})} \]
\[ = \lim_{h \to 0} \frac{1 - 4\left(\frac{1}{4} + h\right)}{h\sqrt{\frac{1}{4} + h}(1 + 2\sqrt{\frac{1}{4} + h})} \]
\[ = \lim_{h \to 0} \frac{-4}{h\sqrt{\frac{1}{4} + h}(1 + 2\sqrt{\frac{1}{4} + h})} \]
\[ = -4. \]

b. \( y - 2 = -4\left(x - \frac{1}{4}\right) \), or \( y = -4x + 3 \).

3.1.32

a. \( f'(1) = \lim_{h \to 0} \frac{1 - (1 + h)^2}{h(1 + h)^2} = \lim_{h \to 0} \frac{1 - 1 - 2h - h^2}{h(1 + h)^2} = \lim_{h \to 0} \frac{-2 - h}{h(1 + h)^2} = -2. \)

b. \( y - 1 = -2(x - 1) \), or \( y = -2x + 3 \).

3.1.33

a. \( f'(4) = \lim_{h \to 0} \frac{\sqrt{2(4+h) + 1} - 3}{h} = \lim_{h \to 0} \frac{\sqrt{9 + 2h} - 3}{\sqrt{9 + 2h} + 3} = \lim_{h \to 0} \frac{9 + 2h - 9}{h(\sqrt{9 + 2h} + 3)} = \lim_{h \to 0} \frac{2}{\sqrt{9 + 2h} + 3} = \frac{1}{3}. \)

b. \( y - 3 = \frac{1}{3}(x - 4) \), or \( y = \frac{1}{3}x + \frac{5}{3} \).

3.1.34

a. \( f'(12) = \lim_{h \to 0} \frac{\sqrt{3(12+h) - 6}}{h} = \lim_{h \to 0} \frac{\sqrt{36 + 3h} - 6}{h} = \lim_{h \to 0} \frac{36 + 3h - 36}{h(\sqrt{36 + 3h} + 6)} = \lim_{h \to 0} \frac{3}{\sqrt{36 + 3h} + 6} = \frac{1}{4}. \)

b. \( y - 6 = \frac{1}{4}(x - 12) \), or \( y = \frac{1}{4}x + 3 \).

3.1.35

a. \( f'(5) = \lim_{h \to 0} \frac{\sqrt{5+h} - 1}{h} = \lim_{h \to 0} \frac{10 - (10 + h)}{10h(10 + h)} = \lim_{h \to 0} \frac{-1}{10(10 + h)} = -\frac{1}{100}. \)

b. \( y - \frac{1}{10} = -\frac{1}{100}(x - 5) \), or \( y = -\frac{1}{100}x + \frac{1}{20} \).

3.1.36

a. \( f'(2) = \lim_{h \to 0} \frac{\sqrt{2+h} - 1}{h} = \lim_{h \to 0} \frac{5 - (3(2+h) - 1)}{3h(3(2+h) - 1)} = \lim_{h \to 0} \frac{-3h}{3h(3h + 3h)} = \lim_{h \to 0} \frac{-3}{3(3h + 3h)} = -\frac{1}{25}. \)

b. \( y - \frac{1}{5} = -\frac{1}{25}(x - 2) \), or \( y = -\frac{1}{25}x + \frac{11}{25} \).

3.1.37

a. \( f'(x) = \lim_{h \to 0} \frac{3(x + h)^2 + 2(x + h) - 10 - (3x^2 + 2x - 10)}{h} \]
\[ = \lim_{h \to 0} \frac{3x^2 + 6xh + 3h^2 + 2x + 2h - 10 - 3x^2 - 2x + 10}{h} \]
\[ = \lim_{h \to 0} \frac{6xh + 2h + 3h^2}{h} = \lim_{h \to 0} (6x + 2 + 3h) = 6x + 2. \)
b. We have \( f'(1) = 8 \), and the tangent line is given by \( y + 5 = 8(x - 1) \), or \( y = 8x - 13 \).

c.

\[ f'(x) = \lim_{h \to 0} \frac{3(x + h)^2 - 3x^2}{h} = \lim_{h \to 0} \frac{3x^2 + 6xh + 3h^2 - 3x^2}{h} = \lim_{h \to 0} (6x + 3h) = 6x. \]

b. We have \( f'(0) = 0 \), and the tangent line is given by \( y - 0 = 0(x - 0) \), so \( y = 0 \).

c.

\[ f'(x) = \lim_{h \to 0} \frac{5(x + h)^2 - 6(x + h) + 1 - (5x^2 - 6x + 1)}{h} \]
\[ = \lim_{h \to 0} \frac{5x^2 + 10xh + 5h^2 - 6x - 6h - 5x^2 + 6x}{h} \]
\[ = \lim_{h \to 0} \frac{10xh + 5h^2 - 6h}{h} \]
\[ = \lim_{h \to 0} (10x + 5h - 6) = 10x - 6. \]

b. We have \( f'(2) = 14 \), so the tangent line is given by \( y - 9 = 14(x - 2) \), or \( y = 14x - 19 \).
3.1.40

a. 
\[ f'(x) = \lim_{h \to 0} \frac{1 - (x + h)^2 - (1 - x^2)}{h} \]
\[ = \lim_{h \to 0} \frac{1 - (x^2 + 2xh + h^2) - 1 + x^2}{h} \]
\[ = \lim_{h \to 0} \frac{-2xh - h^2}{h} \]
\[ = \lim_{h \to 0} (-2x - h) = -2x. \]

b. We have \( f'(-1) = 2 \), so the tangent line is given by \( y = 2x + 2 \).

c. 

3.1.41

a. 
\[ \frac{d}{dx} (ax^2 + bx + c) = \lim_{h \to 0} \frac{a(x + h)^2 + b(x + h) + c - (ax^2 + bx + c)}{h} \]
\[ = \lim_{h \to 0} \frac{ax^2 + 2axh + ah^2 + bx + bh + c - ax^2 - bx - c}{h} \]
\[ = \lim_{h \to 0} \frac{2axh + ah^2 + bh}{h} \]
\[ = \lim_{h \to 0} (2ax + ah + b) = 2ax + b. \]

b. With \( a = 4, b = -3, \) and \( c = 10 \) we have
\[ f'(x) = \frac{d}{dx} (4x^2 - 3x + 10) = 2 \cdot 4 \cdot x + (-3) = 8x - 3. \]
c. From part (b), \( f'(1) = 8 \cdot 1 - 3 = 5 \).

3.1.42

a.
\[
\frac{d}{dx} \sqrt{ax+b} = \lim_{h \to 0} \frac{\sqrt{a(x+h)+b} - \sqrt{ax+b}}{h}
= \lim_{h \to 0} \frac{(\sqrt{a(x+h)+b} - \sqrt{ax+b})(\sqrt{a(x+h)+b} + \sqrt{ax+b})}{h(\sqrt{a(x+h)+b} + \sqrt{ax+b})}
= \lim_{h \to 0} \frac{a(x+h) + b - (ax+b)}{h(\sqrt{a(x+h)+b} + \sqrt{ax+b})}
= \lim_{h \to 0} \frac{a}{h}\frac{ax + ah + b - ax - b}{\sqrt{a(x+h)+b} + \sqrt{ax+b}}
= \lim_{h \to 0} \frac{a}{2\sqrt{ax+b}}
\]
provided \( ax + b > 0 \).

b. With \( a = 5 \) and \( b = 9 \), we have \( \frac{d}{dx} \sqrt{5x+9} = \frac{5}{2\sqrt{5(x+9)}} \).

c. From part (b), \( f'(−1) = \frac{5}{2\sqrt{5(-1)+9}} = \frac{5}{2\sqrt{4}} = \frac{5}{4} \).

3.1.43 \( m_{\tan} = \lim_{h \to 0} \frac{\frac{1}{\sqrt{x+h}+\frac{1}{h}} - \frac{1}{\sqrt{x}}} {\frac{1}{h}} = \lim_{h \to 0} \frac{\frac{2-2(1+h)} {\frac{1}{h}(1+2h)^2}} = \lim_{h \to 0} \frac{1}{2+4h} = -\frac{1}{4} \).

3.1.44
\[
m_{\tan} = \lim_{h \to 0} \frac{2 + h - (2 + h)^2 - (2 - 4)}{h}
= \lim_{h \to 0} \frac{2 + h - 4h - h^2 + 2}{h}
= \lim_{h \to 0} \frac{-3h - h^2}{h}
= \lim_{h \to 0} (-3 - h) = -3.
\]

3.1.45
\[
m_{\tan} = \lim_{h \to 0} \frac{2\sqrt{25+h} - 1 - (2\sqrt{25} - 1)}{h}
= \lim_{h \to 0} \frac{2(\sqrt{25+h} - \sqrt{25})}{h}
= \lim_{h \to 0} \frac{2(\sqrt{25+h} - \sqrt{25})(\sqrt{25+h} + \sqrt{25})} {h(\sqrt{25+h} + \sqrt{25})}
= \lim_{h \to 0} \frac{2(25+h - 25)} {h(\sqrt{25+h} + \sqrt{25})}
= \lim_{h \to 0} \frac{2}{\sqrt{25+h} + \sqrt{25}}
= \frac{1}{5}.
\]
3.1.46  \( m_{\tan} = \lim_{h \to 0} \frac{\pi(3+h)^2 - 9\pi}{h} = \lim_{h \to 0} \frac{\pi(9+6h+h^2) - 9\pi}{h} = \lim_{h \to 0} \frac{6\pi h + \pi h^2}{h} = \lim_{h \to 0} (6\pi + \pi h) = 6\pi. \)

3.1.47  

a. True. Because the graph is a line, any secant line has the same graph as the function and thus the same slope.

b. False. For example, take \( f(x) = x^2, \) \( P = (0,0) \) and \( Q = (1,1). \) Then the secant line has slope \( m_{\sec} = \frac{1-0}{1-0} = 1, \) but the the graph has a horizontal tangent at \( P \) so \( m_{\tan} = 0 \) and \( m_{\sec} > m_{\tan}. \)

c. True. \( m_{\sec} = \frac{(x+h)^2-x^2}{h} = \frac{2xh+h^2}{h} = 2x + h, \) while \( m_{\tan} = \lim_{h \to 0} (2x+h) = 2x. \) Since we assume that \( h > 0, \) we have \( m_{\sec} = 2x + h > 2x = m_{\tan}. \)

3.1.48  \( m_{\tan} = \lim_{h \to 0} \frac{m(x+h)+b-(mx+b)}{h} = \lim_{h \to 0} \frac{m}{h} = m. \) Thus the derivative has the same value as the slope of the line and the graph and formula of the tangent line are the same as those of the function, namely \( mx + b. \)

3.1.49  

a. 
\[
f'(x) = \lim_{h \to 0} \frac{\sqrt{3(x+h) + 1} - \sqrt{3x+1}}{h} = \lim_{h \to 0} \frac{\sqrt{3(x+h) + 1} - \sqrt{3x+1}}{h} \cdot \frac{\sqrt{3x+3h+1} + \sqrt{3x+1}}{\sqrt{3x+3h+1} + \sqrt{3x+1}} = \lim_{h \to 0} \frac{3x + 3h + 1 - 3x - 1}{h(\sqrt{3x+3h+1} + \sqrt{3x+1})} = \lim_{h \to 0} \frac{3}{\sqrt{3x+3h+1} + \sqrt{3x+1}} = \frac{3}{2\sqrt{3x+1}}.
\]

b. We have \( f'(8) = \frac{3}{10}. \) Using the point-slope form, we get that the tangent line has equation \( y - 5 = \frac{3}{10}(x - 8), \) which can be written as \( y = \frac{3}{10}x + \frac{13}{5}. \)

3.1.50  

a. 
\[
f'(x) = \lim_{h \to 0} \frac{\sqrt{x+h+2} - \sqrt{x+2}}{h} = \lim_{h \to 0} \frac{\sqrt{x+h+2} - \sqrt{x+2}}{h} \cdot \frac{\sqrt{x+h+2} + \sqrt{x+2}}{\sqrt{x+h+2} + \sqrt{x+2}} = \lim_{h \to 0} \frac{x + h + 2 - x - 2}{h(\sqrt{x+h+2} + \sqrt{x+2})} = \lim_{h \to 0} \frac{1}{\sqrt{x+h+2} + \sqrt{x+2}} = \frac{1}{2\sqrt{x+2}}.
\]

b. We have \( f'(7) = \frac{1}{6}. \) Using the point-slope form, we get that the tangent line has equation \( y - 3 = \frac{1}{6}(x - 7), \) or \( y = \frac{1}{6}x + \frac{11}{6}. \)

3.1.51  

a. \( f'(x) = \lim_{h \to 0} \frac{\frac{x^2}{h} - \frac{x^2}{h}}{h} = \lim_{h \to 0} \frac{6x+2-(6x+6h+2)}{h(3x+1)(3x+3h+1)} = \lim_{h \to 0} \frac{-6h}{h(3x+1)(3x+3h+1)} = -\frac{6}{(3x+1)^2}. \)

b. We have \( f'(-1) = -\frac{3}{2}. \) Using the point-slope form, we get that the tangent line has equation \( y + 1 = -\frac{3}{2}(x+1), \) which can be written as \( y = -\frac{3}{2}x + \frac{1}{2}. \)

3.1.52  

a. \( f'(x) = \lim_{h \to 0} \frac{x - \frac{1}{h}}{h} = \lim_{h \to 0} \frac{x - x + h}{h(x+h)} = \lim_{h \to 0} \frac{-1}{x^2+h} = -\frac{1}{x^2}. \)

b. We have \( f'(-5) = -\frac{1}{25}. \) Using the point-slope form, we get that the tangent line has equation \( y + \frac{1}{5} = -\frac{1}{25}(x + 5), \) which can be written as \( y = -\frac{1}{25}x - \frac{2}{5}. \)

Copyright © 2014 Pearson Education, Inc.
3.1.53
a. At \( C \) and \( D \), the slope of the tangent line (and thus of the curve) is negative.
b. At \( A, B, \) and \( E \), the slope of the curve is positive.
c. The graph is in its steepest ascent at \( A \) followed by \( B \). At \( E \) it barely increases, at \( D \) it slightly decreases and at \( C \) it is decreasing the most, so the points in decreasing order of slope are \( A, B, E, D, C \).

3.1.54
a. The graph of the function has negative slope to the right of the vertical axis so the slope is negative at \( D \) and \( E \).
b. The graph of the function has positive slope to the left of the vertical axis so the slope is positive at \( A, B, C \).
c. The slope at \( D \) and \( E \) is negative, with a slightly larger absolute value at \( D \). The slope at \( A \) and \( C \) is about equal and positive, and the slope is steepest at \( B \). So the order is \( B, A, C, E, D \), where \( A \) and \( C \) could be switched.

3.1.55
a. From the graph we approximate the derivative by the slope of a secant line: the tangent line to the graph at \( x = 10 \) appears to go through \((8, 250)\) and \((18, 350)\), so the slope of the tangent, which is \( P'(t) = \frac{350 - 250}{18 - 8} = 10 \) kWh per hour, or 10 kW. Similarly, the tangent to the graph at \( x = 20 \) appears to go through \((18, 350)\) and \((23, 325)\), so \( P'(t) \approx \frac{325 - 350}{23 - 18} = -5 \) kWh per hour, or \(-5\) kW.
b. The power is zero where the graph of \( E(t) \) has a horizontal tangent line, which happens approximately at \( t = 6 \) hours and \( t = 18 \) hours.
c. The power has a maximum where the graph of \( E(t) \) has the steepest increase, which is approximately at \( t = 12 \) hours.

3.1.56
a. The average rate of growth is the slope of the secant line between \( t = 20 \) and \( t = 30 \) so \( m_{sec} = \frac{528,000 - 304,744}{30 - 20} \approx 22,326 \), which means that the average population growth is a bit over 22,000 people per year (Census data only provide estimates; there is no use in calculating more accurately).
b. Drawing the secant line from part a) and the approximate tangent line for 1975 (corresponding to \( t = 25 \)), we see that they have about the same slope.
c. The average is given by \( m_{sec} = \frac{1,563,282 - 852,737}{50 - 40} \approx 71,055 \), so Las Vegas is growing at a rate of approximately 71,100 people per year. This is an underestimate of the growth rate in 2000 as the slope of the graph keeps increasing.

3.1.57 Consider \( a = 2 \) and \( f(x) = \frac{1}{x+1} \). Then
\[
f'(2) = \lim_{x \to 2} \frac{f(x) - f(2)}{x - 2} = \lim_{x \to 2} \frac{1}{x+1} - \frac{1}{3},
\]
as required. Further, we have
\[
f'(2) = \lim_{x \to 2} \frac{1}{x+1} - \frac{1}{3} = \lim_{x \to 2} \frac{3 - (x + 1)}{(x - 2)3(x + 1)} = \lim_{x \to 2} \frac{-(x-2)}{(x-2)3(x+1)} = \lim_{x \to 2} \frac{-1}{3(x+1)} = -\frac{1}{9}.
\]

3.1.58 Consider \( a = 2 \) and \( f(x) = \sqrt{x} \). Then
\[
f'(2) = \lim_{h \to 0} \frac{f(2 + h) - f(2)}{h} = \lim_{h \to 0} \frac{\sqrt{2 + h} - \sqrt{2}}{h},
\]
Copyright © 2014 Pearson Education, Inc.
as required. Further, we have

\[
f'(2) = \lim_{h \to 0} \frac{\sqrt{2 + h} - \sqrt{2}}{h} = \lim_{h \to 0} \frac{(\sqrt{2 + h} - \sqrt{2})(\sqrt{2 + h} + \sqrt{2})}{h(\sqrt{2 + h} + \sqrt{2})} = \lim_{h \to 0} \frac{2 + h - 2}{h(\sqrt{2 + h} + \sqrt{2})} = \lim_{h \to 0} \frac{1}{\sqrt{2 + h} + \sqrt{2}} = \frac{1}{2\sqrt{2}}.
\]

3.1.59 Consider \( a = 2 \) and \( f(x) = x^4 \). Then

\[
f'(2) = \lim_{h \to 0} \frac{f(2 + h) - f(2)}{h} = \lim_{h \to 0} \frac{(2 + h)^4 - 16}{h},
\]
as required. Further, we have

\[
f'(2) = \lim_{h \to 0} \frac{(2 + h)^4 - 16}{h} = \lim_{h \to 0} \frac{16 + 32h + 24h^2 + 8h^3 + h^4 - 16}{h} = \lim_{h \to 0} \frac{h(32 + 24h + 8h^2 + h^3)}{h} = \lim_{h \to 0} (32 + 24h + 8h^2 + h^3) = 32.
\]

3.1.60 Consider \( a = 1 \) and \( f(x) = 3x^2 + 4x \). Then

\[
f'(1) = \lim_{x \to 1} \frac{f(x) - f(1)}{x - 1} = \lim_{x \to 1} \frac{3x^2 + 4x - 7}{x - 1},
\]
as desired. Further, we have

\[
f'(1) = \lim_{x \to 1} \frac{3x^2 + 4x - 7}{x - 1} = \lim_{x \to 1} \frac{(x - 1)(3x + 7)}{x - 1} = \lim_{x \to 1} (3x + 7) = 10.
\]

3.1.61 It is not differentiable at \( x = 2 \). The denominator of \( f \) is zero when \( x = 2 \), so \( f \) is not defined at \( x = 2 \), hence it cannot be differentiable there.

3.1.62

a. \( f'(x) = 2x \)

b. \( f'(x) = 3x^2 \)

c. \( f'(x) = 4x^3 \)

d. \( f'(x) = nx^{n-1} \).

3.1.63 In order for \( f \) to be differentiable at \( x = 1 \), it would need to be continuous there. Thus, \( \lim_{x \to 1^-} f(x) = \lim_{x \to 1^+} f(x) = ax - 2 = a - 2 \), so the only possible value for \( a \) is 4. Next, the slopes of the curves on the two sides of \( x = 1 \) must match; this means that the derivative of \( g(x) = 2x^2 \) at \( x = 1 \) must equal the derivative of \( h(x) = 4x - 2 \) at \( x = 1 \). Computing the derivatives gives

\[
g'(1) = \lim_{x \to 1} \frac{g(x) - g(1)}{x - 1} = \lim_{x \to 1} \frac{2x^2 - 2}{x - 1} = \lim_{x \to 1} \frac{2(x + 1)}{1} = 4
\]

\[
h'(1) = \lim_{x \to 1} \frac{h(x) - h(1)}{x - 1} = \lim_{x \to 1} \frac{4x - 2}{x - 1} = \lim_{x \to 1} 4 = 4,
\]
so \( f \) is differentiable at 1 for \( a = 4 \).
3.2 Working with the Derivative

3.2.1 \( f(x) \) refers to the value of the function at \( x \), while \( f'(x) \) refers to the slope of the graph. If the function is positive and increasing, such as \( f(x) = x^2 \) for \( x = 2 \), then \( f(x) > 0 \) and \( f'(x) > 0 \). But if the function is positive and decreasing, such as \( f(x) = x^2 \) for \( x = -2 \), then \( f(x) > 0 \) and \( f'(x) < 0 \).

3.2.2 \( f(x) \) refers to the value of the function at \( x \), while \( f'(x) \) refers to the slope of the graph. If the function is decreasing and positive, such as \( f(x) = -x^3 \) for \( x = -2 \), then \( f'(x) < 0 \) and \( f(x) > 0 \). But if the function is decreasing and negative, such as \( f(x) = -x^3 \) for \( x = 2 \), then \( f'(x) < 0 \) and \( f(x) < 0 \) as well.

3.2.3 Yes, differentiable functions are continuous by Theorem 3.1.

3.2.4 No, there are continuous functions which are not differentiable. For example \( f(x) = |x| \) is continuous everywhere but the graph of \( f \) has a corner at \( a = 0 \), and thus \( f \) is not differentiable at \( a = 0 \).

3.2.5

The function \( f \) is not differentiable at \( x = -2, 0, 2 \), so \( f' \) is not defined at those points. Elsewhere, the slope is constant.

3.2.6

The function \( f \) is not differentiable at \( x = 1 \) so \( f' \) is not defined there. Elsewhere, the slope is constant.

3.2.7 (c) is the only line with negative slope, so it corresponds to derivative (A). Since (d) contains the points \((2, 0)\) and \((0, -1)\), it has slope \( \frac{1}{2} \), so it corresponds to derivative (B). Finally, lines (a) and (b) are parallel; since (b) contains the points \((0, 1)\) and \((-1, 0)\), it has slope 1, so that (a) has slope 1 as well. They both correspond to derivative (C).

3.2.8 Note that (A) and (C) have positive slope, while (B) and (D) have negative slope. Since (a) is the largest positive derivative, it corresponds to (A), which has larger slope than (B). Thus (b), the other positive derivative, corresponds to (C). Since (d) is the negative derivative of largest magnitude, it corresponds to (D), since the slope of (D) has larger magnitude than that of (B). So (c), the other negative derivative, corresponds to (B).

3.2.9

a. The function has non-negative slope everywhere, and as there is a horizontal tangent at \( x = 0 \), so the derivative has to be zero at zero. The graph of the derivative has to be above the x-axis and touching it at \( x = 0 \), so (D) is the graph of the derivative.

b. The graph of this function has three horizontal tangent lines, at \( x = -1, 0, 1 \), and the matching graph of the derivative with three zeros is (C).
c. The function has negative slope on \((-1, 0)\), and positive slope on \((0, 1)\) and has a horizontal tangent at \(x = 0\), so the derivative has to be negative on \((-1, 0)\), positive on \((0, 1)\) and zero at \(x = 0\); the graph is (B).

d. The function has negative slope everywhere so the graph of the derivative has to be negative everywhere, which is graph (A).

### 3.2.10

The function has a positive slope for \(x < 1\) and a negative slope for \(x > 1\), and a horizontal tangent line at \(x = 1\).

### 3.2.11

The function always has non-negative slope, so the derivative is never below the \(x\) axis. However, it does have slope zero at about \(x = 2\).

### 3.2.12

The slope increases until the function crosses the \(y\) axis at \(x = 0\), and then the slope is still positive, but decreases.

### 3.2.13

Note that \(f\) is undefined at \(x = -2\) and \(x = 1\), but is differentiable elsewhere. It is decreasing, and increasingly rapidly, as \(x\) increases towards \(x = -2\). It decreases, but increasingly slowly, and towards a zero slope, as \(x\) increases from 1 towards \(\infty\). Finally, between \(x = -2\) and \(x = 1\), the function increases, but increasingly slowly, until \(x = 0\) and then decreases, but increasingly rapidly, as \(x\) approaches 1. A graph of the derivative is
3.2.14 Note that $f$ is undefined at $x = -1$ and $x = 0$, but is differentiable elsewhere. It is decreasing everywhere it is defined. On $(-\infty, -1)$, it decreases increasingly rapidly as $x \to -1$, while on $(-1, 0)$ it decreases more and more slowly from a very large negative slope as $x \to 0$, until it is almost flat near $x = 0$. Finally, on $(0, \infty)$, it decreases more and more slowly from a very large negative slope and approaches a zero slope as $x \to \infty$. A graph of the derivative is

3.2.15

a. The function $f$ is not continuous at $x = 1$, because the graph has a jump there.

b. The function $f$ is not differentiable at $x = 1$ because it is not continuous at that point (Theorem 3.1 Alternate Version), and it is also not differentiable at $x = 2$ because the graph has a corner there.

c. 

3.2.16

a. The function $g$ is not defined at $x = 1$, because the graph has a hole there.

b. The function $g$ is not differentiable at $x = 1$ because it is not defined at that point, and it is also not differentiable at $x = 2$ because the graph has a cusp there.

c. 

3.2.17 

b. True. A graph of $f(x)$ is
Clearly $f$ is continuous everywhere, since the lines continue forever to the left and right, but it is not differentiable at $x = -1$ since it has a “corner” there, so there is no well-defined tangent.

c. False. If $f'(a)$ exists, then $f$ is differentiable at $x = a$, so it is surely defined there. Thus the domain of $f$ must include $a$. Similarly, if $f'(b)$ exists, then the domain of $f$ must include $b$.

3.2.18 $f'(x) = 2$ means that the slope of the graph of $f$ is always 2. So any line with slope 2 is a possible $f(x)$. The first graph below is the graph of $f'(x)$; the second contains three possible graphs for $f(x)$:

3.2.19 Because $f'(x) = x$ is negative for $x < 0$ and positive for $x > 0$, we see that the graph of $f$ has to have negative slope on $(-\infty, 0)$ and positive slope on $(0, \infty)$ and has to have a horizontal tangent at $x = 0$. Because $f'$ only gives us the slope of the tangent line and not the actual value of $f$, there are infinitely many graphs possible; they all have the same shape, but are shifted along the $y$–axis. The first graph below is the graph of $f'(x)$; the second contains three possible graphs for $f(x)$:
3.2.20

Because the derivative is constant on \((-\infty, 0), (0, 1)\) and \((1, \infty)\), the graph of \(f\) has to consist of pieces of straight lines on these intervals. There are infinitely many possible functions \(f\) that have \(f'\) for its derivative. Because \(f\) is assumed to be continuous, each possible \(f\) is a shift, up or down, of another possible \(f\).

3.2.21 With \(f(x) = 3x - 4\), we have

\[
f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} = \lim_{h \to 0} \frac{3(x + h) - 4 - (3x - 4)}{h} = \lim_{h \to 0} \frac{3h}{h} = \lim_{h \to 0} 3 = 3.
\]

So at \((1, -1)\), the slope of the tangent is \(f'(1) = 3\). Since perpendicular lines have negative reciprocal slopes, the slope of the normal line at \((1, -1)\) is \(-\frac{1}{3}\), and thus its equation is

\[
y - (-1) = \frac{1}{3}(x - 1), \quad \text{or} \quad y = -\frac{1}{3}x - \frac{2}{3}.
\]

3.2.22 With \(f(x) = \sqrt{x}\), we have

\[
f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} = \lim_{h \to 0} \frac{\sqrt{x + h} - \sqrt{x}}{h} = \lim_{h \to 0} \frac{(\sqrt{x + h} - \sqrt{x})(\sqrt{x + h} + \sqrt{x})}{h(\sqrt{x + h} + \sqrt{x})} = \lim_{h \to 0} \frac{x + h - x}{h(\sqrt{x + h} + \sqrt{x})} = \lim_{h \to 0} \frac{1}{\sqrt{x + h} + \sqrt{x}} = \frac{1}{2\sqrt{x}}.
\]

So at \((4, 2)\), the slope of the tangent is \(f'(4) = \frac{1}{2\sqrt{4}} = \frac{1}{4}\). Since perpendicular lines have negative reciprocal slopes, the slope of the normal line at \((4, 2)\) is \(-4\). So its equation is

\[
y - 2 = -4(x - 4) = -4x + 16, \quad \text{or} \quad y = -4x + 18.
\]
3.2.23 With $f(x) = \frac{2}{x}$, we have

$$f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} = \lim_{h \to 0} \frac{\frac{2}{x+h} - \frac{2}{x}}{h} = \lim_{h \to 0} \frac{2x - 2(x + h)}{hx(x + h)} = \lim_{h \to 0} \frac{-2h}{hx(x + h)} = \lim_{h \to 0} \left( -\frac{2}{x(x + h)} \right) = -\frac{2}{x^2}.$$

So at $(1, 2)$, the slope of the tangent is $f'(1) = -\frac{2}{1^2} = -2$. Since perpendicular lines have negative reciprocal slopes, the slope of the normal line at $(1, 2)$ is $\frac{1}{2}$. So its equation is

$$y - 2 = \frac{1}{2}(x - 1) = \frac{1}{2}x - \frac{1}{2}, \quad \text{or} \quad y = \frac{1}{2}x + \frac{3}{2}.$$

3.2.24 With $f(x) = x^2 - 3x$, we have

$$f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} = \lim_{h \to 0} \frac{(x + h)^2 - 3(x + h) - (x^2 - 3x)}{h} = \lim_{h \to 0} \frac{2xh + h^2 - 3h}{h} = \lim_{h \to 0} (2x - 3 + h) = 2x - 3.$$

So at $(3, 0)$, the slope of the tangent is $f'(3) = 2 \cdot 3 - 3 = 3$. Since perpendicular lines have negative reciprocal slopes, the slope of the normal line at $(3, 0)$ is $-\frac{1}{3}$. So its equation is

$$y - 0 = -\frac{1}{3}(x - 3) = -\frac{1}{3}x + 1, \quad \text{or} \quad y = -\frac{1}{3}x + 1.$$

3.2.25

a. [Diagram]

b. $f'_+ (2) = \lim_{h \to 0^+} \frac{|2+h-2|-0}{h} = \lim_{h \to 0^+} \frac{h}{h} = 1$, because for $h > 0$, we have $|h| = h$. Similarly, $f'_- (2) = \lim_{h \to 0^-} \frac{|2+h-2|-0}{h} = \lim_{h \to 0^-} \frac{-h}{h} = -1$, because for $h < 0$, we have $|h| = -h$.

c. Because $f$ is defined at $a = 2$ and the graph of $f$ does not jump, $f$ is continuous at $a = 2$. Because the left-hand and right-hand derivatives are not equal, $f$ is not differentiable at $a = 2$. 

Copyright © 2014 Pearson Education, Inc.
3.2. WORKING WITH THE DERIVATIVE

3.2.26

b. Assuming the point \( a = 1 \), we get

\[
    f'_+(1) = \lim_{{h \to 0^+}} \frac{2(1 + h) + 1 - 3}{h} = \lim_{{h \to 0^+}} \frac{2h}{h} = 2.
\]

Similarly,

\[
    f'_-(1) = \lim_{{h \to 0^-}} \frac{4 - (1 + h)^2 - 3}{h} = \lim_{{h \to 0^-}} \frac{-2h - h^2}{h} = -2.
\]

c. Because \( f \) is defined at \( a = 1 \) and the graph of \( f \) does not jump, \( f \) is continuous at \( a = 1 \). Because the left-hand and right-hand derivatives are not equal, \( f \) is not differentiable at \( a = 1 \).

3.2.27

a.

The graph has a vertical tangent at \( x = 2 \).

b.

The graph has a vertical tangent at \( x = -1 \).

c.

The graph has a vertical tangent at \( x = 4 \).
d. The graph has a vertical tangent at \( x = 0 \).

3.2.28

a. This graph has \( \lim_{x \to a^-} f'(x) = \lim_{x \to a^+} f'(x) = +\infty \), where \( a = 0 \).

b. This graph has \( \lim_{x \to a^-} f'(x) = +\infty \) and \( \lim_{x \to a^+} f'(x) = -\infty \), where \( a = 0 \).

c. This graph has \( \lim_{x \to a^-} f'(x) = -\infty \) and \( \lim_{x \to a^+} f'(x) = +\infty \), where \( a = 0 \).
3.2. WORKING WITH THE DERIVATIVE 183

d. This graph has \( \lim_{x \to a^-} f'(x) = -\infty \) and \( \lim_{x \to a^+} f'(x) = -\infty \), where \( a = 0 \).

3.2.29 We have \( f'(x) = \frac{1}{3}x^{-2/3} \), and \( \lim_{x \to 0} f'(x) = \frac{1}{3} \lim_{x \to 0} x^{-2/3} = \infty \). Thus the graph of \( f \) has a vertical tangent at \( x = 0 \).

3.2.30

a. This circle has vertical tangents at \( x = 3 \) and at \( x = -3 \).

b. This circle has vertical tangents at \( x = -2 \) and \( x = 0 \).
3.2.31  

a. The graph is

b. For \( x < 0 \), we have
\[
 f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} = \lim_{h \to 0} \frac{x + h - x}{h} = \lim_{h \to 0} \frac{h}{h} = \lim_{h \to 0} 1 = 1, 
\]
so that \( f'(x) = 1 \) for \( x < 0 \).

c. For \( x > 0 \), we have
\[
 f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} = \lim_{h \to 0} \frac{x + h + 1 - (x + 1)}{h} = \lim_{h \to 0} \frac{h}{h} = \lim_{h \to 0} 1 = 1, 
\]
so that \( f'(x) = 1 \) for \( x > 0 \).

d. Even though \( f'(x) = 1 \) for \( x > 0 \) and for \( x < 0 \), we know that \( f \) is not differentiable at 0 since it is not continuous there.

3.2.32  

a.  

b. It appears that \( \frac{d}{dx} \sin x = \cos x \).

3.3  Rules of Differentiation

3.3.1  Often the limit definition of \( f' \) is difficult to compute, especially for functions which are reasonably complicated. The rules for differentiation allow us to easily compute the derivatives of complex functions.

3.3.2  It is shown to be valid for all positive integers \( n \). In future sections we will see that it holds for all real numbers.

3.3.3  The functions \( f(x) = Ce^x \) with \( C \neq 0 \) are the only functions with this property.

3.3.4  The sum rule tells us that the derivative of \( f + g \) is \( f' + g' \). That is, the derivative of the sum of two functions is the sum of the derivatives of those functions.
3.3.5 By the constant multiple rule, the derivative of the function $cf$ where $c$ is a constant and $f$ is a function is $cf'$. That is, the derivative of a constant times a function is that same constant times the derivative of the function.

3.3.6 The 5th derivative of a function is found by differentiating the 4th derivative of the function. The 4th derivative is found by differentiating the 3rd derivative of the function, and so on. Thus, one would need to compute $f'$ and then four more derivatives to arrive at the 5th derivative of $f$.

3.3.7 By the power rule, $g' = 5x^{5-1} = 5x^4$.

3.3.8 By the power rule, $f'(t) = 11t^{11-1} = 11t^{10}$.

3.3.9 By the constant rule, $f'(x) = 0$.

3.3.10 By the constant rule, $g'(x) = 0$. (Note that $e^3$ is a constant; its value does not depend on $x$).

3.3.11 By the power rule $h'(t) = 1t^{1-1} = t^0 = 1$.

3.3.12 By the power rule, $f'(v) = 100v^{100-1} = 100v^{99}$.

3.3.13 By the constant multiple rule and the power rule, $f'(x) = 5 \cdot \frac{d}{dx} x^3 = 5 \cdot 3x^2 = 15x^2$.

3.3.14 By the constant multiple and power rules, $g'(w) = \frac{5}{6} \cdot \frac{d}{dw} w^{12} = \frac{5}{6} \cdot 12w^{11} = 10w^{11}$.

3.3.15 By the constant multiple and power rules, $p'(x) = 8 \cdot \frac{d}{dx} x = 8 \cdot 1 = 8$.

3.3.16 By the constant multiple rule and by the result of example 5 in section 3.1,

$$g'(t) = 6 \cdot \frac{d}{dt} \sqrt{t} = 6 \cdot \frac{1}{2\sqrt{t}} = \frac{3}{\sqrt{t}}.$$  

3.3.17 By the constant multiple rule and power rules, $g'(t) = 100 \frac{d}{dt} t^2 = 100 \cdot 2t = 200t$.

3.3.18 By the constant multiple rule and by the result of example 5 in section 3.1,

$$f'(s) = \frac{1}{4} \cdot \frac{d}{ds} \sqrt{s} = \frac{1}{4} \cdot \frac{1}{2\sqrt{s}} = \frac{1}{8\sqrt{s}}.$$  

3.3.19 $f'(x) = \frac{d}{dx} (3x^4 + 7x) = \frac{d}{dx} (3x^4) + \frac{d}{dx} (7x) = 12x^3 + 7$.

3.3.20 $g'(x) = \frac{d}{dx} (6x^5 - x) = \frac{d}{dx} (6x^5) - \frac{d}{dx} (x) = 30x^4 - 1$.

3.3.21 $f'(x) = \frac{d}{dx} (10x^4 - 32x + e^2) = \frac{d}{dx} (10x^4) - \frac{d}{dx} (32x) + \frac{d}{dx} (e^2) = 40x^3 - 32 - 0 = 40x^3 - 32$.

3.3.22 $f'(t) = \frac{d}{dt} (6\sqrt{t} - 4t^3 + 9) = \frac{d}{dt} (6\sqrt{t}) - \frac{d}{dt} (4t^3) + \frac{d}{dt} (9) = \frac{6}{2\sqrt{t}} - 12t^2 + 0 = \frac{3}{\sqrt{t}} - 12t^2$.

3.3.23 $g'(w) = \frac{d}{dw} (2w^3 + 3w^2 + 10w) = 2 \frac{d}{dw} (w^3) + 3 \frac{d}{dw} (w^2) + 10 \frac{d}{dw} (w) = 2(3w^2) + 3(2w) + 10(1) = 6w^2 + 6w + 10$.

3.3.24 $s'(t) = \frac{d}{dt} (4\sqrt{t} - \frac{1}{4}t^4 + t + 1) = \frac{d}{dt} (4\sqrt{t}) - \frac{d}{dt} (\frac{1}{4}t^4) + \frac{d}{dt} (t) + \frac{d}{dt} (1) = \frac{4}{2\sqrt{t}} - t^3 + 1 + 0 = \frac{2}{\sqrt{t}} - t^3 + 1$.

3.3.25 Expanding the product yields $f(x) = 6x^3 + 3x^2 + 4x + 2$. So

$$f'(x) = \frac{d}{dx} (6x^3 + 3x^2 + 4x + 2) = \frac{d}{dx} (6x^3) + \frac{d}{dx} (3x^2) + \frac{d}{dx} (4x) + \frac{d}{dx} (2) = 18x^2 + 6x + 4.$$
3.3.26 Expanding the product yields \( g(r) = 5r^5 + 18r^3 + r^2 + 9r + 3 \). So
\[
g'(r) = \frac{d}{dr}(5r^5 + 18r^3 + r^2 + 9r + 3)\\= \frac{d}{dr}(5r^5) + \frac{d}{dr}(18r^3) + \frac{d}{dr}(r^2) + \frac{d}{dr}(9r) + \frac{d}{dr}(3)\\= 25r^4 + 54r^2 + 2r + 9.
\]

3.3.27 Expanding the product yields \( h(x) = x^4 + 2x^2 + 1 \). So
\[
h'(x) = \frac{d}{dx}(x^4 + 2x^2 + 1) = \frac{d}{dx}(x^4) + \frac{d}{dx}(2x^2) + \frac{d}{dx}(1) = 4x^3 + 4x.
\]

3.3.28 Expanding the product yields \( h(x) = x - \sqrt{x} \). So
\[
h'(x) = \frac{d}{dx}(x - \sqrt{x}) = \frac{d}{dx}(x) - \frac{d}{dx}(\sqrt{x}) = 1 - \frac{1}{2\sqrt{x}}.
\]

3.3.29 \( f \) simplifies as \( f(w) = w^2 - 1 \), so \( f'(w) = 2w \) for \( w \neq 0 \).

3.3.30 \( y \) simplifies as \( y = \frac{(4s)(3s^2 - 2a + 3)}{4s} = 3s^2 - 2s + 3 \). Thus \( y' = 6s - 2 \), for \( s \neq 0 \).

3.3.31 \( g \) simplifies as \( g(x) = \frac{(x - 1)(x + 1)}{x - 1} = x + 1 \). Thus \( g'(x) = 1 \) for \( x \neq 1 \).

3.3.32 \( h \) simplifies as \( h(x) = \frac{(x)(x - 2)(x - 4)}{(x)(x - 2)} = x - 4 \). Thus, \( h'(x) = 1 \) for \( x \neq 0, 2 \).

3.3.33 \( y \) simplifies as \( y = \frac{(\sqrt{x} - \sqrt{a})(\sqrt{x} + \sqrt{a})}{\sqrt{x} - \sqrt{a}} = \sqrt{x} + \sqrt{a} \). Thus \( \frac{dy}{dx} = \frac{1}{2\sqrt{x}} \) for \( x \neq a \).

3.3.34 \( y \) simplifies as \( y = \frac{(x-a)^2}{x-a} = x - a \). Thus \( \frac{dy}{dx} = 1 \) for \( x \neq a \).

3.3.35

a. \( y' = -6x \), so the slope of the tangent line at \( a = 1 \) is \(-6\). Thus, the tangent line at the point \((1, -1)\) is \( y + 1 = -6(x - 1) \), or \( y = -6x + 5 \).

3.3.36

a. \( y' = 3x^2 - 8x + 2 \), so the slope of the tangent line at \( a = 2 \) is \(-2\). Thus, the tangent line at the point \((2, -5)\) is \( y + 5 = -2(x - 2) \), or \( y = -2x - 1 \).
3.3.37

a. \( y' = e^{x} \), so the slope of the tangent line at \( a = \ln 3 \) is 3. Thus, the tangent line at the point \((\ln 3, 3)\) is \( y - 3 = 3(x - \ln 3) \), or \( y = 3x + 3 - 3\ln 3 \).

3.3.38

b. \( y' = 5^x - 1 \), so the slope of the tangent line at \( a = 0 \) is \(-\frac{3}{4}\). Thus, the tangent line at the point \((0, \frac{1}{4})\) is \( y - \frac{1}{4} = -\frac{3}{4} \cdot (x - 0) \), or \( y = -\frac{3x}{4} + \frac{1}{4} \).

3.3.39

a. \( f'(x) = 2x - 6 \), so the slope is zero when \( 2x - 6 = 0 \), which is at \( x = 3 \).

b. The slope is 2 when \( 2x - 6 = 2 \) which is at \( x = 4 \).

3.3.40

a. \( f'(t) = 3t^2 - 27 \), so the slope of the tangent line is zero when \( 3t^2 - 27 = 0 \), which is at \( t = 3 \) and \( t = -3 \).

b. The slope is 21 where \( f'(t) = 3t^2 - 27 = 21 \), or when \( t^2 = 16 \), so at \( t = 4 \) and \( t = -4 \).

3.3.41

a. The slope of the tangent line is given by \( f'(x) = 6x^2 - 6x - 12 \), and this quantity is zero when \( x^2 - x - 2 = 0 \), or \((x - 2)(x + 1) = 0 \). The two solutions are thus \( x = -1 \) and \( x = 2 \), so the points on the graph are \((-1, 11)\) and \((2, -16)\).

b. The slope of the tangent line is 60 when \( 6x^2 - 6x - 12 = 60 \), which is when \( 6x^2 - 6x - 72 = 0 \). Simplifying this quadratic expression yields the equation \( x^2 - x - 12 = 0 \), which has solutions \( x = -3 \) and \( x = 4 \), so the points on the graph are \((-3, -41)\), and \((4, 36)\).

3.3.42

a. The slope of the tangent line is given by \( f'(x) = 2e^x - 6 \). This is equal to zero when \( 2e^x = 6 \), which occurs for \( x = \ln 3 \). The point on the graph is therefore \((\ln 3, 6 - 6\ln 3)\).

b. The slope of the tangent line is 12 when \( 2e^x - 6 = 12 \), or \( e^x = 9 \). This occurs for \( x = \ln 9 \). The point on the graph is therefore \((\ln 9, 18 - 6\ln 9)\).

3.3.43

a. The slope of the tangent line is given by \( \frac{2}{\sqrt{x}} - 1 \). This is equal to zero when \( \sqrt{x} = 2 \), or \( x = 4 \). The point on the graph is \((4, 4)\).

b. The slope of the tangent line is \( -\frac{1}{2} \) when \( \frac{2}{\sqrt{x}} - 1 = -\frac{1}{2} \). Solving for \( x \) gives \( x = 16 \). The point on the graph is \((16, 0)\).
3.3.44 $f'(x) = 9x^2 + 10x + 6$, $f''(x) = 18x + 10$, and $f^{(3)}(x) = 18$.

3.3.45 $f'(x) = 20x^3 + 30x^2 + 3$, $f''(x) = 60x^2 + 60x$, and $f^{(3)}(x) = 120x + 60$.

3.3.46 $f'(x) = 6x + 5e^x$, $f''(x) = 6 + 5e^x$, and $f^{(3)}(x) = 5e^x$.

3.3.47 $f$ simplifies as $f(x) = \frac{(x-4)(x+1)}{x+1} = x - 8$. So for $x \neq -1$, $f'(x) = 1$, $f''(x) = 0$, and $f^{(3)}(x) = 0$.

3.3.48 $f'(x) = f''(x) = f^{(3)}(x) = 10e^x$.

3.3.49  
\begin{enumerate}
\item a. False. $10^5$ is a constant, so the constant rule assures us that $\frac{d}{dx}(10^5) = 0$.
\item b. True. This follows because the slope is given by $f'(x) = e^x > 0$ for all $x$.
\item c. False. $\frac{d}{dx}(e^x) = 0$.
\item d. False. $\frac{d}{dx}(e^x) = e^x$, not $xe^{x-1}$.
\item e. False. We have $\frac{d}{dx}(5x^3 + 2x + 5) = 15x^2 + 2$. Thus we have $\frac{d^n}{dx^n}(5x^3 + 2x + 5) = 0$ for $n \geq 4$.
\end{enumerate}

3.3.50  
\begin{enumerate}
\item a. The slope of the tangent line to $g$ at $x$ is given by $g'(x) = 2x + f'(x)$, so $g'(3) = 6 + f'(3) = 10$. The point on the curve $y = g(x)$ at $x = 3$ is $(3, 9 + f(3)) = (3, 10)$. Thus the equation of the tangent line at this point is $y - 10 = 10(x - 3)$, or $y = 10x - 20$.
\item b. The slope of the tangent line to $h$ at $x$ is given by $h'(x) = 3f'(x)$, so $h'(3) = 3f'(3) = 3 \cdot 4 = 12$. The point on the curve $y = h(x)$ at $x = 3$ is $(3, 3 \cdot f(3)) = (3, 3)$. Thus the equation of the tangent line at this point is $y - 3 = 12(x - 3)$, or $y = 12x - 33$.
\end{enumerate}

3.3.51 First note that because the slope of $4x + 1$ is 4, it must be the case that $f'(2) = 4$. Also, at $x = 2$, we have $y = 4 \cdot 2 + 1 = 9$, so $f(2) = 9$. Because the line tangent to the graph of $g$ at 2 has slope 3, we know that $g'(2) = 3$. The tangent line to $g$ at $x = 2$ must be $y - (-2) = 3(x - 0)$, so the value of the tangent line at 2 (which must also be the value of $g(2)$) is 4. So $g(2) = 4$.

\begin{enumerate}
\item a. $g'(2) = f'(2) + g'(2) = 4 + 3 = 7$. The line contains the point $(2, f(2) + g(2)) = (2, 13)$. Thus, the equation of the tangent line is $y - 13 = 7(x - 2)$, or $y = 7x - 1$.
\item b. $g'(2) = f'(2) - 2g'(2) = 4 - 2 \cdot 3 = -2$. The line contains the point $(2, f(2) - 2g(2)) = (2, 1)$. Thus, the equation of the tangent line is $y - 1 = -2(x - 2)$, or $y = -2x + 5$.
\item c. $g'(2) = 4f'(2) = 4 \cdot 4 = 16$. The line contains the point $(2, 4f(2)) = (2, 36)$. Thus, the equation of the tangent line is $y - 36 = 16(x - 2)$, or $y = 16x + 4$.
\end{enumerate}

3.3.52 $F'(2) = f'(2) + g'(2) = -3 + 1 = -2$.

3.3.53 $G'(2) = 3f'(2) - g'(2) = 3(-3) - 1 = -10$.

3.3.54 $F'(5) = f'(5) + g'(5) = 1 - 1 = 0$.

3.3.55 $G'(5) = 3f'(5) - g'(5) = 3 \cdot 1 - (-1) = 4$.

3.3.56 $\frac{d}{dx}[f(x) + g(x)]_{x=1} = f'(1) + g'(1) = 3 + 2 = 5$.

3.3.57 $\frac{d}{dx}[1.5f(x)]_{x=2} = 1.5f'(2) = 1.5 \cdot 5 = 7.5$.

3.3.58 $\frac{d}{dx}[2x - 3g(x)]_{x=4} = 2 - 3g'(4) = 2 - 3 \cdot 4 = -14$.

3.3.59

a. Let \( f(x) = \sqrt{x} \) and \( a = 9 \). Then \( \lim_{h \to 0} \frac{f(a + h) - f(a)}{h} = \lim_{h \to 0} \frac{\sqrt{9 + h} - \sqrt{9}}{h} = f'(9) \).

b. Because \( f'(x) = \frac{1}{2\sqrt{x}} \), we have \( f'(9) = \frac{1}{6} \), so this is the value of the original limit.

3.3.60

a. Let \( f(x) = x^8 + x^3 \), and \( a = 1 \). Then \( \lim_{h \to 0} \frac{f(a + h) - f(a)}{h} = \lim_{h \to 0} \frac{(1 + h)^8 + (1 + h)^3 - 2}{h} = f'(1) \).

b. Because \( f'(x) = 8x^7 + 3x^2 \), we have \( f'(1) = 8 + 3 = 11 \), so this is the value of the original limit.

3.3.61

a. Let \( f(x) = x^{100} \) and \( a = 1 \). Then \( \lim_{x \to 1} \frac{f(x) - f(1)}{x - 1} = f'(1) \).

b. Because \( f'(x) = 100x^{99} \), we have \( f'(1) = 100 \), so this is the value of the original limit.

3.3.62

It appears that \( \lim_{h \to 0^-} \frac{2^h - 1}{h} \approx 0.6931 \) and \( \lim_{h \to 0^+} \frac{3^h - 1}{h} \approx 1.0986 \).

3.3.63 \( \lim_{x \to 0} \frac{x^{3^x - 1}}{x} = 3 \).

3.3.64 \( \lim_{n \to \infty} \left( 1 + \frac{1}{n} \right)^n \approx 2.7183 \).

3.3.65 \( \lim_{x \to 0^+} x^x = 1 \).

3.3.66 \( \lim_{x \to 0^+} \left( \frac{1}{x} \right)^x = 1 \).

3.3.67 Let \( f(x) = e^x \) and \( a = 0 \). Then we have \( f'(a) = \lim_{x \to a} \frac{f(x) - f(a)}{x - a} = \lim_{x \to 0} \frac{e^x - 1}{x} \). Because \( f'(0) = e^0 = 1 \), this must be the value of \( \lim_{x \to 0} \frac{e^x - 1}{x} \).

3.3.68

a. The instantaneous velocity is given by \( v(t) = \frac{d}{dt}s(t) = -10t + 40 \), \( 0 \leq t \leq 10 \).

b. \( v(t) = 0 \) when \(-10t + 40 = 0\), which occurs at \( t = 4 \).

c. The magnitude of the velocity is \( |v(t)| \). Note that \( v(t) \geq 0 \) for \( 0 \leq t \leq 4 \), and \( v(t) < 0 \) for \( 4 < t \leq 10 \). Thus

\[
|v(t)| = \begin{cases} 
-10t + 40 & \text{for } 0 \leq t \leq 4, \\
10t - 40 & \text{for } 4 < t \leq 10.
\end{cases}
\]

Note that \( |v(0)| = 40 \) and \( |v(10)| = 60 \). The greatest magnitude over this time interval is 60 meters per second.
3.3.69
a. \(d'(t) = 32t\) is the velocity of the stone after \(t\) seconds, measured in feet per second.

b. The stone travels \(d(6) = 16 \cdot 6^2 = 576\) feet and strikes the ground with a velocity of \(32 \cdot 6 = 192\) feet per second. Converting to miles per hour, we have \(192 \cdot \frac{3600}{5280} \approx 130.9\) miles per hour.

3.3.70
a. Because \(p(t) = 1200e^t\), we get \(p'(t) = 1200e^t\) cells per hour.

b. Because \(p'(t)\) is also exponential, it is smallest when \(t = 0\), and largest when \(t = 4\).

3.3.71
a. \(\frac{dD}{dg} = 0.1g + 35\) miles per gallon. It measures the rate of change of the range of the car with respect to the size of the gas tank.

b. \(\frac{dD}{dg}(0) = 35\) miles per gallon. \(\frac{dD}{dg}(5) = 35\) miles per gallon. \(\frac{dD}{dg}(10) = 36\) miles per gallon. A small increase in the size of the tank has a greater effect on the range of the car for large tanks than for small tanks.

c. \(D(12) = 0.05 \cdot 12^2 + 35 \cdot 12 = 427.2\) miles.

3.3.72
\[
f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} = \lim_{h \to 0} \frac{c - c}{h} = \lim_{h \to 0} 0 = 0.
\]

3.3.73
\[
dx^n = \lim_{h \to 0} \frac{(x + h)^n - x^n}{h} = \lim_{h \to 0} \left(\frac{x^n + nx^{n-1}h + \frac{n(n-1)}{2}x^{n-2}h^2 + \cdots + nxh^{n-1} + h^n - x^n}{h}\right)
= \lim_{h \to 0} \left(nx^{n-1} + \frac{n(n-1)}{2}x^{n-2}h + \cdots + nxh^{n-2} + h^{n-1}\right)
= nx^{n-1} + 0 + 0 + \cdots + 0
= nx^{n-1}
\]

3.3.74
a. Let \(m = -n\) so that \(m > 0\).

\[
f'(a) = \lim_{x \to a} \frac{x^n - a^n}{x - a} = \lim_{x \to a} \frac{x^m - a^m}{x - a}
= \lim_{x \to a} \left(\frac{1}{a^{m-1}} \cdot \frac{a^m - x^m}{x - a}\right)
= \left(\lim_{x \to a} \frac{1}{a^{m-1}}\right) \cdot \left(- \lim_{x \to a} \frac{x^m - a^m}{x - a}\right)
= \frac{1}{a^{2m}} \cdot (-ma^{m-1})
= -ma^{m-1} = na^{n-1}.
\]

b. \(\frac{d}{dx} x^{-7} = -7x^{-8}\). Also, \(\frac{d}{dx} x^{-10} = -10x^{-11} = -\frac{10}{x^{11}}\).

3.3.75
a. \(\frac{d}{dx} (\sqrt{x}) = \frac{d}{dx} x^{1/2} = \frac{1}{2} \cdot x^{-1/2} = \frac{1}{2\sqrt{x}}\).
3.3. RULES OF DIFFERENTIATION

b. \[
\frac{d}{dx} x^{3/2} = \lim_{h \to 0} \frac{(x+h)^{3/2} - x^{3/2}}{h}
= \lim_{h \to 0} \frac{((x+h)^{3/2} - x^{3/2})(x+h)^{3/2} + x^{3/2})}{(x+h)^{3/2} + x^{3/2}}
= \lim_{h \to 0} \frac{(x+h)^{3} - x^{3}}{h((x+h)^{3/2} + x^{3/2})}
= \lim_{h \to 0} \frac{x^{3} + 3x^{2}h + 3xh^{2} + h^{3} - x^{3}}{x^{3/2} + x^{3/2}}
= \lim_{h \to 0} \frac{3x^{2} + 3xh + h^{2}}{x^{3/2} + x^{3/2}}
= \frac{3x^{2}}{2x^{3/2}} = \frac{3}{2} x^{1/2}.
\]

c. \[
\frac{d}{dx} x^{5/2} = \lim_{h \to 0} \frac{(x+h)^{5/2} - x^{5/2}}{h}
= \lim_{h \to 0} \frac{((x+h)^{5/2} - x^{5/2})(x+h)^{5/2} + x^{5/2})}{(x+h)^{5/2} + x^{5/2}}
= \lim_{h \to 0} \frac{(x+h)^{5} - x^{5}}{h((x+h)^{5/2} + x^{5/2})}
= \lim_{h \to 0} \frac{x^{5} + 5x^{4}h + 10x^{3}h^{2} + 10x^{2}h^{3} + 5xh^{4} + h^{5} - x^{5}}{x^{5/2} + x^{5/2}}
= \lim_{h \to 0} \frac{5x^{4} + 10x^{3}h + 10x^{2}h^{2} + 5xh^{3} + h^{4}}{(x+h)^{5/2} + x^{5/2}}
= \frac{5x^{4}}{2x^{5/2}} = \frac{5}{2} x^{3/2}.
\]

d. It appears that \( \frac{d}{dx} x^{n^{2}} = \frac{n}{2} \cdot x^{(n/2) - 1} \).

3.3.76

a. \[
\frac{d}{dx} e^{-x} = \lim_{h \to 0} \frac{e^{-(x+h)} - e^{-x}}{h} = \lim_{h \to 0} \frac{e^{-x}(e^{-h} - 1)}{h} = e^{-x} \lim_{h \to 0} \frac{e^{-h} - 1}{h}.
\]

b. Let \( w = -h \). Then \( \lim_{h \to 0} \frac{e^{-h} - 1}{h} = \lim_{w \to 0} \frac{e^{w} - 1}{-w} = - \lim_{w \to 0} \frac{e^{w} - 1}{w} = -1 \).

c. \[
\frac{d}{dx} e^{-x} = e^{-x} \lim_{h \to 0} \frac{e^{-h} - 1}{h} = -e^{-x}.
\]

3.3.77

a. \[
\frac{d}{dx} e^{2x} = \lim_{h \to 0} \frac{e^{2(x+h)} - e^{2x}}{h} = \lim_{h \to 0} \frac{e^{2x}(e^{2h} - 1)}{h} = e^{2x} \lim_{h \to 0} \frac{e^{2h} - 1}{h}.
\]

b. Let \( z = 2h \). Then \( \lim_{h \to 0} \frac{e^{2h} - 1}{h} = \lim_{z \to 0} \frac{e^{z} - 1}{z/2} = 2 \lim_{z \to 0} \frac{e^{z} - 1}{z} = 2 \).

c. \[
\frac{d}{dx} e^{2x} = e^{2x} \lim_{h \to 0} \frac{e^{2h} - 1}{h} = 2e^{2x}.
\]
3.3.78
a. 
\[
\frac{dx^2e^x}{dx} = \lim_{h \to 0} \frac{(x+h)^2e^{x+h} - x^2e^x}{h} \\
= \lim_{h \to 0} e^x \cdot \frac{(x^2 + 2xh + h^2)e^h - x^2}{h} \\
= e^x \lim_{h \to 0} \frac{(x^2 + 2xh + h^2)e^h - x^2}{h}.
\]

b. 
\[
e^x \cdot \lim_{h \to 0} \frac{(x^2 + 2xh + h^2)e^h - x^2}{h} = e^x \left( \lim_{h \to 0} \frac{x^2e^h + 2xhe^h + h^2e^h - x^2}{h} \right) \\
= e^x \left( \lim_{h \to 0} \frac{x^2(e^h - 1) + 2xhe^h + h^2e^h}{h} \right) \\
= e^x \left( x^2 \lim_{h \to 0} \frac{e^h - 1}{h} + 2x \lim_{h \to 0} \frac{e^h}{h} + \lim_{h \to 0} \frac{he^h}{h} \right) \\
= e^x \left( x^2 + 2x \right).
\]

3.3.79
a. Since \( f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} \), the graph of \( D(x) \) should be very close to the graph of \( f'(x) \), since 0.01 is close to zero. Another way of thinking about this is that \( D(x) \) is the slope of a secant from \((x, f(x))\) to \((x + 0.01, f(x + 0.01))\), which is quite close to the slope of the tangent to \( f \) at \( x \). Since 
\[
f'(x) = \frac{d}{dx} \left( \frac{x^2}{2} \right) = \frac{1}{2} \frac{d}{dx} (x) = \frac{1}{2},
\]
we would expect the graph of \( D \) to be close to the constant \( y = \frac{1}{2} \).

b. Graphs of \( D \) for 0.01 and for 0.001 are

![Graphs of D for 0.01 and 0.001](image)

c. Both plots are visually indistinguishable from \( y = \frac{1}{2} \). In fact, they are both equal to \( y = \frac{1}{2} \), since 
\[
\frac{f(x + h) - f(x)}{h} = \frac{x + h - x}{2h} = \frac{h}{2h} = \frac{1}{2}
\]
for any nonzero \( h \).

3.3.80
a. Since \( f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} \), the graph of \( D(x) \) should be very close to the graph of \( f'(x) \), since 0.01 is close to zero. Another way of thinking about this is that \( D(x) \) is the slope of a secant from \((x, f(x))\) to \((x + 0.01, f(x + 0.01))\), which is quite close to the slope of the tangent to \( f \) at \( x \). Since 
\[
f'(x) = \frac{d}{dx} (x^2) = 2x,
\]
we would expect the graph of \( D \) to be close to the line \( y = 2x \).
b. Graphs of $D$ for 0.01 and for 0.001 are

\[ \begin{array}{c}
\text{0.01} \\
-2 & -1 & 0 & 1 & 2 \\
2 & 4
\end{array} \]

\[ \begin{array}{c}
\text{0.001} \\
-2 & -1 & 0 & 1 & 2 \\
2 & 4
\end{array} \]

(see Example 4 in Section 3.1), we would expect the graph of $D$ to be close to the curve $y = \frac{1}{2\sqrt{x}}$.

b. Graphs of $D$ for 0.01 and for 0.001, along with the curve $y = \frac{1}{2\sqrt{x}}$, are

\[ \begin{array}{c}
\text{0.01} \\
\text{f}'(x) \\
1 & 2 & 3 & 4 \\
0 & 0.2 & 0.4 & 0.6 & 0.8 & 1.0
\end{array} \]

\[ \begin{array}{c}
\text{0.001} \\
\text{f}'(x) \\
1 & 2 & 3 & 4 \\
0 & 0.2 & 0.4 & 0.6 & 0.8 & 1.0
\end{array} \]

c. Both plots are visually indistinguishable from $f'(x) = \frac{1}{2\sqrt{x}}$.

### 3.4 The Product and Quotient Rules

#### 3.4.1 The derivative of the product $fg$ with respect to $x$ is given by $f'(x)g(x) + f(x)g'(x)$.

#### 3.4.2 The derivative of the quotient $\frac{f}{g}$ with respect to $x$ is given by $\frac{g(x)f'(x) - f(x)g'(x)}{(g(x))^2}$.

#### 3.4.3 $\frac{d}{dx} (x^n) = nx^{n-1}$ for all integers $n$.

#### 3.4.4 By the extended power rule, $\frac{d}{dx} \frac{1}{x^{10}} = \frac{d}{dx} x^{-10} = -10x^{-11} = -\frac{10}{x^{11}}$.

By the quotient rule, $\frac{d}{dx} \frac{1}{x^{10}} = \frac{x^{10} \cdot 0 - 1 \cdot 10x^9}{(x^{10})^2} = -\frac{10x^9}{x^{20}} = -\frac{10}{x^{11}}$.

#### 3.4.5 $\frac{d}{dx} e^{kx} = ke^{kx}$ for all real numbers $k$. 

Copyright © 2014 Pearson Education, Inc.
3.4.6 Expanding first, we have \( f(x) = x^3 - 3x^2 + 4x - 12 \), so \( f'(x) = 3x^2 - 6x + 4 \). Using the product rule:

\[
f'(x) = \frac{d}{dx} (x - 3) \cdot (x^2 + 4) + (x - 3) \frac{d}{dx} (x^2 + 4)
= x^2 + 4 + (x - 3)(2x)
= x^2 + 4 + 2x^2 - 6x = 3x^2 - 6x + 4.
\]

3.4.7 \( f'(x) = 12x^3(2x^2 - 1) + 3x^4 \cdot 4x = 24x^5 - 12x^3 + 12x^5 = 36x^5 - 12x^3 \).

3.4.8 \( g'(x) = 6 - (2e^x + 2xe^x) \).

3.4.9 \( f'(t) = 5t^4e^t + t^5e^t = t^4e^t(t + 5) \).

3.4.10 \( g'(w) = (10w + 3)e^w + (5w^2 + 3w + 1)e^w = e^w(5w^2 + 13w + 4) \).

3.4.11 \( h'(x) = (1)(x^3 + x^2 + x + 1) + (x - 1)(3x^2 + 2x + 1) = x^3 + x^2 + x + 1 + 3x^3 + 2x^2 + x - 3x^2 - 2x - 1 = 4x^3 \).

3.4.12 \( f'(x) = -\frac{3}{x^2} \cdot (x^2 + 1) + (1 + \frac{1}{x^2}) \cdot (2x) = -\frac{3}{x^2} - \frac{3}{x} + 2x + \frac{2}{x} = 2x - \frac{3}{x^2} \).

3.4.13 \( g'(w) = e^w(w^3 - 1) + e^w \cdot 3w^2 = e^w(w^3 + 3w^2 - 1) \).

3.4.14 \( s'(t) = 4e^{\sqrt{t}} + 4e^t \cdot \frac{1}{2\sqrt{t}} = e^t \left( 4\sqrt{t} + \frac{2}{\sqrt{t}} \right) \).

3.4.15

a. \( f'(x) = 1(3x + 4) + (x - 1) \cdot 3 = 6x + 1 \).

b. \( f'(x) = \frac{d}{dx} (3x^2 + x - 4) = 6x + 1 \).

3.4.16

a. \( y' = (2t + 7)(3t - 4) + (t^2 + 7t) \cdot 3 = 9t^2 + 34t - 28 \).

b. \( y' = \frac{d}{dt} (3t^3 + 17t^2 - 28t) = 9t^2 + 34t - 28 \).

3.4.17

a. \( g'(y) = (12y^2 - 2y)(y^2 - 4) + (3y^4 - y^2) \cdot 2y = 18y^5 - 52y^3 + 8y \).

b. \( g'(y) = \frac{d}{dy} (3y^6 - 13y^4 + 4y^2) = 18y^5 - 52y^3 + 8y \).

3.4.18

a. \( h'(z) = (3z^2 + 8z + 1)(z - 1) + (z^3 + 4z^2 + z) \cdot 1 = 4z^3 + 9z^2 - 6z - 1 \).

b. \( h'(z) = \frac{d}{dz} (z^3 + 3z^2 - 3z - z) = 4z^3 + 9z^2 - 6z - 1 \).

3.4.19 \( f'(x) = \frac{(x + 1)(1 - x)}{(x + 1)^2} = \frac{1}{(x + 1)^2} \).

3.4.20 \( f'(x) = \frac{(x + 2)(3x^2 - 8x + 1) - (3x^3 - 4x^2 + x)(1)}{(x^2 - 2)^2} = \frac{2x^3 - 10x^2 + 16x - 2}{(x^2 - 2)^2} \).

3.4.21 \( f'(x) = \frac{(e^x + 1)e^{-x} - (e^{2x} + 1)}{(e^x + 1)^2} = \frac{e^x}{(e^x + 1)^2} \).

3.4.22 \( f'(x) = \frac{(2e^x + 1)(e^{-x}) - (2e^x - 1)2e^x}{(2e^x + 1)^2} = \frac{2e^x(2e^{x+1} - (2e^x + 1))}{(2e^x + 1)^2} = \frac{4e^x}{(2e^x + 1)^2} \).

3.4.23 \( f'(x) = (1)e^{-x} + x(-e^{-x}) = e^{-x}(1 - x) \).

3.4.24 \( f'(x) = \frac{1}{2}x^{-1/2}e^{-x} + \sqrt{x}(e^{-x}) = e^{-x}(\frac{1}{2\sqrt{x}} - \sqrt{x}) = \frac{1 - 2x}{e^{(x/2)} \sqrt{x}} \).

3.4.25 \( y' = \frac{d}{dx} \left( \frac{3x - 1}{2t - 2} \right) = \frac{(2t - 2)(3x - 1)(2) - 2t(3x - 1)(2)}{(2t - 2)^2} = -\frac{4}{(2t - 2)^2} = - \frac{1}{(t - 1)^2} \).
3.4.26 \( h'(w) = \frac{(w^2+1)(2w)-(w^2-1)(2w)}{(w^2+1)^2} = \frac{2w^3+2w-2w^3+2w}{(w^2+1)^2} = \frac{4w}{(w^2+1)^2} \).

3.4.27 \( g'(x) = \frac{(x^2-1)e^x-e^x-2x}{(x^2-1)^2} = \frac{e^x(x^2-2x-1)}{(x^2-1)^2} \).

3.4.28 \( y' = \frac{d}{dx} \left( \frac{2\sqrt{x}-1}{4x+1} \right) = \frac{(4x+1)(\sqrt{x})-2(\sqrt{x}-1)}{(4x+1)^2} = \frac{4\sqrt{x}+\frac{1}{\sqrt{x}}-8\sqrt{x}+4}{(4x+1)^2} \cdot \frac{\sqrt{x}}{\sqrt{x}} = \frac{-4x+1+4\sqrt{x}}{\sqrt{(4x+1)^2}} \).

3.4.29 a. \( f(w) = \frac{w(3w^2-1)-(w^3-w)}{w^2} = \frac{2w^3}{w^2} = 2w \) for \( w \neq 0 \).

b. \( f(w) = \frac{d}{dx}(w^2-w-1) = 2w \) for \( w \neq 0 \).

3.4.30 a. \( y' = \frac{4x(12x^2-16x+4)-(4x^3-8x^2+4x)^2}{(4x^2)^2} = \frac{48x^3-64x^2+16x-16x^3+32x^2-16x}{16x^2} = \frac{32x^3-32x^2}{16x^2} = 2x - 2 \).

b. \( y' = \frac{d}{dx}(s^2 - 2s + 1) = 2s - 2 \) for \( s \neq 0 \).

3.4.31 a. \( y' = \frac{(x-a)(2x)-(x^2-a^2)-1}{(x-a)^2} = \frac{2x^2-2ax-x-a^2}{(x-a)^2} = \frac{x^2-2ax+a^2}{(x-a)^2} = \frac{(x-a)^2}{(x-a)^2} = 1. \)

b. \( y' = \frac{d}{dx} \left( \frac{(x-a)(x+a)}{x-a} \right) = \frac{d}{dx}(x+a) = 1 \) for \( x \neq a \).

3.4.32 a. \( y' = \frac{(x-a)(2x-2a)-(x^2-2ax+a^2)}{(x-a)^2} = \frac{x^2-2ax+a^2}{(x-a)^2} = \frac{(x-a)^2}{(x-a)^2} = 1. \)

b. \( y' = \frac{d}{dx} \left( \frac{(x-a)^2}{x-a} \right) = \frac{d}{dx}(x-a) = 1 \) for \( x \neq a \).

3.4.33

\[ y' = \frac{(x-1)-(x+5)}{(x-1)^2} = -\frac{6}{(x-1)^2}. \]

At \( a = 3 \) we have \( y' = -\frac{6}{4} = -\frac{3}{2} \) and \( y = 4 \), so the equation of the tangent line is \( y - 4 = -\frac{3}{2} \cdot (x - 3) \), or \( y = -\frac{3}{2}x + \frac{17}{2} \).

3.4.34

\[ y' = \frac{(3x-1)4x-(2x^2)^3}{(3x-1)^2} = \frac{6x^2-4x}{(3x-1)^2}. \]

At \( a = 1 \) we have \( y' = \frac{3}{2} \) and \( y = 1 \), so the equation of the tangent line is \( y - 1 = \frac{3}{2} \cdot (x - 1) \), or \( y = \frac{3}{2}x + \frac{1}{2} \).
3.4.35  

a. \( y' = 2 + (1)e^x + xe^x \).
At \( a = 0 \) we have \( y' = 2 + 1 + 0 = 3 \) and \( y = 1 \). So the equation of the tangent line is \( y - 1 = 3(x - 0) \), or \( y = 3x + 1 \).

b. 

\[ y^\prime = \frac{x e^x - e^x}{x^2} \]
At \( a = 1 \) we have \( y' = \frac{e - e}{1} = 0 \), and \( y = e \). Thus, the equation of the tangent line is \( y - e = 0 \), or \( y = e \).

3.4.36  

a. \( y' = \frac{x e^x - e^x}{x^2} \).
At \( a = 1 \) we have \( y' = \frac{e - e}{1} = 0 \), and \( y = e \). Thus, the equation of the tangent line is \( y - e = 0 \), or \( y = e \).

b. 

3.4.37  

\[ f'(x) = (-9) \cdot 3 \cdot x^{-9} - 1 = -27x^{-10} \].

3.4.38  

\[ y' = \frac{d}{dp}(4p^{-3}) = -12p^{-4} \].

3.4.39  

\[ g'(t) = \frac{d}{d\theta}(3t^2 + 6t^{-7}) = 6t - 42t^{-8} \].

3.4.40  

\[ y' = \frac{d}{dw}(w^2 + 5 + w^{-1}) = 2w - w^{-2} \].

3.4.41  

\[ g'(t) = \frac{d}{d\theta}(1 + 3t^{-1} + t^{-2}) = -3t^{-2} - 2t^{-3} \].

3.4.42  

\[ p'(x) = \frac{d}{dx}(2x^{-2} + \frac{3}{2}x^{-4} + \frac{1}{2}x^{-5}) = -4x^{-3} - 6x^{-5} - \frac{5}{2}x^{-6} \].

3.4.43  

\[ f'(x) = (1)e^{7x} + x(7e^{7x}) = e^{7x}(7x + 1) \].

3.4.44  

\[ g'(t) = 2e^{t/2} + (2t)e^{t/2}(1/2) = e^{t/2}(t + 2) \].

3.4.45  

\[ f'(x) = 3 \cdot 15 \cdot e^{3x} = 45e^{3x} \].

3.4.46  

\[ y' = 6x - 2 - 2e^{-2x} \].

3.4.47  

\[ g'(x) = \frac{d}{dx}(xe^{-3x}) = e^{-3x} - xe^{-3x}(3) = e^{-3x}(1 - 3x) \].

3.4.48  

\[ f'(x) = (-2)e^{-x} + (1 - 2x)(-e^{-x}) = -3e^{-x} + 2xe^{-x} = e^{-x}(2x - 3) \].

3.4.49  

\[ y'(x) = \frac{d}{dx} \left( \frac{x}{2}e^x + e^{-x} \right) = \frac{2}{3}e^x - e^{-x} \].

3.4.50  

\[ \frac{dA}{dt} = (0.075) \cdot 2500e^{0.075t} = 187.5e^{0.075t} \].
3.4.51

a. \( p'(t) = \frac{(t+2)200-200t}{(t+2)^2} = \frac{400}{(t+2)^2} \).

b. \( p'(5) = \frac{400}{81} \approx 4.91. \)

c. The value of \( p' \) is as large as possible when its denominator is as small as possible, which is when \( t = 0 \). The value of \( p'(0) \) is 100.

d. \( \lim_{t \to \infty} p'(t) = \lim_{t \to \infty} \frac{400}{(t+2)^2} = 0. \) This means that the population eventually has a growth rate of 0, which means that the population approaches a steady state.

e. 

3.4.52

a. \( p'(t) = \frac{-400(e^{-0.2t})}{(1+7e^{-0.2t})^2} = \frac{1120e^{-0.2t}}{(1+7e^{-0.2t})^2}. \)

b. \( p'(5) \approx 32.24. \)

c. From the graph we see that the growth rate is maximal at about \( t = 9.8. \)

d. \( \lim_{t \to \infty} p'(t) = \lim_{t \to \infty} \frac{1120e^{-0.2t}}{(1+7e^{-0.2t})^2} = \frac{1120e^{-0.2t}}{(1+7e^{-0.2t})^2} = \frac{0}{1} = 0. \) This means that the population eventually has a growth rate of 0, which means that the population approaches a steady state.

e. 

3.4.53

a. The instantaneous rate of change is \( Q'(t) = -1.386e^{-0.0693t} \) mg/hr.

b. At \( t = 0 \) hours, we have \( Q'(0) = -1.386, \) so the amount of antibiotic is decreasing at a rate of 1.386 mg/hr. At \( t = 2 \) hours, we have \( Q'(2) = -1.386e^{-0.1386} \approx -1.207, \) so the amount of antibiotic is decreasing at a rate of about 1.207 mg/hr.

c. \( \lim_{t \to \infty} Q(t) = 20 \lim_{t \to \infty} e^{-0.0693t} = 0. \) In the long run, the antibiotic is all used up. \( \lim_{t \to \infty} Q'(t) = -1.386 \lim_{t \to \infty} e^{-0.0693t} = 0. \) The rate of change of the amount of antibiotic in the bloodstream also goes to zero as \( t \to \infty. \)

3.4.54

a. After 10 years we will have \( A(10) = 200e^{0.398} \approx 297.77. \)

b. The growth rate is \( A'(t) = 200 \cdot (0.0398e^{0.0398t}) = 7.96e^{0.0398}. \) After 10 years, the growth rate is \( A'(10) = 7.96e^{0.398} \approx 11.85 \) dollars/year.

c. The tangent line is given by \( y = 297.77 = 11.85(t-10), \) or \( y = 11.85t + 179.27. \)

3.4.55

a. The slope is \( f'(x) = e^{2x} + 2xe^{2x}. \) This is zero when \( e^{2x}(1+2x) = 0, \) which occurs when \( x = -\frac{1}{2}. \)

b. The graph of \( f \) has a horizontal tangent line at \( x = -\frac{1}{2}. \)

3.4.56

a. The slope is \( f'(t) = -5e^{-0.05t} \) and equals \(-5\) when \( t = 0. \)
b. Because $e^{-0.05t} > 0$ for all $t$, we have $f'(t) = -5e^{-0.05t} < 0$ for all $t$. The graph of $f$ therefore has no horizontal tangent line.

3.4.57 $g'(x) = \frac{(x-2)((x+1)e^x+e^x)-(x+1)e^x}{(x-2)^2} = \frac{e^x}{(x-2)^2} \cdot \frac{(x-2)(x+2)-(x+1)}{1} = \frac{e^x}{(x-2)^2} \cdot (x^2 - x - 5)$.

3.4.58 First note that $x^3 - 1 = (x-1)(x^2 + x + 1)$. So we can simplify $h(x)$ as $h(x) = \frac{2x^2 - 1}{x^2 + x + 1}$. Thus

$$h'(x) = \frac{(x^2 + x + 1)(4x) - (2x^2 - 1)(2x + 1)}{(x^2 + x + 1)^2} = \frac{4x^3 + 4x^2 + 4x - (4x^3 + 2x^2 - 2x - 1)}{(x^2 + x + 1)^2} = \frac{2x^2 + 6x + 1}{(x^2 + x + 1)^2}.$$

3.4.59

$$h'(x) = \frac{(x + 1) \frac{d}{dx}(xe^x) - xe^x \cdot 1}{(x + 1)^2} = \frac{(x + 1)(e^x + xe^x) - xe^x}{(x + 1)^2} = \frac{xe^x + x^2 e^x + e^x + xe^x - xe^x}{(x + 1)^2} = \frac{e^x(x^2 + x + 1)}{(x + 1)^2}.$$

3.4.60

$$h'(x) = \frac{x^2 e^x \cdot 1 - (x + 1)(x^2 e^x + 2xe^x)}{x^4 e^x} = \frac{e^x(x^2 - (x + 1)(x^2 + 2x))}{x^4 e^x} = \frac{x^2 - (x^3 + 2x^2 + x^2 + 2x)}{x^4 e^x} = -\frac{x^2 - 2x^2 - 2x}{x^4 e^x} = -\frac{x^2 + 2x + 2}{x^3 e^x}.$$

3.4.61

a. False. In fact, because $e^5$ is a constant, its derivative is zero.

b. False. It is certainly a reasonable way to proceed, but one could also write the given quantity as $x + 3 + 2x^{-1}$, and then proceed using the sum rule and the power rule and the extended power rule.

c. False. $\frac{d}{dx} (\frac{1}{x^7}) = \frac{d}{dx} (x^{-5}) = -5x^{-6} = -\frac{5}{x^6}$.

d. True. The derivative of $e^{3x}$ is $3e^{3x}$, and each succeeding derivative results in an extra factor of 3.

3.4.62 $f'(x) = -x^{-2} = -\frac{1}{x^2}$. $f''(x) = 2x^{-3} = \frac{2}{x^3}$. $f'''(x) = -6x^{-4} = -\frac{6}{x^4}$.

3.4.63

$$f'(x) = x^2 (3e^{3x}) + e^{3x}(2x) = e^{3x}(3x^2 + 2x)$$

$$f''(x) = e^{3x}(6x + 2) + (3x^2 + 2x)3e^{3x} = e^{3x}(9x^2 + 12x + 2)$$

$$f'''(x) = e^{3x}(18x + 12 + (9x^2 + 12x + 2)(3e^{3x}) = e^{3x}(27x^2 + 54x + 18) = 9e^{3x}(3x^2 + 6x + 2).$$

3.4.64

$$f'(x) = \frac{d}{dx} \left( \frac{x}{x + 2} \right) = \frac{(x + 2) - x}{(x + 2)^2} = \frac{2}{(x + 2)^2} = \frac{2}{x^2 + 2x + 4} = \frac{2}{(x + 2)^2}$$

$$f''(x) = \frac{d}{dx} \left( \frac{2}{x^2 + 4x + 4} \right) = \frac{(x^2 + 4x + 4) \cdot 0 - 2(2x + 4)}{(x + 2)^4} = -\frac{4(x + 2)}{(x + 2)^4} = -\frac{4}{(x + 2)^3}.$$
3.4.65

\[ f'(x) = \frac{d}{dx} \left( \frac{x^2 - 7x}{x + 1} \right) = \frac{(x + 1)(2x - 7) - (x^2 - 7x) \cdot 1}{(x + 1)^2} = \frac{x^2 + 2x - 7}{(x + 1)^2} \]

\[ f''(x) = \frac{d}{dx} \left( \frac{x^2 + 2x - 7}{(x + 1)^2} \right) = \frac{d}{dx} \left( \frac{x^2 + 2x - 7}{x^2 + 2x + 1} \right) \]

\[ = \frac{(x^2 + 2x + 1)(2x + 2) - (x^2 + 2x - 7)(2x + 2)}{(x + 1)^4} \]

\[ = \frac{(2x^2 + 4x + 2) - (2x^2 + 14x - 14)}{(x + 1)^3} = \frac{16}{(x + 1)^3} \]

3.4.66

\[ f'(x) = \frac{d}{dx} \left( \frac{(2-x)(2+x)}{x-2} \right) = \frac{d}{dx}(-2 + x) = \frac{d}{dx}(-2 - x) = -1, \text{ for } x \neq 2. \]

3.4.67

\[ f'(x) = \frac{d}{dx} \left( 4x^2 - \frac{2x}{5x+1} \right) = 8x - \frac{(5x+1)^2 - (2x)(5)}{(5x+1)^2} = 8x - \frac{2}{(5x+1)^2}. \]

3.4.68

\[ f'(z) = 2z(e^z + 4) + z^2 \cdot 3e^z - \frac{(z^2+1)^2 - 2z(2z)(2z)}{(z+1)^2} = 8z + e^z(3z^2 + 2z) + \frac{2z^2 - 2}{(z+1)^2}. \]

3.4.69

\[ h'(r) = \frac{(r + 1)(-1 - \frac{1}{\sqrt{r}}) - (2 - r - \sqrt{r}) \cdot 1}{(r + 1)^2} \]

\[ = \frac{-r - \frac{\sqrt{r}}{2} - 1 - \frac{1}{\sqrt{r}} - 2 + r + \sqrt{r}}{(r + 1)^2} \]

\[ = \frac{\sqrt{r} - \frac{1}{\sqrt{r}} - 3}{2\sqrt{r}} \cdot \frac{2\sqrt{r}}{2\sqrt{r}} \]

\[ = \frac{r - 1 - 6\sqrt{r}}{2\sqrt{r}(r + 1)^2}. \]

3.4.70

\[ y' = \frac{(\sqrt{x} - \sqrt{a}) \cdot 1 - (x - a) \frac{1}{2\sqrt{x}}}{(\sqrt{x} - \sqrt{a})^2} \]

\[ = \frac{\left( \frac{\sqrt{x} - \sqrt{a}}{2\sqrt{x}} \right) \cdot 2\sqrt{x}}{2\sqrt{x}} \]

\[ = \frac{2x - 2\sqrt{ax} - x + a}{2\sqrt{x}\sqrt{a}} \]

\[ = \frac{x - 2\sqrt{ax} + a}{2\sqrt{x}\sqrt{a}} \]

\[ = \frac{(\sqrt{x} - \sqrt{a})^2}{2\sqrt{x}\sqrt{a}} \]

\[ = \frac{1}{2\sqrt{x}}. \]

3.4.71

\[ h'(x) = (35x^6 + 5)(6x^3 + 3x^2 + 3) + (5x^7 + 5x)(18x^2 + 6x) \]

\[ = 300x^9 + 135x^8 + 105x^6 + 120x^3 + 45x^2 + 15. \]
3.4.72

a. \( g'(x) = 2xf(x) + x^2f'(x) \), so \( g'(2) = 2 \cdot 2 \cdot f(2) + 4 \cdot f'(2) = 8 + 12 = 20. \) Thus, the tangent line is given by \( y - 8 = 20(x - 2) \), or \( y = 20x - 32. \)

b. \( h'(x) = \frac{(x-3)f'(x) - f(x)}{(x-3)^2} \), so \( h'(2) = \frac{(-1)3 - 2}{(1-1)^2} = -5. \) Also, \( h(2) = -2. \) Thus, the tangent line is given by \( y + 2 = (-5)(x - 2) \), or \( y = -5x + 8. \)

3.4.73

a.

\[
y' = -\frac{54x}{(x^2+9)^2}. \text{ At } x = 2, \ y' = -\frac{108}{169} \text{ and } y = \frac{27}{13}. \text{ Thus the tangent line is given by } y = \frac{27}{13}(x - 2), \text{ or } y = -\frac{108}{169}x + \frac{567}{169}.
\]

b.

\[
y = \frac{3}{10}(x - 2).\]

3.4.74 \( \frac{d}{dx} [f(x)g(x)]|_{x=1} = f'(1)g(1) + f(1)g'(1) = 3 \cdot 4 + 5 \cdot 2 = 22. \)

3.4.75 \( \frac{d}{dx} \left[ \frac{f(x)}{g(x)} \right] |_{x=2} = \frac{g(2)f'(2) - f(2)g'(2)}{(g(2))^2} = \frac{25 - 4}{4} = \frac{3}{2}. \)

3.4.76 \( \frac{d}{dx} [xf(x)]|_{x=3} = f(3) + 3 \cdot f'(3) = 3 + 3 \cdot 2 = 9. \)

3.4.77 \( \frac{d}{dx} \left[ \frac{f(x)}{x+2} \right] |_{x=4} = \frac{(4+2)f'(4) - f(4)}{36} = \frac{6 - 2}{36} = \frac{1}{9}. \)

3.4.78 \( \frac{d}{dx} \left[ \frac{xf(x)}{y(x)} \right] |_{x=4} = \frac{g(4)(f(4) + 4f'(4)) - 4f(4)g'(4)}{(g(4))^2} = \frac{3(2+4) - 4 \cdot 2 \cdot 1}{9} = \frac{10}{9}. \)

3.4.79 \( \frac{d}{dx} \left[ \frac{f(x)g(x)}{x} \right] |_{x=4} = \frac{4f'(4)g(4) + f(4)g'(4) - f(4)g(4)}{16} = \frac{4(1+3+2) - 2 \cdot 3}{16} = \frac{14}{16} = \frac{7}{8}. \)

3.4.80

a. Because the slope of \( f \) at 2 is \( f'(2) = 4 \) and the slope of \( g \) at 2 is \( g'(2) = 3 \) and \( f(2) = 4 \cdot 2 + 1 = 9, \)

\( g(2) = 3 \cdot 2 - 2 = 4 \) we have \( g'(2) = f'(2)g(2) + f(2)g'(2) = 4 \cdot 4 + 9 \cdot 3 = 43. \) Thus, the tangent line at this point is \( y - 36 = 43(x - 2), \) or \( y = 43x - 50. \)

b. \( g'(2) = \frac{g(2)f'(2) - f(2)g'(2)}{(g(2))^2} = \frac{4 \cdot 9 - 3}{16} = \frac{-11}{16}. \) So the equation of the tangent line at this point is \( y - \frac{9}{4} = -\frac{11}{16}(x - 2), \) or \( y = -\frac{11}{16}x + \frac{29}{8}. \)

3.4.81

a. The instantaneous rate of change is \( \frac{d}{dx}F(x) = -\frac{2kQq}{x^3} = -\frac{1.8 \times 10^{10}Qq}{x^3} \) Newtons per meter.

b. \( \left[ \frac{d}{dx}F(x) \right] |_{x=0.001} = \frac{1.8 \times 10^{10}}{(0.001)^3} = -\frac{1.8 \times 10^{10}}{10^{-9}} = -1.8 \times 10^9 \) Newtons per meter.

c. Because the distance \( x \) appears in the denominator of \( F'(x) \), the absolute value of the instantaneous rate of change decreases with the separation.

3.4.82

a. The instantaneous rate of change if \( \frac{d}{dx}F(x) = \frac{2GMm}{x^3} \) Newtons per meter.

b. \( \left[ \frac{d}{dx}F(x) \right] |_{x=0.01} = \frac{13.4 \times 10^{-11}(0.1)^2}{(0.01)^3} = 1.34 \times 10^{-6} \) Newtons per meter.
c. Because the distance \( x \) appears in the denominator of \( F'(x) \), the instantaneous rate of change decreases with the separation.

3.4.83 We attempt a solution with functions of the form \( f(x) = e^{ax} \) and \( g(x) = e^{bx} \), because these functions are multiples of their own derivatives. The derivative of \( fg \) is \((a+b)e^{(a+b)x}\), while the product of the derivatives is \( abe^{(a+b)x} \). These would be equal if we could have \( a + b = ab \), so that \( b = \frac{a}{a-1} \). This occurs, for example, when \( a = b = 2 \). Thus the functions \( f(x) = g(x) = e^{2x} \) have the desired property.

3.4.84 We attempt a solution with functions of the form \( f(x) = e^{ax} \) and \( g(x) = e^{bx} \), because these functions are multiples of their own derivatives. The derivative of \( f/g \) is \( (a-b)e^{(a-b)x} \), while the quotient of the derivatives is \( \frac{a}{b} \cdot e^{(a-b)x} \). These would be equal if we could have \( a - b = \frac{a}{b} \), so that \( a(1 - \frac{1}{b}) = b \), or \( a = \frac{b^2}{b-1} \). This occurs, for example, when \( a = 4 \) and \( b = 2 \). Thus the functions \( f(x) = e^{4x} \) and \( g(x) = e^{2x} \) have the desired property.

3.4.85
a. The tangent line at \( x = a \) is \( y - a^2 = 2a(x - a) \) and at \( x = b \) is \( y - b^2 = 2b(x - b) \). These intersect when \( a^2 + 2ax - 2a^2 = b^2 + 2bx - 2b^2 \), or \( 2a - 2b)x = a^2 - b^2 \), which is met when \( x = \frac{a+b}{2} \). So \( c = \frac{a+b}{2} \).

b. The tangent line at \( x = a \) is \( y - \sqrt{a} = \frac{1}{2\sqrt{a}}(x - a) \) and at \( x = b \) is \( y - \sqrt{b} = \frac{1}{2\sqrt{b}}(x - b) \). These intersect when \( \sqrt{a} + \frac{1}{2\sqrt{a}}(x - a) = \sqrt{b} + \frac{1}{2\sqrt{b}}(x - b) \), or \( \left( \frac{1}{2\sqrt{a}} - \frac{1}{2\sqrt{b}} \right) x = \frac{\sqrt{a} - \sqrt{b}}{2} \), which is met when \( x = \sqrt{ab} \). So \( c = \sqrt{ab} \).

c. The tangent line at \( x = a \) is \( y - \frac{1}{a} = -\frac{1}{a^2}(x - a) \) and at \( x = b \) is \( y - \frac{1}{b} = -\frac{1}{ab}(x - b) \). These intersect when \( \frac{1}{a} - \frac{1}{a^2}(x - a) = \frac{1}{b} - \frac{1}{ab}(x - b) \), or \( \left( \frac{a}{x^2} - \frac{1}{ax} \right) = \left( \frac{2}{a} - \frac{1}{ab} \right) \), which is met when \( x \left( \frac{1}{a} - \frac{1}{a^2} \right) = \frac{2}{a} - \frac{2}{a} \), or \( x \left( \frac{a^2 - b^2}{a^2b^2} \right) = \frac{2(a-b)}{ab} \). Thus we arrive at \( x = \frac{2ab}{a+b} \). So \( c = \frac{2ab}{a+b} \).

d. The tangent line at \( x = a \) is \( y - f(a) = f'(a)(x-a) \) and at \( x = b \) is \( y - f(b) = f'(b)(x-b) \). These intersect when \( f(a) + f'(a)(x-a) = f(b) + f'(b)(x-b) \), or \( (f'(a) - f'(b))x = f(b) - f(a) - f'(b)b + f'(a)a \). Solving for \( x \) yields \( x = \frac{f(b)-f(a)-f'(b)b+f'(a)a}{f'(a)-f'(b)} \) provided \( f'(a) \neq f'(b) \) (which occurs when the tangent lines are parallel and don’t intersect).

3.4.86
a. 
\[
\frac{d}{dx} \left( \frac{f(x)}{g(x)} \right) = \lim_{h \to 0} \frac{f(x+h)g(x) - f(x)g(x+h)}{h} = \lim_{h \to 0} \frac{f(x+h)g(x) - f(x)g(x+h)}{h \cdot g(x+h)g(x)}.
\]

b. 
\[
\lim_{h \to 0} \frac{f(x+h)g(x) - f(x)g(x) + f(x)g(x) - f(x)g(x+h)}{h \cdot g(x+h)g(x)} = \lim_{h \to 0} \frac{g(x) \left( \frac{f(x+h)-f(x)}{h} \right) - f(x) \left( \frac{g(x+h)-g(x)}{h} \right)}{g(x)g(x+h)} = \frac{g(x)f'(x) - f(x)g'(x)}{(g(x))^2}.
\]

c. \( F' \) exists provided that \( f \) and \( g \) are differentiable, and \( g(x) \neq 0 \). Note that we used the fact that \( \lim_{h \to 0} g(x+h) = g(x) \), which is true because \( g \) is continuous (because it is differentiable).

Copyright © 2014 Pearson Education, Inc.
3.4.87
\[ \frac{d^2}{dx^2}(f(x)g(x)) = \frac{d}{dx}(f'(x)g(x) + f(x)g'(x)) \]
\[ = f''(x)g(x) + f'(x)g'(x) + f'(x)g'(x) + f(x)g''(x) \]
\[ = f''(x)g(x) + 2f'(x)g'(x) + f(x)g''(x). \]

3.4.88
a. Since \( k = 1 \) we have \( \frac{d}{dx}(e^{kx}) = \frac{d}{dx}(e^x) = e^x = ke^{kx}. \)

b. \[ \frac{d}{dx}e^{(n+1)x} = \frac{d}{dx}(e^{nx} \cdot e^x) \]
\[ = \left( \frac{d}{dx}e^{nx} \right) e^x + e^{nx} \left( \frac{d}{dx}e^x \right) \]
\[ = ne^{nx}e^x + e^{nx}e^x \]
\[ = ne^{(n+1)x} + e^{(n+1)x} \]
\[ = (n + 1)e^{(n+1)x}. \]

3.4.89 Let \( k = -m \), where \( m \) is a positive integer. Then \( \frac{d}{dx}(e^{kx}) = \frac{d}{dx} \left( \frac{1}{e^{mx}} \right) = \frac{d}{dx}e^{-mx} = -me^{-mx} = ke^{kx}. \)

3.4.90
\[ \frac{d^2}{dx^2} \left[ \frac{f(x)}{g(x)} \right] = \frac{d}{dx} \left[ \frac{g(x)f'(x) - f(x)g'(x)}{(g(x))^2} \right] \]
\[ = \frac{(g(x))^2 \left( [g'(x)f'(x) + g(x)f''(x)] - [f(x)g''(x) + g'(x)f'(x)] \right)}{(g(x))^4} - \frac{(g(x))^4}{(g(x))^4} - \frac{2g(x)g'(x)}{(g(x))^3} \]
\[ = \frac{(g(x))^2 f''(x) - g(x)g(x)f''(x) - 2g(x)g'(x)f'(x)}{(g(x))^3} + 2f(x)(g'(x))^2 \]
\[ = \frac{(g(x))^2}{(g(x))^3}. \]

3.4.91
a. \[ \frac{d}{dx}(f(x)g(x)h(x)) = \frac{d}{dx}[f(x)g(x)] \cdot h(x) + f(x)g(x) \cdot \frac{d}{dx}h(x) \]
\[ = f'(x)g(x)h(x) + f(x)g'(x)h(x) + f(x)g(x)h'(x) \]
\[ = f'(x)g(x)h(x) + f(x)g'(x)h(x) + f(x)g(x)h'(x). \]

b. \[ \frac{d}{dx}[e^{2x}(x - 1)(x + 3)] = 2e^{2x}(x - 1)(x + 3) + e^{2x}(x + 3) + e^{2x}(x - 1) \]
\[ = e^{2x}(2x^2 + 4x - 6 + x + 3 + x - 1) \]
\[ = e^{2x}(2x^2 + 6x - 4) = 2e^{2x}(x^2 + 3x - 2). \]

3.4.92
a. \((fg)'(x) = (f'g + fg')' = f''g + f'g' + f'g' + fg'' = f''g + 2f'g' + fg''\).
b. We proceed by induction. For \( n = 1 \), we have that
\[
(fg)' = \sum_{k=0}^{1} f^{(k)}g^{(1-k)} = f'g + fg'.
\]

Now suppose that the rule holds for \( n = m \). We will show that the rule holds for \( n = m + 1 \).
\[
(fg)^{(m+1)} = \left( (fg)^{(m)} \right)' = \sum_{k=0}^{n} \binom{n}{k} (f^{(k)}g^{(n-k)})'
= \sum_{k=0}^{n} \binom{n}{k} \left( f^{(k+1)}g^{(n-k)} + f^{(k)}g^{(n+1-k)} \right)
= \sum_{k=0}^{n} \binom{n}{k} \left( f^{(k+1)}g^{(n+1-(k+1))} + f^{(k)}g^{(n+1-k)} \right)
= \sum_{k=1}^{n+1} \binom{n+1}{k-1} f^{(k)}g^{(n+1-k)} + \sum_{k=0}^{n} \binom{n}{k} f^{(k)}g^{(n+1-k)}
= \sum_{k=0}^{n+1} \binom{n+1}{k} f^{(k)}g^{(n+1-k)},
\]

because \( \binom{n}{0} = \binom{n}{n+1} = 1 \) and \( \binom{n}{k-1} + \binom{n}{k} = \binom{n+1}{k} \).

c. \((a + b)^n = \sum_{k=0}^{n} \binom{n}{k} a^k b^{n-k}\) follows a similar pattern.

### 3.5 Derivatives of Trigonometric Functions

#### 3.5.1
Clearly \( \sin \frac{x}{x} \) is undefined at zero since the denominator vanishes, so direct substitution will not work.

#### 3.5.2
It is an important ingredient in the derivation of the formula \( \frac{d}{dx} \sin x = \cos x \).

#### 3.5.3
Because \( \tan x = \frac{\sin x}{\cos x} \) and \( \cot x = \frac{\cos x}{\sin x} \), we can use the quotient rule to compute these derivatives, because we know the derivatives of \( \sin x \) and of \( \cos x \).

#### 3.5.4
Remember the rule that the derivative of a \(^{\text{co}}\) function can be obtained from the derivative of a function by changing all of the functions in the formula to their cofunctions, and introducing a factor of negative one. Thus, for example, because \( \frac{d}{d\theta} \tan \theta = \sec^2 \theta \), we would have \( \frac{d}{d\theta} \cot \theta = -\csc^2 \theta \).

#### 3.5.5
\( f'(x) = \cos x \) and \( f''(\pi) = \cos \pi = -1 \).

#### 3.5.6
Because \( \frac{d}{dx} \sin x = \cos x \), the graph of \( \sin x \) will have a horizontal tangent line where the cosine function crosses the \( x \) axis. This happens at all real numbers of the form \( x = \frac{2n+1}{2} \pi \) where \( n \) is an integer.

#### 3.5.7
\[
\lim_{x \to 0} \frac{\sin 3x}{x} = \lim_{x \to 0} \frac{3 \sin 3x}{3x} = 3 \lim_{x \to 0} \frac{\sin 3x}{3x} = 3 \cdot 1 = 3.
\]

#### 3.5.8
\[
\lim_{x \to 0} \frac{\sin 5x}{3x} = \frac{1}{3} \lim_{x \to 0} \frac{5 \sin 5x}{5x} = \frac{5}{3} \lim_{x \to 0} \frac{\sin 5x}{5x} = \frac{5}{3} \cdot 1 = \frac{5}{3}.
\]

#### 3.5.9
\[
\lim_{x \to 0} \frac{\sin 7x}{\sin 3x} = \lim_{x \to 0} \frac{\frac{7 \sin 7x}{7x}}{\frac{\sin 3x}{3x}} = \frac{7}{3} \lim_{x \to 0} \frac{\sin 7x}{7x} = \frac{7}{3} \cdot 1 = \frac{7}{3}.
\]

Copyright © 2014 Pearson Education, Inc.
\[3.5.10\quad \lim_{x \to 0} \frac{\sin 3x}{\tan 4x} = \lim_{x \to 0} \frac{3x}{4x} \cdot \frac{\sin 4x}{\cos 4x} = \frac{3 \cdot 1 \cdot 1}{4 \cdot 1} = \frac{3}{4}\]

\[3.5.11\quad \lim_{x \to 0} \frac{\tan 5x}{x} = \lim_{x \to 0} \frac{5 \sin 5x}{5x \cos 5x} = 5 \lim_{x \to 0} \frac{\sin 5x}{5x} \cdot \frac{1}{\cos 5x} = 5 \cdot 1 \cdot 1 = 5\]

\[3.5.12\quad \lim_{\theta \to 0} \frac{\cos^2 \theta - 1}{\theta} = \left( \lim_{\theta \to 0} (\cos \theta + 1) \right) \cdot \left( \lim_{\theta \to 0} \frac{\cos \theta - 1}{\theta} \right) = 2 \cdot 0 = 0\]

\[\lim_{x \to 0} \frac{\tan 7x}{\sin x} = \lim_{x \to 0} \frac{\sin 7x}{\cos 7x \cdot \sin x} = \lim_{x \to 0} \left( \frac{1}{\cos 7x} \cdot \frac{x}{\sin x} \cdot \frac{7 \sin 7x}{7x} \right) = 7 \cdot 1 \cdot 1 \cdot 1 = 7\]

\[\lim_{\theta \to 0} \frac{\sec \theta - 1}{\theta} = \lim_{\theta \to 0} \frac{\cos \theta - 1}{\theta \cos \theta} = \lim_{\theta \to 0} \frac{1 - \cos \theta}{\theta} \cdot \lim_{\theta \to 0} \frac{1 - \cos \theta}{\theta} = 1 \cdot 0 = 0\]

\[\lim_{x \to 2} \frac{\sin(x - 2)}{x^2 - 4} = \lim_{x \to 2} \left( \frac{1}{x + 2} \cdot \frac{\sin(x - 2)}{x - 2} \right) = \lim_{x \to 2} \frac{1}{x + 2} \cdot \lim_{x \to 2} \frac{\sin(x - 2)}{x - 2} = \frac{1}{4} \cdot 1 = \frac{1}{4}\]

\[\lim_{x \to -3} \frac{\sin(x + 3)}{x^2 + 8x + 15} = \lim_{x \to -3} \frac{\sin(x + 3)}{(x + 5)(x + 3)} = \lim_{x \to -3} \frac{1}{x + 5} \cdot \lim_{x \to -3} \frac{\sin(x + 3)}{x + 3} = \frac{1}{2} \cdot 1 = \frac{1}{2}\]

\[y' = \cos x - \sin x\]

\[y' = 10x - \sin x\]

\[y = -e^{-x} \sin x + e^{-x} \cos x = e^{-x}(\cos x - \sin x)\]

\[y' = \cos x + 2e^{0.5x}\]

\[y' = \sin x + x \cos x\]

\[y' = 6e^{6x} \sin x + e^{6x} \cos x = e^{6x}(6 \sin x + \cos x)\]

\[y' = \frac{(\sin x + 1)(-\sin x) - (\cos x)(\cos x)}{(1 + \sin x)^2} = \frac{-1(\sin^2 x + \cos^2 x) - \sin x}{(1 + \sin x)^2} = \frac{-1(1 + \sin x)}{(1 + \sin x)^2} = -\frac{1}{1 + \sin x}\]

\[y' = \frac{(1 + \sin x)(-\cos x) - (1 - \sin x)(\cos x)}{(1 + \sin x)^2} = -\frac{2 \cos x}{(1 + \sin x)^2}\]

\[y' = \cos x \cos x + \sin x \cdot (-\sin x) = \cos^2 x - \sin^2 x = \cos(2x)\]

\[y' = \frac{(\sin x + 1)(2x \sin x + (x^2 - 1) \cos x) - \cos x(x^2 - 1) \sin x}{(\sin x + 1)^2} = \frac{2x \sin^2 x + 2x \sin x + x^2 \cos x - \cos x}{(\sin x + 1)^2}\]

\[y' = -\sin x \cos x + \cos x(-\sin x) = -2 \sin x \cos x = -\sin(2x)\]
3.5.28 \[ y' = \frac{(1 + \cos x)(\sin x + x \cos x) - x \sin x(-\sin x)}{(1 + \cos x)^2} \]
\[ = \frac{\sin x + x \cos x + \sin x \cos x + x \cos^2 x + x \sin^2 x}{(1 + \cos x)^2} \]
\[ = \frac{\sin x + x \cos x + \sin x \cos x + x}{(1 + \cos x)^2} \]
\[ = \frac{\sin x(1 + \cos x) + x(1 + \cos x)}{(1 + \cos x)^2} \]
\[ = \frac{\sin x + x}{1 + \cos x}. \]

3.5.29 \[ \frac{d}{dx}(\cot x) = \frac{d}{dx} \left( \frac{\cos x}{\sin x} \right) = \frac{\sin x(-\sin x) - \cos x(1)}{\sin^2 x} = -\frac{\sin^2 x + \cos^2 x}{\sin^2 x} = -\frac{1}{\sin^2 x} = -\csc^2 x. \]

3.5.30 \[ \frac{d}{dx}(\sec x) = \frac{d}{dx} \left( \frac{1}{\cos x} \right) = \frac{0 - (-\sin x)}{\cos^2 x} = \frac{1}{\cos x} \cdot \frac{\sin x}{\cos x} = \sec x \tan x. \]

3.5.31 \[ \frac{d}{dx}(\csc x) = \frac{d}{dx} \left( \frac{1}{\sin x} \right) = \frac{0 - \cos x}{\sin^2 x} = -\frac{1}{\sin x} \cdot \frac{\cos x}{\sin x} = -\csc x \cot x. \]

3.5.32 \[ y' = \sec^2 x - \csc^2 x. \]

3.5.33 \[ y' = \sec x \tan x - \csc x \cot x. \]

3.5.34 \[ y' = \sec x \tan x \tan x + \sec x \sec^2 x = \sec x(\tan^2 x + \sec^2 x). \]

3.5.35 \[ y' = 5e^{5x} \csc x + e^{5x}(-\csc x \cot x) = e^{5x} \csc x(5 - \cot x). \]

3.5.36 \[ y' = \frac{(1 + \tan w)\sec^2 w - \tan w \sec^2 w}{(1 + \tan w)^2} = \frac{\sec^2 w}{(1 + \tan w)^2}. \]

3.5.37 \[ y' = \frac{(1 + \csc x)(-\csc^2 x) - \cot x(-\csc x \cot x)}{(1 + \csc x)^2} \]
\[ = -\csc^2 x - \csc^3 x + \csc x(\csc^2 x - 1) \]
\[ = -\frac{\csc x(1 + \csc x)}{(1 + \csc x)^2} \]
\[ = -\csc x \cdot \frac{1 + \csc x}{1 + \csc x}. \]

3.5.38 \[ y' = \frac{(1 + \sec t)\sec^2 t - \tan t(\sec t \tan t)}{(1 + \sec t)^2} \]
\[ = \frac{\sec^2 t + \sec^3 t - \sec t(\sec^2 t - 1)}{(1 + \sec t)^2} \]
\[ = \frac{\sec t(1 + \sec t)}{(1 + \sec t)^2} \]
\[ = \frac{\sec t}{1 + \sec t}. \]

Copyright © 2014 Pearson Education, Inc.
3.5.39
\[ y' = 0 - \frac{\sec z \tan z \csc z - \sec z \csc z \cot z}{\sec^2 z \csc^2 z} \]
\[ = \frac{\sec z \csc z (\cot z - \tan z)}{\sec^2 z \csc^2 z} \]
\[ = \cot z - \tan z \]
\[ = \cos^2 z - \sin^2 z = \cos(2z). \]

3.5.40 Because \( \csc^2 \theta - 1 = \cot^2 \theta \), we have \( y' = \frac{d}{d\theta} \cot^2 \theta = -\csc^2 \theta \cot \theta + \cot \theta (\csc^2 \theta) = -2 \csc^2 \theta \cot \theta. \)

3.5.41 \( y' = \sin x + x \cos x \), so \( y'' = \cos x + \cos x - x \sin x = 2 \cos x - x \sin x. \)

3.5.42 \( y' = - \sin x \), so \( y'' = - \cos x. \)

3.5.43 \( y' = e^x \sin x + e^x \cos x \), so \( y'' = e^x \sin x + e^x \cos x + e^x (- \sin x) = 2e^x \cos x. \)

3.5.44 \( y' = \frac{1}{2} e^x \cos x + \frac{1}{2} e^x (- \sin x) \), so
\[ y'' = \frac{1}{2} e^x \cos x + \frac{1}{2} e^x (- \sin x) + \frac{1}{2} e^x (- \sin x) + \frac{1}{2} e^x (- \cos x) = -e^x \sin x. \]

3.5.45 \( y' = - \csc^2 x \) and \( y'' = -((\csc x \cot x) \csc x + \csc x(- \csc x \cot x)) = 2 \cot x \csc^2 x. \)

3.5.46 \( y' = \sec^2 x \) and \( y'' = \sec x \tan x (\sec x) + \sec x (\sec x \tan x) = 2 \tan x \sec^2 x. \)

3.5.47
\[ y' = \sec x \tan x \csc x - \sec x \csc x \cot x = \sec x \csc x (\tan x - \cot x) = \sec^2 x - \csc^2 x \]
\[ y'' = \sec x (\sec x \tan x) + (\sec x \tan x) \sec x - ((\csc x \cot x) \csc x + \csc x(- \csc x \cot x)) \]
\[ = 2 \sec^2 x \tan x + 2 \csc^2 x \cot x. \]

3.5.48
\[ y' = (- \sin x) \sin x + \cos x \cos x = \cos^2 x - \sin^2 x = \cos(2x) \]
\[ y'' = 2 \cos x (- \sin x) - 2 \sin x \cos x = -2(2 \sin x \cos x) = -2 \sin(2x). \]

3.5.49
a. False. \( \frac{d}{dx} \sin^2 x = \sin x \cos x + \cos x \sin x = 2 \sin x \cos x \neq \cos^2 x. \)

b. False. \( \frac{d^2}{dx^2} \sin x = \frac{d}{dx} \cos x = -\sin x \neq \sin x. \)

c. True. \( \frac{d^4}{dx^4} \cos x = \frac{d^4}{dx^4} (- \sin x) = \frac{d^2}{dx^2} (- \cos x) = \frac{d}{dx} \sin x = \cos x. \)

d. True. In fact, \( \pi/2 \) isn’t even in the domain of \( \sec x. \)

3.5.50 \( \lim_{x \to 0} \frac{\sin ax}{bx} = \frac{a}{b} \lim_{x \to 0} \frac{\sin ax}{ax} = \frac{a}{b} \cdot 1 = \frac{a}{b}. \)

3.5.51 \( \lim_{x \to 0} \frac{\sin ax}{\sin bx} = \lim_{x \to 0} \frac{a \sin ax}{ax} \cdot \frac{bx}{\sin bx} = \frac{a}{b} \lim_{x \to 0} \frac{\sin ax}{ax} \cdot \lim_{x \to 0} \frac{bx}{\sin bx} = \frac{a}{b} \cdot 1 \cdot 1 = \frac{a}{b}. \)

3.5.52 Let \( x = t + \pi/2. \) Then as \( t \to 0, \ x \to \pi/2. \)
\[ \lim_{t \to 0} \frac{\cos x}{x - \pi/2} = \lim_{t \to 0} \frac{\cos(t + \pi/2)}{t} = \lim_{t \to 0} \frac{-\sin t}{t} = -1. \]

3.5.53 \( \lim_{x \to 0} 3 \sec^5 x = 3 \frac{\sec^5(0)}{4} = \frac{3}{4}. \)

Copyright © 2014 Pearson Education, Inc.
3.5.54 \( \lim_{x \to \infty} \frac{\cos x}{x} = 0 \), because \( -\frac{1}{x} \leq \frac{\cos x}{x} \leq \frac{1}{x} \), and \( \lim_{x \to -\infty} \frac{1}{x} = 0 \), so we can apply the squeeze theorem.

3.5.55 \( \lim_{x \to \pi/4} \frac{3 \csc(2x) \cot(2x)}{3 csc(2x) \cot(2x)} = \lim_{x \to \pi/4} \frac{3 \cos \frac{\pi}{2}}{(\sin \frac{\pi}{2})^2} = 3 \cdot \frac{0}{1} = 0 \).

3.5.56 \( \frac{dy}{dx} = (1 + \cos x) \cos x - \sin x (-\sin x) = \frac{1 + \cos x}{1 + \cos x} = 1 + \cos x \).

3.5.57 \( \frac{dy}{dx} = \cos x \sin x + x(-\sin x) \cos x = \sin x \cos x - x \sin^2 x + x \cos^2 x = \frac{1}{2} \sin 2x + x \cos 2x \).

3.5.58 \( \frac{dy}{dx} = \frac{0 - 1 \cdot \cos x}{(2 + \sin x)^2} = -\frac{\cos x}{(2 + \sin x)^2} \).

3.5.59 \( \frac{dy}{dx} = \frac{(\sin x - \cos x)(\cos x) - \sin x(\cos x + \sin x)}{(\sin x - \cos x)^2} = -\frac{\sin^2 x - \cos^2 x}{(\sin x - \cos x)^2} = -\frac{1}{(\sin x - \cos x)^2} \). This can be further simplified if desired, since \( (\sin x - \cos x)^2 = \sin^2 x - 2 \sin x \cos x + \cos^2 x = 1 - 2 \sin x \cos x \), so that the answer is the same as \( \frac{1}{2 \sin x \cos x - 1} \).

3.5.60 \( \frac{dy}{dx} = \frac{(1 + x^3)(\cos x - x \sin x) - x(\cos x)(3x^2)}{(1 + x^3)^2} = \frac{\cos x - x \sin x - x^4 \sin x - 2x^3 \cos x}{(1 + x^3)^2} \).

3.5.61 \( \frac{dy}{dx} = \frac{(1 + \cos x) \sin x - (1 - \cos x)(-\sin x)}{(1 + \cos x)^2} = \frac{2 \sin x}{(1 + \cos x)^2} \).

3.5.62

b.

a. \( y' = 4 \cos^2 x - 4 \sin^2 x \), so \( y' \left( \frac{\pi}{6} \right) = 4 \left( \frac{1}{4} - \frac{3}{4} \right) = -2 \). Also, \( y \left( \frac{\pi}{6} \right) = 4 \cdot \frac{\sqrt{3}}{2} \cdot \frac{1}{2} = \sqrt{3} \). The tangent line is thus given by \( y - \sqrt{3} = -2 \left( x - \frac{\pi}{6} \right) \), or \( y = -2x + \sqrt{3} + \frac{2\pi}{3} \).

3.5.63

b.

a. \( y' = 2 \cos x \), so \( y' \left( \frac{\pi}{6} \right) = \sqrt{3} \). Also, \( y \left( \frac{\pi}{6} \right) = 2 \). The tangent line is thus given by \( y - 2 = \sqrt{3} \left( x - \frac{\pi}{6} \right) \), or \( y = \sqrt{3}x + 2 - \frac{\sqrt{3}}{6} \).
3.5.64

a. \( y' = -\csc x \cot x \), so \( y' \left( \frac{\pi}{4} \right) = -\sqrt{2} \). Also, \( y \left( \frac{\pi}{4} \right) = \sqrt{2} \). The tangent line is thus given by \( y - \sqrt{2} = -\sqrt{2} \left( x - \frac{\pi}{4} \right) \), or \( y = -\sqrt{2}x + \sqrt{2} + \frac{\sqrt{2}\pi}{4} \).

b.

3.5.65

a. \( y' = \frac{(1-\cos x)(-\sin x) - \cos x \sin x}{(1-\cos x)^2} = -\frac{\sin x}{(1-\cos x)^2} \), so \( y' \left( \frac{\pi}{3} \right) = -2\sqrt{3} \). Also, \( y \left( \frac{\pi}{3} \right) = 1 \). The tangent line is thus given by \( y - 1 = -2\sqrt{3} \left( x - \frac{\pi}{3} \right) \), or \( y = -2\sqrt{3}x + \frac{2\sqrt{3}\pi}{3} + 1 \).

b.

3.5.66

a. A horizontal tangent line occurs when \( g'(x) = 1 - \cos x = 0 \), which is when \( \cos x = 1 \). This occurs when \( x = 2n\pi \), where \( n \) is any integer.

b. A slope of 1 occurs when \( g'(x) = 1 - \cos x = 1 \), which is when \( \cos x = 0 \). This occurs when \( x = \frac{2n+1}{2} \cdot \pi \), where \( n \) is any integer.

3.5.67 For a horizontal tangent line we need \( f'(x) = 1 + 2 \sin x = 0 \), or \( \sin x = -\frac{1}{2} \). This occurs for \( x = \frac{7\pi}{6} + 2n\pi \) where \( n \) is any integer, or for \( x = \frac{11\pi}{6} + 2n\pi \) where \( n \) is any integer.

3.5.68

a. The derivative of graph (a) is graph (D), because graph (a) has a positive slope everywhere, its derivative must be positive everywhere, and graph (D) is the only one with this property.

b. The derivative of graph (b) is graph (B), because graph (b) has negative slope everywhere, its derivative must be negative everywhere, and graph (B) is the only one with this property.

c. The derivative of graph (c) is graph (A), because graph (c) has horizontal tangents at 0 and \( \pm \pi \), its derivative needs to be 0 at these points, and only graph (A) has this property.

d. The derivative of graph (d) is graph (C), because graph (d) has horizontal tangents at \( \pm \frac{\pi}{2} \) and \( \pm \frac{3\pi}{2} \), its derivative needs to be 0 at these points, and only graph (C) has this property.

3.5.69

a. The graph of \( y(t) \) oscillates between \( -e^{-kt} \) and \( e^{-kt} \) because \(-1 \leq \sin t \leq 1\). Because \( e^{-kt} \) decreases as \( k \) increases, the oscillations have a smaller and smaller amplitude as \( k \) increases.

b. \( v(t) = y'(t) = 30 \cos t \) cm per second.

c. \( v(t) = 30 \cos t = 0 \) when \( t = \frac{2n+1}{2} \cdot \pi \) where \( n \) is a non-negative integer. At those times, the position is given by
\[
\begin{cases}
0 & \text{if } n \text{ is even} \\
-60 & \text{if } n \text{ is odd}.
\end{cases}
\]

d. The maximum velocity is 30 cm per second because \( |\cos t| \leq 1 \) for all \( t \). We have \( \cos t = 1 \) for \( t = 2n\pi \) for any integer \( n \). At those times, \( y(2n\pi) = -30 \).

e. The graph of \( f(t) = e^{-kt} \sin t \) oscillates between \(-e^{-kt}\) and \( e^{-kt}\) because \(-1 \leq \sin t \leq 1\). Because \( e^{-kt} \) decreases as \( k \) increases, the oscillations have a smaller and smaller amplitude as \( k \) increases.

f. \( a(t) = v'(t) = -30 \sin t \).

3.5.70

a.

The graph of \( f(t) = e^{-kt} \sin t \) oscillates between \(-e^{-kt}\) and \( e^{-kt}\) because \(-1 \leq \sin t \leq 1\). Because \( e^{-kt} \) decreases as \( k \) increases, the oscillations have a smaller and smaller amplitude as \( k \) increases.

b. For \( k = 1 \), we have \( f'(t) = -e^{-t} \sin t + e^{-t} \cos t \), which is zero when \( \cos t - \sin t = 0 \), which occurs for \( t = \frac{\pi}{4} + n\pi \) where \( n \) is any integer.

c. Because \(-1 \leq \sin t \leq 1\) and \( e^{-t} > 0 \) for all \( t \), we have \(-e^{-t} \leq e^{-t} \sin t \leq e^{-t}\). And because \( \lim_{t \to \infty} e^{-t} = 0 \), we have that \( \lim_{t \to \infty} e^{-t} \sin t = 0 \) by the squeeze theorem. This means that the vibrations approach zero in the long run.
3.5.71
a. \( y'(t) = A \cos t, \ y''(t) = -A \sin t, \) so \( y''(t) + y(t) = -A \sin t + A \sin t = 0 \) for all \( A \) and all \( t \).

b. \( y'(t) = -B \sin t, \ y''(t) = -B \cos t, \) so \( y''(t) + y(t) = -B \cos t + B \cos t = 0 \) for all \( B \) and all \( t \).

c. \( y' = A \cos t - B \sin t, \ y'' = -A \sin t - B \cos t, \) so \( y''(t) + y(t) = -A \sin t - B \cos t + A \sin t + B \cos t = 0 \) for all \( A, B, t \).

3.5.72 \( \frac{d}{dx}(2 \sin x \cos x) = (2 \cos x) \cos x + (2 \sin x)(-\sin x) = 2(\cos^2 x - \sin^2 x) = 2 \cos 2x \).

3.5.73
\[
\lim_{x \to 0} \frac{\cos x - 1}{x} = \lim_{x \to 0} \frac{(\cos x - 1)(\cos x + 1)}{x(\cos x + 1)} = \lim_{x \to 0} \frac{\cos^2 x - 1}{x(\cos x + 1)} = \lim_{x \to 0} \frac{-\sin^2 x}{x(\cos x + 1)} = \lim_{x \to 0} \frac{-\sin x}{x} \cdot \lim_{x \to 0} \frac{-\sin x}{(\cos x + 1)} = 1 \cdot 0 = 0.
\]

3.5.74 Using the half-angle formula \( \frac{1 - \cos x}{2} = \sin^2(x/2) \),
\[
\lim_{x \to 0} \frac{\cos x - 1}{x} = \lim_{x \to 0} \frac{1 - \cos x}{2x/2} = \lim_{x \to 0} \frac{-\sin^2(x/2)}{x/2} = -\lim_{x \to 0} \sin(x/2) \cdot \lim_{x \to 0} \frac{\sin x/2}{x/2} = -1 \cdot 1 = 0.
\]

3.5.75
\[
\frac{d}{dx} \cos x = \lim_{h \to 0} \frac{\cos(x + h) - \cos x}{h} = \lim_{h \to 0} \frac{\cos x \cos h - \sin x \sin h - \cos x}{h} = \cos x \left( \lim_{h \to 0} \frac{\cos h - 1}{h} \right) - \sin x \left( \lim_{h \to 0} \frac{\sin h}{h} \right) = \cos x \cdot 0 - \sin x \cdot 1 = -\sin x.
\]

3.5.76 \( f \) is continuous at 0 if and only if \( \lim_{x \to 0} f(x) = f(0) \). Because \( \lim_{x \to 0} f(x) = \lim_{x \to 0} \frac{3 \sin x}{x} = 3 \), we require \( a = 3 \) in order for \( f \) to be continuous.

3.5.77 \( g \) is continuous at 0 if and only if \( \lim_{x \to 0} g(x) = g(0) \). Because \( \lim_{x \to 0} g(x) = \lim_{x \to 0} \frac{1 - \cos x}{2x} = \frac{1}{2} \cdot 0 = 0 \), we require \( a = 0 \) in order for \( g \) to be continuous.

3.5.78
a. The unit circle consists of 360 degrees and \( 2\pi \) radians, so each degree corresponds to \( \frac{2\pi}{360} = \frac{\pi}{180} \) radians.

b. \( \lim_{x \to 0} \frac{s(x)}{x} = \lim_{x \to 0} \frac{\sin(x/180)}{x} = \pi \lim_{x \to 0} \frac{\sin(x/180)}{x} = \frac{\pi}{180} \cdot 1 = \frac{\pi}{180} \).

3.5.79
a. \( \frac{d}{dx} \sin^2 x = \sin x \cos x + \cos x \sin x = 2 \sin x \cos x \).

b. \( \frac{d}{dx} \sin^3 x = \frac{d}{dx}(\sin^2 x)(\sin x) = (2 \sin x \cos x) \sin x + \sin^2 x \cdot \cos x = 3 \sin^2 x \cos x \).

c. \( \frac{d}{dx} \sin^4 x = \frac{d}{dx}(\sin^3 x)(\sin x) = (3 \sin^2 x \cos x)(\sin x) + (\sin^3 x)(\cos x) = 4 \sin^3 x \cos x \).
3.5. DERIVATIVES OF TRIGONOMETRIC FUNCTIONS

3.5.80 Consider the statement \( \frac{d^{2n}}{dx^{2n}} \sin x = (-1)^n \sin x \). This statement is valid for \( n = 1 \) because
\[
\frac{d^2}{dx^2} \sin x = \frac{d}{dx} \cos x = -\sin x.
\]
Now suppose the statement is valid for some positive integer \( n \). Then
\[
\frac{d^{2n+2}}{dx^{2n+2}} \sin x = \frac{d^2}{dx^2} \left( \frac{d^{2n}}{dx^{2n}} \sin x \right) = \frac{d^2}{dx^2}((-1)^n \sin x) = (-1)^n \cdot (-1) \sin x = (-1)^{n+1} \sin x,
\]
which completes the proof.
Similarly, consider the statement \( \frac{d^{2n}}{dx^{2n}} \cos x = (-1)^n \cos x \). This statement is valid for \( n = 1 \) because
\[
\frac{d^2}{dx^2} \cos x = \frac{d}{dx}(-\sin x) = -\cos x.
\]
Now suppose the statement is valid for some positive integer \( n \). Then
\[
\frac{d^{2n+2}}{dx^{2n+2}} \cos x = \frac{d^2}{dx^2} \left( \frac{d^{2n}}{dx^{2n}} \cos x \right) = \frac{d^2}{dx^2}((-1)^n \cos x) = (-1)^n \cdot (-1) \cos x = (-1)^{n+1} \cos x,
\]
which completes the proof.

3.5.81
a. \( f(x) = \sin x, \ a = \frac{\pi}{6} \).

b. \( \lim_{h \to 0} \frac{\sin \left( \frac{\pi}{6} + h \right) - \frac{1}{2}}{h} = f' \left( \frac{\pi}{6} \right) = \cos \left( \frac{\pi}{6} \right) = \frac{\sqrt{3}}{2} \).

3.5.82
a. \( f(x) = \cos x, \ a = \frac{\pi}{6} \).

b. \( \lim_{h \to 0} \frac{\cos \left( \frac{\pi}{6} + h \right) - \frac{\sqrt{3}}{2}}{h} = f' \left( \frac{\pi}{6} \right) = -\sin \left( \frac{\pi}{6} \right) = -\frac{1}{2} \).

3.5.83
a. \( f(x) = \cot x, \ a = \frac{\pi}{4} \).

b. \( \lim_{x \to \pi/4} \frac{\cot(x) - 1}{x - \frac{\pi}{4}} = f' \left( \frac{\pi}{4} \right) = -\csc^2 \left( \frac{\pi}{4} \right) = -2 \).

3.5.84
a. \( f(x) = \tan x, \ a = \frac{5\pi}{6} \).

b. \( \lim_{h \to 0} \frac{\tan \left( \frac{5\pi}{6} + h \right) + \frac{1}{\sqrt{3}}}{h} = f' \left( \frac{5\pi}{6} \right) = \sec^2 \left( \frac{5\pi}{6} \right) = \frac{4}{3} \).
3.5.85

a. Since \( \frac{d}{dx}(\sin x) = \cos x = \lim_{h \to 0} \frac{f(x+h)-f(x)}{h} \), the graph of \( D(x) \) should be very close to the graph of \( \cos x \), since 0.01 is close to zero. Another way of thinking about this is that \( D(x) \) is the slope of a secant from \((x, \sin x)\) to \((x + 0.01, \sin(x + 0.01))\), which is quite close to the slope of the tangent to \( f \) at \( x \), which is \( \cos x \).

b. Graphs of \( D \) for 0.01 and for 0.001 are

c. Both plots are visually indistinguishable from \( y = \cos x \).

3.5.86

a. Since \( \frac{d}{dx}(\cos x) = -\sin x = \lim_{h \to 0} \frac{f(x+h)-f(x)}{h} \), the graph of \( D(x) \) should be very close to the graph of \( -\sin x \), since 0.01 is close to zero. Another way of thinking about this is that \( D(x) \) is the slope of a secant from \((x, \cos x)\) to \((x + 0.01, \cos(x + 0.01))\), which is quite close to the slope of the tangent to \( f \) at \( x \), which is \( -\sin x \).

b. Graphs of \( D \) for 0.01 and for 0.001 are

c. Both plots are visually indistinguishable from \( y = -\sin x \).

3.5.87

a. Since \( \frac{d}{dx} \left( \frac{x^3 + 1}{3} \right) = x^2 = \lim_{h \to 0} \frac{f(x+h)-f(x)}{h} \), the graph of \( D(x) \) should be very close to the graph of \( y = x^2 \), since 0.01 is close to zero. Another way of thinking about this is that \( D(x) \) is the slope of a secant from \((x, f(x))\) to \((x + 0.01, (x + 0.01)^2)\), which is quite close to the slope of the tangent to \( f \) at \( x \), which is \( x^2 \).
b. Graphs of $D$ for 0.01 and for 0.001 are

![Graphs of D for 0.01 and 0.001](image)

c. Both plots are visually indistinguishable from $y = x^2$.

3.5.88

a. Since $\frac{d}{dx}(\tan x) = \sec^2 x = \lim_{h \to 0} \frac{f(x+h)-f(x)}{h}$, the graph of $D(x)$ should be very close to the graph of $\sec^2 x$, since 0.01 is close to zero. Another way of thinking about this is that $D(x)$ is the slope of a secant from $(x, \tan x)$ to $(x + 0.01, \tan(x + 0.01))$, which is quite close to the slope of the tangent to $f$ at $x$, which is $\sec^2 x$.

b. Graphs of $D$ for 0.01 and for 0.001, together with a plot of $f'(x) = \sec^2 x$, are

![Graphs of D and f for 0.01 and 0.001](image)

c. Both plots are visually indistinguishable from $y = \sec^2 x$.

3.6 Derivatives as Rates of Change

3.6.1

The average rate of change over the interval $[a, a + \Delta x]$ is the slope of the line through $(a, f(a))$ and $(a + \Delta x, f(a + \Delta x))$, given by $m_{avg} = \frac{f(a+\Delta x)-f(a)}{\Delta x}$. The instantaneous rate of change is the limit of this expression as $\Delta x \to 0$, which is the slope of the tangent line at $(a, f(a))$.

3.6.2 If $\frac{dy}{dx}$ is large, then small changes in $x$ will result in relatively large changes in the value of $y$.

3.6.3 If $\frac{dy}{dx}$ is small, then small changes in $x$ will result in relatively small changes in the value of $y$.

3.6.4 The speed of an object is the absolute value of its velocity. Thus, velocity encompasses the direction that the object is moving, while speed does not (it is always positive).
3.6.5 Acceleration is the instantaneous rate of change of the velocity; that is, if \( s(t) \) is the position of an object at time \( t \), then \( s''(t) = \frac{d^2}{dt^2}(v(t)) = a(t) \) is the acceleration of the object at time \( t \).

3.6.6 Since the acceleration is a negative constant, it is \( -c \) for some \( c > 0 \), so that the velocity is \( v(t) = -ct + k \) for some constant \( k \). So as \( t \) increases, the velocity decreases.

3.6.7
a. \( v_{\text{avg}} = \frac{f(0.75) - f(0)}{0.75} = \frac{30 - 0}{0.75} = 40 \) mph.

b. \( v_{\text{avg}} = \frac{f(0.75) - f(0.25)}{0.75 - 0.25} = \frac{30 - 10}{0.5} = 40 \) mph.

This is a pretty good estimate, since the graph is nearly linear over that time interval.

c. \( v_{\text{avg}} = \frac{f(2.25) - f(1.75)}{2.25 - 1.75} = \frac{-14 - 16}{0.5} = -60 \) mph.

At 11 a.m. the velocity is \( v(2) \approx -60 \) mph. The car is moving south with a speed of approximately 60 mph.

d. From 9 a.m. until about 10:08 a.m., the car moves north, away from the station. Then it moves south, passing the station at approximately 11:02 a.m., and continues south until about 11:40 a.m. Then the car drives north until 12:00 noon stopping south of the station.

3.6.8
a. \( v_{\text{avg}} = \frac{s(1.5) - s(0)}{1.5 - 0} = \frac{600 - 0}{1.5} = 400 \) mph.

b. \( v_{\text{avg}} = \frac{s(8.5) - s(7.5)}{8.5 - 7.5} = \frac{0 - 300}{1} = -300 \) mph.

c. The velocity is zero from about 9 a.m. until 11:10 a.m. when the plane is at the gate in Minneapolis.

d. \( v(6) \approx \frac{800 - 1400}{1} = -600 \) mph. The velocity is negative as the plane returns to Seattle.

3.6.9

b. \( f'(t) = 0 \) when \( t = 2 \) — that is when the object is stationary. For \( 0 \leq t < 2 \) we have \( f'(t) < 0 \) so the object is moving to the left. For \( 2 < t \leq 5 \) we have \( f'(t) > 0 \) so the object is moving to the right.

c. \( f'(1) = -2 \) ft/sec and \( f''(t) = 2 \) ft/sec\(^2\), so in particular, \( f''(1) = 2 \) ft/sec\(^2\).

d. \( f'(t) = 0 \) when \( t = 2 \) and \( f''(2) = 2 \) ft/sec\(^2\).

e. The speed, which is the magnitude of the velocity, is increasing for \( 2 < t \leq 5 \), since for \( 0 \leq t < 2 \) the velocity is negative but getting closer to zero, so the speed is decreasing, while to the right of \( t = 2 \), it is positive but getting further from zero, so the speed is increasing.
3.6.10

b. \( f'(t) = 0 \) when \( t = 2 \) — that is when the object is stationary. For \( 0 \leq t < 2 \) we have \( f'(t) > 0 \) so the object is moving to the right. For \( 2 < t \leq 5 \) we have \( f'(t) < 0 \) so the object is moving to the left.

c. \( f'(1) = 2 \text{ ft/sec} \) and \( f''(t) = -2 \text{ ft/sec}^2 \), so in particular, \( f''(1) = -2 \text{ ft/sec}^2 \).

d. \( f'(t) = 0 \) when \( t = 2 \) and \( f''(2) = -2 \text{ ft/sec}^2 \).

e. The speed, which is the magnitude of the velocity, is increasing for \( 2 < t \leq 5 \), since for \( 0 \leq t < 2 \) the velocity is positive but getting closer to zero, so the speed is decreasing, while to the right of \( t = 2 \), it is negative but getting further from zero, so the speed is increasing.

3.6.11

b. \( f'(t) = 0 \) when \( t = \frac{9}{4} \) — that is when the object is stationary. For \( 0 \leq t < \frac{9}{4} \) we have \( f'(t) < 0 \) so the object is moving to the left. For \( \frac{9}{4} < t \leq 3 \) we have \( f'(t) > 0 \) so the object is moving to the right.

c. \( f'(1) = -5 \text{ ft/sec} \) and \( f''(t) = 4 \text{ ft/sec}^2 \), so in particular, \( f''(1) = 4 \text{ ft/sec}^2 \).

d. \( f'(t) = 0 \) when \( t = \frac{9}{4} \) and \( f'' \left( \frac{9}{4} \right) = 4 \text{ ft/sec}^2 \).

e. The speed, which is the magnitude of the velocity, is increasing for \( \frac{9}{4} < t \leq 3 \), since for \( 0 \leq t < \frac{9}{4} \) the velocity is negative but getting closer to zero, so the speed is decreasing, while to the right of \( t = \frac{9}{4} \), it is positive but getting further from zero, so the speed is increasing.
### 3.6.12

a. \( f(t) = 18t - 3t^2 \)

b. \( f'(t) = 0 \) when \( t = 3 \) — that is when the object is stationary. For \( 0 \leq t < 3 \) we have \( f'(t) > 0 \) so the object is moving to the right. For \( 3 < t \leq 8 \) we have \( f'(t) < 0 \) so the object is moving to the left.

c. \( f'(1) = 12 \text{ ft/sec} \) and \( f''(t) = -6 \text{ ft/sec}^2 \), so in particular, \( f''(1) = -6 \text{ ft/sec}^2 \).

d. \( f'(t) = 0 \) when \( t = 3 \) and \( f''(3) = -6 \text{ ft/sec}^2 \).

e. The speed, which is the magnitude of the velocity, is increasing for \( 3 < t \leq 8 \), since for \( 0 \leq t < 3 \) the velocity is positive but getting closer to zero, so the speed is decreasing, while for \( t > 3 \), it is negative but getting further from zero, so the speed is increasing.

### 3.6.13

b. \( f'(t) = 0 \) when \( 6(t-2)(t-5) = 0 \), which is at \( t = 2 \) and \( t = 5 \) — that is when the object is stationary. For \( 0 \leq t < 2 \) we have \( f'(t) > 0 \) so the object is moving to the right. For \( 2 < t < 5 \) we have \( f'(t) < 0 \) so the object is moving to the left. For \( 5 < t \leq 6 \) we have \( f'(t) > 0 \), so the object is moving to the right again.

c. \( f'(1) = 24 \text{ ft/sec} \) and \( f''(t) = 12t - 42 \), so \( f''(1) = -30 \text{ ft/sec}^2 \).

d. \( f'(t) = 0 \) when \( t = 2 \) and \( t = 5 \). We have \( f''(2) = -18 \text{ ft/sec}^2 \) and \( f''(5) = 18 \text{ ft/sec}^2 \).

e. The speed, which is the magnitude of the velocity, is increasing when the graph of the velocity is getting further from zero as \( t \) increases. This happens starting at \( t = 2 \), where the velocity is zero, until the velocity curve hits its minimum. This minimum occurs when the slope of the tangent to the velocity curve is zero. The slope of the tangent to the velocity curve is \( f''(t) \), which is zero for \( t = \frac{42}{12} = \frac{7}{2} \). Thus the speed is increasing for \( 2 < t < \frac{7}{2} \). It then decreases until \( t = 5 \), at which point it starts increasing again, as the velocity becomes increasingly positive, for \( 5 < t \leq 6 \).
3.6.14

b. \( f'(t) = 0 \) when \(-18(t - 3)(t - 1) = 0\), which is at \( t = 1 \) and \( t = 3 \) — that is when the object is stationary. For \( 0 \leq t < 1 \) we have \( f'(t) < 0 \) so the object is moving to the left. For \( 1 < t < 3 \) we have \( f'(t) > 0 \) so the object is moving to the right. For \( 3 < t \leq 4 \) we have \( f'(t) < 0 \), so the object is moving to the left again.

c. \( f'(1) = 0 \) ft/sec and \( f''(t) = -36t + 72 \), so \( f''(1) = 36 \) ft/sec².

d. \( f'(t) = 0 \) when \( t = 1 \) and \( t = 3 \). We have \( f''(1) = 36 \) ft/sec² and \( f''(3) = -36 \) ft/sec².

e. The speed, which is the magnitude of the velocity, is increasing when graph of the velocity is getting further from zero as \( t \) increases. This happens starting at \( t = 1 \), where the velocity is zero, until the velocity curve hits its maximum. This maximum occurs when the slope of the tangent to the velocity curve is zero. The slope of the tangent to the velocity curve is \( f''(t) \), which is zero for \( t = 2 \). Thus the speed is increasing for \( 1 < t < 2 \). It then decreases until \( t = 3 \), at which point it starts increasing again as the velocity becomes increasingly negative, for \( 3 < t \leq 4 \).

3.6.15

a. \( v(t) = s'(t) = -32t + 64 \) ft/sec.

b. The highest point is reached at the instant when the stone changes from moving upward (where \( v > 0 \)) to moving downward (where \( v < 0 \)), so it must occur when \( v = 0 \), which is at \( t = 2 \).

c. The height of the stone at its highest point is \( s(2) = -16 \cdot 4 + 64 \cdot 2 + 32 = 96 \) feet.

d. The stone strikes the ground when \( s(t) = 0 \) for \( t > 0 \). Using the quadratic formula we see that this occurs when \( t = 2 + \sqrt{5} \approx 4.449 \) seconds.

e. The velocity when the stone hits the ground is \( v(2 + \sqrt{5}) = -32(2 + \sqrt{5}) + 64 = -32\sqrt{5} \approx -78.38 \) feet per second.

f. The velocity curve is a line with negative slope; it passes through the \( t \) axis at \( t = 2 \). So prior to \( t = 2 \), the velocity is positive but decreasing, so the speed is decreasing. Subsequent to \( t = 2 \), the velocity is negative and becoming increasingly negative, so the speed is increasing. Thus the speed is increasing for \( t > 2 \) until the stone strikes the ground, at \( t = 2 + \sqrt{5} \). (The time \( t = 2 \) is the time at which the stone reaches the top of its arc, at which point the velocity is momentarily zero).

3.6.16

a. \( v(t) = s'(t) = -12t + 64 \) ft/sec.

b. The highest point is reached at the instant when the stone changes from moving upward (where \( v > 0 \)) to moving downward (where \( v < 0 \)), so it must occur when \( v = 0 \), which is at \( t = \frac{16}{3} \).

c. The height of the stone at its highest point is \( s \left( \frac{16}{3} \right) = \frac{1088}{3} \approx 362.67 \) feet.
d. The stone strikes the ground when \( s(t) = 0 \) for \( t > 0 \). Using the quadratic formula we see that this occurs when \( t = \frac{16}{3} + \frac{1}{3}\sqrt{34} \approx 13.11 \) seconds.

e. The velocity when the stone hits the ground is \( v\left( \frac{16}{3} + \frac{1}{3}\sqrt{34} \right) \approx -93.3 \) feet per second.

3.6.17

a. The average growth rate from 1995 to 2005 is \( \frac{p(10) - p(0)}{10 - 0} = \frac{8038 - 7055}{10} = 98.3 \) thousand people/year.

b. The instantaneous growth rate is \( p'(t) = -0.54t + 101 \). In 1997 we have \( p'(2) = 99.92 \) thousand people per year and in 2005 we have \( p'(10) = 95.6 \) thousand people per year.

c. The population was growing but the rate was slowing over this time interval.

3.6.18

a. The average growth rate from 1995 to 2000 is \( \frac{c(5) - c(0)}{5 - 0} \approx \frac{171.96 - 151}{5} \approx 4.19 \).

Between 2005 and 2010 it is \( \frac{c(10) - c(5)}{10 - 5} \approx \frac{195.84 - 171.96}{5} \approx 4.78 \), so the average growth rate is larger between 2005 and 2010.

b. The instantaneous growth rate is \( c'(t) = 3.926e^{0.026t} \). We have \( c'(5) \approx 4.47 \) and \( c'(10) \approx 5.09 \). Again, the growth rate is greater at the later date.

c. The rate of change of the CPI is increasing.

3.6.19

a. False. For example, when a ball is thrown up in the air near the surface of the earth, its acceleration is constant (due to gravity) but its velocity changes during its trip.

b. True. If the rate of change of velocity is zero, then velocity must be constant.

c. False. If the velocity is constant over an interval, then the average velocity is equal to the instantaneous velocity over the interval.

d. True. For example, a ball dropped from a tower has negative acceleration and increasing speed as it falls toward the earth.

3.6.20 The velocity is \( v(t) = s'(t) = -1.6t \). The feather strikes the surface of the moon when \( s(t) = 40 - 0.8t^2 = 0 \). This occurs when \( t = \sqrt{50} \approx 7.07 \) seconds. The velocity at this time is \( v(\sqrt{50}) = -1.6\sqrt{50} \approx -11.31 \) meters per second, and \( a(\sqrt{50}) = -1.6 \) meters per second².

3.6.21 In each case, the stone reaches its maximum height when its velocity is zero. On Mars, this occurs when \( v(t) = s'(t) = 96 - 12t = 0 \), or when \( t = 8 \) seconds. So the maximum height on Mars is \( s(8) = 384 \) feet.

On Earth, this occurs when \( v(t) = s'(t) = 96 - 32t = 0 \), or when \( t = 3 \) seconds. So the maximum height on Earth is \( s(3) = 144 \) feet.

The stone will travel \( 384 - 144 = 240 \) feet higher on Mars.

Copyright © 2014 Pearson Education, Inc.
3.6.22

a. Both stones reach their highest points when the derivative of their position functions are 0. Note, however that \( f'(t) = -32t + 48 = g'(t) \). Thus both stones reach their maximum height at \( t = \frac{48}{32} = \frac{3}{2} \).

b. The height of the stone thrown from the bridge at \( t = 1.5 \) seconds is \( f(1.5) = 68 \) feet, while the other stone reaches \( g(1.5) = 36 \) feet, so the one thrown from the bridge goes 32 feet higher.

c. The stone from ground level hits the ground when \( g(t) = 0 \), which occurs when \( -16t^2 + 48t + 32 = 0 \), or \( t^2 - 3t - 2 = 0 \), or \( t = \frac{3 + \sqrt{9 - 4(-2)}}{2} = \frac{3 + \sqrt{17}}{2} \approx 3.56 \). At that time, the velocity is approximately \(-65.97 \) feet per second.

3.6.23

The first stone reaches its maximum height when \( f'(t) = -32t + 32 = 0 \), so after 1 second, and its maximum height is therefore \( f(1) = -16 + 32 + 48 = 64 \) feet.

The second stone reaches its maximum height when \( g'(t) = -32t + v_0 = 0 \), so when \( t = \frac{v_0}{32} \). Its height at that time is \( g(v_0/32) = -16(v_0/32)^2 + (v_0^2/32) = \frac{v_0^2}{64} \). This is equal to 64 when \( v_0 = 64 \) feet per second.

3.6.24

a. The slope of the curve (which is the velocity) increases until about 5:30 p.m., so the car is speeding up over that time interval. From 5:30 p.m. until about 6:20 p.m. the velocity is decreasing. After that it is speeding up until 7:00 p.m.

b. The slope is the largest at about 5:30 p.m. and smallest at about 6:20 p.m.

c. The maximum velocity is approximately 40 mph and the minimum is about 5 mph. These are estimates based on visually computing slopes of tangent lines. Your mileage may vary.

3.6.25

a. The velocity is zero at \( t = 1, 2, \) and 3.

b. The object is moving in the positive direction when the slope of \( s \) is positive, so for \( t \in (0, 1) \) and \( t \in (2, 3) \). It is moving in the negative direction for \( t \in (1, 2) \) and \( t \in (3, \infty) \).

d. The speed, which is the magnitude of the velocity, is increasing when the velocity curve is moving further from the \( x \) axis. From the graph, this is roughly in the intervals \((0, 0.5), (1, 1.5), (2, 2.5), \) and \((3, \infty)\). It is decreasing when the velocity curve is moving closer to the \( x \) axis, which is roughly in the intervals \((0.5, 1), (1.5, 2), \) and \((2.5, 3)\).

3.6.26

a. \( \frac{dL}{dt} \) represents the rate of change of the length of the species. The derivative is decreasing over time.

b. Over time, the species is getting bigger, but the rate of change is approaching zero.

Copyright © 2014 Pearson Education, Inc.
3.6.27
a. Because the graph represents the growth rate, the slowest rate (of about 1.1 million people per year) occurs at about \( t = 30 \), which corresponds to the year 1930.

b. The largest growth rate occurs at about \( t = 60 \), so the year 1960 at the largest growth rate of about 2.9 million per year.

c. Because \( p'(t) > 0 \) for all \( t \) shown on the graph, \( p(t) \) is never decreasing.

d. The population growth rate \( p'(t) \) is increasing from about 1905 to 1915, from 1930 to 1960, and from 1980 to 1990.

3.6.28
a. The peak of \( A(L) = \frac{P(L)}{L} = -L^2 + 10L + 200 \) occurs when the slope is zero. Note that \( P'(L) = -3L^2 + 20L + 200 \).

b. We seek \( L_0 \) so that \( \frac{dA}{dL}(L_0) = 0 \), which occurs when \( L_0 \cdot P''(L_0) - P'(L_0) = 0 \), or when \( P'(L_0) = P''(L_0) = A(L_0) \). Thus if the peak of \( A \) occurs at \( L_0 \), we have \( M(L_0) = A(L_0) \).

c. The velocity of the marble is decreasing.

d. \( s(t) = 80 \) when \( \frac{100t}{(t+1)^2} = 80 \), or \( 100t = 80t + 80 \), which occurs when \( t = 4 \) seconds.

e. \( v(t) = 50 \) when \( \frac{100}{(t+1)^2} = 50 \), or \( (t + 1)^2 = 2 \). This occurs for \( t = \sqrt{2} - 1 \approx 0.414 \) seconds.

Copyright © 2014 Pearson Education, Inc.
3.6.30  

a.  

The function $\frac{db}{dh}$ shows the rate of increase in height (in meters) per cm increase in the base diameter of the tree.

b.  

3.6.31  

a.  

The function $\frac{db}{dp}$ shows the rate of increase in height (in meters) per cm increase in the base diameter of the tree.

b.  

\[ R(p) = \frac{100p}{p^2+1} \]

\[ R'(p) = \frac{100(1-p^2)}{(p^2+1)^2} \]

c. $R'(p)$ is zero at $p = 1$, and the maximum of $R(p)$ occurs at this same value of $p$, so that is the price to charge in order to maximize revenue. The revenue at this price is $50.00.

3.6.32  

a.  

The number of miles increases with the number of gallons of gasoline.

b.  

The gas mileage is $m(g)/g$. The number of miles per gallon decreases during the first 1.5 gallons or so, then increases until it peaks again just short of 4 gallons.
c.

\[ \frac{dm}{dg} \] represents the instantaneous rate of change of the number of miles driven per unit of gasoline consumed.

3.6.33

a. The mass oscillates about the equilibrium point.

b. \( \frac{dx}{dt} = 10 \cos t + 10 \sin t \) is the velocity of the mass at time \( t \).

c. \( \frac{dx}{dt} = 0 \) when \( \sin t = -\cos t \), which occurs when \( t = \frac{4n+3}{4} \pi \) where \( n \) is any positive integer.

d. The model is unrealistic as it ignores the effects of friction and gravity. In reality, the amplitude would decrease as the mass oscillates.

3.6.34

a. \( p(10) = 1000e^{-1} \approx 368 \text{ mb} \), so the pressure on Mt. Everest is about 632 mb less than at sea level.

b. The average pressure change is \( \frac{p(5)-p(0)}{5} = \frac{1000(e^{-0.5}-1)}{5} \approx -78.7 \text{ mb per km} \).

c. The rate of change in pressure is \( p'(5) = -100e^{-5/10} \approx -60.7 \text{ mb per km} \).

d. Because \( p'(z) = -100e^{-z/10} \), it increases as \( z \) increases.

e. \( \lim_{z \to \infty} p(z) = 0 \) means that if we go high enough, there is essentially no atmospheric pressure.

3.6.35

a. Juan starts out faster, but slows toward the end, while Jean starts slower but increases her speed toward the end. Since the position of both runners is the same at the end of the race, it ends in a tie.

b. Because both start and finish at the same time, they finish with the same average angular velocity.

c. It is a tie.

d. Jean’s velocity is given by \( \theta'(t) = \frac{\pi t}{4} \). At \( t = 2 \), \( \theta'(2) = \frac{\pi}{2} \) radians per minute. Her velocity is greatest at \( t = 4 \).

e. Juan’s velocity is given by \( \varphi'(t) = \pi - \frac{\pi t}{4} \). At \( t = 2 \), \( \varphi'(2) = \frac{\pi}{2} \) radians per minute as well. His velocity is greatest at \( t = 0 \).
3.6.36

a. The energy function.

b. \( P(t) = E'(t) = 100 + 8t - \frac{t^2}{3} \) kWh per hour, or kW.

3.6.37

a. At the beginning the volume is 4,000,000 cubic meters.

b. The tank is empty when \( V(t) = 100(200 - t)^2 = 0 \), which occurs when \( t = 200 \).

c. Because \( V(t) \) can be written as \( V(t) = 4,000,000 - 40,000t + 100t^2 \), the flow rate is \( V'(t) = -40,000 + 200t \) cubic meters per minute.

d. The magnitude of the flow rate is largest when \( t = 0 \) and smallest when \( t = 200 \).

3.6.38

a. b. The average growth rate for the first ten days is \( \frac{P(10) - P(0)}{10} \approx \frac{237.7 - 200}{10} = 3.77 \) cells per day.
c. The maximum growth rate is where the curve $P(t)$ is the steepest, which appears to be at just shy of 100 days. 

$$d. \quad P'(t) = \frac{0 - 1600 \cdot (-14e^{-0.02t})}{1 + e^{-0.02t}} = \frac{224e^{-0.02t}}{1 + e^{-0.02t}}.$$ 

e. At 100 days the population is a little larger than 800. By doing a little bit of zooming, we can see that the maximum occurs at about $t = 97.3$ days with a population of 800.

### 3.6.39

a. $v(t) = y'(t) = -15e^{-t}\cos t - 15e^{-t}\sin t$, so $v(1) \approx -7.625$ meters per second, and $v(3) \approx .63$ meters per second.

b. She is moving down for approximately 2.4 seconds, and then up until about 5.5 seconds, and then down again until about 8.6 seconds, and then up again.

c. The maximum velocity going up appears to be about .65 meters per second.

### 3.6.40

a. 

$$V'(t) = \begin{cases} 
\frac{8t}{5} & \text{for } 0 \leq t \leq 45, \\
-\frac{8t}{5} + 144 & \text{for } 45 \leq t \leq 90.
\end{cases}$$

This is in cubic feet per day.

c. The flow increases for the first 45 days, then decreases. The flow rate is at a maximum at 45 days.

### 3.6.41

a. $T'(t) = 160 - 80x$, so $T'(1) = 80$, so the heat flux at 1 is $-80$. At $x = 3$ we have $T'(3) = -80$, so the heat flux at 3 is 80.

b. The heat flux $-T'(x)$ is negative for $0 \leq x < 2$ and positive for $2 < x \leq 4$.

c. At any point other than the midpoint of the rod, heat flows toward the closest end of the rod, and “out the end.”

### 3.6.42

a. By Example 5 in Section 3.1, $f'(x) = \frac{1}{2\sqrt{x}}$, so that $f'(4) = \frac{1}{2\sqrt{4}} = \frac{1}{4}$. 

Copyright © 2014 Pearson Education, Inc.
b. We have
\[
\frac{f(4 + h) - f(4)}{h} = \frac{\sqrt{4 + h} - 2}{h} = \frac{(\sqrt{4 + h} - 2)(\sqrt{4 + h} + 2)}{h(\sqrt{4 + h} + 2)} = \frac{4 + h - 4}{h(\sqrt{4 + h} + 2)} = \frac{1}{\sqrt{4 + h} + 2}.
\]

Now if \( h \) is small, then \( \sqrt{4 + h} \approx 2 \), so that the difference quotient is \( \approx \frac{1}{4} = f'(4) \).

c.
\[
\begin{array}{|c|c|c|c|c|c|}
\hline
h & \frac{\sqrt{4+h}-2}{h} & \text{Error} & h & \frac{\sqrt{4+h}-2}{h} & \text{Error} \\
\hline
0.1 & 0.248457 & 0.00154 & -0.1 & 0.251582 & 0.00158 \\
0.01 & 0.249844 & 0.00016 & -0.01 & 0.250156 & 0.00016 \\
0.001 & 0.249984 & 0.00002 & -0.001 & 0.250016 & 0.00002 \\
0.0001 & 0.249998 & 1.6 \times 10^{-6} & -0.0001 & 0.250002 & 1.6 \times 10^{-6} \\
\hline
\end{array}
\]
The value of \( \frac{\sqrt{4+h}-2}{h} \) indeed approaches \( f'(4) = \frac{1}{4} \), as we would expect from part (a).

d. As expected from the calculation in part (a), the error in the approximation approaches zero as \( h \) gets small.

3.6.43
a. With \( h = \frac{1}{2} \), the centered difference quotient gives
\[
f'(4) \approx \frac{f\left(4 + \frac{1}{2}\right) - f\left(4 - \frac{1}{2}\right)}{1} = \sqrt{4.5} - \sqrt{3.5} \approx 0.250.
\]
So the equation of the line going through \((4, 2)\) with slope 0.250 is \( y - 2 = 0.250(x - 4) \), or \( y = 0.250x + 1 \).
A plot of the curve together with this line is:

Since the curve is relatively flat, even this fairly large value of \( h \) approximates the slope of the curve pretty well.

b.
\[
\begin{array}{|c|c|c|}
\hline
h & \frac{\sqrt{4+h}-\sqrt{3-h}}{h} & \text{Error} \\
\hline
0.1 & 0.25002 & 1.95 \times 10^{-5} \\
0.01 & 0.25000 & 1.95 \times 10^{-7} \\
0.001 & 0.25000 & 1.95 \times 10^{-9} \\
0.0001 & 0.25000 & 1.95 \times 10^{-11} \\
\hline
\end{array}
\]
For any of these values of \( h \), the approximated slope is the true value to within several decimal places.

c. In the centered difference quotient, \( h \) represents a distance on each side of the point in question, so a negative value of \( h \) would be the same as using its absolute value.
d. Both sets of estimates are very good; however, the centered difference is correct to within four decimal places even for \( h = 0.1 \).

\[ \text{3.6.44} \]

a. Using the forward difference quotient with \( h = 0.5 \), we get

\[
\frac{f'(2) \approx f(2 + 0.5) - f(2)}{0.5} = \frac{81 - 55}{0.5} = 52 \text{ feet/second.}
\]

b. Using the centered difference quotient with \( h = 0.5 \) gives

\[
\frac{f'(2) \approx f(2 + 0.5) - f(2 - 0.5)}{2 \cdot 0.5} = \frac{f(2.5) - f(1.5)}{1} = 81 - 33 = 48 \text{ feet/second.}
\]

\[ \text{3.6.45} \]

a. Since the secant will most closely approximate the tangent for values of \( h \) closer to zero, we want to use the smallest possible value of \( h \) in each case; near \( x = 1 \), this is \( h = 0.5 \), since we have values for \( \text{erf} \) at 0.95 and at 1.05. Then the forward and centered difference quotients give

\[
f'(1) \approx f(1 + 0.05) - f(1) = 0.862436 - 0.842701 = 0.019735 \approx 0.395
\]

\[
f'(1) \approx f(1 + 0.05) - f(1 - 0.05) = \frac{f(1.05) - f(0.95)}{0.1} = \frac{0.862436 - 0.820891}{0.1} \approx 0.415.
\]

b. Since \( \frac{2}{e^x} \approx 0.415107 \), the error in the forward difference approximation is \( \approx 0.415107 - 0.394706 = 0.0204 \), and the error in the centered difference approximation is \( \approx 0.415453 - 0.415107 = 0.000346 \).

\[ \text{3.7 The Chain Rule} \]

\[ \text{3.7.1} \] If \( y = f(x) \) and \( u = g(x) \) then \( \frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} \). Alternatively, we have \( \frac{d}{dx}(f(g(x))) = f'(g(x))g'(x) \).

\[ \text{3.7.2} \] We would need to know \( f'(3) \). This is because \( h'(1) = f'(g(1))g'(1) = f'(3) \cdot 5 \), but we can’t finish this calculation unless we know \( f'(3) \).

\[ \text{3.7.3} \] The derivative of \( f(g(x)) \) equals \( f' \) evaluated at \( g(x) \) multiplied by \( g' \) evaluated at \( x \).

\[ \text{3.7.4} \] The inner function is \( \cos x \) and the outer function is \( u^4 \), so with \( y = f(u) \) and \( u = g(x) \), we have \( f(u) = u^4 \) and \( g(x) = \cos x \). Then \( y = (\cos x)^4 = \cos^4 x \).

\[ \text{3.7.5} \] The inner function is \( x^2 + 10 \) and the outer function is \( u^{-5} \), so with \( y = f(u) \) and \( u = g(x) \), we have \( f(u) = u^{-5} \) and \( g(x) = x^2 + 10 \). Then \( y = (x^2 + 10)^{-5} \).

\[ \text{3.7.6} \] Let \( h(x) = x^2 + 1, g(u) = \cos u, \) and \( f(v) = v^4 \). Then \( f(g(h(x))) = f(g(x^2 + 1)) = f(\cos(x^2 + 1)) = (\cos(x^2 + 1))^4 = Q(x) \).

\[ \text{3.7.7} \] With \( u = 3x + 7 \) and \( y = u^{10} \) we have \( \frac{dw}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = 10u^9 \cdot 3 = 30(3x + 7)^9 \).

\[ \text{3.7.8} \] With \( u = 5x^2 + 11x \) and \( y = u^{20} \) we have \( \frac{dy}{dx} = \frac{du}{da} \cdot \frac{du}{dx} = 20u^{19}(10x + 11) = 20(5x^2 + 11x)^{19}(10x + 11) \).

\[ \text{3.7.9} \] With \( u = \sin x \) and \( y = u^5 \), we have \( \frac{dy}{dx} = \frac{du}{dx} \cdot \frac{du}{dx} = 5u^4(\cos x) = 5\sin^4 x \cos x \).

\[ \text{3.7.10} \] With \( u = x^5 \) and \( y = \cos u \), we have \( \frac{dy}{dx} = \frac{du}{dx} \cdot \frac{du}{dx} = (- \sin u)(5x^4) = -5x^4 \sin x^5 \).

\[ \text{3.7.11} \] With \( u = 5x - 7 \) and \( y = e^u \), we have \( \frac{dy}{dx} = \frac{du}{dx} \cdot \frac{du}{dx} = e^{u(5)} = 5e^{5x-7} \).

\[ \text{3.7.12} \] With \( u = 7x - 1 \) and \( y = \sqrt{u} \) we have \( \frac{dy}{dx} = \frac{du}{dx} \cdot \frac{du}{dx} = \frac{1}{2\sqrt{u}} \cdot 7 = \frac{7}{2\sqrt{7x-1}} \).
3.7.13 With \( u = x^2 + 1 \) and \( y = \sqrt{u} \) we have \( \frac{du}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = \frac{1}{2\sqrt{u}} \cdot (2x) = \frac{x}{\sqrt{x^2+1}}. \)

3.7.14 With \( u = \sqrt{x} \) and \( y = e^u \) we have \( \frac{du}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = e^u \cdot \frac{1}{2\sqrt{x}} = \frac{e^{\sqrt{x}}}{2\sqrt{x}}. \)

3.7.15 With \( u = 5x^2 \) and \( y = \tan u \) we have \( \frac{du}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = \sec^2 u \cdot 10x = 10x \sec^2(5x^2). \)

3.7.16 With \( u = \frac{\pi}{4} \) and \( y = \sin u \) we have \( \frac{du}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = \cos u \cdot \frac{1}{4} = \frac{1}{4} \cos \frac{\pi}{4}. \)

3.7.17 With \( u = e^x \) and \( y = \sec u \) we have \( \frac{du}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = (\sec u \cdot \tan u) \cdot (e^x) = e^x \cdot \sec e^x \cdot \tan e^x. \)

3.7.18 With \( u = -x^2 \) and \( y = e^u \) we have \( \frac{du}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = e^u \cdot (-2x) = -2xe^u = -2xe^{-x^2}. \)

3.7.19 With \( g(x) = 3x^2 + 7x \) and \( f(u) = u^{10} \) we have \( \frac{d}{dx} [f(g(x))] = f'(g(x))g'(x) = 10(3x^2 + 7x)^9(6x + 7). \)

3.7.20 With \( g(x) = x^2 + 2x + 7 \) and \( f(u) = u^8 \), we have

\[
\frac{d}{dx} [f(g(x))] = f'(g(x))g'(x) = 8(x^2 + 2x + 7)^7(2x + 2) = 16(x^2 + 2x + 7)^7(x + 1).
\]

3.7.21 With \( g(x) = 10x + 1 \) and \( f(u) = \sqrt{u} \), we have \( \frac{d}{dx} [f(g(x))] = f'(g(x))g'(x) = \frac{1}{2\sqrt{10x+1}} \cdot 10 = \frac{5}{\sqrt{10x+1}}. \)

3.7.22 With \( g(x) = x^2 + 9 \) and \( f(u) = \sqrt{u} \), we have \( \frac{d}{dx} [f(g(x))] = f'(g(x))g'(x) = \frac{1}{2\sqrt{u}} \cdot (2x) = \frac{x}{\sqrt{x^2+9}}. \)

3.7.23 With \( g(x) = 7x^3 + 1 \) and \( f(u) = 5u^{-3} \), we have

\[
\frac{d}{dx} [f(g(x))] = f'(g(x))g'(x) = -15(7x^3 + 1)^{-4}(21x^2) = -315(7x^3 + 1)^{-4} \cdot x^2.
\]

3.7.24 With \( g(t) = 5t + 1 \) and \( f(u) = \cos u \), we have

\[
\frac{d}{dt} [f(g(t))] = f'(g(t))g'(t) = -\sin(5t + 1) \cdot 5 = -5\sin(5t + 1).
\]

3.7.25 With \( g(x) = 3x + 1 \) and \( f(u) = \sec u \), we have

\[
\frac{d}{dx} [f(g(x))] = f'(g(x))g'(x) = \sec(3x + 1) \tan(3x + 1) \cdot 3 = 3\sec(3x + 1)\tan(3x + 1).
\]

3.7.26 With \( g(x) = e^x \) and \( f(u) = \csc u \), we have

\[
\frac{d}{dx} [f(g(x))] = f'(g(x))g'(x) = -\csc e^x \cot e^x \cdot e^x = -e^x \csc e^x \cot e^x.
\]

3.7.27 With \( g(x) = e^x \) and \( f(u) = \tan u \), we have \( \frac{d}{dx} [f(g(x))] = f'(g(x))g'(x) = \sec^2 u \cdot e^x = e^x \sec^2 e^x. \)

3.7.28 With \( g(t) = \tan t \) and \( f(u) = e^u \), we have \( \frac{d}{dt} [f(g(t))] = f'(g(t))g'(t) = e^{\tan t} \cdot \sec^2 t. \)

3.7.29 With \( g(x) = 4x^3 + 3x + 1 \) and \( f(u) = \sin u \), we have

\[
\frac{d}{dx} [f(g(x))] = f'(g(x))g'(x) = \cos u \cdot (12x^2 + 3) = (12x^2 + 3) \cdot \cos(4x^3 + 3x + 1).
\]

3.7.30 With \( g(t) = t^2 + t \) and \( f(u) = \csc u \), we have

\[
\frac{d}{dt} [f(g(t))] = f'(g(t))g'(t) = -(\csc u)(\cot u) \cdot (2t + 1) = -(2t + 1) \csc(t^2 + t) \cot(t^2 + t).
\]

3.7.31 With \( g(x) = 2\sqrt{x} \) and \( f(u) = \sin u \), we have \( \frac{d}{dx} [f(g(x))] = f'(g(x))g'(x) = \cos(2\sqrt{x}) \cdot \frac{1}{\sqrt{x}} = \frac{\cos(2\sqrt{x})}{\sqrt{x}}. \)
3.7.32 First note that \( \frac{d}{d\theta} (\cos^4 \theta) + \frac{d}{d\theta} (\sin^4 \theta) \). To compute the first term, let \( g_1(\theta) = \cos \theta \) and \( f(u) = u^4 \). Then \( \frac{df}{d\theta} \cos^4 \theta = 4 \cos^3 \theta (-\sin \theta) = -4 \sin \theta \cos^3 \theta \).

Similarly, to compute the second term, let \( g_2(\theta) = \sin \theta \) and \( f(u) = u^4 \). Then \( \frac{df}{d\theta} \sin^4 \theta = 4 \sin^3 \theta (\cos \theta) = 4 \cos \theta \sin^3 \theta \). Thus, \( \frac{dy}{dx} = \frac{dy}{dt} = -4 \sin \theta \cos^3 \theta + 4 \cos \theta \sin^3 \theta \). This can be further simplified to \( 4 \cos \theta \sin \theta (\sin^2 \theta - \cos^2 \theta) = 2 \sin 2\theta (-\cos 2\theta) = -\sin 4\theta \).

3.7.33 With \( g(x) = \sec x + \tan x \) and \( f(u) = u^5 \) we have
\[
\frac{d}{dx} [f(g(x))] = f'(g(x))g'(x) = 5u^4 \cdot (\sec x \tan x + \sec^2 x)
\]
\[
= 5(\sec x + \tan x)^4(\sec x \tan x + \sec^2 x)
\]
\[
= 5 \sec x(\sec x + \tan x)^5.
\]

3.7.34 With \( g(z) = 4 \cos z \) and \( f(u) = \sin u \) we have
\[
\frac{dy}{dz} = f'(g(z))g'(z) = \cos(4 \cos z) \cdot (-4 \sin z) = -4 \sin z \cos(4 \cos z).
\]

3.7.35
a. \( u = g(x) = \cos x, y = f(u) = u^3 \). So \( \frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = 3 \cos^2 x \cdot (-\sin x) = -3 \cos^2 x \sin x \).

b. \( u = g(x) = x^3, y = f(u) = \cos u \). So \( \frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = -\sin(x^3) \cdot 3x^2 = -3x^2 \sin x^3 \).

3.7.36
a. \( u = g(x) = e^x, y = f(u) = u^3 \). So \( \frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = 3(e^x)^2 \cdot e^x = 3e^{3x} \).

b. \( u = g(x) = x^3, y = f(u) = e^u \). So \( \frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = e^x \cdot 3x^2 \).

3.7.37
a. \( h'(3) = f'(g(3))g'(3) = f'(1) \cdot 20 = 5 \cdot 20 = 100 \).

b. \( h'(2) = f'(g(2))g'(2) = f'(5) \cdot 10 = (-10) \cdot 10 = -100 \).

c. \( p'(4) = g'(f(4))f'(4) = g'(1) \cdot (-8) = 2 \cdot (-8) = -16 \).

d. \( p'(2) = g'(f(2))f'(2) = g'(3) \cdot 2 = 20 \cdot 2 = 40 \).

e. \( h'(5) = f'(g(5))g'(5) = f'(2) \cdot 20 = 2 \cdot 20 = 40 \).

3.7.38
a. \( h'(1) = f'(g(1))g'(1) = f'(4) \cdot 9 = 7 \cdot 9 = 63 \).

b. \( h'(2) = f'(g(2))g'(2) = f'(1) \cdot 7 = (-6) \cdot 7 = -42 \).

b. \( h'(3) = f'(g(3))g'(3) = f'(5) \cdot 3 = 2 \cdot 3 = 6 \).

d. \( k'(3) = g'(g(3))g'(3) = g'(5) \cdot 3 = (-5) \cdot 3 = -15 \).

e. \( k'(1) = g'(g(1))g'(1) = g'(4) \cdot 9 = (-1) \cdot 9 = -9 \).

f. \( k'(5) = g'(g(5))g'(5) = g'(3) \cdot (-5) = 3 \cdot (-5) = -15 \).

3.7.39 We are looking for the change in pressure with respect to time, or \( \frac{dp}{dt} = \frac{dp}{da} \cdot \frac{da}{dt} \). When the altitude is 13,330, we have \( t = 70 \). So
\[
\left. \frac{dp}{dt} \right|_{t=70} = \left. \frac{dp}{da} \right|_{a=13330} \cdot \left. \frac{da}{dt} \right|_{t=70}.
\]
Using centered difference quotients, we have
\[
\frac{dp}{da} \bigg|_{a=13330} \approx \frac{p(14330) - p(12330)}{2 \cdot 1000} = \frac{738 - 793}{2000} = \frac{11}{400} = -0.0275 \\
\frac{da}{dt} \bigg|_{t=70} \approx \frac{a(80) - a(60)}{2 \cdot 10} = \frac{13440 - 12710}{20} = \frac{730}{20} = 36.5.
\]
Thus the rate of change in pressure experienced at an altitude of 13,330 feet is
\[
\frac{dp}{dt} \bigg|_{t=70} \approx -0.0275 \cdot 36.5 \approx -1.004 \text{ hPa/minute},
\]
or about a decrease of 1 hPa per minute.

**3.7.40** If \(T(a)\) is the temperature at altitude \(a\), then we are looking for \(\frac{dT}{dt}\) when \(t = 1.5\). When \(t = 1.5\), we have \(a = 2.1\), so that
\[
\frac{dT}{dt} \bigg|_{t=1.5} = \frac{dT}{da} \bigg|_{a=2.1} \cdot \frac{da}{dt} \bigg|_{t=1.5}.
\]
a. We are given that the lapse rate is 6.5° C per kilometer of altitude; this means that \(\frac{dT}{da}\) has a constant value of -6.5. To compute the other factor, use the centered difference quotient around \(t = 1.5\):
\[
\frac{da}{dt} \bigg|_{t=1.5} \approx \frac{a(2) - a(1)}{2 \cdot 0.5} = a(2) - a(1) = 2.5 - 1.7 = 0.8 \text{ km/hr}.
\]
Thus
\[
\frac{dT}{dt} \bigg|_{t=1.5} \approx -6.5 \cdot 0.8 = -5.2^\circ \text{C/km \cdot km/hr} = -5.2^\circ \text{C/hr}.
\]
b. If the lapse rate increases, then the multiplier of -6.5 becomes more negative, so the time rate of change of the temperature is larger in magnitude — that is, the temperature falls faster over time (and with altitude) than in part (a).

c. The above calculation did not rely on knowledge of the actual temperature. All we were concerned with was the rate of change of the temperature, not with its actual value.

**3.7.41** Take \(g(x) = 2x^6 - 3x^3 + 3\), and \(n = 25\). Then \(y' = n(g(x))^{n-1}g'(x) = 25(2x^6 - 3x^3 + 3)^{24}(12x^5 - 9x^2)\).

**3.7.42** Take \(g(x) = \cos x + 2 \sin x\), and \(n = 8\). Then \(y' = n(g(x))^{n-1}g'(x) = 8(\cos x + 2 \sin x)^7(2 \cos x - \sin x)\).

**3.7.43** Take \(g(x) = 1 + 2 \tan x\), and \(n = 15\). Then \(y' = n(g(x))^{n-1}g'(x) = 15(1 + 2 \tan x)^{14}(2 \sec^2 x) = 30(1 + 2 \tan x)^{14} \sec^2 x\).

**3.7.44** Take \(g(x) = 1 - e^x\), and \(n = 4\). Then \(y' = n(g(x))^{n-1}g'(x) = 4(1 - e^x)^3(-e^x) = -4e^x(1 - e^x)^3\).

**3.7.45**
\[
\frac{d}{dx} \sqrt{1 + \cot^2 x} = \frac{1}{2 \sqrt{1 + \cot^2 x}} \cdot \frac{d}{dx} (1 + \cot^2 x) \\
= \frac{1}{2 \sqrt{1 + \cot^2 x}} \cdot 2 \cot x \cdot \frac{d}{dx} \cot x \\
= \frac{1}{2 \sqrt{1 + \cot^2 x}} \cdot \frac{d}{dx} (\cot x) \cdot (-\csc^2 x) \\
= -\cot x \csc^2 x \cdot \frac{1}{\sqrt{1 + \cot^2 x}}.
\]
3.7.46
\[ \frac{d}{dx} \sqrt{(3x - 4)^2 + 3x} = \frac{1}{2 \sqrt{(3x - 4)^2 + 3x}} \cdot \frac{d}{dx} ((3x - 4)^2 + 3x) \]
\[ = \frac{1}{2 \sqrt{(3x - 4)^2 + 3x}} \cdot (2(3x - 4) \cdot \frac{d}{dx} (3x - 4) + 3) \]
\[ = \frac{1}{2 \sqrt{(3x - 4)^2 + 3x}} \cdot (2(3x - 4) \cdot 3 + 3) \]
\[ = \frac{18x - 21}{2 \sqrt{(3x - 4)^2 + 3x}}. \]

3.7.47
\[ \frac{d}{dx} \sin(\sin(e^x)) = \cos(\sin(e^x)) \cdot \frac{d}{dx} (\sin(e^x)) = \cos(\sin(e^x)) \cdot \cos(e^x) \cdot e^x. \]

3.7.48
\[ \frac{d}{dx} \sin^2(e^{3x+1}) = 2 \sin(e^{3x+1}) \frac{d}{dx} \sin(e^{3x+1}) \]
\[ = 2 \sin(e^{3x+1}) \cos(e^{3x+1}) \frac{d}{dx} e^{3x+1} \]
\[ = 2 \sin(e^{3x+1}) \cos(e^{3x+1}) e^{3x+1} \cdot 3 \]
\[ = 3e^{3x+1} \sin(2e^{3x+1}). \]

3.7.49
\[ \frac{d}{dx} \sin^5(\cos 3x) = 5 \sin^4(\cos 3x) \cdot \frac{d}{dx} (\sin(\cos 3x)) \]
\[ = 5 \sin^4(\cos 3x) \cdot \cos(\cos 3x) \cdot \frac{d}{dx} (\cos 3x) \]
\[ = 5 \sin^4(\cos 3x) \cdot \cos(\cos 3x) \cdot (-\sin 3x) \cdot 3 \]
\[ = -15 \sin^4(\cos 3x) \cos(\cos 3x) \sin 3x. \]

3.7.50
\[ \frac{d}{dx} \cos^4(7x^3) = 4 \cos^3(7x^3) \cdot \frac{d}{dx} \cos(7x^3) \]
\[ = 4 \cos^3(7x^3)(-\sin(7x^3)) \cdot \frac{d}{dx} (7x^3) \]
\[ = 4 \cos^3(7x^3)(-\sin(7x^3)) \cdot 21x^2 \]
\[ = -84x^2 \sin(7x^3) \cos^3(7x^3). \]

3.7.51
\[ \frac{d}{dx} \tan(e^{\sqrt{3}x}) = \sec^2(e^{\sqrt{3}x}) \cdot \frac{d}{dx} e^{\sqrt{3}x} \]
\[ = \sec^2(e^{\sqrt{3}x}) \cdot e^{\sqrt{3}x} \cdot \frac{d}{dx} \sqrt{3}x \]
\[ = \sec^2(e^{\sqrt{3}x}) \cdot e^{\sqrt{3}x} \cdot \frac{3}{2\sqrt{3}x}. \]

3.7.52
\[ \frac{d}{dx} (1 - e^{-0.05x})^{-1} = -\frac{1}{(1 - e^{-0.05x})^2} \cdot \frac{d}{dx} (1 - e^{-0.05x}) \]
\[ = -\frac{1}{(1 - e^{-0.05x})^2} \cdot (-0.05e^{-0.05x}) \]
\[ = \frac{0.05e^{-0.05x}}{(1 - e^{-0.05x})^2}. \]
3.7.53 \( \frac{d}{dx} \sqrt{x + \sqrt{x}} = \frac{1}{2\sqrt{x + \sqrt{x}}} \cdot \frac{d}{dx} (x + \sqrt{x}) = \frac{1}{2\sqrt{x + \sqrt{x}}} \cdot \left(1 + \frac{1}{2\sqrt{x}}\right) \).

3.7.54
\[
\frac{d}{dx} \sqrt{x + \sqrt{x + \sqrt{x}}} = \frac{1}{2\sqrt{x + \sqrt{x + \sqrt{x}}} \cdot \frac{d}{dx} \left(x + \sqrt{x + \sqrt{x}}\right)} = \frac{1}{2\sqrt{x + \sqrt{x + \sqrt{x}}} \cdot \left(1 + \frac{1}{2\sqrt{x + \sqrt{x}}} \cdot \left(1 + \frac{1}{2\sqrt{x}}\right)\right)}.
\]

Note that on the last step, we used the result of the previous problem.

3.7.55 \( \frac{d}{dx} f(g(x^2)) = f'(g(x^2)) \cdot \frac{d}{dx} (g(x^2)) = f'(g(x^2)) \cdot g'(x^2) \cdot 2x. \)

3.7.56 \( \frac{d}{dx} [f(g(x^m))]^n = n[f(g(x^m))]^{n-1} f'(g(x^m)) g'(x^m) (mx^{m-1}). \)

3.7.57 \( y' = 5 \left( \frac{x}{x + 1} \right)^4 \cdot (x + 1)(1 - x(1)) = \frac{5x^4}{(x + 1)^6}. \)

3.7.58 \( y' = 8 \left( \frac{e^x}{x + 1} \right)^7 \cdot (x + 1)e^x - e^x = \frac{8xe^{8x}}{(x + 1)^9}. \)

3.7.59 \( y' = e^{x^2 + 1} (2x) \sin x^3 + e^{x^2 + 1} (\cos x^3) 3x^2 = xe^{x^2 + 1} (2 \sin x^3 + 3x \cos x^3). \)

3.7.60 \( y' = \sec^2 (xe^{x}) ((1)e^x + xe^x) = e^x (1 + x) \sec^2 (xe^{x}). \)

3.7.61 \( \frac{dy}{d\theta} = 2\theta \sec 5\theta + \theta^2 (5 \sec 5\theta \tan 5\theta) = \theta \sec 5\theta (2 + 5\theta \tan 5\theta). \)

3.7.62
\[
y' = 5 \left( \frac{3x}{4x + 2} \right)^4 \cdot \frac{(4x + 2)3 - (3x)4}{(4x + 2)^2} = 5 \left( \frac{3x}{4x + 2} \right)^4 \cdot \frac{6}{(4x + 2)^2} = \frac{5(3x)^4}{(4x + 2)^4} \cdot \frac{6}{(4x + 2)^2} = \frac{2430x^4}{(4x + 2)^6}. \]

3.7.63
\[
y' = 4((x + 2)(x^2 + 1))^3 \cdot ((1)(x^2 + 1) + (x + 2)(2x)) = 4((x + 2)(x^2 + 1))^3(3x^2 + 4x + 1) = 4(x + 2)^3(x^2 + 1)^3(3x + 1)(x + 1). \]

3.7.64
\[
y' = 2e^{2x}(2x - 7)^5 + e^{2x}(5(2x - 7)^4 \cdot 2) = e^{2x}(2x - 7)^4(2(2x - 7) + 10) = e^{2x}(2x - 7)^4(4x - 4) = 4e^{2x}(2x - 7)^4(x - 1). \]

Copyright © 2014 Pearson Education, Inc.
3.7.65 \( y' = \frac{1}{2}(x^4 + \cos 2x)^{-1/2}(4x^3 - 2\sin 2x) = \frac{2x^3 - \sin 2x}{\sqrt{x^4 + \cos 2x}} \)

3.7.66 \( y' = \frac{(t + 1)(1 \cdot e^t + te^t) - te^t \cdot 1}{(t + 1)^2} = \frac{te^t + t^2e^t + e^t + te^t - te^t}{(t + 1)^2} = \frac{e^t(t^2 + t + 1)}{(t + 1)^2}. \)

3.7.67 \( y' = 2(p + \pi)^{1/2} \sin p^2 + (p + \pi)^{3/2} (\cos p^2)(2p) = (p + \pi)(2\sin p^2 + 2p^2 \cos p^2 + 2p\pi \cos p^2) = 2(p + \pi)(\sin p^2 + p^2 \cos p^2 + p\pi \cos p^2). \)

3.7.68 \( y' = 3(z + 4)^2 \tan z + (z + 4)^3 \sec^2 z = (z + 4)^2(3 \tan z + (z + 4) \sec^2 z). \)

3.7.69

a. True. The product rule alone will suffice.

b. True — although if you are a masochist you could write it as \( \frac{1}{(x^2 + 10)^{1/2}} \), expand the denominator using the binomial theorem, and then use the quotient rule — thus avoiding the chain rule. However, the chain rule is clearly the easier method.

c. True. The derivative of the composition \( f(g(x)) \) is the product of \( f'(g(x)) \) with \( g'(x) \), so it is the product of two derivatives.

d. False. In fact, \( \frac{d}{dx} P(Q(x)) = P'(Q(x))Q'(x). \)

3.7.70

\[
\frac{d^2}{dx^2}(x \cos x^2) = \frac{d}{dx}(\cos x^2 - 2x^2 \sin x^2)
= -2x \sin x^2 - 4x \sin x^2 - 4x^3 \cos x^2
= -6x \sin x^2 - 4x^3 \cos x^2.
\]

3.7.71

\[
\frac{d^2}{dx^2} \sin x^2 = \frac{d}{dx}(2x \cos x^2)
= 2(\cos x^2 - 2x^2 \sin x^2)
= 2 \cos x^2 - 4x^2 \sin x^2.
\]

Note that in the middle of this calculation we used a result from the middle of the previous problem — namely the derivative of \( x \cos x^2. \)

3.7.72

\[
\frac{d^2}{dx^2} \sqrt{x^2 + 2} = \frac{d}{dx} \left( \frac{1}{2}(x^2 + 2)^{-1/2} \right)
= \frac{d}{dx} \left( \frac{x}{\sqrt{x^2 + 2}} \right)
= \frac{x^2 + 2 - x \cdot \frac{x}{\sqrt{x^2 + 2}}}{x^2 + 2}
= \frac{x^2 + 2 - x^2}{x^2 + 2}
= \frac{2}{(x^2 + 2)^{3/2}}.
\]

Copyright © 2014 Pearson Education, Inc.
3.7.73 \[ \frac{d^2}{dx^2} e^{-2x^2} = \frac{d}{dx} \left( -4xe^{-2x^2} \right) = -4e^{-2x^2} + 8xe^{-2x^2} = 4e^{-2x^2}(4x^2 - 1). \]

3.7.74

a. \[ \frac{d}{dx} (x^2 + x)^2 = 2(x^2 + x) \cdot \frac{d}{dx}(x^2 + x) = 2(x^2 + x)(2x + 1) = 4x^3 + 6x^2 + 2x. \]

b. \[ \frac{d}{dx} (x^2 + x)^2 = \frac{d}{dx}(x^4 + 2x^3 + x^2) = 4x^3 + 6x^2 + 2x. \]

3.7.75 \[ \frac{d}{dx} \sqrt{f(x)} = \frac{1}{2\sqrt{f(x)}} \cdot f'(x). \]

3.7.76 \[ \frac{d}{dx} \sqrt{f(x)g(x)} = \frac{1}{2\sqrt{f(x)g(x)}} \cdot \frac{d}{dx}(f(x)g(x)) = \frac{f'(x)g(x) + f(x)g'(x)}{2\sqrt{f(x)g(x)}}. \]

3.7.77

\[ y' = \frac{(x^3 - 6x - 1)(2x)(2x - 1) - (x^2 - 1)(3x^2 - 6)(x^3 - 6x - 1)}{(x^3 - 6x - 1)^2}, \]

so \( y'(3) = \frac{(27 - 18 - 1)(8)(6) - 64(21)}{64} = \frac{768 - 1344}{64} = -2. \] The equation of the tangent line is thus \( y - 8 = -9(x - 3) \), or \( y = -9x + 35 \).

3.7.78

\[ y' = \sqrt{5 - x^2} - \frac{x^2}{\sqrt{5 - x^2}}. \] Thus we have \( y'(1) = 2 - \frac{1}{2} = \frac{3}{2} \), and \( y'(-2) = 1 - \frac{1}{4} = -\frac{3}{4} \). The tangent lines we are seeking are \( y - 2 = \frac{3}{2}(x - 1) \) and \( y + 2 = -3(x + 2) \), or \( y = \frac{3}{2}x + 1 \) and \( y = -3x - 8 \).

3.7.79

a. \( g'(4) = 3, \) \( g(4) = 3 \cdot 4 - 5 = 7. \) \( f'(7) = -2, \) \( f(7) = -2 \cdot 7 + 23 = 9. \) Thus, \( h(4) = f(g(4)) = f(7) = 9, \) and \( h'(4) = f'(g(4))g'(4) = f'(7) \cdot 3 = -2 \cdot 3 = -6. \)

b. The tangent line to \( h \) at \((4, 9)\) is given by \( y - 9 = -6(x - 4) \), or \( y = -6x + 33 \).

3.7.80

a. \( g(1) = f(1^2) = f(1) = 4. \)

b. \( g'(x) = f'(x^2) \cdot 2x. \)

c. Using the previous result, \( g'(1) = f'(1) \cdot 2 = 3 \cdot 2 = 6. \)

d. The tangent line is given by \( y - 4 = 6(x - 1) \), or \( y = 6x - 2. \)
3.7.81

\( y'(x) = 2e^{2x} \), so \( y' \left( \frac{\ln 3}{2} \right) = 2e^{\ln 3} = 6 \). Also, \( y' \left( \frac{\ln 3}{2} \right) = e^{\ln 3} = 3 \). The tangent line is therefore given by \( y - 3 = 6 \left( x - \frac{\ln 3}{2} \right) \), or \( y = 6x + 3 - 3\ln 3 \).

3.7.82 First, note that \( g'(x) = f'(\sin x) \cdot \cos x \).

a. \( g'(0) = f'(0) \cdot \cos 0 = 3 \cdot 1 = 3 \).

b. \( g' \left( \frac{\pi}{2} \right) = f'(1) \cdot \cos \frac{\pi}{2} = 5 \cdot 0 = 0 \).

c. \( g'\left( \pi \right) = f'(0) \cdot \cos \pi = 3 \cdot (-1) = -3 \).

3.7.83 First, note that \( g'(x) = \cos(\pi f(x)) \cdot \pi f'(x) \).

a. \( g'(0) = \cos(\pi \cdot f(0)) \cdot \pi f'(0) = \cos(-3\pi) \cdot 3\pi = -3\pi \).

b. \( g'(1) = \cos(\pi \cdot f(1)) \cdot \pi f'(1) = \cos(3\pi) \cdot 5\pi = -5\pi \).

3.7.84

a. \( \frac{dy}{dt} = -y_0\sqrt{\frac{k}{m}} \sin \left( t\sqrt{\frac{k}{m}} \right) \).

b. The amplitude of the velocity (which is \( y_0\sqrt{\frac{k}{m}} \)) would decrease by a factor of 2, and the period would increase by a factor of 2.

c. The amplitude of the velocity would increase by a factor of 2, and the period would decrease by a factor of 2.

d. The units for \( -y_0\sqrt{\frac{k}{m}} \) would be meters. \( \sqrt{\frac{\text{kg/sec}^2}{\text{kg}}} = \text{meters/sec} \). Inside the sine function the units for \( t \cdot \sqrt{\frac{k}{m}} \) are sec \( \cdot \frac{1}{\text{sec}} = 1 \), so the factor involving the sine function is unitless (as it should be).

3.7.85

a. \( \frac{d^2y}{dt^2} = \frac{d}{dt} \left( -y_0\sqrt{\frac{k}{m}} \sin \left( t\sqrt{\frac{k}{m}} \right) \right) = -y_0 \cdot \frac{k}{m} \cdot \cos \left( t\sqrt{\frac{k}{m}} \right) \).

b. \( -\frac{k}{m}y = -\frac{k}{m} \left( y_0 \cos \left( t\sqrt{\frac{k}{m}} \right) \right) = \frac{d^2y}{dt^2} \).

3.7.86

a. The period of \( \cos x \) is \( 2\pi \). The period of a function of the form \( y = a\cos bx \) is \( \frac{2\pi}{b} \). Thus, the period of \( y \) is \( \frac{2\pi}{\sqrt{\frac{k}{m}}} = 2\pi \sqrt{\frac{m}{k}} \).

b. \( \frac{dT}{dm} = \frac{d}{dm} \left( 2\pi \sqrt{\frac{m}{k}} \right) = \frac{2\pi}{\sqrt{\frac{m}{k}}} \cdot \frac{1}{2\sqrt{m/k}} = \frac{\pi}{\sqrt{mk}} \).

c. Because \( k \) and \( m \) are greater than 0, and \( \pi \) is greater than 0, this quotient is greater than 0. Physically this means that the period is increasing as mass increases: the oscillations get slower.
### 3.7.87

a. 

\[
\frac{dy}{dt} = -5e^{-t/2} \cos \left( \frac{\pi t}{8} \right) - \frac{5\pi}{4} e^{-t/2} \sin \left( \frac{\pi t}{8} \right). 
\]

c. The velocity is zero at about \(-2.3\) and at about \(5.7\), and the displacement has a maximum and a minimum at these points.

### 3.7.88

We have

\[
\frac{dy}{dt} = -e^{-t} (\sin 2t - 2 \cos 2t) + e^{-t} (2 \cos 2t + 4 \sin 2t) = e^{-t} (3 \sin 2t + 4 \cos 2t) \\
\frac{d^2y}{dt^2} = -e^{-t} (3 \sin 2t + 4 \cos 2t) + e^{-t} (6 \cos 2t - 8 \sin 2t) = e^{-t} (-11 \sin 2t + 2 \cos 2t).
\]

Then

\[
y''(t) + 2y'(t) + 5y(t) = e^{-t} (-11 \sin 2t + 2 \cos 2t) + e^{-t} (6 \cos 2t + 8 \sin 2t) + e^{-t} (5 \sin 2t - 10 \cos 2t) \\
= e^{-t} ((-11 + 6 + 5) \sin 2t + (2 + 8 - 10) \cos 2t) \\
= e^{-t} (0 + 0) = 0,
\]

as desired.

### 3.7.89

a. Assuming a non leap year, March 1st corresponds to \(t = 59\). We have \(D(59) = 12 - 3 \cos \left( \frac{2\pi (69)}{365} \right) \approx 10.88\) hours.

b. \(\frac{d}{dt} D(t) = 3 \cdot \frac{2\pi}{365} \sin \left( \frac{2\pi (t+10)}{365} \right)\) hours per day.

c. \(D'(59) \approx 0.048\) hours per day \(\approx \) 2 minutes and 52 seconds per day. This means that on March 1st, the days are getting longer by just shy of 3 minutes per day.

d. 

e. The largest increase in the length of the days appears to be at about \(t = 81\), and the largest decrease at about \(t = 265\). These correspond to March 22nd and to September 22nd. The least rapid changes occur at about \(t = 172\) and \(t = 355\). These correspond to June 21st and December 21st.
3.7.90

a. \[ M(0) = 250(1000)(1 - (10)^{-30} \cdot 10^{30}) = 250,000 \cdot (1 - 1) = 0 \text{ grams.} \]

b. \[ V(1000) = 500 - (.5)(1000) = 500 - 500 = 0. \]

c. \[ C(0) = \frac{M(0)}{V(0)} = \frac{0}{500} = 0. \]

\[ C(1000) \text{ isn’t defined because } V(1000) = 0, \text{ but it appears that } \lim_{t \to 1000} C(t) = 500. \]

The concentration of the salt in the tank increases with time, although it levels off as it nears 500 grams per liter.

d. \[ M'(t) = 250(-1)(1 - 10^{-30}(1000 - t)^{10}) + 250(1000 - t)(-10^{-30} \cdot 10(1000 - t)^9 \cdot (-1)) \]
\[ = -250 + 250 \cdot 10^{-30}(1000 - t)^{10} + 250 \cdot 10 \cdot 10^{-30}(1000 - t)^{10} \]
\[ = 250(-1 + 11 \cdot 10^{-30}(1000 - t)^{10}). \]

e. It is convenient to rewrite \( C(t) \) first:
\[ C(t) = \frac{M(t)}{V(t)} = \frac{250(1000 - t)}{1000 - t} \cdot \left( 1 - \frac{(1000 - t)^{10}}{1000^{10}} \right) = 500 \cdot \left( 1 - \left( 1 - \frac{t}{1000} \right)^{10} \right). \]

Then \( C'(t) = 500 \cdot \left( 0 - 10 \left( 1 - \frac{t}{1000} \right)^9 \cdot \frac{1}{1000} \right) = 5 \left( 1 - \frac{t}{1000} \right)^9. \]

f. The derivative is positive for \( 0 \leq t \leq 1000 \), so the concentration is increasing on this interval.

3.7.91

a. \[ E'(t) = 400 + 200 \cos \left( \frac{\pi t}{12} \right) \text{ MW.} \]

b. Because the maximum value of \( \cos \theta \) is 1, the maximum value of \( E'(t) \) will be 600 MW, where \( \cos \left( \frac{\pi t}{12} \right) = 1 \), which is where \( t = 0 \), which corresponds to noon.
c. Because the minimum value of \( \cos \theta \) is \(-1\), the minimum value of \( E'(t) \) will be 200 MW, where \( \cos \left( \frac{\pi}{12} \right) = -1 \), which is where \( \frac{\pi}{12} = \pi \), or \( t = 12 \), which corresponds to midnight.

### 3.7.92

a. \[ \frac{d}{dt} \cos 2t = -2 \sin 2t, \quad \text{and} \quad \frac{d}{dt} (\cos^2 t - \sin^2 t) = -2 \sin t \cos t. \] Thus, \(-2 \sin 2t = -4 \sin t \cos t, \) so \( \sin 2t = 2 \sin t \cos t. \)

b. \[ \frac{d}{dt} (2 \cos^2 t - 1) = -4 \cos t \sin t, \] so again, \( \sin 2t = 2 \sin t \cos t. \)

c. \[ \frac{d}{dt} (1 - 2 \sin^2 t) = -4 \sin t \cos t, \] so all signs point toward the truth of \( \sin 2t = 2 \sin t \cos t. \)

### 3.7.93

a. \[ f'(x) = \frac{d}{dx} \cos^2 x = 2 \cos x (-\sin x) + 2 \sin x \cos x = 0. \]

b. If \( f(x) \) is a constant, then the output value must be the same at any input value, so we choose to evaluate \( f \) at a nice value like \( x = 0 \). We see that \( f(0) = \cos^2 0 + \sin^2 0 = 1^2 + 0^2 = 1, \) so we must have \( \cos^2 x + \sin^2 x = 1 \) for all \( x \).

### 3.7.94

a. \( g(x) = kx \) and \( f(u) = e^u. \) Then \( f(g(x)) = f(kx) = e^{kx}. \)

b. \[ \frac{d}{dx} f(g(x)) = f'(g(x))g'(x) = e^{kx} \cdot k = ke^{kx}. \]

### 3.7.95

\[ \frac{d}{dx} \left( f(x) (g(x))^{-1} \right) = f'(x)(g(x))^{-1} + f(x)(-g(x))^{-2}g'(x) = \frac{f'(x)}{g(x)} - \frac{f(x)g'(x)}{(g(x))^2} = \frac{g(x)f'(x) - f(x)g'(x)}{(g(x))^2}. \]

### 3.7.96

a. \[ \frac{d^2}{dx^2} [f(g(x))] = \frac{d}{dx} [f'(g(x))g'(x)] \]
\[ = f''(g(x))g'(x)g'(x) + f'(g(x))g''(x) \]
\[ = f''(g(x))(g'(x))^2 + f'(g(x))g''(x). \]

b. Let \( g(x) = 3x^4 + 5x^2 + 2 \). Then \( g'(x) = 12x^3 + 10x \) and \( g''(x) = 36x^2 + 10. \) Let \( f(u) = \sin u. \) Then \( f'(u) = \cos u \) and \( f''(u) = -\sin u. \)

We have \[ \frac{d^2}{dx^2} \sin(3x^4 + 5x^2 + 2) = -\sin(3x^4 + 5x^2 + 2) \cdot (12x^3 + 10x)^2 + \cos(3x^4 + 5x^2 + 2) \cdot (36x^2 + 10). \]

### 3.7.97

a. \( h(x) = (x^2 - 3)^5, \ a = 2. \)

b. \( h'(x) = 5(x^2 - 3)^4(2x) = 10x(x^2 - 3)^4, \) so the value of this limit is \( h'(2) = 20. \)

### 3.7.98

a. \( h(x) = \sqrt{4 + \sin x}, \ a = 0. \)

b. \( h'(x) = \frac{1}{2} \cdot (4 + \sin x)^{-1/2} \cdot \cos x = \frac{\cos x}{2\sqrt{4 + \sin x}}, \) so the value of this limit is \( h'(0) = \frac{1}{4}. \)

### 3.7.99

a. \( h(x) = \sin x^2, \ a = \frac{\pi}{2}. \)

---

Copyright © 2014 Pearson Education, Inc.
Previously we had seen that this result held for all integers. In this section, we extended the result to all rational numbers.

3.8 Implicit Differentiation

3.8.1 Implicit differentiation gives a single unified derivative, whereas solving for \( y \) explicitly yields two different functions.

3.8.2 In implicit differentiation, the independent and dependent variables may both appear on the same side of an equation, so one must keep track of which is which.

3.8.3 The result of implicit differentiation is often an expression involving both the dependent and independent variables, so one would need to know both in order to calculate the value of the derivative.

3.8.4 Previously we had seen that this result held for all integers. In this section, we extended the result to all rational numbers.

3.8.5

a. \( 4x^3 + 4y^3 \frac{dy}{dx} = 0 \). Thus \( 4y^3 \frac{dy}{dx} = -4x^3 \), so \( \frac{dy}{dx} = -\frac{x^3}{y^3} \).

b. When \( x = 1 \) and \( y = -1 \), we have \( \frac{dy}{dx} = -1 = 1 \).
3.8. IMPLICIT DIFFERENTIATION

3.8.6

a. $1 = e^y \frac{dy}{dx}$, so $\frac{dy}{dx} = \frac{1}{e^y} = \frac{1}{x}$.

b. When $x = 2$, $\frac{dy}{dx} = \frac{1}{x} = \frac{1}{2}$.

3.8.7

a. $2y \frac{dy}{dx} = 4$, so $\frac{dy}{dx} = \frac{2}{y}$.

b. $\left. \frac{dy}{dx} \right|_{(1,2)} = \frac{2}{2} = 1$.

3.8.8

a. $2y \frac{dy}{dx} + 3 = 0$, so $\frac{dy}{dx} = -\frac{3}{2y}$.

b. $\left. \frac{dy}{dx} \right|_{(1,\sqrt{5})} = -\frac{3}{2 \sqrt{5}} = -\frac{3\sqrt{5}}{10}$.

3.8.9

a. $\frac{dy}{dx} \cos y = 20x^3$, so $\frac{dy}{dx} = \frac{20x^3}{\cos y}$.

b. $\left. \frac{dy}{dx} \right|_{(1,\pi)} = \frac{20}{\cos \pi} = -20$.

3.8.10

a. $\frac{1}{2\sqrt{x}} - \frac{1}{\sqrt{y}} \frac{dy}{dx} = 0$, so $\frac{dy}{dx} = \frac{\sqrt{y}}{2\sqrt{x}}$.

b. When $x = 4$ and $y = 1$ we have $\frac{dy}{dx} = \frac{\sqrt{7}}{2\sqrt{4}} = \frac{1}{4}$.

3.8.11

a. $-\frac{dy}{dx} \sin y = 1$, so $\frac{dy}{dx} = -\frac{1}{\sin y} = -\csc y$.

b. $\left. \frac{dy}{dx} \right|_{(0,\pi/2)} = -\csc(\pi/2) = -1$.

3.8.12

a. $(y + x \frac{dy}{dx}) \sec^2(xy) = 1 + \frac{dy}{dx}$, so $y \frac{dy}{dx} \sec^2(xy) - \frac{dy}{dx} = 1 - y \sec^2(xy)$. Factoring out $\frac{dy}{dx}$ on the left-hand side gives $\frac{dy}{dx} (x \sec^2(xy) - 1) = 1 - y \sec^2(xy)$, so $\frac{dy}{dx} = \frac{1 - y \sec^2(xy)}{x \sec^2(xy) - 1}$.

b. $\left. \frac{dy}{dx} \right|_{(0,0)} = \frac{-1-0}{0-1} = -1$.

3.8.13 $(y + x \frac{dy}{dx}) \cos(xy) = 1 + \frac{dy}{dx}$, so $y \cos(xy) + x \frac{dy}{dx} \cos(xy) = 1 + \frac{dy}{dx}$. If we rearrange terms in order to have the terms with a factor of $\frac{dy}{dx}$ all on the same side, we obtain $y \cos(xy) - 1 = \frac{dy}{dx} - x \frac{dy}{dx} \cos(xy)$. Factoring out the $\frac{dy}{dx}$ factor gives $y \cos(xy) - 1 = \frac{dy}{dx} (1 - x \cos(xy))$, so $\frac{dy}{dx} = \frac{y \cos(xy) - 1}{1 - x \cos(xy)}$.

3.8.14 $(y + x \frac{dy}{dx}) e^{xy} = 2 \frac{dy}{dx}$, so $y e^{xy} + x \frac{dy}{dx} e^{xy} = 2 \frac{dy}{dx}$. We can write this as $y e^{xy} = 2 \frac{dy}{dx} - x \frac{dy}{dx} e^{xy}$, and factoring out the factor of $\frac{dy}{dx}$ on the right yields $y e^{xy} = \frac{dy}{dx} (2 - xe^{xy})$. Finally, we can divide to obtain $\frac{dy}{dx} = \frac{ye^{xy}}{2 - xe^{xy}}$.

3.8.15 $1 + \frac{dy}{dx} = -\sin y \cdot \frac{dy}{dx}$, so $\frac{dy}{dx} + (\sin y) \frac{dy}{dx} = -1$, and $\frac{dy}{dx} = -\frac{1}{1+\sin y}$.

3.8.16 $1 + 2 \frac{dy}{dx} = \frac{1}{\sqrt{y}} \frac{dy}{dx}$, so $1 = \frac{1}{2 \sqrt{y}} \frac{dy}{dx} - 2 \frac{dy}{dx}$, and thus $1 = \frac{dy}{dx} \left( \frac{1}{\sqrt{y}} - 2 \right)$. Because the right-hand side of this equation can be written as $\frac{dy}{dx} \left( \frac{1-2\sqrt{y}}{\sqrt{y}} \right)$, we have $\frac{dy}{dx} = \frac{2\sqrt{y}}{1-2\sqrt{y}}$.

3.8.17 $-2y \frac{dy}{dx} \sin(y^2) + 1 = \frac{dy}{dx} e^y$, which we can write as $1 = \frac{dy}{dx} e^y + 2y \frac{dy}{dx} \sin(y^2)$, or $1 = \frac{dy}{dx} (e^y + 2y \sin(y^2))$. Thus, $\frac{dy}{dx} = \frac{1}{e^y + 2y \sin(y^2)}$.

3.8.18 $\frac{dy}{dx} = \frac{(y-1)-(x+1) \frac{dy}{dx}}{(y-1)^2}$, which we can write as $(y-1)^2 \cdot \frac{dy}{dx} = y - 1 - (x + 1) \frac{dy}{dx}$. If we rearrange terms in order to have terms with a factor of $\frac{dy}{dx}$ all on the same side, we obtain $\frac{dy}{dx} (y-1)^2 + \frac{dy}{dx} (x + 1) = y - 1$. Factoring out the common factor of $\frac{dy}{dx}$ yields $\frac{dy}{dx} ((y-1)^2 + (x + 1)) = y - 1$, so $\frac{dy}{dx} = \frac{y-1}{(y-1)^2 + x + 1}$. 

Copyright © 2014 Pearson Education, Inc.
3.8.19

\[ 3x^2 = \frac{(x - y)(1 + \frac{dy}{dx}) - (x + y)(1 - \frac{dy}{dx})}{(x - y)^2} \]
\[ 3x^2(x - y)^2 = x + x \frac{dy}{dx} - y - y \frac{dy}{dx} - x + x \frac{dy}{dx} - y + y \frac{dy}{dx} \]
\[ 3x^2(x - y)^2 + 2y = 2x \frac{dy}{dx} \]
\[ \frac{dy}{dx} = \frac{3x^2(x - y)^2 + 2y}{2x} \]

3.8.20

\[ 3(y + x \frac{dy}{dx})(xy + 1)^2 = 1 - 2y \frac{dy}{dx} \]
\[ 3x \frac{dy}{dx}(xy + 1)^2 + 2y \frac{dy}{dx} = 1 - 3y(xy + 1)^2 \]
\[ \frac{dy}{dx}(3x(xy + 1)^2 + 2y) = 1 - 3y(xy + 1)^2 \]
\[ \frac{dy}{dx} = \frac{1 - 3y(xy + 1)^2}{3(x(xy + 1)^2 + 2y)}. \]

3.8.21

\[ 18x^2 + 21 \frac{dy}{dx} y^2 = 13(y + x \frac{dy}{dx}) \]
\[ 21 \frac{dy}{dx} y^2 - 13x \frac{dy}{dx} = 13y - 18x^2 \]
\[ \frac{dy}{dx} = \frac{13y - 18x^2}{21y^2 - 13x}. \]

3.8.22

\[ \cos x \cos y + \sin x(- \sin y) \frac{dy}{dx} = \cos x + (- \sin y) \frac{dy}{dx} \]
\[ \cos x \cos y - \cos x = \sin x \sin y \frac{dy}{dx} - \sin y \frac{dy}{dx} \]
\[ \cos x \cos y - \cos x = (\sin x \sin y - \sin y) \frac{dy}{dx} \]
\[ \frac{dy}{dx} = \frac{\cos x \cos y - \cos x}{\sin x \sin y - \sin y}. \]

3.8.23

\[ \frac{4x^3 + 2y \frac{dy}{dx}}{2 \sqrt{x^4 + y^2}} = 5 + 6y \frac{dy}{dx} \]
\[ y \frac{dy}{dx} - 6 \frac{dy}{dx} y^2 \sqrt{x^4 + y^2} = 5 \sqrt{x^4 + y^2} - 2x^3 \]
\[ \frac{dy}{dx} = \frac{5 \sqrt{x^4 + y^2} - 2x^3}{y - 6y^2 \sqrt{x^4 + y^2}} \]
3.8.24

\[ \frac{1}{2}(x + y^2)^{-1/2} \left( 1 + 2y \frac{dy}{dx} \right) = (\cos y) \frac{dy}{dx} \]

\[ \frac{1}{2\sqrt{x + y^2}} = \cos y \frac{dy}{dx} - \frac{y \cdot dy/dx}{\sqrt{x + y^2}} \]

\[ \frac{1}{2\sqrt{x + y^2}} = \left( \cos y - \frac{y}{\sqrt{x + y^2}} \right) \frac{dy}{dx} \]

\[ \frac{dy}{dx} = \frac{1}{2(\cos y \sqrt{x + y^2} - y)} \]

3.8.25

a. \(2^2 + 2 \cdot 1 + 1^2 = 7\), so the point \((2, 1)\) does lie on the curve.

b. \(2x + y + xy' + 2yy' = 0\), which can be written \((x + 2y)y' = -2x - y\). Solving for \(y'\) yields \(y' = \frac{-2x - y}{x + 2y}\). Thus, at the point \((2, 1)\) we have \(y' = \frac{-2}{3}\). The equation of the tangent line is therefore \(y - 1 = \frac{-2}{3}(x - 2)\), or \(y = \frac{-5}{4}x + \frac{7}{2}\).

3.8.26

a. \((-1)^4 - (-1)^2 \cdot 1 + 1^4 = 1\), so the point \((-1, 1)\) does lie on the curve.

b. \(4x^3 - 2xy - x^2 y' + 4y^3 y' = 0\), which can be written \(y'(4y^3 - x^2) = 2xy - 4x^3\). Thus, \(y' = \frac{2xy - 4x^3}{4y^3 - x^2}\). Thus, at the point \((-1, 1)\) we have \(y' = \frac{2}{3}\). The equation of the tangent line is therefore \(y - 1 = \frac{2}{3}(x + 1)\), or \(y = \frac{2}{3}x + \frac{5}{3}\).

3.8.27

a. \(\sin \pi + \frac{\pi^2}{\pi} = \pi^2\), so the point \(\left( \frac{\pi^2}{\pi}, \pi \right)\) does lie on the curve.

b. \(y' \cos y + 5 = 2yy'\), so \(5 = y'(2y - \cos y)\), so \(y' = \frac{5}{2y - \cos y}\). At the given point we have \(y' = \frac{5}{2\pi + 1}\). The equation of the tangent line is therefore \(y - \pi = \frac{5}{2\pi + 1} \left( x - \frac{\pi^2}{\pi} \right)\), or \(y = \frac{5}{2\pi + 1}x + \frac{\pi(1 + \pi)}{2\pi + 1}\).

3.8.28

a. \(1^3 + 1^3 = 2 \cdot 1 \cdot 1\), so the point \((1, 1)\) does lie on the curve.

b. \(3x^2 + 3y^2 y' = 2(y + xy')\), which can be written \((3y^2 - 2x)y' = 2y - 3x^2\), so \(y' = \frac{2y - 3x^2}{3y^2 - 2x}\). At the given point we have \(y' = \frac{2}{5} - \frac{3}{2} = -1\). The equation of the tangent line is therefore \(y - 1 = -1(x - 1)\), or \(y = -x + 2\).

3.8.29

a. \(\cos \left( \frac{\pi}{2} - \frac{\pi}{4} \right) + \sin \frac{\pi}{4} = \sqrt{2} + \sqrt{2} = \sqrt{2}\), so the point \(\left( \frac{\pi}{2}, \frac{\pi}{4} \right)\) does lie on the curve.

b. \((1 - y'')(-\sin(x - y)) + y' \cos y = 0\), which can be written as \(y'(\cos y + \sin(x - y)) = \sin(x - y)\), so \(y' = \frac{\sin(x - y)}{\cos y + \sin(x - y)}\). At the given point we have \(y' = \frac{1}{2}\). The equation of the tangent line is therefore \(y - \frac{\pi}{4} = \frac{1}{2} \left( x - \frac{\pi}{2} \right)\), or \(y = \frac{1}{2}x\).

3.8.30

a. \((1 + 2^2)^2 = 25 = \frac{25}{4} \cdot 1 \cdot 2^2\), so the point \((1, 2)\) does lie on the curve.

Copyright © 2014 Pearson Education, Inc.
b. $2(x^2 + y^2)(2x + 2yy') = \frac{25}{4} \cdot (y^2 + 2xyy')$, which can be written as $y' \left[ 4y(x^2 + y^2) - \frac{25}{2} xy \right] = \frac{25}{4} y^2 - 4x(x^2 + y^2)$, so $y' = \frac{25y^2 - 4x(x^2 + y^2)}{4y(x^2 + y^2) - \left(2xy^3/2y\right)}$. At the given point we have $y' = \frac{25 - 20}{40 - 25} = \frac{1}{5}$. The equation of the tangent line is therefore $y - 2 = \frac{1}{5}(x - 1)$, or $y = \frac{1}{5}x + \frac{9}{5}$.

3.8.31 $1 + 2yy' = 0$, so $y' = -\frac{1}{2y}$. Differentiating again, we obtain

$$y'' = -\frac{1}{2} \cdot \frac{-y'}{y^2} = \frac{y''}{2y^2} = \left(-\frac{1}{2y}\right) \cdot \frac{1}{2y^2} = -\frac{1}{4y^3}.$$  

3.8.32 $4x + 2yy' = 0$, so $y' = -\frac{2x}{y}$. Differentiating again, we obtain

$$y'' = \frac{-2y + 2xy'}{y^2} = \frac{-2y + \frac{-4x^2}{y}}{y^2} = -\frac{2y^2 + 4x^2}{y^3}.$$  

3.8.33 $1 + \frac{dy}{dx} = (\cos y)\frac{du}{dx}$, so $1 = \frac{dy}{dx} (\cos y - 1)$, and thus $\frac{du}{dx} = \frac{1}{\cos y - 1}$. Thus

$$\frac{d^2 y}{dx^2} = -\frac{1}{(\cos y - 1)^2} \left(-\sin y \frac{dy}{dx} \right) = -\frac{\sin y}{(\cos y - 1)^2} \cdot \frac{1}{\cos y - 1} = \frac{\sin y}{(\cos y - 1)^3}.$$  

3.8.34 $4x^3 - 4y'y^3 = 0$, so $y' = -\frac{x^3}{y^3}$. Differentiating again, we obtain

$$y'' = -\frac{3x^2y^3 - x^3 \cdot 3y^2y'}{y^6} = \frac{3x^3y^3 - 3x^2y}{y^4} = \frac{3x^3 \cdot \left(-\frac{x^3}{y^3}\right) - 3x^2y}{y^4} = -\frac{3x^6 + 3x^2y^4}{y^7}.$$  

3.8.35 $2ye^{2y} + 1 = y'$, so $y' = \frac{1}{1 - 2e^{2y}}$. Differentiating again, we obtain

$$y'' = -\left(1 - 2e^{2y}\right)^{-2} \left(-4e^{2y}y'\right) = \frac{4e^{2y}}{\left(1 - 2e^{2y}\right)^3}.$$  

3.8.36 $\cos x + 2xy + x^2y' = 0$, so $y' = -\frac{2xy + \cos x}{x^2}$. Differentiating again, we obtain

$$y'' = -\frac{x^2(2y + 2xy' - \sin x) - 2x(2xy + \cos x)}{x^4} = \frac{x^2 \sin x + 2x \cos x + 2x^2y - 2x^3y'}{x^4} = \frac{x \sin x + 2 \cos x + 2xy + 2(2x + \cos x)}{x^3} = \frac{x \sin x + 4 \cos x + 6xy}{x^3}.$$  

3.8.37 $\frac{dy}{dx} = \frac{5}{4} \cdot \frac{5^{x-1}}{x^3} = \frac{5}{4} \cdot \frac{1}{x^3}.$

3.8.38 $\frac{dy}{dx} = \frac{2x - 1}{3(x^2 - x + 2)^{2/3}}.$

3.8.39 $\frac{dy}{dx} = \frac{5}{3} \cdot \frac{2}{(5x + 1)^{3/2}} = \frac{10}{3(5x + 1)^{3/2}}.$

3.8.40 $\frac{dy}{dx} = e^{2\sqrt{x}} + \frac{3}{2}e^{\sqrt{x}}.$

3.8.41 $\frac{dy}{dx} = \frac{1}{4} \left(\frac{2x}{4x - 3}\right)^3 \cdot \frac{2(4x - 3) - 2x \cdot 4}{(4x - 3)^2} = -\frac{3}{2} \left(\frac{4x - 3}{2x}\right)^3 \cdot \frac{1}{(4x - 3)^2} = -\frac{3}{2} \frac{3}{2(4x - 3)^{5/4}}.$

Copyright © 2014 Pearson Education, Inc.
3.8. IMPLICIT DIFFERENTIATION

3.8.42 \( y' = 1 \cdot (x + 1)^{1/3} + x \cdot \frac{1}{3}(x + 1)^{-2/3} = \frac{3(x + 1)}{3(x + 1)^{2/3}} + \frac{x}{3(x + 1)^{2/3}} = \frac{4x + 3}{3(x + 1)^{2/3}}. \)

3.8.43 Note that \( y = (1 + x^{1/3})^{2/3} \), so \( y' = \frac{2}{3}(1 + x^{1/3})^{-1/3} \cdot \frac{1}{3}x^{-2/3} = \frac{2}{9x^{2/3}(1 + x^{1/3})^{1/3}}. \)

3.8.44 \( \frac{dy}{dx} = \frac{(x^{1/3} + x) - x(\frac{1}{3}x^{-2/3} + 1)}{(x^{1/3} + x)^2} = \frac{4x^{1/3}}{5(x^{1/3} + x)^2}. \)

3.8.45 \( \frac{1}{3}x^{-\frac{4}{3}} + 4y^{\frac{3}{4}}y' = 0 \), so at the given point we have \( \frac{1}{3} + \frac{4}{3}y' = 0 \), so \( y' = -\frac{1}{4}. \)

3.8.46 \( \frac{2}{3}x^{-\frac{4}{3}} + \frac{2}{3}y^{-\frac{4}{3}}y' = 0 \), so at the given point we have \( \frac{2}{3} + \frac{2}{3}y' = 0 \), so \( y' = -1. \)

3.8.47 \( x^{\frac{1}{3}} + \frac{1}{3}x^{-\frac{2}{3}}y' + y' = 0 \), so at the given point we have \( 2 + \frac{1}{3} \cdot \frac{1}{4}y' + y' = 0 \), so \( \frac{13}{12}y' = -2 \), so \( y' = -\frac{24}{13}. \)

3.8.48 \( \frac{2}{3}(x + y)^{-\frac{5}{3}}(1 + y') = y' \), so at the given point we have \( \frac{2}{3} \cdot \frac{1}{3} \cdot (1 + y') = y' \), so \( \frac{1}{3} = \frac{3}{3}y' \), so \( y' = \frac{1}{3}. \)

3.8.49 \( y + xy' + 3 \frac{4}{2}x^{\frac{2}{3}}y^{-\frac{5}{3}} - \frac{1}{2}x^{\frac{2}{3}}y^{-\frac{5}{3}}y' = 0 \), so at the given point we have \( 1 + y' + \frac{3}{2} - \frac{1}{2}y' = 0 \), so \( \frac{1}{2}y' = -\frac{5}{2} \), so \( y' = -5. \)

3.8.50 \( y^5 + \frac{5}{2}xy^3y' + \frac{3}{2}x^2y + x^2y' = 0 \), so at the given point we have \( 1 + 10y' + 3 + 8y' = 0 \), so \( y' = -\frac{2}{5}. \)

3.8.51

a. False. For example, the equation \( y \cos(xy) = x \), cannot be solved explicitly for \( y \) in terms of \( x \).

b. True. We have \( 2x + 2yy' = 0 \), and the result follows by solving for \( y' \).

c. False. The equation \( x = 1 \) doesn’t represent any sort of function — it is either just a number, or perhaps a vertical line, but it doesn’t represent a differentiable function.

d. False. \( y + xy' = 0 \), so \( y' = -\frac{y}{x} \), \( x \neq 0 \).

3.8.52

a. There are three points on the curve associated with \( x = 1 \). When \( x = 1 \), we have \( 1 + y^3 - y = 1 \), so \( y(y^2 - 1) = 0 \). The three points are thus \( (1,0), (1,1) \) and \( (1,-1) \). Differentiating yields \( 1 + 3y^2y' - y' = 0 \), so \( y' = \frac{1}{1-3y^2} \).

At \( (1,0) \), we have \( y' = 1 \), so the tangent line is given by \( y = x - 1 \).

At \( (1,1) \), we have \( y' = -\frac{1}{2} \), so the tangent line is given by \( y - 1 = -\frac{1}{2}(x - 1) \), or \( y = -\frac{1}{2}x + \frac{3}{2} \).

At \( (1,-1) \), we have \( y' = -\frac{1}{2} \), so the tangent line is given by \( y + 1 = -\frac{1}{2}(x - 1) \), or \( y = -\frac{1}{2}x - \frac{3}{2} \).
3.8.53

a. There are two points on the curve associated with $x = 1$. When $x = 1$, we have $1 + y^2 - y = 1$, so $y(y - 1) = 0$. The two points are thus $(1, 0)$ and $(1, 1)$. Differentiating yields $1 + 2yy' - y' = 0$, so $y' = \frac{1}{1 - 2y}$.
At $(1, 0)$, we have $y' = 1$, so the tangent line is given by $y = x - 1$.
At $(1, 1)$, we have $y' = -1$, so the tangent line is given by $y - 1 = -1(x - 1)$, or $y = -x + 2$.

3.8.54

a. There are two points on the curve associated with $x = 2$. When $x = 2$, we have $32 = 2y^2$, so $y^2 = 16$, so $y = \pm 4$. The two points are thus $(2, 4)$ and $(2, -4)$. Differentiating yields $12x^2 = 2yy'(4 - x) + y^2$.
At $(2, -4)$, we have $48 = -8y'(2) - 16$, so $y' = -4$. Thus the tangent line is given by $y + 4 = -4(x - 2)$, or $y = -4x + 4$.
At $(2, 4)$, we have $y' = 4$, so the tangent line is given by $y - 4 = 4(x - 2)$, or $y = 4x - 4$.

3.8.55

a. $y(2x) + (x^2 + 4)y' = 0$, so $y' = -\frac{2xy}{x^2 + 4}$.

b. At $y = 1$ we have $x^2 + 4 = 8$, so $x = \pm 2$. At the point $(2, 1)$ we have $y' = -\frac{4}{8} = -\frac{1}{2}$. At the point $(-2, 1)$ we have $y' = \frac{8}{8} = \frac{1}{2}$. Thus, the equations of the tangent lines are given by $y - 1 = -\frac{1}{2}(x - 2)$ and $y - 1 = \frac{1}{2}(x + 2)$, or $y = -\frac{1}{2}x + 2$ and $y = \frac{1}{2}x + 2$.

c. $y = \frac{8}{x^2 + 4}$, so $y' = \frac{0 - 8 \cdot 2x}{(x^2 + 4)^2} = -\frac{16x}{(x^2 + 4)^2}$.

d. $y' = -\frac{16x}{(x^2 + 4)^2} = -\frac{2x}{x^2 + 4} \cdot \frac{8}{x^2 + 4} = -\frac{2x}{x^2 + 4}$, so $y = -\frac{2xy}{x^2 + 4}$.

3.8.56

a. From number 48, we have that $y' = -\frac{1}{1 - 3y^2}$. A vertical tangent would occur at a point whose $y$ value would make $1 - 3y^2$ equal to zero. So we are looking for where $3y^2 = 1$ or $y = \pm \frac{1}{\sqrt{3}}$.
If $y = \frac{1}{\sqrt{3}}$, then $x + \left(\frac{1}{\sqrt{3}}\right)^3 - \frac{1}{\sqrt{3}} = 1$, so $x = 1 + \frac{2\sqrt{3}}{9}$, and there is a vertical tangent at $\left(\frac{1}{\sqrt{3}}, 1 + \frac{2\sqrt{3}}{9}\right)$.
If $y = -\frac{1}{\sqrt{3}}$, then $x + \left(-\frac{1}{\sqrt{3}}\right)^3 - \left(-\frac{1}{\sqrt{3}}\right) = 1$, so $x = 1 - \frac{2\sqrt{3}}{9}$, and there is a vertical tangent at $\left(-\frac{1}{\sqrt{3}}, 1 - \frac{2\sqrt{3}}{9}\right)$.

b. Because $y'$ is never zero, there are no horizontal tangent lines.
3.8.57
a. From number 49, we have that \( y' = \frac{1}{1-2y} \). A vertical tangent would occur at a point whose \( y \) value would make \( 1 - 2y \) equal to zero. So we are looking for where \( 2y = 1 \) or \( y = \frac{1}{2} \).

If \( y = \frac{1}{2} \), then \( x + \frac{1}{4} - \frac{1}{2} = 1 \), so \( x = \frac{3}{4} \), and there is a vertical tangent at \( \left( \frac{3}{4}, \frac{1}{2} \right) \).

b. Because \( y' \) is never zero, there are no horizontal tangent lines.

3.8.58
a. \( 3y^2y' = 2ax \), so \( y' = \frac{2ax}{3y^2} \).

b. \( y = \sqrt[3]{ax^2} \).

c.

\[
\begin{align*}
  y & = \sqrt[3]{ax^2} \\
  \frac{dy}{dx} & = \frac{2ax}{3y^2} = \frac{1}{1+2y}
\end{align*}
\]

3.8.59
a. If we write \( y^3 - 1 = xy - x \), we have \( (y - 1)(y^2 + y + 1) = x(y - 1) \), so either \( y = 1 \) or else we may divide by \( y - 1 \) to get \( y^2 + y + 1 = x \). So the curve consists of the line \( y = 1 \), which is a horizontal line with \( \frac{dy}{dx} = 0 \), together with the curve \( y^2 + y + 1 = x \), which is a horizontally oriented parabola; differentiating gives \( 2y \frac{dy}{dx} + \frac{dy}{dx} = 1 \), so \( \frac{dy}{dx} = \frac{1}{1+2y} \).

b. Assuming \( y \neq 1 \), we have

\[
\begin{align*}
  y^3 - 1 & = x(y - 1) \\
  (y - 1)(y^2 + y + 1) & = x(y - 1) \\
  y^2 + y + 1 & = x \\
  y^2 + y + (1 - x) & = 0,
\end{align*}
\]

so by the quadratic formula we have \( y = \frac{-1 \pm \sqrt{4x-3}}{2} \). The third branch of the curve is the line \( y = 1 \).

c.

\[
\begin{align*}
  \frac{dy}{dx} & = \frac{1}{1+2y}
\end{align*}
\]
3.8.60  
a. \[ 2yy' = \frac{(2x(4-x) - x^2)(4 + x) - x^2(4-x)}{(4 + x)^2} = \frac{(8x - 3x^2)(4 + x) - 4x^2 + x^3}{(4 + x)^2} = \frac{32x - 8x^2 - 2x^3}{(4 + x)^2} \]. Thus \[ y' = \frac{16x - 4x^2 - x^3}{y(4 + x)^2} \].

b. \[ y = \pm \sqrt{\frac{x^2(4-x)}{4+x}} \].

c.

3.8.61  
a. \[ 4x^3 = 4x - 4yy', \text{ so } y' = \frac{x-x^3}{y} \].

b. \[ y = \pm \sqrt{x^2 - \frac{x^4}{2}} \].

c.

3.8.62  
a. \[ 2yy'(x + 2) + y^2 = 12x - 3x^2. \text{ So } y' = \frac{12x-3x^2-y^2}{2y(x+2)} \].
3.8. IMPLICIT DIFFERENTIATION

b. $y^2 = \frac{x^2(6 - x)}{x + 2}$, so $y = \pm \sqrt{\frac{x^2(6 - x)}{x + 2}}$.

c.

The slope of the normal line is the negative reciprocal of the slope of the tangent line. From Exercise 25, $y' = -\frac{5}{4}$, so the slope of the normal line is $\frac{4}{5}$. At the point $(2, 1)$ we have the line $y - 1 = \frac{4}{5}(x - 2)$, or $y = \frac{4}{5}x - \frac{3}{5}$.

3.8.63

The slope of the normal line is the negative reciprocal of the slope of the tangent line. From Exercise 26, $y' = \frac{2}{3}$, so the slope of the normal line is $-\frac{3}{2}$. At the point $(-1, 1)$ we have the line $y - 1 = -\frac{3}{2}(x + 1)$, or $y = -\frac{3}{2}x - \frac{1}{2}$.
3.8.65

The slope of the normal line is the negative reciprocal of the slope of the tangent line. From Exercise 27, \( y' = \frac{6}{2\pi + 1} \), so the slope of the normal line is \(-\frac{2\pi + 1}{\pi}\). At the point \( \left( \frac{\pi}{5}, \pi \right) \) we have the line \( y - \pi = -\frac{2\pi + 1}{5}(x - \frac{\pi^2}{5}) \), or \( y = -\frac{2\pi + 1}{5}x + \frac{2\pi^3 + \pi^2 + 25\pi}{25} \).

3.8.66

The slope of the normal line is the negative reciprocal of the slope of the tangent line. From Exercise 28, \( y' = -1 \), so the slope of the normal line is 1. At the point \( (1, 1) \) we have the line \( y - 1 = x - 1 \), or \( y = x \).

3.8.67

The slope of the normal line is the negative reciprocal of the slope of the tangent line. From Exercise 29, \( y' = \frac{1}{2} \), so the slope of the normal line is \(-2 \). At the point \( \left( \frac{\pi}{4}, \frac{\pi}{4} \right) \) we have the line \( y - \frac{\pi}{4} = -2(x - \frac{\pi}{4}) \), or \( y = -2x + \frac{3\pi}{4} \).
3.8.68

The slope of the normal line is the negative reciprocal of the slope of the tangent line. From Exercise 30, \( y' = \frac{1}{3} \), so the slope of the normal line is \(-3\). At the point \((1,2)\) we have the line \(y - 2 = -3(x - 1)\), or \(y = -3x + 5\).

3.8.69

We have \(9x^2 + 21y^2y' = 10y'\), so at the point \((1,1)\) we have \(9 + 21y' = 10y'\), so \(y' = -\frac{9}{11}\). Thus, the tangent line is given by \(y - 1 = -\frac{9}{11}(x - 1)\), or \(y = -\frac{9}{11}x + \frac{20}{11}\). The normal line is given by \(y - 1 = \frac{11}{9}(x - 1)\), or \(y = \frac{11}{9}x - \frac{2}{9}\).

3.8.70

We have \(4x^3 = 4x + 4yy'\), so at the point \((2,2)\) we have \(32 = 8 + 8y'\), so \(y' = 3\). Thus, the tangent line is given by \(y - 2 = 3(x - 2)\), or \(y = 3x - 4\). The normal line is given by \(y - 2 = -\frac{1}{3}(x - 2)\), or \(y = -\frac{1}{3}x + \frac{8}{3}\).
3.8.71

We have \(2(x^2 + y^2 - 2x)(2x + 2yy' - 2) = 4x + 4yy',\)
so at the point \((2, 2)\) we have \(2(4 + 4 - 4 + 4y' -
2) = 8 + 8y',\) so \(16 + 32y' = 8 + 8y',\) so \(y' = -\frac{1}{3}.
Thus, the tangent line is given by \(y - 2 = -\frac{1}{3}(x - 2),\) or \(y = \frac{1}{3}x + \frac{8}{3}.
The normal line is given by \(y - 2 = 3(x - 2),\) or \(y = 3x - 4.\)

3.8.72

We have \(2(x^2 + y^2)(2x + 2yy') = \frac{25}{3} (2x - 2yy'),\)
so at the point \((2, -1)\) we have \(2 \cdot 5 \cdot (4 - 2y') =
\frac{25}{3} (4 + 2y'),\) so \(40 - 20y' = \frac{100}{3} + \frac{50}{3} y',\) so \(120 -
60y' = 100 + 50y',\) and thus \(y' = \frac{2}{11}.
Thus, the tangent line is given by \(y + 1 = \frac{2}{11}(x - 2),\)
or \(y = \frac{2}{11}x - \frac{15}{11}.\) The normal line is given by \(y + 1 = -\frac{11}{2}(x - 2),\) or \(y = -\frac{11}{2}x + 10.\)

3.8.73

a. \(1280 = 40L^{1/3}K^{2/3},\) so \(0 = \frac{40}{3} L^{-2/3} K^{2/3} + \frac{80}{3} L^{1/3} K^{-1/3}.\) Multiplying both sides by \(\frac{3}{40} L^{2/3} K^{1/3}\)
yields
\[
0 = K + 2L \frac{dK}{dL}, \text{ so } \frac{dK}{dL} = -\frac{1}{2} \frac{K}{L}.
\]
b. With \(L = 8\) and \(K = 64, \frac{dK}{dL} = -\frac{64}{16} = -4.\)

3.8.74 \(A = \pi r \sqrt{r^2 + h^2} = 1500 \pi.\) So \(\pi r' \sqrt{r^2 + h^2} + \pi r \frac{r' + \sqrt{r^2 + h^2}}{2} = 0.\) So \(r'(r^2 + h^2) + r^2 r' + rh = 0,\) so
\(r' = -\frac{rh}{2r^2 + h^2}.\) At \(r = 30\) and \(h = 40,\) we have \(r' = -\frac{1200}{1800 + 1600} = -\frac{6}{17}.\)

3.8.75 \(V = \frac{x^2 h^2 (3r - h)}{3} = \frac{5\pi}{3}.\) So
\[
\frac{1}{3} [2\pi h (3r - h) + \pi h^2 (3r' - 1)] = 0,
6rh - 2h^2 + 3h^2 r' - h^2 = 0,
\]
so \(r' = 1 - \frac{2r}{h}.\)
At \(r = 2\) and \(h = 1,\) we have \(r' = 1 - 4 = -3.\)

3.8.76 \(V = \frac{x^2 (b + a)(b - a)^2}{4} = 64 \pi^2.\) So
\[(b' + 1)(b - a)^2 + (b + a) \cdot 2 \cdot (b - a)(b' - 1) = 0,\]

Copyright © 2014 Pearson Education, Inc.
\[ b'(b-a)^2 + 2(b^2 - a^2)b' = 2(b^2 - a^2) - (b-a)^2, \]

\[ b'(b-a)(b-a+2b+2a) = (b-a)(2b+2a-(b-a)), \]

\[ \frac{db}{da} = \frac{(b-a)(b+3a)}{(b-a)(3b+a)} = \frac{b+3a}{3b+a}. \]

At \( a = 6 \) and \( b = 10 \) we have \( \frac{db}{da} = \frac{28}{36} = \frac{7}{9}. \)

3.8.77 Note for \( y = mx, \) \( \frac{dy}{dx} = m = \frac{y}{x}, \) and for \( x^2 + y^2 = a^2, \) \( \frac{dy}{dx} = -\frac{x}{y}. \) So for any point \((x, y),\) we have \( \frac{y}{x} \)

and \( -\frac{x}{y} \) are negative reciprocals.

3.8.78 For \( y = cx^2 \) we have \( y' = 2cx \) and for \( x^2 + y^2 = k, \) we have \( y' = -\frac{x}{y}. \) Let \((a, b)\) be a point on both curves. Then \( b = ca^2, \) so the point has the form \((a, ca^2).\) A normal line to the ellipse \( x^2 + 2y^2 = k \) would have slope \( \frac{2y}{x} = \frac{2a^2}{a} = 2ca, \) which is the slope of the tangent line to the parabola \( y = cx^2 \) at the point in question. Thus the two curves are orthogonal at any points of intersection.

3.8.79 For \( xy = a \) we have \( xy' + y = 0, \) so \( y' = -\frac{y}{x}. \) For \( x^2 - y^2 = b, \) we have \( 2x - 2yy' = 0, \) so \( y' = \frac{x}{y}. \) Let \((c, d)\) be a point on both curves. Then the slope of the normal line to the first curve is \( \frac{d}{c}, \) but that is the slope of the tangent line to the second curve. Thus the two curves are orthogonal at any points of intersection.

3.8.80

\[ \frac{5}{2\sqrt{x}} - \frac{5y'}{\sqrt{y}} = \cos x, \quad \text{so} \quad \frac{5y'}{\sqrt{y}} = \frac{5}{2\sqrt{x}} - \cos x, \quad \text{and thus} \quad y' = \frac{\sqrt{y}}{5} \left( \frac{5}{2\sqrt{x}} - \cos x \right) = \frac{\sqrt{y}}{5} \left( \frac{5 - 2\sqrt{x}\cos x}{2\sqrt{x}} \right) \]

At the point \((4\pi, \pi)\) we have \( y'(4\pi, \pi) = \frac{\sqrt{\pi}}{5} \left( \frac{5 - 2\sqrt{2\pi}\cos \pi}{2\sqrt{2\pi}} \right) = \frac{5 - 4\sqrt{\pi}}{20}. \)

3.8.81

\[
\begin{align*}
(2x + 2yy')(x^2 + y^2 + x) + (x^2 + y^2)(2x + 2yy' + 1) &= 8y^2 + 16xyy' \\
2yy'(x^2 + y^2 + x) + (x^2 + y^2)2yy' - 16xyy' &= 8y^2 - 2x(x^2 + y^2 + x) - (x^2 + y^2)(2x + 1) \\
y' &= \frac{8y^2 - 2x(x^2 + y^2 + x) - (x^2 + y^2)(2x + 1)}{2y(x^2 + y^2 + x) + 2y(x^2 + y^2) - 16xy} \\
&= \frac{8y^2 - 2x^3 - 2xy^2 - 2x^2 - 2x^3 - x^2 - 2xy^2 - y^2}{2y(x^2 + y^2 + x + x^2 + y^2 - 8x)} \\
&= \frac{7y^2 - 3x^2 - 4xy^2 - 4x^3}{2y(2x^2 + 2y^2 - 7x)}. \\
\end{align*}
\]

3.8.82

\[
\begin{align*}
\frac{21x^6 + 2yy'}{2\sqrt{3x^7 + y^2}} &= 2y\sin y\cos y + 100(y + xy') \\
21x^6 + 2yy' &= 4y\sin y\cos y\sqrt{3x^7 + y^2} + 200y\sqrt{3x^7 + y^2} + 200xy'\sqrt{3x^7 + y^2} \\
200y\sqrt{3x^7 + y^2} - 21x^6 &= 2yy' - 4y\sin y\cos y\sqrt{3x^7 + y^2} - 200xy'\sqrt{3x^7 + y^2} \\
y' &= \frac{200y\sqrt{3x^7 + y^2} - 21x^6}{2y - 4\sin y\cos y\sqrt{3x^7 + y^2} - 200xy'\sqrt{3x^7 + y^2}}.
\end{align*}
\]
3.8.83 \( \frac{y'}{2\sqrt{y}} + y + xy' = 0 \), so \( y' + 2x\sqrt{yy'} = -2y\sqrt{y} \), so \( y' = -\frac{2y\sqrt{y}}{2x\sqrt{y} + 1} \). Differentiating again we obtain
\[
y'' = -\frac{(2x\sqrt{y} + 1)(3\sqrt{yy'}) - 2y\sqrt{y} \left( \frac{2y\sqrt{y} + y'}{\sqrt{y}} \right)}{(2x\sqrt{y} + 1)^2} = \frac{-2x\sqrt{y} + 1}{(2x\sqrt{y} + 1)^2} \left( 6\frac{y''}{\sqrt{y} + 1} + 4y^2 + 2xyy' \right) = \frac{-2y\sqrt{y} + 1}{2x\sqrt{y} + 1} \left( 2x\sqrt{y} + 1 \right) \frac{10y^2 + 16xy^2\sqrt{y}}{(2x\sqrt{y} + 1)^3}.
\]

3.8.84 First differentiate implicitly: \( 2yy' - 3y - 3xy' = 0 \); simplifying gives \( y' = -\frac{3y}{2y^2 - 3x} \). The tangent line can be horizontal when \( y' = 0 \), which happens when the numerator is zero, so that \( y = 0 \). So any point on \( y^2 - 3xy = 2 \) with \( y = 0 \) fulfills the requirement — but there are no such points, since setting \( y = 0 \) gives \( 0 = 2 \). So the tangent line is never horizontal. The tangent line can be vertical when the denominator of \( y' \) is zero, so for all points on the curve \( y^2 - 3xy = 2 \) where \( 2y = 3x \) but \( y \neq 0 \). Substituting \( 2y \) for \( 3x \) in the equation of the curve gives \( y^2 - 2y^2 = 2 \), so that \( -y^2 = 2 \), which is again impossible. So the tangent to the curve is never vertical either. A plot of the curve seems to confirm these results:

3.8.85 First, differentiate implicitly: \( 2x(3y^2 - 2y^3) + x^2(6yy' - 6y^2y') = 0 \). Collecting terms and simplifying gives
\[
y' = \frac{2x(3y^2 - 2y^3)}{6x^2(y^2 - y)} = \frac{3y - 2y^2}{3x(y - 1)}.
\]
The tangent line can be horizontal when the numerator is zero, so when \( 3y = 2y^2 \). This happens for \( y = 0 \) and for \( y = \frac{3}{2} \). But \( y = 0 \) is impossible, since substituting \( y = 0 \) into the equation for the curve gives \( 0 = 4 \). Similarly, substituting \( y = \frac{3}{2} \) gives
\[
x^2 \left( 3 \cdot \frac{9}{4} - 2 \cdot \frac{27}{8} \right) = 0,
\]
and again we get the absurdity \( 0 = 4 \). Thus the curve has no horizontal tangents. The tangent line can be vertical when the denominator of \( y' \) vanishes, so when \( 3x(y - 1) = 0 \). This happens for \( x = 0 \) and for \( y = 1 \).
But $x = 0$ is impossible, giving $0 = 4$ again upon substitution into the equation of the curve, so we are left with $y = 1$. Substituting $y = 1$ into the equation of the curve gives $x^2 = 4$, so that $x = \pm 2$. The curve has vertical tangents at $(2, 1)$ and at $(-2, 1)$. This analysis is supported by the following plot of the given curve, together with the vertical tangents and apparent horizontal asymptotes at $y = \frac{3}{2}$ and $y = 0$ in gray:

3.8.86 First differentiate implicitly: $2x(y - 2) + x^2y' - y'e^y = 0$, so that $y' = \frac{2x(y - 2)}{x^2 - e^y}$. The tangent line can be horizontal when the numerator is zero, so when $2x(y - 2) = 0$, so that either $x = 0$ or $y = 2$. But $x = 0$ is impossible since then the original equation is $-e^y = 0$, which has no solutions. $y = 2$ is also impossible since then the original equation reduces to $-e^2 = 0$, which is false. So the tangent line is never horizontal. The tangent line can be vertical when the denominator of $y'$ is zero, so when $e^y = x^2$. Substituting $x^2$ for $e^y$ in the original equation gives $x^2(y - 2) - x^2 = 0$, or $x^2(y - 3) = 0$. This holds when $x = 0$ (which we know is impossible from the above), or when $y = 3$. Substituting $y = 3$ into the original equation gives $x^2(3 - 2) - e^3 = 0$, so that $x = \pm e^{3/2}$. So there are two points where the tangent line is vertical: $(\pm e^{3/2}, 3)$. This analysis is supported by the following plot of the given curve, together with the vertical tangents and an apparent horizontal asymptote $y = 2$ in gray:

3.8.87 First differentiate implicitly: $(1 - y^2) + x(\frac{-2y}{3y^2 - 2xy}) + 3y^2y' = 0$, so that $y' = \frac{y^2 - 1}{3y^2 - 2xy}$. The tangent line can be horizontal when the numerator is zero, i.e., when $y = \pm 1$. But substituting $y = \pm 1$ into the original equation gives $\pm 1 = 0$, which is impossible. So the tangent line is never horizontal. The tangent line can be
vertical when the denominator vanishes, so when \( 3y^2 - 2xy = 0 \). This can happen when \( y = 0 \); substituting \( y = 0 \) into the original equation gives \( x = 0 \), so the tangent line is vertical at \((0,0)\). If \( y \neq 0 \), we can divide through by \( y \) to get \( 3y = 2x \), or \( x = \frac{3}{2}y \). Substitute into the original equation to get

\[
\frac{3}{2}y(1 - y^2) + y^3 = 0, \quad \text{or} \quad \frac{3}{2}y - \frac{1}{2}y^3 = 0, \quad \text{or} \quad \frac{1}{2}y(3 - y^2) = 0.
\]

Since we have assumed \( y \neq 0 \) here, we are left with \( y = \pm \sqrt{3} \), so that (since \( x = \frac{3}{2}y \)), \( x = \pm \frac{3\sqrt{3}}{2} \). The curve has vertical tangents at the two points

\[
\left( \frac{3\sqrt{3}}{2}, \sqrt{3} \right), \quad \left( -\frac{3\sqrt{3}}{2}, -\sqrt{3} \right).
\]

This analysis is supported by the following plot of the given curve, together with the vertical tangents and apparent horizontal asymptotes at \( y = \pm 1 \) in gray.

### 3.9 Derivatives of Logarithmic and Exponential Functions

#### 3.9.1
\( y = \ln x \) if and only if \( x = e^y \). Differentiating implicitly yields \( 1 = e^y \cdot y' \), so \( y' = \frac{1}{e^y} = \frac{1}{e^x} = \frac{1}{x} \) for \( x > 0 \).

#### 3.9.2
We have already established that if \( y = \ln x \) for \( x > 0 \) then \( y' = \frac{1}{x} \). By the symmetry about the \( y \)-axis, we know that for \( x < 0 \), the derivative of \( y = \ln |x| \) should have the same absolute value but the opposite sign of the derivative for the corresponding positive \( x \) value. But this is the property that \( \frac{1}{x} \) has for \( x < 0 \)—it is negative and has the right absolute value. So we see that for both \( x > 0 \) and \( x < 0 \), \( \frac{d}{dx} \ln |x| = \frac{1}{x} \).

#### 3.9.3
\( \frac{d}{dx} \ln(kx) = \frac{1}{k} \cdot k = \frac{1}{x} \). This is valid for \( x > 0 \) if \( k > 0 \) and \( x < 0 \) if \( k < 0 \). Also, we can write \( \ln(kx) = \ln(k) + \ln(x) \), so its derivative is \( 0 + \frac{1}{x} = \frac{1}{x} \).
3.9.4 \( \frac{d}{dx} b^x = b^x \ln b \), for \( b > 0 \) and all \( x \). In the case \( b = e \), the rule states that \( \frac{d}{dx} e^x = e^x \ln e = e^x \) because \( \ln e = 1 \).

3.9.5 \( \frac{d}{dx} \log_b x = \frac{1}{x \ln b} \) for \( b > 0, b \neq 1 \) and \( x > 0 \). If \( b = e \), we have \( \frac{d}{dx} \log_e x = \frac{1}{x \ln e} = \frac{1}{x} \).

3.9.6 We use inverse property 3 from the text: \( b^x = (e^{\ln b})^x = e^{(\ln b) \cdot x} = e^{x \ln b} \).

3.9.7 \( f(x) = e^{\ln(g(x))} = e^{h(x) \cdot \ln(g(x))} \).

3.9.8 To apply the procedure of logarithmic differentiation to an equation of the form \( y = f(x) \) (where \( f \) is likely a complicated expression): Take the logarithm to both sides of the equation, then use the properties of logarithms to simplify the expression \( \ln(f(x)) \). Then differentiate both sides, obtaining \( \frac{1}{y} y' \) on the left and some other expression on the right. Then solve for \( y' \), replacing \( y \) by \( f(x) \) if desired.

3.9.9 \( \frac{d}{dx} \ln(7x) = \frac{1}{x} \cdot 7 = \frac{7}{x} \).

3.9.10 \( \frac{d}{dx} (x^2 \ln x) = 2x \ln x + x^2 \cdot \frac{1}{x} = 2x \ln x + x = (2 \ln x + 1) \).

3.9.11 \( \frac{d}{dx} \ln(x^2) = \frac{1}{x^2} \cdot (2x) = \frac{2}{x} \).

3.9.12 \( \frac{d}{dx} \ln(2x^8) = \frac{1}{2x^8} \cdot (16x^7) = \frac{8}{x} \).

3.9.13 \( \frac{d}{dx} (\ln|\sin x|) = \frac{1}{\sin x} \cdot (\cos x) = \cot x \).

3.9.14 \( \frac{d}{dx} \ln^2 x = \frac{2}{x^2} \cdot (2x) = \frac{4x}{x^2} = \frac{4}{x} \).

3.9.15 \( \frac{d}{dx} \left[ \ln \left( \frac{x+1}{x-1} \right) \right] = \frac{1}{x+1} \left( \frac{(x-1)(x+1)}{(x+1)(x-1)} \right) = 1 - \frac{2}{x^2 - 4} = \frac{2}{1 - x^2} \).

3.9.16 \( \frac{d}{dx} e^x \ln x = e^x \ln x + e^x \).

3.9.17 \( \frac{d}{dx} (x^2 + 1 \ln x) = 2x \ln x + x^2 + 1 \).

3.9.18 \( \frac{d}{dx} \ln|x^2 - 1| = \frac{1}{x^2 - 1} \cdot 2x = \frac{2x}{x^2 - 1} \).

3.9.19 \( \frac{d}{dx} (\ln|nx|) = \frac{1}{nx} \cdot \frac{1}{x} = \frac{1}{nx^2} \).

3.9.20 \( \frac{d}{dx} (\ln(\cos^2 x)) = \frac{1}{\cos^2 x} \cdot (-2 \sin x \cos x) = -2 \tan x \).

3.9.21 \( \frac{d}{dx} \left( \frac{\ln x}{\ln x + 1} \right) = \frac{(\ln x + 1)(1) - (\ln x)(1)}{(\ln x + 1)^2} = \frac{1}{x(\ln x + 1)^2} \).

3.9.22 \( \frac{d}{dx} (\ln(e^x + e^{-x})) = \frac{1}{e^x + e^{-x}} (e^x - e^{-x}) = \frac{e^x - e^{-x}}{e^x + e^{-x}} \).

3.9.23 \( \frac{dy}{dx} = 8x^2 \ln 8 \).

3.9.24 \( y' = 5^x \cdot \ln 5 \cdot 3 = 5 \cdot \ln 5 \cdot 5^x \).

3.9.25 \( y' = 5 \cdot \frac{d}{dx} 4^x = 5 \cdot \ln 4 \cdot 4^x \).

3.9.26 \( y' = - \ln 4 \cdot 4^{-x} \sin x + 4^{-x} \cos x \).

3.9.27 \( y' = 3x^2 - 3x^2 \ln 3 = 3x^2(3 + x \ln 3) \).

3.9.28 \( \frac{dP}{dt} = \frac{-40(\ln 2 - 2^{-1})}{(1 + 2^{-1})^2} = \frac{40 \ln 2 - 2^{-1}}{(1 + 2^{-1})^2} \).

3.9.29 \( \frac{dA}{dt} = 250(1.045)^{4t} \cdot \ln(1.045) \cdot 4 = 1000 \ln(1.045) \cdot 1.045^{4t} \).
3.9.30 \( \frac{d}{dx} \ln 10^x = \frac{d}{dx} x \cdot \ln 10 = \ln 10. \)

3.9.31
a. \( T = 10 \cdot 2^{-0.274 \cdot 16} \) minutes \( \approx 28.7 \) seconds.
b. \( \frac{\Delta T}{\Delta x} = \frac{10 \cdot 2^{-0.274 \cdot x} - 10 \cdot 2^{-0.274 \cdot 2}}{8 - 2} \approx -0.78 \) minutes per 1000 feet, which is about -46.512 seconds per 1000 feet.
c. \( \frac{dT}{dx} = -2.74 \cdot 2^{-0.274 \cdot a} \cdot \ln 2. \) At \( a = 8 \) we have \( \frac{dT}{dx} = -2.74 \cdot 2^{-0.274 \cdot 8} \cdot \ln 2 \approx -0.42 \) minutes per 1000 feet. Every 1000 feet the airplane climbs, leaves about 0.42 minutes less time of consciousness, which corresponds to about 24.94 seconds.

3.9.32

![Graph of Energy vs. Time]

a. 

b. \( \frac{dE}{dM} = 25000 \cdot 1.5 \cdot \ln 10 \cdot 10^{1.5M}. \) At \( M = 3 \) we have \( \frac{dE}{dM} = 25000 \cdot 1.5 \cdot \ln 10 \cdot 10^{3/2} \approx 2,730,530,025 \) Joules per unit change in \( M. \) As the magnitude goes from 3 to 4, the energy goes up by this amount.

3.9.33

a. At \( Q = 10 \mu \text{Ci} \) we have \( 10 = 350 \cdot \left( \frac{1}{2} \right)^{\ell/13.1}, \) so \( \ln(1/35) = \frac{t}{13.1} \ln(1/2), \) so \( t = 13.1 \cdot \frac{\ln 35}{\ln 2} \approx 67.19 \) hours.
b. \( \frac{dQ}{dt} = 350 \cdot \ln \left( \frac{1}{2} \right) \cdot \left( \frac{1}{2} \right)^{\ell/13.1}. \) We have \( Q'(12) \approx -9.815, Q'(24) \approx -5.201, \) and \( Q'(48) \approx -1.461, \) all in units of \( \mu \text{Ci/hr}. \) The rate at which the iodine decreases is decreasing in absolute value as time increases.

3.9.34 \( f'(x) = e^x e^{-1}. \)

3.9.35 \( f'(x) = 2^x \ln 2. \)

3.9.36 \( f'(x) = 2\sqrt{\pi} \sqrt{\pi}^{-1}. \)

3.9.37 \( g'(y) = e^y y^c + e^{y+1} y^{-1}. \)

3.9.38 \( s'(t) = -\sin(2t) \cdot 2^{t} \ln 2. \)

3.9.39 \( r'(\theta) = e^{2t} \cdot 2 = e^{2t}. \)

3.9.40 \( \frac{dy}{dx} = \frac{d}{dx}(\pi \cdot \ln(x^3 + 1)) = \pi \cdot \frac{3x^2}{x^3 + 1}. \)

3.9.41 \( f'(x) = 2x^{3/2} + 3 \left( 2x - 3 \right) x^{1/2} = 5x^{3/2} - \left( \frac{9}{2} \right) x^{1/2}. \)

3.9.42 \( \frac{dy}{dx} = 0.74x^{-0.26 \sec^2(x^0.74)}. \)

3.9.43 \( f'(x) = \frac{(2^x + 1)x^{2x} \ln 2 - 2x(2x \ln 2)}{(2^x + 1)^2} = \frac{2^x \ln 2}{(2^x + 1)^2}. \)

3.9.44 \( f'(x) = \pi (2x + 1)^{\pi - 1}(2^x \ln 2). \)

3.9.45 Let \( y = x^{\cos x}. \) Then \( \ln y = \cos x \ln x. \) Differentiating both sides gives

\[
\frac{1}{y} y' = (-\sin x) \ln x + \cos x \cdot \frac{1}{x}.
\]

Therefore,

\[
y' = x^{\cos x} \left( \frac{\cos x}{x} \ln x - \sin x \ln x \right).
\]

At \( \frac{x}{2} \) we have \( y' \left( \frac{x}{2} \right) = \left( \frac{x}{2} \right)^0 \left( \frac{0}{\pi/2} - \ln \left( \frac{x}{2} \right) \right) = -\ln \left( \frac{x}{2} \right). \)
3.9.46 Let \( y = x^{\ln x} \). Then \( \ln y = \ln x \ln x = (\ln x)^2 \). Differentiating both sides gives
\[
\frac{1}{y} \frac{dy}{dx} = 2 \ln x \cdot \frac{1}{x}.
\]
Therefore,
\[
y' = x^{\ln x - 1} \cdot 2 \ln x.
\]
At \( e \) we have \( y'(e) = e^{1-1} \cdot 2 \ln e = 2 \).

3.9.47 Let \( y = x^{\sqrt{x}} \). Then \( \ln y = \sqrt{x} \cdot \ln x \). Differentiating both sides gives
\[
\frac{1}{y} \frac{dy}{dx} = \frac{1}{2\sqrt{x}} \ln x + \frac{\sqrt{x}}{x}.
\]
Therefore,
\[
y' = x^{\sqrt{x}} \left( \frac{\ln x + 2}{2\sqrt{x}} \right).
\]
At 4 we have \( y'(4) = 4^2 \left( \frac{\ln 4 + 2}{4} \right) = 4 \ln 4 + 8 \).

3.9.48 Because \( f(x) = (x^2 + 1)^x \), we have \( \ln f(x) = x \ln(x^2 + 1) \). Thus,
\[
\frac{1}{f(x)} f'(x) = (1) \ln(x^2 + 1) + x \cdot \frac{1}{x^2 + 1} \cdot 2x.
\]
Therefore,
\[
f'(x) = (x^2 + 1)^x \left( \ln(x^2 + 1) + \frac{2x^2}{x^2 + 1} \right).
\]
We have \( f'(1) = (1 + 1)^1(\ln(1 + 1) + \frac{2}{1+1}) = 2(\ln 2 + 1) = 2 \ln 2 + 2 \).

3.9.49 Because \( f(x) = (\sin x)^{\ln x} \), we have \( \ln f(x) = \ln x \ln \sin x \). Differentiating both sides gives
\[
\frac{1}{f(x)} f'(x) = \frac{1}{x} \cdot \ln \sin x + \ln x \cdot \frac{1}{\sin x} \cos x.
\]
Therefore,
\[
f'(x) = (\sin x)^{\ln x} \left( \frac{\ln \sin x + \ln(\sin x) \cot x}{x} \right).
\]
We have \( f'(\frac{\pi}{2}) = 0 \) because \( \cot \frac{\pi}{2} = 0 \) and \( \ln \sin \frac{\pi}{2} = \ln 1 = 0 \).

3.9.50 Because \( f(x) = \tan^{x-1} x \), we have \( \ln f(x) = (x - 1) \ln \tan x \). Differentiating both sides gives
\[
\frac{1}{f(x)} f'(x) = (1) \ln \tan x + (x - 1) \frac{1}{\tan x} \sec^2 x.
\]
Therefore,
\[
f'(x) = (\tan^{x-1} x)(\ln \tan x + (x - 1) \sec x \sec x).
\]
We have \( f'(\frac{\pi}{4}) = (1)^{\pi/4-1}(\ln 1 + (\frac{\pi}{4} - 1)(\sqrt{2})(\sqrt{2})) = \frac{\pi}{4} - 2 \).

3.9.51 Let \( y = x^{\sin x} \). Then \( \ln y = \sin x \ln x \), so \( \frac{1}{y} y' = \cos x \ln x + \frac{x^{\sin x}}{x} \). At the point \((1,1)\) we have \( y' = \sin 1 \), so the tangent line is given by \( y - 1 = (\sin 1)(x - 1) \), or \( y = \sin 1)x + 1 - \sin 1 \).

3.9.52 Let \( y = x^{\sqrt{x}} \). Then we have \( \ln y = \sqrt{x} \cdot \ln x \), so
\[
\frac{1}{y} y' = \frac{\ln x}{2\sqrt{x}} + \frac{\sqrt{x}}{x} \quad \text{and thus} \quad y' = x^{\sqrt{x}} \left( \frac{\ln x}{2\sqrt{x}} + \frac{\sqrt{x}}{x} \right) = x^{\sqrt{x}} \left( \frac{\sqrt{x}(\ln x + 2)}{2x} \right).
\]
This expression is zero only when \( \ln x + 2 = 0 \), or \( x = e^{-2} \).
3.9.53 Let \( y = (x^2)^x = x^{2x} \). Then \( \ln y = x \ln x^2 \) and \( \frac{1}{y'} = \ln x^2 + 2 \), so \( y' = x^{2x}(\ln x^2 + 2) \). This quantity is zero when \( \ln x^2 = -2 \), or \( x^2 = e^{-2} \). Thus there are horizontal tangents at \( |x| = e^{-1} \), so for \( x = \pm \frac{1}{e} \). The two tangent lines are given by \( y = \frac{1}{e^{2/e}} \left( \frac{1}{e} + \frac{1}{2} \right) \) and \( y = e^{2/e} \left( -\frac{1}{e} , e^{2/e} \right) \).

3.9.54 Let \( y = \ln^x \). Then \( \ln y = (\ln x)^2 \). Thus \( \frac{1}{y} y' = 2 \ln x - \frac{1}{2} \), so \( y' = \ln^x \left( 2 \ln x \right) \cdot \ln^x \left( \frac{2 \ln x}{x} \right) \). This quantity is zero when \( \ln x = 0 \), which is at \( x = 1 \). The equation of the tangent line at \( (1, 1) \) is therefore \( y = 1 \).

3.9.55 \( y' = 4 \cdot \frac{2x}{(x^2-1) \ln 3} = \frac{8x}{(x^2-1) \ln 3} \).

3.9.56 \( y' = \frac{1}{x \ln 10} \).

3.9.57 \( y' = -\sin x (\ln(\cos^2 x)) + \cos x \cdot \left( \frac{2 \cos x}{\cos^2 x} \right) = -\sin x (\ln(\cos^2 x) + 2) \).

3.9.58 \( y' = \frac{1}{\ln 8 \tan x} \cdot \sec^2 x \).

3.9.59 \( y' = \frac{d}{dx} (\log_4 x)^{-1} = - (\log_4 x)^{-2} \cdot \frac{1}{x \ln 4} = - \frac{1}{x (\ln 4) (\log x)^2} = - \frac{\ln 4}{x \ln^2 x} \).

3.9.60 \( y' = \frac{1}{(\ln 2) (\log_2 x)} \cdot \frac{1}{x \ln^2 x} = \frac{1}{x (\ln 2) \ln x} \).

3.9.61 Let \( y = \frac{(x+1)^{10}}{(2x-4)^8} \), so \( \ln y = \ln \left( \frac{(x+1)^{10}}{(2x-4)^8} \right) = 10 \ln(x+1) - 8 \ln(2x-4) \). Then
\[
\frac{1}{y'} = \frac{10}{x+1} - \frac{8}{2x-4} - 2,
\]
\[
y' = \frac{(x+1)^{10}}{(2x-4)^8} \cdot \frac{10}{x+1} - \frac{8}{2x-4} = \frac{10}{x+1} - \frac{8}{x-2} \).

3.9.62 Let \( y = x^2 \cos x \). Then \( \ln y = \ln(x^2 \cos x) = 2 \ln x + \ln(\cos x) \). So \( \frac{1}{y} y' = 2 \ln x + \frac{1}{\cos x} \cdot (-\sin x) \), so
\[
y' = x^2 \cos x \cdot \left( \frac{2}{x} + \frac{1}{\cos x} \cdot (-\sin x) \right) = 2x \cos x - x^2 \sin x \).

3.9.63 Let \( y = x^\ln x \). Then \( \ln y = (\ln x)^2 \). Thus \( \frac{1}{y} y' = 2 \ln x - \frac{1}{2}, \) so \( y' = x^\ln x \left( \frac{2 \ln x}{x} \right) = 2x^{-1+\ln x} \ln x \).

3.9.64 Let \( y = \left( \frac{\tan^{10} x}{(5x+3)^3} \right) \). Then \( \ln y = \ln \left( \frac{\tan^{10} x}{(5x+3)^3} \right) = 10 \ln(\tan x) - 6 \ln(5x+3) \). Then
\[
\frac{1}{y'} = \frac{10}{\tan x} \sec^2 x - \frac{6}{5x+3} \cdot 5,
\]
\[
y' = \frac{\tan^{10} x}{(5x+3)^3} \left( \frac{10 \sec^2 x}{\tan x} - \frac{30}{5x+3} \right) \).

3.9.65 Let \( y = \sqrt{(x+1)^{3/2}(x-4)^{5/2}} \). Then \( \ln y = \ln \left( \sqrt{(x+1)^{3/2}(x-4)^{5/2}} \right) = \frac{3}{2} \ln(x+1) + \frac{5}{2} \ln(x-4) - \frac{3}{2} \ln(5x+3) \). Then
\[
\frac{1}{y'} = \frac{3}{2(x+1)} + \frac{5}{2(x-4)} - \frac{10}{3(5x+3)} \cdot \left( \frac{3}{2(x+1)} + \frac{5}{2(x-4)} - \frac{10}{3(5x+3)} \right) \).

3.9.66 Let \( y = \frac{x^8 \cos^3 x}{\sqrt{x-1}} \). Then \( \ln y = \ln \left( \frac{x^8 \cos^3 x}{\sqrt{x-1}} \right) = 8 \ln x + 3 \ln \cos x - \frac{1}{2} \ln(x-1) \). Then
\[
\frac{1}{y'} = \frac{8}{x} - \frac{3 \sin x}{\cos x} - \frac{1}{2x-2},
\]
\[
y' = \frac{x^8 \cos^3 x}{\sqrt{x-1}} \left( \frac{8}{x} - 3 \tan x - \frac{1}{2x-2} \right) \).

Copyright © 2014 Pearson Education, Inc.
3.9.67 Let \( y = (\sin x)^{\tan x} \), and assume \( 0 < x < \pi, \ x \neq \frac{\pi}{2} \). Then \( \ln y = (\tan x) \ln(\sin x) \). Then

\[
\frac{1}{y} \frac{dy}{dx} = (\sec^2 x) \ln(\sin x) + \frac{\tan x \cos x}{\sin x},
\]

\[
y' = (\sin x)^{\tan x} \left( (\sec^2 x) \ln(\sin x) + 1 \right)
\]

3.9.68 Let \( y = (1 + \frac{1}{x})^{2x} \). Then \( \ln y = 2x \ln \left(1 + \frac{1}{x}\right) \). Then

\[
\frac{1}{y} \frac{dy}{dx} = 2 \ln \left(1 + \frac{1}{x}\right) + 2x \left(\frac{1}{1 + \frac{1}{x}}\right) \cdot \left(-\frac{1}{x^2}\right),
\]

\[
y' = \left(1 + \frac{1}{x}\right)^{2x} \left(2 \ln \left(1 + \frac{1}{x}\right) - \frac{2}{x + 1}\right)
\]

3.9.69
a. False. \( \log_2 3 \) is a constant, so its derivative is 0.
b. False. If \( x < -1 \), then the right-hand side is defined while the left-hand side isn’t.
c. False. The correct way to write that function would be \( e^{(x+1)\ln 3} \).
d. False. \( \frac{d}{dx}(\sqrt{2})^x = (\sqrt{2})^x \ln(\sqrt{2}) \).
e. True. This follows from the generalized power rule.

3.9.70 \( \frac{d^3}{dx^3}(x^{4.2}) = \frac{d^2}{dx^2}(4.2x^{3.2}) = \frac{d}{dx}(4.2)(3.2)x^{2.2} = (4.2)(3.2)(2.2)x^{1.2} \). So \( \frac{d^3}{dx^3} \bigg|_{x=1} = (4.2)(3.2)(2.2) = 29.568 \).

3.9.71 \( \frac{d^2}{dx^2}(\log x) = \frac{d}{dx} \left(\frac{1}{x \ln 10}\right) = -\frac{1}{x^2 \ln 10}. \)

3.9.72 \( \frac{d}{dx}(2^x) = (2^x) \ln 2 \). \( \frac{d^2}{dx^2}(2^x) = \frac{d}{dx}(2^x) \ln 2 = (2^x)(\ln 2)^2 \). Clearly, each new derivative is the same as the old multiplied by a factor of \( \ln 2 \). So after \( n \) derivatives, the result is \( \frac{d^n}{dx^n}(2^x) = 2^x(\ln 2)^n \).

3.9.73 \( \frac{d^3}{dx^3}(x^2 \ln x) = \frac{d^2}{dx^2}(2x \ln x + x) = \frac{d}{dx}(2 \ln x + 2 + 1) = \frac{2}{x} \).

3.9.74
a. \( y' = \frac{d}{dx}e^{x \ln(x^2+1)} = e^{x \ln(x^2+1)} \left(\ln(x^2+1) + \frac{2x^2}{x^2+1}\right) = (x^2+1)^x \left(\ln(x^2+1) + \frac{2x^2}{x^2+1}\right) \).

b. Let \( y = (x^2 + 1)^x \). Then \( \ln y = x \ln(x^2 + 1) \), so \( \frac{1}{y} y' = \ln(x^2 + 1) + \frac{2x^2}{x^2+1} \), and thus \( y' = (x^2 + 1)^x \left(\ln(x^2+1) + \frac{2x^2}{x^2+1}\right) \).

3.9.75
a. \( y' = \frac{d}{dx} (e^{x \ln 3}) = (e^{x \ln 3}) \cdot \ln 3 = 3^x \ln 3 \).

b. Let \( y = 3^x \). Then \( \ln y = x \ln 3 \). So \( \frac{1}{y} y' = \ln 3 \), and \( y' = 3^x \ln 3 \).

3.9.76
a. \( y' = \frac{d}{dx} e^{h(x) \ln(g(x))} = e^{h(x) \ln(g(x))} \left(h'(x) \ln(g(x)) + \frac{h(x)g'(x)}{g(x)}\right) = g(x)^h(x) \left(h'(x) \ln(g(x)) + \frac{h(x)g'(x)}{g(x)}\right). \)

b. Let \( y = g(x)^{h(x)} \). Then \( \ln y = h(x) \ln(g(x)) \). So \( \frac{1}{y} y' = \left(h'(x) \ln(g(x)) + \frac{h(x)g'(x)}{g(x)}\right) \), and thus \( y' = g(x)^{h(x)} \left(h'(x) \ln(g(x)) + \frac{h(x)g'(x)}{g(x)}\right) \).

3.9.77 \( f'(x) = \frac{d}{dx}(4 \ln(3x + 1)) = \frac{4}{3x+1} \cdot 3 = \frac{12}{3x+1}. \)

3.9.78 \( f'(x) = \frac{d}{dx}(\ln 2x - 3 \ln(x^2 + 1)) = \frac{1}{x} - \frac{6x}{x^2+1} . \)
3.9.79 \[ f'(x) = \frac{d}{dx} \left( \frac{1}{2} \ln 10x \right) = \frac{d}{dx} \frac{1}{2} \ln 10 + \ln x = \frac{1}{2}. \]

3.9.80 \[ f'(x) = \frac{d}{dx} \left( \log_2 2^x - \frac{1}{2} \log_2 (x + 1) \right) = 0 - \frac{1}{2} \cdot \frac{1}{(x+1) \ln 2} = -\frac{1}{(\ln 4)(x+1)}. \]

3.9.81 \[ f'(x) = \frac{d}{dx} \left( \ln(2x-1) + 3 \ln(x+2) - 2 \ln(1-4x) \right) = \frac{2}{2x-1} + \frac{3}{x+2} + \frac{8}{1-4x}. \]

3.9.82 \[ f'(x) = \frac{d}{dx} \left( 4 \ln(\sec x) + 2 \ln(\tan x) \right) = \frac{4 \sec x \tan x}{\sec x} + \frac{2 \sec^2 x}{\tan x} = 4 \tan x + 2 \sec x \csc x. \]

3.9.83

\[
y' = \frac{d}{dx} \sin x \ln^2 = (\cos x)(\ln 2)^2 \sin x. \quad \text{At } x = \pi/2 \text{ we have } y' = 0, \text{ so the tangent line is given by } y = 2.
\]

3.9.84 We have

\[
y' = -\sin x (\ln(\cos^2 x)) + \cos x \left( \frac{2(\cos x)(-\sin x)}{\cos^2 x} \right) = -\sin x (2 + \ln(\cos^2 x)).
\]

This quantity is zero when \( \sin x = 0 \) or \( 2 + \ln(\cos^2 x) = 0 \), and the latter occurs when \( \cos^2 x = e^{-2} \), or \( \cos x = \pm e^{-1} \).

\( \sin x = 0 \) for \( x = 0, \pi, 2\pi \). \( \cos x = e^{-1} \) for \( x \approx 1.194 \) and \( x \approx 5.089 \). Finally, \( \cos x = -e^{-1} \) for \( x \approx 1.948 \) and \( x \approx 4.336 \). These seven numbers represent the locations of the horizontal tangent lines on \([0, 2\pi]\).

3.9.85 Let \( y = x^{10x} \). Then \( \ln y = 10x \ln x \), so \( \frac{1}{y} y' = 10 \ln x + 10 \), and \( y' = 10x^{10x} \cdot \ln x + 1 \).

3.9.86 Let \( y = (2x)^{2x} \). Then \( \ln y = 2x \ln(2x) \), and \( \frac{1}{y} y' = 2 \ln(2x) + 2 \), so \( y' = 2(2x)^{2x} \cdot (\ln(2x) + 1) \).

3.9.87 Let \( y = x^{\cos x} \). Then we have \( \ln y = \cos x \ln x \), and \( \frac{1}{y} y' = -\sin x \ln x + \frac{\cos x}{x} \). Thus, \( y' = x^{\cos x} \left( \frac{\cos x}{x} - \sin x \ln x \right) \).

3.9.88 \( \frac{d}{dx} (x^\pi + \pi^x) = \pi x^{\pi-1} + \pi^x \ln \pi \).

3.9.89 Let \( y = (1 + \frac{1}{x})^x \). Then \( \ln y = x \ln (1 + \frac{1}{x}) \), so

\[
\frac{1}{y} y' = \ln \left( 1 + \frac{1}{x} \right) + x \left( -\frac{1/x^2}{1 + 1/x} \right) = \ln \left( 1 + \frac{1}{x} \right) - \frac{1}{x + 1}.
\]

Therefore, \( y' = \left( 1 + \frac{1}{x} \right) \left( \ln \left( 1 + \frac{1}{x} \right) - \frac{1}{x + 1} \right) \).

3.9.90 Let \( y = (1 + x^2)^{\sin x} \). Then \( \ln y = \sin x \cdot \ln(1 + x^2) \), so \( \frac{1}{y} y' = \cos x \cdot \ln(1 + x^2) + \sin x \cdot \frac{2x}{1 + x^2} \). Therefore we have \( y' = (1 + x^2)^{\sin x} \left( \cos x \cdot \ln(1 + x^2) + \frac{2x \sin x}{1 + x^2} \right) \).

3.9.91 Let \( y = x^{x^{10}} \). Then \( \ln y = x^{10} \ln x \), so \( \frac{1}{y} y' = 10x^9 \ln x + \frac{x^{10}}{x} = x^9 (10 \ln x + 1) \). Thus \( y' = x^{x^{10}} \cdot x^9 (10 \ln x + 1) \).

3.9.92 Let \( y = (\ln x)^x \). Then \( \ln y = x^2 \ln(\ln x) \). So \( \frac{1}{y} y' = 2x \ln(\ln x) + \frac{x^2}{x \ln x} \). Therefore,

\[
y' = x^{\ln x} \left( 2 \ln(\ln x) + \frac{1}{\ln x} \right).
\]
3.9.93

a. We used a graphing rectangle of \([0, 25] \times [0, 8000]\).

b. To find when \(P(t)\) hits 5000, we solve \(5000 = \frac{400000}{50 + 7950e^{-0.5t}}\), or \(50 + 7950e^{-0.5t} = 80\). This leads to \(7950e^{-0.5t} = 30\), or \(-0.5t = \ln\left(\frac{30}{7950}\right)\). So we have \(t = 2 \ln(265) \approx 11.16\) years.

The carrying capacity is \(\lim_{t \to \infty} P(t) = 400000\). Ninety percent of 8000 is 7200, so we seek the time when \(P(t) = 7200\). We have \(7200 = \frac{400000}{50 + 7950e^{-0.5t}}\), or \(50 + 7950e^{-0.5t} = \frac{50}{9}\). This leads to \(7950e^{-0.5t} = \frac{50}{9}\), or \(-0.5t = \ln\left(\frac{50}{71550}\right)\). So we have \(t = 2 \ln\left(\frac{71550}{50}\right) \approx 14.53\) years.

c. \(\frac{dP}{dt} = -\frac{400000}{(50 + 7950e^{-0.5t})^2} \cdot (7950)(-0.5)e^{-0.5t}\).

At \(t = 0\) we have \(P'(0) = \frac{400000 \cdot 7950 \cdot -0.5}{8000^2} = \frac{159000000}{8000^2} \approx 25\) fish per year.

At \(t = 5\) we have \(P'(5) = \frac{1590000000e^{-5/2}}{(50 + 7950e^{-0.5 \times 5})^2} \approx 264\) fish per year.

d. The maximum is at about \(t = 10\) years.

3.9.94

a. \(P(t) = \frac{6 \times 10^9 \cdot 15 \times 10^9}{6 \times 10^2 + 9 \times 10^5 e^{-0.025t}} = \frac{3 \times 10^{10}}{2 + 3e^{-0.025t}}\).

b. \(P(21) = \frac{3 \times 10^{10}}{2 + 3e^{-0.025 \times 21}} \approx 7.95 \times 10^9\).

\(P(t) = 12,000,000,000\) when \(2 + 3e^{-0.025t} = \frac{5}{2}\), which is when \(e^{-0.025t} = \frac{1}{5}\). This occurs for \(t = 40 \ln 6 \approx 71.67\) years.

3.9.95

a. \(\ln(P(t)) = \ln(3 \cdot 10^{10}) - \ln(2 + 3e^{-0.025t})\). \(\frac{d}{dt} \ln(P(t)) = \frac{P'(t)}{P(t)} = r(t) = \frac{0.075e^{-0.025t}}{2 + 3e^{-0.025t}}\), \(r(0) = \frac{0.075}{5} = 0.015\), so the population is growing at 1.5% per year in 1999.
b. \( r(11) = \frac{0.075 e^{-0.275}}{2.5e^{0.025}} \approx 0.0133 \).
\( r(21) = \frac{0.075 e^{-0.525}}{2.5e^{0.025}} \approx 0.0118 \).
The relative growth rate decreases over time.

c. \( \lim_{t \to \infty} r(t) = \lim_{t \to \infty} \frac{0.075}{3 + 2e^{0.025t}} = 0 \), because the denominator increases without bound. The relative
growth rate becomes smaller and smaller as the population nears the carrying capacity.

3.9.96

a. \( P(t) = \frac{1500 \cdot 1000}{1500 - 500e^{-0.1t}} \). As \( t \to \infty \), the population
decreases and gets closer to the carrying capacity of 1000.

b. \( P'(t) = -\frac{7.5 \times 10^7 e^{-0.1t}}{1500 - 500e^{-0.1t}} \). \( P'(0) = -\frac{7.5 \times 10^7}{1500} \approx -75 \) deer per year.

c. The population reaches 1200 deer when \( 1200 = \frac{1500 \cdot 1000}{1500 - 500e^{-0.1t}} \). This occurs when
\(-500e^{-0.1t} = \frac{1.5 \times 10^6}{1200} - 1500 \), or when \(-0.1t = \ln(0.5) \), or when \( t = -10 \ln(0.5) \approx 6.93 \) years. It will take almost 7 years until
the deer population reaches 1200.

3.9.97

a. \[
\begin{array}{|c|c|}
\hline
\text{t} & \text{A(t)} \\
\hline
5 & $17,442.50 \\
15 & $72,704.68 \\
25 & $173,248.49 \\
35 & $356,177.57 \\
\hline
\end{array}
\]
Average growth on \([5, 15]\) is \( \frac{A(15) - A(5)}{10} \approx $5526 per year. Average growth on \([15, 25]\) is \( \frac{A(25) - A(15)}{10} \approx $10,054 per year. Average growth on \([25, 35]\) is \( \frac{A(35) - A(25)}{10} \approx $18,293 per year.

b. \( A(40) \approx $497,872.68. \)

c. \( A'(t) = 50,000 \cdot 12 \cdot (1.005)^{12t} \cdot \ln(1.005) \approx 2993 \cdot (1.005)^{12t} \). The rate of growth of the investment
increases over time, so the earlier you start saving, the higher the rate of increase will be when you
retire.

3.9.98 We search for a solution to \( x^p = e^x \). If the two curves will have only one point of intersection, then
they should be tangent at the point of intersection. So we need \( px^{p-1} = e^x \), so we require \( px^{p-1} = x^p \), so
\( x = p \). So \( p^p = e^p \), and therefore we must have \( p = e \). So we have \( x^e = e^x \) intersecting at the point \((e, e^e)\),
and that is the only point of intersection.

3.9.99 We search for a solution to \( x = p^x \). If the two curves will have only one point of intersection, then
they should be tangent at the point of intersection. So we need \( 1 = p^x \ln p \), or \( \frac{1}{\ln p} = p^x = x \). So \( \ln p = \frac{1}{x} \)
and \( p = e^{1/x} \). Then we have \( x = p^x = (e^{1/x})^x = e \). So the point of intersection is \((e, e)\) and the value of \( p \) is
\( e^{1/e} \approx 1.44467. \)
3.9.100

By inspection, we see that the point (3, 27) is on all three curves.

3.9.101 Let \( f(x) = \ln x \) and \( a = e \). Then \( f'(e) = \lim_{x \to e} \frac{\ln x - 1}{x - e} = \frac{1}{e} \).

3.9.102 Let \( f(x) = \ln x \) and \( a = e^8 \). Then \( f'(e^8) = \lim_{h \to 0} \frac{\ln(e^8 + h) - 8}{h} = \frac{1}{e^8} \).

3.9.103 Let \( f(x) = x^a \) and \( a = 3 \). Then \( f'(3) = \lim_{h \to 0} \frac{(3 + h)^3 - 27}{h} = 3^3 \cdot (\ln 3 + 1) = 27(1 + \ln 3) \).

3.9.104 Let \( f(x) = 5^x \) and \( a = 2 \). Then \( f'(2) = \lim_{x \to 2} \frac{5^x - 25}{x - 2} = 25 \ln 5 \).

3.9.105 Let \( y = u(x)^v(x) \). Then \( \ln y = v(x) \ln u(x) \), so \( \frac{1}{y} y' = v'(x) \ln u(x) + v(x) \cdot \frac{u'(x)}{u(x)} \). Thus we have

\[
y' = u(x)^v(x) \cdot \left( v'(x) \ln u(x) + v(x) \cdot \frac{u'(x)}{u(x)} \right) = u(x)^v(x) \cdot \left( \frac{v(x)}{u(x)} \frac{du}{dx} + \ln u(x) \frac{dv}{dx} \right).
\]

3.10 Derivatives of Inverse Trigonometric Functions

3.10.1

\[
\frac{d}{dx} \sin^{-1} x = \frac{1}{\sqrt{1-x^2}}, \quad -1 < x < 1
\]

\[
\frac{d}{dx} \tan^{-1} x = \frac{1}{1+x^2}, \quad -\infty < x < \infty
\]

\[
\frac{d}{dx} \sec^{-1} x = \frac{1}{|x|\sqrt{x^2-1}}, \quad |x| > 1.
\]

3.10.2 \( y' = \frac{1}{\sqrt{1-x^2}} \). At \( x = 0 \) we have \( y'(0) = 1 \).

3.10.3 \( y' = \frac{1}{1+x^2} \). At \( x = -2 \) we have \( y'(-2) = \frac{1}{1+4} = \frac{1}{5} \).

3.10.4 \( \frac{d}{dx} \sin^{-1} x = \frac{1}{\sqrt{1-x^2}} = -\frac{1}{\sqrt{1-x^2}} = -\frac{d}{dx} \cos^{-1} x \).

3.10.5 \( (f^{-1})'(8) = \frac{1}{f'(x_0)} = \frac{1}{4} \).

3.10.6 \( (f^{-1})'(y_0) = \frac{1}{f'(x_0)} \) where \( f(x_0) = y_0 \).

3.10.7 \( \frac{d}{dx} \sin^{-1}(2x) = \frac{2}{\sqrt{1-4x^2}} \).

3.10.8 \( \frac{d}{dx}(x \sin^{-1} x) = \sin^{-1} x + \frac{x}{\sqrt{1-x^2}} \).

3.10.9 \( \frac{d}{dw} \cos(\sin^{-1}(2w)) = (-\sin(\sin^{-1}(2w))) \cdot \frac{d}{dw} (\sin^{-1}(2w)) = -2w \cdot \frac{2}{\sqrt{1-4w^2}} = -\frac{4w}{\sqrt{1-4w^2}} \).

\begin{align*}
3.10.27 & \quad \frac{d}{dx} \csc^{-1}(\tan e^x) = -\frac{1}{|\tan e^x|\sqrt{(\tan e^x)^2-1}} \cdot (\sec^2 e^x) \cdot e^x = -\frac{e^x \sec^2 e^x}{|\tan e^x|\sqrt{(\tan e^x)^2-1}}.
\end{align*}
\begin{align*}
3.10.28 & \quad \frac{d}{dx} \sin(\tan^{-1}(\ln x)) = \cos(\tan^{-1}(\ln x)) \cdot \frac{1}{1+(\ln x)^2} \cdot \frac{1}{x} = \frac{\cos(\tan^{-1}(\ln x))}{x|\ln x|^2}.
\end{align*}
\begin{align*}
3.10.29 & \quad \frac{d}{dx} \cot^{-1}(e^x) = -\frac{1}{1+e^{2x}} \cdot e^x = -\frac{e^x}{1+e^{2x}}.
\end{align*}
\begin{align*}
3.10.30 & \quad \frac{d}{dx} \frac{1}{\tan^{-1}(x^2+4)} = \frac{d}{dx} \left( \tan^{-1}(x^2+4) \right)^{-1} \\
&= - (\tan^{-1}(x^2+4))^{-2} \cdot \frac{1}{1+(x^2+4)^2} \cdot 2x \\
&= -\frac{2x}{(1+(x^2+4)^2) \cdot (\tan^{-1}(x^2+4))^2}.
\end{align*}
3.10.31  \( f'(x) = \frac{1}{1+x^2} \cdot 2 \), so \( f'\left( \frac{x}{3} \right) = \frac{1}{1+\left( \frac{x}{3} \right)^2} \cdot 2 = 1 \). Thus the equation of the tangent line is \( y - \frac{x}{3} = 1 \left( x - \frac{1}{3} \right) \), or \( y = x + \frac{x}{3} - \frac{1}{3} \).

3.10.32  \( f'(x) = \frac{1}{\sqrt{1-x^2}} \cdot \frac{1}{4} = \frac{1}{\sqrt{16} - 2} \), so \( f'(2) = \frac{1}{\sqrt{172}} \). Thus the equation of the tangent line is \( y - \frac{2}{6} = \frac{1}{\sqrt{172}} (x - 2) \), or \( y = \frac{1}{2\sqrt{3}} x + \frac{2}{3} - \frac{1}{\sqrt{3}} \).

3.10.33  \( f'(x) = -\frac{1}{\sqrt{1-x^2}} \cdot 2x = -\frac{2x}{\sqrt{1-x^2}} \), so \( f'\left( \frac{1}{\sqrt{2}} \right) = -\frac{\sqrt{2}}{\sqrt{1-(1/4)}} = -\frac{2\sqrt{2}}{\sqrt{3}} \). Thus the equation of the tangent line is \( y - \frac{\pi}{3} = -\frac{2\sqrt{2}}{\sqrt{3}} \left( x - \frac{1}{\sqrt{2}} \right) \), or \( y = -\frac{2\sqrt{2}}{\sqrt{3}} x + \frac{\pi}{3} + \frac{2}{\sqrt{3}} \).

3.10.34  \( f'(x) = \frac{1}{\sqrt{1-e^{2x^2-1}}} \cdot e^x \), so \( f'\left( \ln 2 \right) = \frac{2}{2\sqrt{4-1}} = \frac{1}{\sqrt{3}} \). Thus the equation of the tangent line is \( y - \frac{\pi}{3} = \frac{1}{\sqrt{3}} (x - \ln 2) \), or \( y = \frac{1}{\sqrt{3}} x + \frac{\pi}{3} - \ln \frac{2}{\sqrt{3}} \).

3.10.35  

a. \( x = \cot \theta \), so \( \theta = \cot^{-1} \left( \frac{x}{150} \right) \). Then \( \frac{d\theta}{dx} = -\frac{1}{1+\left( \frac{x}{150} \right)^2} \cdot \frac{1}{150} = -\frac{150}{(150)^2 + x^2} \). When \( x = 500 \), we have \( \frac{d\theta}{dx} = -\frac{150}{(150)^2 + 500^2} \approx -0.0055 \text{ radians per meter} \).

b. The most rapid change is at \( x = 0 \) where \( \frac{d\theta}{dx} = -\frac{1}{150} \approx -0.0067 \text{ radians per meter} \).

3.10.36  

a. \( x = \cot \theta \), so \( \theta = \cot^{-1} \left( \frac{x}{400} \right) \). Then \( \frac{d\theta}{dx} = -\frac{1}{1+\left( \frac{x}{400} \right)^2} \cdot \frac{1}{400} = -\frac{400}{(400)^2 + x^2} \). When \( x = 500 \), we have \( \frac{d\theta}{dx} = -\frac{400}{(400)^2 + 500^2} \approx -0.00976 \text{ radians per meter} \).

b. The most rapid change is at \( x = 0 \), where the plane is directly over head.

3.10.37  \( f(4) = 16 \text{ so } (f^{-1})'(16) = \frac{1}{f(4)} = \frac{1}{2} \).

3.10.38  \( f(4) = 10 \text{ so } (f^{-1})'(10) = \frac{1}{f(4)} = \frac{1}{172} = 2 \).

3.10.39  \( f(1) = -1 \text{ so } (f^{-1})'(-1) = \frac{1}{f(1)} = \frac{1}{-5} = -\frac{1}{5} \).

3.10.40  \( f(2) = 5 \text{ so } (f^{-1})'(5) = \frac{1}{f(2)} = \frac{1}{4} \).

3.10.41  \( f \left( \frac{\pi}{4} \right) = 1 \text{ so } (f^{-1})'(1) = \frac{1}{f' \left( \frac{\pi}{4} \right)} = \frac{1}{\sec^2 \left( \frac{\pi}{4} \right)} = \frac{1}{2} \).

3.10.42  \( f(-3) = 12 \text{ so } (f^{-1})'(-12) = \frac{1}{f'(-3)} = \frac{1}{-3} = -\frac{1}{3} \).
3.10.43 \( f(4) = 2 \) so \( (f^{-1})'(2) = \frac{1}{f'(4)} = \frac{1}{(1/2\sqrt{2})} = 4 \).

3.10.44 \( f(2) = 8 \) and \( (f^{-1})'(8) = \frac{1}{f'(2)} = \frac{1}{3\cdot 2^2} = \frac{1}{12} \).

3.10.45 \( f(4) = 36 \) and \( (f^{-1})'(36) = \frac{1}{f'(4)} = \frac{1}{\pi(4+2)} = \frac{1}{12} \).

3.10.46 \( f(1) = 7 \) and \( (f^{-1})'(7) = \frac{1}{f'(1)} = \frac{1}{2.5} = -\frac{1}{2} \).

3.10.47 Note that \( f(1) = 3 \). So \( (f^{-1})'(3) = \frac{1}{f'(1)} = \frac{1}{2} \).

3.10.48 \( (f^{-1})'(4) = \frac{1}{f'(7)} = \frac{1}{2\sqrt{2}} = \frac{1}{2} \).

3.10.49 \( (f^{-1})'(4) = \frac{1}{f'(7)} = \frac{4}{5} \), so \( f'(7) = \frac{5}{4} \).

3.10.50 \( (f^{-1})'(7) = \frac{1}{f'(4)} = \frac{1}{\sqrt{2}} = \frac{\sqrt{2}}{2} \).

3.10.51

a. Since \( f(0) = 4 \), and no other value of \( x \) gives \( f(x) = 4 \), we get \( (f^{-1})'(4) = \frac{1}{f'(0)} = \frac{1}{2} \).

b. Since \( f(1) = 6 \), and no other value of \( x \) gives \( f(x) = 6 \), we get \( (f^{-1})'(6) = \frac{1}{f'(1)} = \frac{2}{3} \).

c. Since the table does not give any \( x \) for which \( f(x) = 1 \), we cannot determine \( (f^{-1})'(1) \) from the information given.

d. From the table directly, \( f'(1) = \frac{3}{2} \).

3.10.52

a. We have, directly from the table, \( f'(f(0)) = f'(2) = 2 \).

b. Since \( f(-4) = 0 \), and no other value of \( x \) gives \( f(x) = 0 \), we get \( (f^{-1})'(0) = \frac{1}{f'(-4)} = \frac{1}{5} \).

c. Since \( f(-2) = 1 \), and no other value of \( x \) gives \( f(x) = 1 \), we get \( (f^{-1})'(1) = \frac{1}{f'(-2)} = \frac{1}{4} \).

d. Since \( f(4) = 4 \), we want to find \( (f^{-1})'(4) \). Since \( f(4) = 4 \), and no other value of \( x \) gives \( f(x) = 4 \), we get \( (f^{-1})'(4) = \frac{1}{f'(4)} = 1 \).

3.10.53

a. True, because \( \frac{d}{dx} \sin^{-1} x = -\frac{d}{dx} \cos^{-1} x \).

b. False. \( \frac{d}{dx} \tan^{-1} x = \frac{1}{1+x^2} \) for all \( x \), and this doesn’t equal \( \sec^2 x \) anywhere except at the origin (one curve is always less than or equal to one, and the other is always greater than or equal to one).

c. True. \( \frac{d}{dx} \sin^{-1} x = \frac{1}{\sqrt{1-x^2}} \), and this is minimal when its denominator is as big as possible, which occurs when \( x = 0 \). So the smallest possible slope of a tangent line for this function on \((-1, 1)\) is \( \frac{1}{\sqrt{1-0^2}} = 1 \).

d. True. \( \frac{d}{dx} \sin x = \cos x \) and \( \cos x = 1 \) for \( x = 0 \) and \(-1 \leq \cos x \leq 1 \) for all \( x \). Thus 1 is the largest possible slope for a tangent line to the sine function.

e. True. This follows because the function \( \frac{1}{x} \) is its own inverse. (Note that \( f(f(x)) = \frac{1}{f(x)} = \frac{1}{1/x} = x \). Thus, the derivative of the inverse of \( f \) is the derivative of \( f \), which is \( -\frac{1}{x^2} \).
3.10.54

a. 

\[ f'(x) = \sin^{-1}(x) + \frac{x-1}{\sqrt{1-x^2}} \]

b. Note that \( f' \) is zero and \( f \) has a horizontal tangent line at about \( x = 0.528 \).

3.10.55

a. 

\[ f'(x) = 2x \sin^{-1}(x) + \frac{x^2-1}{\sqrt{1-x^2}} \]

c. Note that \( f' \) is zero and \( f \) has a horizontal tangent line at about \( x = -0.61 \) and at about \( x = 0.61 \).

3.10.56

a. 

\[ f'(x) = \frac{\frac{1}{|x|\sqrt{x^2-1}}-\sec^{-1}x}{x^2} = \frac{1}{|x|\sqrt{x^2-1}} - \frac{\sec^{-1}x}{x^2} \]

c. Note that \( f' \) is zero and \( f \) has a horizontal tangent line at about \( x = 1.53 \).

3.10.57

a. 

\[ f'(x) = -e^{-x} \tan^{-1}x + e^{-x} \frac{1}{1+x^2} \]

c. Note that \( f' \) is zero and \( f \) has a horizontal tangent line at about \( x = 0.75 \).
3.10.58

a. 

b. \( f'(x) = \frac{(x^2+1)\frac{4}{x^2} - (\tan^{-1} x)2x}{(x^2+1)^2} = \frac{1-2x\tan^{-1} x}{(x^2+1)^2} \). 

c. Note that \( f' \) is zero and \( f \) has a horizontal tangent line at about \( x = 0.765 \) and at about \( x = -0.765 \).

3.10.59 Let \( f(y) = 3y - 4 \). Then \( f'(y) = 3 \) for all \( y \) in the domain of \( f \). Let \( y = f^{-1}(x) \). \((f^{-1})'(x) = \frac{1}{f'(y)} = \frac{1}{3} \).

3.10.60 Let \( f(y) = |y + 2| \) for \( y \leq -2 \). Then \( f(y) = -(y + 2) \), and \( f'(y) = -1 \). Thus \((f^{-1})'(x) = \frac{1}{f'(y)} = \frac{1}{-1} = -1 \).

3.10.61 Let \( x = f(y) = y^2 - 4 \) for \( y > 0 \). Note that this means that \( y = \sqrt{x+4} \). Then \( f'(y) = 2y \). So \((f^{-1})'(x) = \frac{1}{f'(y)} = \frac{1}{2y} = \frac{1}{2\sqrt{x+4}} \).

3.10.62 Let \( x = \frac{y}{y+5} \). Then \( x(y + 5) = y \), so \( y - xy = 5x \). Thus, \( y = f^{-1}(x) = \frac{5x}{1-x} \).

Therefore \((f^{-1})'(x) = \frac{1}{y} = \frac{1}{(1-x)^2} \).

3.10.63 For \( y \geq -2 \), let \( x = \sqrt{y+2} \). Note that it then follows that \( x \geq 0 \). Then \( 1 = \frac{y}{2\sqrt{y+2}} \) and \( x^2 = y + 2 \), so \( y = x^2 - 2 \). Thus we have \((f^{-1})'(x) = y' = 2\sqrt{x^2 - 2} + 2 = 2|x| = 2x \), because \( x \geq 0 \).

3.10.64 For \( y > 0 \), let \( x = y^{2/3} \). Then \( 1 = \frac{2}{3}y^{-1/3}y' \). So \( y' = \frac{3}{2}y^{1/3} = \frac{3}{2}(x^{3/2})^{1/3} = \frac{3}{2}x^{1/2} \) where \( x > 0 \).

3.10.65 For \( y > 0 \), let \( x = y^{-1/2} \). Then \( 1 = 2\sqrt{y^{1/2}}y' \), so \( y' = -2y^{3/2} = -2(x^{-2})^{3/2} = -2x^{-3} \) where \( x > 0 \).

3.10.66 Let \( x = y^3 + 3 \). Then \( 1 = 3y^2y' \), so \( y' = \frac{1}{3y^2} = \frac{1}{3(x-3)^2/2}, \) where \( x \neq 3 \).

3.10.67

a. Because \( \frac{l}{10} = \csc(\theta) \), \( \theta = \csc^{-1} \left( \frac{l}{10} \right) \), and \( \frac{d\theta}{dl} = -\frac{1}{\sqrt{(l/10)^2-1}} \cdot \frac{1}{10} = -\frac{10}{l\sqrt{l^2-100}} \).

b. \( \frac{d\theta}{dl} \big|_{l=50} = -\frac{10}{50\sqrt{2500-100}} \approx -0.0041 \) radians per foot.

\( \frac{d\theta}{dl} \big|_{l=20} = -\frac{10}{20\sqrt{400-100}} \approx -0.029 \) radians per foot.

\( \frac{d\theta}{dl} \big|_{l=11} = -\frac{10}{11\sqrt{121-100}} \approx -0.198 \) radians per foot.

c. \( \lim_{l\to10^+} \frac{10}{\sqrt{l^2-100}} = -\infty \). The angle changes very quickly as we approach the dock.

d. \( \frac{d\theta}{dl} \) is negative because this measures the change in \( \theta \) as \( l \) increases — but when the boat is approaching the dock, \( l \) is decreasing.

3.10.68

a. Because the triangle from the top of the cliff to the falcon is isosceles and has a base of \( 80 - h \), we get that the falcon is also \( 80 - h \) feet from the cliff. So \( \tan \theta = \frac{h}{80-h} \), or \( \theta = \tan^{-1} \left( \frac{h}{80-h} \right) \).

b. \( \frac{d\theta}{dh} = \frac{d}{dh} \tan^{-1} \left( \frac{h}{80-h} \right) = \frac{1}{1+(\frac{h}{80-h})^2} \cdot \frac{80-h+h}{(80-h)^2} = \frac{80}{(80-h)^2+h^2} \).

\( \frac{d\theta}{dh} \big|_{h=60} = \frac{80}{20^2+60^2} = \frac{1}{50} \) radians per foot.
3.10.69
a. \( \sin \theta = \frac{c}{b} \), so \( \theta = \sin^{-1} \left( \frac{c}{b} \right) \). Thus \( \frac{d \theta}{dc} = \frac{1}{\sqrt{1 - \left( \frac{c}{b} \right)^2}} = \frac{1}{\sqrt{D^2 - c^2}}. \)

b. \( \frac{d \theta}{dc} \bigg|_{c=0} = \frac{1}{\sqrt{D^2}} = \frac{1}{D}. \)

3.10.70
a. \( \cos \theta = \frac{d}{b} \), so \( \theta = \cos^{-1} \left( \frac{d}{b} \right) \). Thus \( \frac{d \theta}{dc} = -\frac{1}{\sqrt{1 - \left( \frac{d}{b} \right)^2}} = -\frac{1}{\sqrt{D^2 - c^2}}. \)

b. \( \frac{d \theta}{dc} \bigg|_{c=0} = -\frac{1}{D}. \) This is the opposite result of Exercise 69, as \( \theta \) now increases with decreasing \( c \).

3.10.71 \( (f^{-1})'(y_0) = \frac{1}{f'(x_0)} \) where \( y_0 = f(x_0) \).
\[
\frac{dy}{dx} \sin^{-1} x = \frac{1}{\cos(\sin^{-1} x)} = \frac{1}{\sqrt{1 - \sin^2(\sin^{-1} x)}} = \frac{1}{\sqrt{1 - x^2}}.
\]

3.10.72
a. \( \frac{d}{dx} \cos^{-1} x = -\frac{1}{\sin(\cos^{-1} x)} = -\frac{1}{\sqrt{1 - \cos^2(\cos^{-1} x)}} = -\frac{1}{\sqrt{1 - x^2}}. \)

b. \( \frac{d}{dx} (\sin^{-1} x + \cos^{-1} x) = \frac{d}{dx} \frac{\pi}{2} = 0 \), so \( \frac{d}{dx} \sin^{-1} x = -\frac{d}{dx} \cos^{-1} x. \) But \( \frac{d}{dx} \sin^{-1} x = \frac{1}{\sqrt{1 - x^2}} \), so \( \frac{d}{dx} \cos^{-1} x = -\frac{1}{\sqrt{1 - x^2}}. \)

3.10.73 Using the identity \( \cot^{-1}(x) + \tan^{-1}(x) = \frac{\pi}{2} \), we have
\[
\frac{d}{dx} \cot^{-1}(x) + \frac{d}{dx} \tan^{-1}(x) = 0, \quad \text{so} \quad \frac{d}{dx} \cot^{-1}(x) = -\frac{d}{dx} \tan^{-1}(x).
\]
Likewise, because \( \csc^{-1}(x) + \sec^{-1}(x) = \frac{\pi}{2} \), we have
\[
\frac{d}{dx} \csc^{-1}(x) + \frac{d}{dx} \sec^{-1}(x) = 0, \quad \text{so} \quad \frac{d}{dx} \csc^{-1}(x) = -\frac{d}{dx} \sec^{-1}(x).
\]

3.10.74
a. \( y_0 = f(x_0), \) so \( y_0 = ax_0 + b. \) Thus \( b = y_0 - ax_0 \) and \( a = \frac{y_0 - b}{x_0}. \)

b. \( x_0 = f^{-1}(y_0), \) so \( x_0 = cy_0 + d. \) Thus \( d = x_0 - cy_0 \) and \( c = \frac{x_0 - d}{y_0}. \) Also, because \( (f^{-1})'(y_0) = \frac{1}{f'(x_0)} \) and \( f'(x_0) = \alpha, \) \( (f^{-1})'(y_0) = c, \) we have that \( c = \frac{1}{\alpha}. \) Finally, substituting into the equation for \( d \) gives
\[
d = x_0 - \frac{y_0}{\alpha}.
\]

c. We show that \( L(M(x)) = x. \)
\[
L(M(x)) = a(cx + d) + b
= acx + ad + b
= x + ad + b
= x + a(x_0 - cy_0) + (y_0 - ax_0)
= x + ax_0 - acy_0 + y_0 - ax_0
= x - y_0 + y_0 = x.
\]

3.11 Related Rates
3.11.1 The area of a circle of radius \( r \) is \( A(r) = \pi r^2 \). If the radius \( r = r(t) \) changes with time, then the area of the circle is a function of \( r \) and \( r \) is a function of \( t \), so ultimately \( A \) is a function of \( t \). If the radius changes at rate \( \frac{dr}{dt} \), then the area changes at rate \( 2\pi r \frac{dr}{dt} \).
3.11.2 Using implicit differentiation, we can find the rate of change of a function which implicitly depends on a variable without needing the explicit dependence.

3.11.3 Because area is width times height, if one increases, the other must decrease in order for the area to remain constant.

3.11.4 In this section, we typically have related quantities which change with time, and by differentiating, we obtain relationships between the rates of change of these quantities.

3.11.5 \( A(x) = x^2, \ \frac{dx}{dt} = 2 \) meters per second.

c. 
\[
\frac{dA}{dt} = 2x \frac{dx}{dt}, \text{ so at } x = 10 \text{ meters we have } \frac{dA}{dt} = 2 \cdot 10 \cdot 2 \text{ m/s} = 40 \text{ m}^2/\text{s}.
\]

b. At \( x = 20 \) meters we have \( \frac{dA}{dt} = 2 \cdot 20 \cdot 2 \text{ m/s} = 80 \text{ m}^2/\text{s}.

3.11.6
a. Let \( x \) be the length of a side of the square. Then \( \frac{dx}{dt} = -1 \) meters per second. Because \( A = x^2 \), we have \( \frac{dA}{dt} = \frac{dA}{dx} \frac{dx}{dt} = 2x \cdot (-1) = -2x \) square meters per second. Thus \( A'(5) = -10 \), and so the area of the square is decreasing at 10 square meters per second when \( x = 5 \).

b. If \( l \) is the length of a diagonal of a square with side length \( x \), then \( x^2 + x^2 = l^2 \) by the Pythagorean Theorem, so \( l(x) = \sqrt{2}x \). Thus \( \frac{dl}{dx} \frac{dx}{dt} = \sqrt{2} \cdot (-1) = -\sqrt{2} \). The diagonals are decreasing at a rate of \( \sqrt{2} \) meters per second.

3.11.7
a. Let \( x \) be the length of a leg of an isosceles right triangle. Then \( \frac{dx}{dt} = 2 \) meters per second. The area is given by \( A(x) = \frac{1}{2}x^2 \). Thus, \( \frac{dA}{dx} = \frac{dA}{dx} \frac{dx}{dt} = x \cdot 2 = 2x \) square meters per second. When \( x = 2 \), we have \( \frac{dA}{dx} = 4 \), so the area is increasing at 4 square meters per second.

b. When the hypotenuse is 1 meter long, the legs are \( \frac{1}{\sqrt{2}} \) meters long. So \( A'(\frac{1}{\sqrt{2}}) = 2 \cdot \frac{1}{\sqrt{2}} = \sqrt{2} \), so the area is increasing at \( \sqrt{2} \) square meters per second.

c. If \( h \) is the length of the hypotenuse, then \( x^2 + x^2 = h^2 \), so \( h = \sqrt{2}x \). So \( \frac{dh}{dx} \frac{dx}{dt} = \sqrt{2} \frac{dx}{dt} = \sqrt{2} \cdot 2 = 2\sqrt{2} \) meters per second.

3.11.8
a. Let \( x \) be the length of a leg, and \( h \) the length of the hypotenuse. Then \( x^2 + x^2 = h^2 \), so \( h = \sqrt{2}x \). Thus \( \frac{dh}{dt} = \sqrt{2} \frac{dx}{dt} \), and because we are given that \( \frac{dh}{dt} = -4 \), we must have \( \frac{dx}{dt} = -\frac{4}{\sqrt{2}} = -2\sqrt{2} \) meters per second.

Therefore, \( \frac{dA}{dt} = \frac{dA}{dx} \frac{dx}{dt} = 2x \cdot -2\sqrt{2} = -4\sqrt{2}x \). When \( x = 5 \), we have \( \frac{dA}{dt} = -20\sqrt{2} \) square meters per second. The area is decreasing at a rate of \( 20\sqrt{2} \) square meters per second.

b. As mentioned above, \( \frac{dx}{dt} = -2\sqrt{2} \), so the legs are decreasing at a rate of \( 2\sqrt{2} \) meters per second.

c. When the triangle has area 4 square meters, the legs have length \( x = 2\sqrt{2} \) meters. At that time, \( \frac{dA}{dt} = \frac{dA}{dx} \frac{dx}{dt} = 2x(-2\sqrt{2}) = -4\sqrt{2}x = -4 \cdot 2\sqrt{2}\sqrt{2} = -16 \). The area is decreasing at 16 square meters per second.
3.11.9

a. Let \( r \) be the radius of the circle and \( A \) the area, and note that we are given \( \frac{dA}{dt} = 1 \) square cm per second. Because \( A = \pi r^2 \), we have \( \frac{dA}{dt} = \frac{dA}{dr} \frac{dr}{dt} \), so

\[
1 = 2\pi r \frac{dr}{dt},
\]

and thus

\[
\frac{dr}{dt} = \frac{1}{2\pi r}.
\]

When \( r = 2 \), we have \( \frac{dr}{dt} = \frac{1}{4\pi} \) cm per second.

b. When \( c = 2\pi r = 2 \), we have \( r = \frac{1}{2} \). At this time, \( \frac{dr}{dt} = \frac{1}{2\pi \frac{1}{2}} = \frac{1}{\pi(1/2)} = \frac{1}{2} \) cm per second.

3.11.10 \( V(x) = x^3 \), so \( \frac{dV}{dx} = 3x^2 \frac{dx}{dx} \). At \( x = 50 \) cm and \( \frac{dx}{dt} = 2 \) cm/s we have \( \frac{dV}{dt} = 3 \cdot (50)^2 \cdot 2 = 15000 \) cm\(^3\)/s.

3.11.11 \( A(x) = \pi x^2 \), so \( \frac{dA}{dx} = 2\pi x \frac{dx}{dx} \). At \( x = 10 \) ft and \( \frac{dx}{dt} = -2 \) ft/min we have \( \frac{dA}{dt} = 2\pi \cdot 10 \cdot (-2) = -40\pi \) ft\(^2\)/min.

3.11.12 \( V(x) = x^3 \), so \( \frac{dV}{dx} = 3x^2 \frac{dx}{dx} \). When \( x = 12 \) ft we have \( 3(144)\frac{ft^2}{dx} \cdot \frac{dx}{dt} = -0.5 \) ft\(^3\)/min, so \( \frac{dx}{dt} = -\frac{1}{864} \) ft/min \( \approx -0.0012 \) ft/min.

3.11.13 \( V(r) = \frac{4}{3} \pi r^3 \), so \( \frac{dV}{dr} = 4\pi r^2 \frac{dr}{dr} \). At \( r = 10 \) inches we have \( 4\pi(10)^2 \frac{dr}{dr} = 15 \) in\(^3\)/min. Thus, \( \frac{dr}{dt} = \frac{3}{8\pi} \) in/min \( \approx 0.012 \) in/min.

3.11.14 Let \( x \) be the distance from the piston to the base of the cylinder. Then the volume is \( V(x) = 25\pi x \), so \( \frac{dV}{dx} = 25\pi \frac{dx}{dx} \). Because \( \frac{dx}{dt} = -3 \) cm/s we have \( \frac{dV}{dt} = 25\pi (-3) \) cm\(^3\)/s = \( -75\pi \) cm\(^3\)/s.

3.11.15 \( V(r) = \frac{4}{3} \pi r^3 \), and \( S(r) = 4\pi r^2 \). \( \frac{dV}{dr} = 4\pi r^2 \frac{dr}{dr} = k \cdot 4\pi r^2 \), so \( \frac{dr}{dt} = k \), the constant of proportionality.

3.11.16 Let \( z \) be the distance from the origin to the bug’s position \( P(x, x^2) \) on the parabola. Then \( z = \sqrt{x^2 + x^4} = x\sqrt{1 + x^2} \). We have

\[
1 = \frac{dz}{dt} = \frac{dz}{dx} \frac{dx}{dt} = \left( \frac{1}{2} \sqrt{1 + x^2} + x \cdot \frac{1}{2} \cdot \frac{1}{2} \sqrt{1 + x^2} \right) \frac{dx}{dt} = \left( 1 + 2x^2 \right) \frac{dx}{dt}.
\]

Therefore, \( \frac{dx}{dt} = \frac{\sqrt{1 + x^2}}{2} \). When \( x = 2 \), we have \( \frac{dx}{dt} = \frac{\sqrt{5}}{2} \) cm per minute.

Also, \( \frac{dy}{dt} = \frac{dy}{dx} \frac{dx}{dt} = 2x \frac{dx}{dt} \). So at the given point, \( \frac{dy}{dt} = 4\sqrt{5} \) cm per minute.

3.11.17 Using the results of the previous exercise, we are seeking the value of \( x \) where \( \frac{dx}{dt} = \frac{dy}{dt} = 2x \frac{dx}{dt} \). This occurs for \( x = \frac{1}{2} \), so the desired point is \( \left( \frac{1}{2}, \frac{1}{4} \right) \).

3.11.18 Let \( x \) be the amount by which the sides have increased from their initial dimensions. Then \( A(x) = (2 + x)(4 + x) = 8 + 6x + x^2 \). So \( \frac{dA}{dx} = (6 + 2x) \frac{dx}{dx} \). With \( \frac{dx}{dt} = 1 \) cm/s, and at \( t = 20 \) s we have \( x = 20 \) cm, so \( \frac{dA}{dt} = (6 + 2 \cdot 20) \) cm \( \cdot 1 \) cm/s = \( 46 \) cm\(^2\)/s.

3.11.19

By similar triangles, \( \frac{2}{3} = \frac{6}{10} \), so \( b = 25h \). Also, \( A = \frac{1}{2} bh = 12.5h^2 \), so the volume for \( 0 \leq h \leq 2 \) is \( V(h) = 12.5 \cdot h^2 \cdot 20 = 250h^2 \). For \( 2 < h \leq 3 \), \( V(h) = 250 \cdot h^2 + 50 \cdot 20 \cdot (h - 2) = 1000h - 1000 \). When \( t = 250 \) minutes, then \( V = 250 \) min \( \cdot 1 \) m\(^3\)/min = \( 250 \) m\(^3\). So \( V(h) = 250h^2 = 250 \), so \( h = 1 \) m. At that time \( \frac{dV}{dt} = 500h \frac{dh}{dt} = 500 \cdot 1 \cdot \frac{dh}{dt} = 1 \) m\(^3\)/min. So \( \frac{dh}{dt} = \frac{1}{500} \) m/min = \( 0.002 \) m/min = \( 2 \) mm/min.

Fill time: The volume of the entire swimming pool is \( 2000 \) cubic meters, so at \( 1 \) cubic meter per minute, it will take \( 2000 \) minutes.
3.11.20
Let \( x \) be the distance the shadow has traveled, \( h \) the altitude of the jet, and \( z \) the line of flight of the jet. We have that \( \frac{dz}{dt} = 550 \) mi/hr and \( h = z \cdot \sin(10^\circ) \approx 0.174z \), so \( \frac{dh}{dt} = 0.174 \frac{dz}{dt} = 95.7 \) mi/hr. Also, \( x = z \cdot \cos(10^\circ) \approx 0.985z \), so \( \frac{dx}{dt} = 0.985 \frac{dz}{dt} = 541.64 \) mi/hr. So the shadow is moving at about 541.64 miles per hour.

3.11.21
Let \( x \) be the distance the surface ship has traveled and \( D \) the depth of the submarine. We have \( \frac{dx}{dt} = 10 \) km/hr. Note that \( D = x \cdot \tan 20^\circ \), so \( \frac{dD}{dt} = x \cdot \tan 20^\circ \approx 0.364x \). We have \( \frac{dx}{dt} = 3 \cdot 64 \) km/hr. The depth of the submarine is increasing at a rate of 3.64 km/hr.

3.11.22 Let \( x(t) \) be the distance that the westbound boat has traveled at time \( t \) and \( y(t) \) the distance the southbound boat has travelled at time \( t \). Note that the distance \( z \) between them is given by \( z = \sqrt{x^2 + y^2} \). Also note that we are given that \( \frac{dx}{dt} = 20 \) and \( \frac{dy}{dt} = 15 \). We have
\[
\frac{dz}{dt} = \frac{1}{2 \sqrt{x^2 + y^2}} \left( 2x \frac{dx}{dt} + 2y \frac{dy}{dt} \right) = \frac{20x + 15y}{\sqrt{x^2 + y^2}}.
\]
After 30 minutes (which is \( \frac{1}{2} \) hour), we have \( x = 10 \) and \( y = 7.5 \), and so \( \sqrt{x^2 + y^2} = \sqrt{10^2 + (7.5)^2} = 12.5 \). So \( \frac{dz}{dt} = \frac{200 + 112.5}{12.5} = 25 \) miles per hour.

3.11.23
Let \( x \) be the distance from the base of the ladder to the wall, and \( h \) the distance from the top of the ladder to the floor. Then by the Pythagorean Theorem, we have that \( x^2 + h^2 = 169 \). Thus, \( 2x \frac{dx}{dt} + 2h \frac{dh}{dt} = 0 \), so \( \frac{dh}{dt} = -\frac{x}{h} \frac{dx}{dt} \), and we are given that \( \frac{dx}{dt} = 0.5 \) feet per second. At \( x = 5 \) we have \( h = \sqrt{169 - 25} = 12 \) feet. Thus, \( \frac{dh}{dt} = -\frac{5}{12} \cdot 0.5 = -\frac{5}{24} \) feet per second. So the top of the ladder slides down the wall at \( \frac{5}{24} \) feet per second.

3.11.24
Let \( x \) be the distance from the base of the ladder to the wall, and \( h \) the distance from the top of the ladder to the floor. Then by the Pythagorean Theorem, we have that \( x^2 + h^2 = 144 \). Thus, \( 2x \frac{dx}{dt} + 2h \frac{dh}{dt} = 0 \). We are given that \( \frac{dx}{dt} = 0.2 \) feet per second. We are seeking the configuration when \( \frac{dh}{dt} = -0.2 \) feet per second. This occurs when \( 0.2x = 0.2h \), or \( x = h \). At this point in time, the triangle is forming a 45-45-90 triangle with \( x = h = 6\sqrt{2} \).
3.11. RELATED RATES

3.11.25

By similar triangles, \( \frac{x+y}{20} = \frac{5}{3} \), so \( x+y = 4y \), so \( x = 3y \), and \( \frac{dy}{dt} = 3 \frac{dy}{dt} \). Because we are given that \( \frac{dx}{dt} = -8 \), we have \( \frac{dy}{dt} = -\frac{3}{2} \) feet per second. The tip of her shadow is therefore moving at \( -8 - \frac{8}{3} = -\frac{32}{3} \) feet per second.

3.11.26

Let \( D \), \( x \) and \( y \) be as pictured. By the Pythagorean theorem, we know that \( D^2 = (90 - x)^2 + y^2 \). We are given that \( \frac{dD}{dt} = 18 \) feet per second, and \( \frac{dy}{dt} = 20 \) feet per second. Differentiating, we obtain \( 2D \frac{dD}{dt} = -2(90-x) \frac{dx}{dt} + 2y \frac{dy}{dt} \). After 1 second, we have that \( x = 18 \) and \( y = 20 \), and \( D = 4\sqrt{349} \) feet. So \( \frac{dD}{dt} = \frac{3}{4\sqrt{349}} (-72 \cdot 18 + 20 \cdot 20) \approx -11.99 \) feet per second. So the distance between the runners is decreasing at a rate of about 11.99 feet per second.

3.11.27

\( V = \frac{1}{3} \pi r^2 h \) where \( r = 3h \), so \( V = 3\pi h^3 \). We have that \( \frac{dV}{dt} = 9\pi h^2 \frac{dh}{dt} \), and we given that \( \frac{dh}{dt} = 2 \) at the moment when \( h = 12 \), so at that time, \( \frac{dV}{dt} = 9\pi \cdot 144 \text{cm}^2 \cdot 2 \text{cm/sec} = 2592\pi \text{cm}^3/\text{s} \). This is the rate at which the volume of the sandpile is increasing, so it must also be the rate at which the sand is leaving the bin, because there is no other sand involved.

3.11.28

Let \( h(t) \) be the height of the water in the tank at time \( t \). Then the volume of the water in the tank at time \( t \) is given by \( V = \pi r^2 h \). We are seeking \( \frac{dV}{dt} \) when \( \frac{dh}{dt} = -\frac{1}{2} \) foot per minute. Because \( \frac{dV}{dt} = \frac{dv}{dt} \frac{dh}{dt} = -\frac{1}{2} \pi \), the volume of the water in the tank is decreasing at \( \frac{1}{2} \) cubic feet per minute, so the water is draining out at \( \frac{1}{2} \) cubic feet per minute.

3.11.29

Let \( h \) be the depth of the water in the tank at time \( t \), and let \( r \) be the radius of the cone-shaped water at time \( t \). By similar triangles, we have that \( \frac{h}{r} = \frac{1}{3} \), so \( h = 2r \). The volume of the water in the tank is given by \( V = \frac{1}{3} \pi r^2 h = \frac{1}{3} \pi h^3 \cdot h = \frac{2\pi}{3} h^3 \). Thus, \( \frac{dV}{dt} = \frac{2\pi}{3} h^2 \frac{dh}{dt} \), and so when \( h = 3 \) we have -2 ft\(^3\)/s = \( \frac{9\pi}{3} \frac{d}{dt} \), so \( \frac{dh}{dt} = -\frac{8}{9\pi} \) ft/s. So the depth of the water is decreasing at a rate of \( \frac{8}{9\pi} \) feet per second.

3.11.30

We have that \( V = \pi r^2 h \), and \( r \) is a constant 2 inches, so \( V = 4\pi h \), and \( \frac{dV}{dt} = 4\pi \frac{dh}{dt} \). Because we are given that \( \frac{dh}{dt} = -0.25 \) inches per second, we have that \( \frac{dV}{dt} = 4\pi(-0.25) = -\pi \text{in}^3/\text{s} \). Thus, the soda is being sucked out at a rate of \( \pi \) cubic inches per second.

3.11.31

Let \( h \) be the depth of the water in the tank at time \( t \), and let \( r \) be the radius of the cone-shaped water at time \( t \). By similar triangles, we have that \( \frac{h}{r} = \frac{12}{6} \), so \( h = 2r \). The volume of the water in the tank is given by \( V = \frac{1}{3} \pi r^2 h = \frac{1}{3} \pi r^2 \cdot h = \frac{\pi}{12} r^3 \). Thus, \( \frac{dV}{dt} = \frac{\pi r^2}{12} \frac{dh}{dt} \). When \( \frac{dh}{dt} = -1 \), we have \( \frac{dV}{dt} = -\frac{\pi r^2}{4} \). When \( h = 6 \), we have \( \frac{dV}{dt} = -9\pi \), so the water is draining from the tank at 9\pi cubic feet per minute.

3.11.32

The volume of a segment of water of height \( h \) within a hemisphere of radius 10 is given by \( V = \frac{1}{3} \pi h^2(30 - h) = 10\pi h^2 - \frac{1}{3} \pi h^3 \). We have that \( \frac{dV}{dt} = 20\pi h \frac{dh}{dt} - \pi h^2 \frac{dh}{dt} \). We are given that \( \frac{dV}{dt} = 3 \text{m}^3/\text{min} \), so when \( h = 5 \) we have \( 3 = (100\pi - 25\pi) \frac{dh}{dt} \), so \( \frac{dh}{dt} = \frac{1}{5\pi} \) meters per minute.

3.11.33

Let \( r \) be the radius of the surface of water of height \( h \) at time \( t \). Then the center of that surface, a point on the edge of the sphere on the surface, and the center of the sphere form a right triangle with legs \( 10-h \) and \( r \) and with hypotenuse 10, so that

\[
10^2 = (10-h)^2 + r^2, \quad \text{or} \quad 100 = 100 - 20h + h^2 + r^2 \quad \text{or} \quad 20h = h^2 + r^2.
\]
Thus \(20 \frac{dh}{dt} = 2h \frac{dh}{dt} + 2r \frac{dr}{dt}\). When \(h = 5\), we have \(10 \cdot \frac{3}{5\pi} = 5 \cdot \frac{3}{\pi} + 5\sqrt{3} \frac{dr}{dt}\), so \(\frac{dr}{dt} = \frac{\sqrt{3}}{2\pi}\). The surface area is given by \(S = \pi r^2\), so \(\frac{dS}{dt} = 2\pi r \frac{dr}{dt}\), so at this moment it is given by \(\frac{dS}{dt} = 2 \pi \cdot 5 \cdot \frac{\sqrt{3}}{2\pi} = \frac{\sqrt{3}}{2}\) square meters per minute.

### 3.11.34

Let \(h\) be the height of the balloon at time \(t\). We have \(\tan \theta = \frac{h}{300}\), so \(\theta = \tan^{-1} \left( \frac{h}{300} \right)\). Thus, \(\frac{dh}{dt} = \frac{1}{300} \left(1 + \left(\frac{h}{300}\right)^2\right) \frac{dh}{dt}\). At the moment when \(h = 400\), we have \(\frac{dh}{dt} = \frac{1}{300 + 2000000} \cdot 20 = 0.024\) radians per second.

### 3.11.35

Let \(x\) be the distance the motorcycle has traveled since the instant it went under the balloon, and let \(y\) be the height of the balloon above the ground \(t\) seconds after the motorcycle went under it. We have \(x^2 + y^2 = D^2\) where \(D\) is the distance between the motorcycle and the balloon. Thus, \(2x \frac{dx}{dt} + 2y \frac{dy}{dt} = 2D \frac{dD}{dt}\), and we are given that \(\frac{dx}{dt} = 10\) feet per second, and \(\frac{dy}{dt} = 40\) mph = \(\frac{176}{3}\) ft/s. After 10 seconds have passed, we have that \(y = 150 + 100 = 250\) ft, \(x = \frac{17600}{3}\) ft and \(D = \sqrt{250^2 + \left(\frac{17600}{3}\right)^2} \approx 638\) ft. Thus, \(\frac{dD}{dt} \approx \frac{638}{3} \left(\frac{17600}{3} + 2500\right) \approx 57.89\) feet per second.

### 3.11.36

We have that the radius of the reel is 2 inches, so if \(L\) is the length and \(R\) is the number of revolutions, that \(L = 4\pi R\). So \(\frac{dL}{dt} = 4\pi \frac{dR}{dt}\), so \(\frac{dR}{dt} = 4\pi \cdot 1.5 = 6\pi\) inches per second.

### 3.11.37

Let \(x\) be the distance between the fish and the fisherman’s feet, and let \(D\) be the distance between the fish and the tip of the pole. Then \(D^2 = x^2 + 144\), so \(2D \frac{dD}{dt} = 2x \frac{dx}{dt}\). Note that \(\frac{dD}{dt} = -\frac{1}{2}\) ft/sec, so when \(x = 20\) ft, we have \(\frac{dx}{dt} = \frac{\sqrt{400+144}}{20} \left(-\frac{1}{2}\right) \approx -0.3887\) ft/sec \(-4.66\) in/sec. The fish is moving toward the fisherman at about 4.66 in/sec.

### 3.11.38

Let \(x\) be the horizontal distance of the kite, and let \(D\) be the length of the string. Then \(D^2 = x^2 + 2500\), so \(2D \frac{dD}{dt} = 2x \frac{dx}{dt}\), so \(\frac{dD}{dt} = \frac{x}{D} \frac{dx}{dt}\). When \(D = 120\) feet, then \(x = \sqrt{11900} \approx 109\) feet. Therefore, \(\frac{dD}{dt} \approx \frac{109}{120} \cdot 5 \approx 4.54\) feet per second.

### 3.11.39

Let \(D\) be the length of the rope from the boat to the capstan, and let \(x\) be the horizontal distance from the boat to the dock. By the Pythagorean Theorem, \(x^2 + 25 = D^2\), so \(2x \frac{dx}{dt} = 2D \frac{dD}{dt}\), so \(\frac{dx}{dt} = \frac{D}{x} \frac{dD}{dt}\). We are given that \(\frac{dD}{dt} = -3\) feet per second, so when \(x = 10\), we have \(\frac{dx}{dt} = \frac{\sqrt{125}}{10} \cdot (-3) = -3\sqrt{5}\) feet per second. The boat is approaching the dock at \(\frac{3\sqrt{5}}{2}\) feet per second.
3.11.40 \( y = 50x - x^2 \), so \( \frac{dy}{dt} = 50 \frac{dx}{dt} - 2x \frac{dx}{dt} \). We are given that \( \frac{dx}{dt} = 30 \) feet per second. For \( x = 10 \), we have \( \frac{dy}{dt} = 1500 - 600 = 900 \) feet per second. For \( x = 40 \), \( \frac{dy}{dt} = 1500 - 2400 = -900 \) feet per second.

3.11.41 Let \( x \) be the distance the westbound airliner has traveled between noon and \( t \) hours after 1:00, and let \( y \) be the distance the northbound airliner has traveled \( t \) hours after 1:00, and let \( D \) be the distance between the planes. We have \( D^2 = x^2 + y^2 \), so \( 2D \frac{dD}{dt} = 2x \frac{dx}{dt} + 2y \frac{dy}{dt} \). We are given that \( \frac{dx}{dt} = 500 \) mph and \( \frac{dy}{dt} = 550 \) mph. At 2:30, we have that \( x = 500 + 500 \cdot 1.5 = 1250 \), and \( y = 550 \cdot 1.5 = 825 \) miles.

\[ D = \sqrt{2243125} \approx 1497.7 \text{ miles.} \]

Thus \( \frac{dD}{dt} \approx \frac{1250 - 825}{1497.7} \approx 720.27 \text{ miles per hour.} \]

3.11.42 Let \( l \) be the length of a side of triangle, and let \( x \) be the line segment from a vertex to the midpoint of the opposite side. Then \( \frac{x}{l} = \frac{1}{2} \), so \( l = \sqrt{2} x \). Now \( A = \frac{1}{2} l^2 = \frac{x^2}{\sqrt{2}} \). Thus \( \frac{dA}{dt} = \frac{2}{\sqrt{2}} \frac{dx}{dt} \), and when \( x = 0 \), this quantity is zero.

3.11.43 Let \( \theta \) be the angle between the hands of the clock, and \( D \) the distance between the tips of the hands. By the Law of Cosines, \( D^2 = 2.5^2 + 3^2 - 15 \cos \theta \). So \( 2D \frac{dD}{dt} = 15 \sin \theta \frac{d\theta}{dt} \). At 9:00 AM, we have \( D^2 = 6.25 + 9 \), so \( D = \sqrt{15.25} \). Also, \( \theta = \pi/2 \) so \( \sin \theta = 1 \). Thus, \( \frac{d\theta}{dt} = \frac{\pi}{10} \). Now \( \frac{dD}{dt} = \frac{dD}{dt} - \frac{d\theta}{dt} \) where \( \frac{dD}{dt} \) is the angular change of the minute hand and \( \frac{d\theta}{dt} \) is the angular change of the hour hand. We have \( \frac{dD}{dt} = \frac{\pi}{10} \text{ radians per minute} \) and \( \frac{d\theta}{dt} = \frac{\pi}{300} \text{ radians per minute} \), so \( \frac{dD}{dt} = \frac{\pi}{300} \text{ radians per minute} \). Thus \( \frac{dD}{dt} = \frac{25\pi}{15.25} \approx 0.18436 \text{ meters per minute, or about 11.06 meters per hour.} \)

3.11.44 For the small pool, \( V_s = 25\pi h_s \), so \( \frac{dV_s}{dt} = 25\pi \frac{dh_s}{dt} \), and we are given that \( \frac{dh_s}{dt} = .5 \) meters per minutes, so \( \frac{dV_s}{dt} = 12.5\pi \text{ m}^3/\text{min.} \) Because the pools are being filled at the same rate, this number is also \( \frac{dV_l}{dt} \) for the large pool. We have \( V_L = 64\pi h_L \), so \( \frac{dV_L}{dt} = 64\pi \frac{dh_L}{dt} \), so \( \frac{dh_L}{dt} = \frac{25 \pi}{125} \) meters per minute.

3.11.45

a. Let \( A \) be the point where the drogster started, let \( B \) be the point where camera 1 is located and let \( C = y(t) \) be the position of the car at time \( t \). Let \( \theta \) be angle \( ABC \). Note that \( \tan \theta = \frac{y}{50} \), so \( \sec^2 \theta \cdot \frac{d\theta}{dt} = \frac{1}{50} \frac{dy}{dt} \). At time \( t = 2 \), we have that \( \tan^2 \theta = 4 \), so \( \sec^2 \theta = \tan^2 \theta + 1 = 5 \). So \( \frac{dy}{dt} = 5 \cdot 50 \cdot .75 = 187.5 \text{ feet per second.} \)

b. Let \( D \) be the point where camera 2 is located, and let \( \phi \) be angle \( ADC \). The \( \phi = \tan^{-1} \left( \frac{y}{100} \right) \), so \( \frac{d\phi}{dt} = \frac{1}{100} \frac{dy}{dt} \). After 2 seconds, we know that \( y = 100 \) and \( \frac{dy}{dt} = 187.5 \). Thus \( \frac{d\phi}{dt} = \frac{187.5}{100} \cdot 187.5 = 0.9375 \text{ radians per second.} \)

3.11.46 The volume of the upper tank is \( V_u = \frac{1}{3} \pi r^2 h \) with \( \frac{h}{r} = \frac{5}{4} \), so \( V_u = \frac{\pi}{4} \cdot 16 \cdot h^3/3 \). We have \( \frac{dV_u}{dt} = \frac{16 \pi}{3} \frac{dh}{dt} \), and we are given that \( \frac{dh}{dt} = -0.5 \) meters per minute. If \( h = 3 \), we have \( \frac{dV_u}{dt} = -144 \pi/3 \) meters per minute.

The volume of the lower tank is given by \( V_l = 16 \pi h_l \), so \( \frac{dV_l}{dt} = 16 \pi \frac{dh_l}{dt} = 144 \pi/50 \), so \( \frac{dh_l}{dt} = \frac{9}{50} \) meters per minute.

Now suppose that \( h = 1 \). Then \( \frac{dV_u}{dt} = 16 \pi \frac{50}{50} \) meters per minute. Then \( \frac{dV_l}{dt} = 16 \pi \frac{16 \pi}{50} \), so \( \frac{dh_l}{dt} = \frac{1}{50} \) meters per minute.

3.11.47 By the Law of Sines, \( \frac{\sin \theta}{3} = \frac{\sin \left( \frac{3\pi}{4} - \theta \right)}{2} \), so \( 2 \sin \theta = \sin \left( \frac{3\pi}{4} - \theta \right) = s \left( \sin \left( \frac{3\pi}{4} \right) \cos \theta - \cos \left( \frac{3\pi}{4} \right) \sin \theta \right) \).

We have

\[
2 \sin \theta = \sqrt{2} s \sin \left( \frac{\theta + \pi}{2} \right)
\]

\[
2 \tan \theta = \sqrt{2} s \tan \left( \theta + \pi \right)
\]

\[
\tan \theta = \frac{(\sqrt{2}/2 \cdot s)}{2 - (\sqrt{2}/2 \cdot s)} = \frac{\sqrt{2}s}{4 - \sqrt{2}s}
\]

\[
\theta = \tan^{-1} \left( \frac{\sqrt{2}s}{4 - \sqrt{2}s} \right)
\]

Copyright © 2014 Pearson Education, Inc.
Thus, \( \frac{d\theta}{dt} = \frac{\sqrt{3} \cdot \frac{ds}{dt}}{4 - 2\sqrt{2}s + s^2} \). When \( \frac{ds}{dt} = 15 \) and \( s = 7.5 \) we arrive at \( \frac{d\theta}{dt} = 0.543 \) radians per hour.

### 3.11.48

Let \( s \) be the distance the ship has traveled. By the Law of Sines, \( \frac{\sin \theta}{s} = \frac{\sin(\frac{5\pi}{3} - \theta)}{1.5} \), so \( 1.5 \sin \theta = s \cdot (\sin \left(\frac{5\pi}{3}\right) \cos \theta - \cos \left(\frac{5\pi}{3}\right) \sin \theta) \). We have

\[
\sin \theta = \frac{\sqrt{3}}{3} s (\sin \theta + \cos \theta)
\]

\[
\tan \theta = \frac{\sqrt{2}}{3} s (\tan \theta + 1)
\]

\[
\tan \theta = \frac{(\sqrt{2}/3) \cdot s}{1 - (\sqrt{2}/3)s} = \frac{\sqrt{2} s}{3 - \sqrt{2} s}
\]

\[
\theta = \tan^{-1} \left( \frac{\sqrt{2} s}{3 - \sqrt{2} s} \right).
\]

Thus, \( \frac{d\theta}{dt} = \frac{3\sqrt{2} \cdot \frac{ds}{dt}}{9 - 6\sqrt{2}s + 4s^2} \). At noon, \( 2s^2 = 1.5^2 \), so \( s = \frac{3}{\sqrt{8}} \). At 1:30 pm \( s = 18 + \frac{3}{\sqrt{8}} \approx 19.06 \) mi, and \( \frac{ds}{dt} = 12 \) mi/hr, so \( \frac{d\theta}{dt} \approx 0.0391 \) radians per hour.

### 3.11.49

Let \( h \) be the amount the elevator has risen. Then we have \( \frac{h}{20} = \tan \theta \), so \( \frac{1}{20} \frac{dh}{dt} = \sec^2 \theta \frac{d\theta}{dt} \). We are given that \( \frac{dh}{dt} = 5 \) m/s. At \( h = -10 \), we have \( \tan \theta = -5 \), so \( \sec^2 \theta = 1 + \tan^2 \theta = 1 + (-5)^2 = 1.25 \). So \( \frac{d\theta}{dt} = \frac{1}{20 \cdot 1.25} \cdot 5 = \frac{1}{8} \) radian per second.

When \( h = 20 \), we have that \( \tan \theta = 1 \), so \( \sec^2 \theta = 1 + 1^2 = 2 \), and thus \( \frac{d\theta}{dt} = \frac{1}{20 \cdot 2} \cdot 5 = \frac{5}{8} \) radian per second.

### 3.11.50

Let \( \theta \) be the angle \( RLP \) where \( L \) represents the lighthouse and \( R \) represents the point on the land where the light is currently hitting. Let \( s \) be the distance from the point \( P \) to the point \( R \). We are given that \( \frac{d\theta}{dt} = \frac{2\pi}{25} \) radians per second. Note that \( \tan \theta = \frac{20}{29} \), so \( \sec^2 \theta \cdot \frac{d\theta}{dt} = \frac{1}{29} \frac{ds}{dt} \). When the light is at point \( Q \), \( \tan \theta = \frac{20}{25} \), so \( \sec^2 \theta = 1 + \frac{4}{25} = \frac{29}{25} \). Then

\[
\frac{ds}{dt} = 500 \cdot \frac{2\pi}{15} \cdot \frac{29}{25} = \frac{232\pi}{3} \text{ m/s}.
\]

The beam moves more slowly when \( R \) is near \( P \), and more quickly when it is further away from \( P \).

### 3.11.51

Let \( x \) be the distance the eastbound boat has traveled at time \( t \) and let \( s \) be the distance the northeastbound boat has traveled. Note the diagram shown. By the Law of Sines, \( \frac{\sin \left(\frac{\pi}{2} - \theta\right)}{s} = \frac{\sin \left(\frac{\pi}{4} + \theta\right)}{x} \).

Thus,

\[
x \left( \sin \left(\frac{\pi}{2}\right) \cos \theta - \cos \left(\frac{\pi}{2}\right) \sin \theta \right) = s \left( \sin \left(\frac{\pi}{4}\right) \cos \theta + \cos \left(\frac{\pi}{4}\right) \sin \theta \right).
\]

So

\[
x \cos \theta = \frac{\sqrt{2}}{2} \cdot s \cdot \cos \theta + \frac{\sqrt{2}}{2} \cdot s \cdot \sin \theta
\]

\[
x = \frac{\sqrt{2}}{2} s + \frac{\sqrt{2}}{2} \tan \theta,
\]

and thus \( \tan \theta = \frac{x - \frac{\sqrt{2}}{2} s}{\frac{\sqrt{2}}{2} s} = \frac{\sqrt{2} x - s}{s} \), and therefore

\[
\theta = \tan^{-1} \left( \frac{\sqrt{2} x - s}{s} \right).
\]
We have
\[ \frac{d\theta}{dt} = \frac{1}{1 + \left(\sqrt{2x - s}\right)^2} \cdot \left(\sqrt{2} \left(\frac{dx}{dt} - \frac{ds}{dt}\right) - s - \sqrt{2}x - s\right) \cdot \frac{ds}{dt} = \frac{\sqrt{2} \left( s\frac{dx}{dt} - x\frac{ds}{dt}\right)}{s^2 + \left(\sqrt{2}x - s\right)^2}. \]

At time \( t \), we have \( s(t) = 15t \) and \( x(t) = 12t \), so
\[ \frac{dx}{st} - x \frac{ds}{dt} = 15t \cdot 12 - 12t \cdot 15 = 0. \]
Thus \( \theta' = 0 \) for every value of \( t \), so that the angle is constant.

3.11.52 Let \( D \) be the distance from the bottom center of the Ferris wheel to the cart. Note that \( \tan \theta = \frac{D}{20} \), so \( \theta = \tan^{-1} \left(\frac{D}{20}\right) \), and
\[ \frac{d\theta}{dt} = \frac{20 \cdot \frac{dD}{dt}}{400 + D^2} = \frac{20}{400 + D^2} \cdot \frac{dD}{dt}. \]
Let \( \alpha \) be the angle pictured. By the Law of Cosines,
\[ D^2 = 5^2 + 5^2 - 2 \cdot 5 \cdot 5 \cdot \cos \alpha = 50 - 50 \cos \alpha. \]
Differentiating gives \(2D \frac{dD}{dt} = 50 \frac{d\alpha}{dt} \cdot \sin \alpha\). Solving for \( \frac{dD}{dt} \) gives
\[ \frac{dD}{dt} = \frac{25 \sin \alpha}{D} \cdot \frac{d\alpha}{dt}. \]
At \( t = 40 \) seconds (which is \( \frac{2}{3} \) minutes), we have \( \alpha = \frac{2\pi}{3} \), so that \( D^2 = 50 - 50 \cos \frac{2\pi}{3} = 75 \) and thus \( D = 5\sqrt{3} \). Also \( \sin \alpha = \frac{\sqrt{3}}{2} \). Finally, we are given that \( \frac{d\alpha}{dt} = \pi \) radians per minute. Thus we have
\[ \frac{dD}{dt} = \frac{25 \cdot \frac{\sqrt{3}}{2}}{5\sqrt{3}} \cdot \pi = \frac{5\pi}{2}. \]
Finally, we get
\[ \frac{d\theta}{dt} = \frac{20}{400 + 75} \cdot \frac{5\pi}{2} = \frac{2\pi}{19} \approx 0.331 \text{ radians per second}. \]
3.11.53 Let $\alpha$ be the angle between the line of sight to the bottom of the screen and the line of sight to the point 3 feet below where the floor and the wall meet. Note that $\cot \alpha = \frac{3}{4}$ and $\cot(\alpha + \theta) = \frac{7}{10}$, so $\alpha = \cot^{-1}\left(\frac{3}{4}\right)$ and $\alpha + \theta = \cot^{-1}\left(\frac{7}{10}\right)$. Thus, $\theta = \cot^{-1}\left(\frac{7}{10}\right) - \cot^{-1}\left(\frac{3}{4}\right)$. So

$$\frac{d\theta}{dt} = \frac{10x'}{100 + x^2} + \frac{3x'}{9 + x^2},$$

and at $x = 30$ feet, and with $\frac{dx}{dt} = 3$ feet per second, we have $\frac{d\theta}{dt} = -\frac{30}{1000} + \frac{9}{900} \approx -0.0201$ radians per second.

3.11.54 Let $r$ be the distance from the point on the highway perpendicular to the searchlight to the right-hand edge of the beam, and let $l$ be the distance from that point to the left-hand edge of the beam. Then $w = l - r$. We have

$$r = 100\tan(\theta - \frac{\pi}{32}) \quad \text{and} \quad l = 100\tan(\theta + \frac{\pi}{32}).$$

Thus

$$\frac{dw}{dt} = \frac{dl}{dt} - \frac{dr}{dt} = 100\left(\sec^2\left(\theta + \frac{\pi}{32}\right) - \sec^2\left(\theta - \frac{\pi}{32}\right)\right) \cdot \frac{d\theta}{dt} = 100\left(\tan^2\left(\theta + \frac{\pi}{32}\right) - 1 - \left(\tan^2\left(\theta - \frac{\pi}{32}\right) - 1\right)\right) \cdot \frac{d\theta}{dt} = 100\left(\tan^2\left(\theta + \frac{\pi}{32}\right) - \tan^2\left(\theta - \frac{\pi}{32}\right)\right) \cdot \frac{d\theta}{dt}.$$

With $\frac{d\theta}{dt} = \frac{\pi}{6}$ radians per second and $\theta = \frac{\pi}{4}$, we have

$$\frac{dw}{dt} = 100\left(\tan^2\frac{35\pi}{96} - \tan^2\frac{29\pi}{96}\right) \cdot \frac{\pi}{6} \approx 153.081 \text{ meters per second.}$$

3.11.55

a. The volume of the water in the tank (as a function of $h$ — the depth of the water in the tank) is given by 5 times the area of the segment of water in a cross-sectional circle. For a tank of radius 1, the formula for such a segment is $\cos^{-1}(1 - h) - (1 - h)\sqrt{2h - h^2}$. Thus the volume of the water in the tank is given by $V = 5\cos^{-1}(1 - h) - (1 - h)\sqrt{2h - h^2}$. We have

$$\frac{dV}{dt} = 5 \cdot \left(\frac{1}{\sqrt{1 - (1 - h)^2}} \cdot \frac{-d(1 - h)}{dt} + \frac{d(1 - h)}{dt} \sqrt{2h - h^2} - \frac{(1 - h)^2}{\sqrt{2h - h^2}} \frac{d(1 - h)}{dt}\right)$$

$$= 5 \left(\sqrt{2h - h^2} + \frac{1 - (1 - h)^2}{\sqrt{2h - h^2}}\right) \cdot \frac{d(1 - h)}{dt} = \frac{5(2h - h^2 + 1 - 1 + 2h - h^2)}{\sqrt{2h - h^2}} \cdot \frac{d(1 - h)}{dt} = \frac{5(2(2h - h^2))}{\sqrt{2h - h^2}} \cdot \frac{d(1 - h)}{dt} = 10\sqrt{2h - h^2} \cdot \frac{dh}{dt}.$$

When $h = \frac{1}{2}$, we have

$$-\frac{3}{2} = \frac{dV}{dt} = 10\sqrt{1 - \frac{1}{4}} \frac{dh}{dt} \quad \text{so} \quad \frac{dh}{dt} = -\frac{\sqrt{3}}{10} \text{ meters per hr.}$$

b. The surface area of the water is given by $S = 5 \cdot 2\sqrt{2h - h^2}$. So $\frac{dS}{dt} = 10 \cdot \frac{2h - 2h}{2\sqrt{2h - h^2}} \cdot \frac{dh}{dt}$, so at $h = .5$, we have $\frac{5}{\sqrt{3/4}} \cdot (-\frac{\sqrt{3}}{10}) = -1 \text{ square meters per hr.}$
3.11.56 At time $t$, the boat traveling west has gone $20t$ miles while the boat traveling southwest has gone $15t$ miles. Let $D$ be the distance between the boats; the line between the boats forms the third side of a triangle. Then by the law of cosines,

$$D^2 = (20t)^2 + (15t)^2 - 2 \cdot 20t \cdot 15t \cos 45^\circ = 625t^2 - 600t^2 \cdot \frac{\sqrt{2}}{2} = \left(625 - 300\sqrt{2}\right)t^2.$$ 

Thus

$$D = \left(625 - 300\sqrt{2}\right)^{1/2}t,$$

so that

$$\frac{dD}{dt} = \left(625 - 300\sqrt{2}\right)^{1/2} \approx 14.168 \text{ mph}.$$ 

**Chapter Review**

1. a. False. This function is not differentiable at $x = \frac{1}{2}$. It is possible for a function to be continuous at a point and not differentiable at that point.

b. False. For example, $f(x) = x^2 + 3$ and $g(x) = x^2 + 100$ have the same derivative, but aren’t the same function.

c. False. For example, $\frac{d}{dx}|e^{-x}| = \frac{d}{dx}e^{-x} = -e^{-x} \neq |e^{-x}|$.

d. False. For example, the function $f(x) = |x|$ has no derivative at 0, but there is no vertical tangent there.

e. True. For example, a ball dropping from a high tower has acceleration due to gravity which is negative, but it is speeding up as it falls because the velocity (which is negative also) is in the same direction as the acceleration.

2.

a. $f'(2) = \lim_{h \to 0} \frac{4(2 + h)^2 - 7(2 + h) + 5 - 7}{h}$

$$= \lim_{h \to 0} \frac{16 + 16h + 4h^2 - 14 - 7h - 16 + 14}{h}$$

$$= \lim_{h \to 0} \frac{4h^2 + 9h}{h} = \lim_{h \to 0} (4h + 9) = 9.$$

b. The tangent line at (2, 7) is given by $y - 7 = 9(x - 2)$, or $y = 9x - 11$.

3.

a. $f'(1) = \lim_{h \to 0} \frac{5(1 + h)^3 + (1 + h) - 6}{h}$. Expanding yields

$$\lim_{h \to 0} \frac{5(1 + 3h^2 + 3h + h^3) + 1 + h - 6}{h} = \lim_{h \to 0} \frac{5 - 15h^2 + 15h + 5h^3 + h - 5}{h}.$$ 

This can be written as

$$\lim_{h \to 0} \frac{5h^3 - 15h^2 + 16h}{h} = \lim_{h \to 0} (5h^2 - 15h + 16) = 16.$$ 

b. The tangent line at (1, 6) is given by $y - 6 = 16(x - 1)$, or $y = 16x - 10$. 

Copyright © 2014 Pearson Education, Inc.
4. a. \[ y'(0) = \lim_{h \to 0} \frac{h + 3}{h} - 3 = \lim_{h \to 0} \frac{h + 3 - 6h - 3}{(2h + 1)h} = \lim_{h \to 0} -\frac{5h}{2h + 1} = -5. \]
b. The tangent line at (0, 3) is given by \( y - 3 = -5x \), or \( y = -5x + 3 \).

5. a. \[ f'(0) = \lim_{h \to 0} \frac{\frac{1}{2\sqrt{3h + 1}} - \frac{1}{2}}{h} = \lim_{h \to 0} \frac{1 - \sqrt{3h + 1}}{2\sqrt{3h + 1} \cdot h} = \lim_{h \to 0} \frac{(1 - \sqrt{3h + 1})(1 + \sqrt{3h + 1})}{2\sqrt{3h + 1} \cdot h(1 + \sqrt{3h + 1})} = \lim_{h \to 0} \frac{1 - (3h + 1)}{2\sqrt{3h + 1} \cdot h(1 + \sqrt{3h + 1})}. \]
Simplifying yields \( \lim_{h \to 0} -\frac{3}{2\sqrt{3h + 1}(1 + \sqrt{3h + 1})} = -\frac{3}{4} \).

b. The tangent line at \((0, \frac{1}{2})\) is given by \( y - \frac{1}{2} = -\frac{3}{4}x \), or \( y = -\frac{3}{4}x + \frac{1}{2} \). A graph of the curve together with the tangent line is shown.

6. a. Let \( f(t) = -4.9t^2 + 25t + 1 \).

b. \( f'(1) = \lim_{h \to 0} \frac{f(1+h) - f(1)}{h} \approx 15.2 \) meters per second.
c. \( f'(1) = \lim_{h \to 0} \frac{-4.9(1 + h)^2 + 25(1 + h) + 1 + 4.9 - 25 - 1}{h} = \lim_{h \to 0} \frac{-4.9 - 9.8h - 4.9h^2 + 25h + 4.9}{h} = \lim_{h \to 0} (-4.9h + 15.2) = 15.2. \)

7.

a. Average growth is \( \frac{p(60) - p(50)}{10} = 2.7 \) million people per year.

b. The curve is pretty straight between \( t = 50 \) and \( t = 60 \), so the secant line between these two points is approximately as steep as the tangent line at a point in between.

c. A reasonable estimate to the instantaneous growth rate at 1985 would be the slope of the secant line between \( t = 80 \) and \( t = 90 \). This is \( \frac{p(90) - p(80)}{10} = 2.217 \) million people per year.

8.

a. The graph has the steepest slope at about \( t = 18 \). At this point the rate is about \( \frac{N(20) - N(16)}{4} = 400 \) bacteria per hour.

b. It is smallest at \( t = 0 \) or \( t = 36 \), where it is about \( \frac{N(36) - N(32)}{4} \approx \frac{4900 - 4800}{4} = 25 \) bacteria per hour.

c. The average growth rate over \([0, 36]\) is \( \frac{N(36) - N(0)}{36} \approx \frac{4900 - 400}{36} = \frac{4500}{36} = 125 \) bacteria per hour.

9.

a. \( v(15) \approx \frac{400 - 200}{5} = 40 \) meters per second.

b. Because the graph is a straight line for \( t \geq 30 \), \( v(70) = \frac{D(90) - D(60)}{30} = \frac{1600 - 1400}{30} = \frac{20}{3} \) meters per second. The points at 60 and 90 were chosen because it is easier to detect the function values at those points using the given grid.

c. The average velocity is \( \frac{D(90) - D(20)}{70} \approx \frac{1600 - 550}{70} = 15 \) meters per second.

e. The parachute was deployed.

10.

\[
f'(x) = \lim_{h \to 0} \frac{2(x + h)^2 - 3(x + h) + 1 - (2x^2 - 3x + 1)}{h} = \lim_{h \to 0} \frac{2x^2 + 4xh + 2h^2 - 3x - 3h + 1 - 2x^2 + 3x - 1}{h} = \lim_{h \to 0} \frac{(4x - 3)h + 2h^2}{h} = \lim_{h \to 0} (4x - 3 + 2h) = 4x - 3.
\]
11. 

\[ g'(x) = \lim_{h \to 0} \frac{\sqrt{2(x + h) - 3} - \sqrt{2x - 3}}{h} \]

\[ = \lim_{h \to 0} \frac{\sqrt{2(x + h) - 3} - \sqrt{2x - 3}}{h} \cdot \frac{\sqrt{2(x + h) - 3} + \sqrt{2x - 3}}{\sqrt{2(x + h) - 3} + \sqrt{2x - 3}} \]

\[ = \lim_{h \to 0} \frac{2(x + h) - 3 - (2x - 3)}{h(\sqrt{2(x + h) - 3} + \sqrt{2x - 3})} \]

\[ = \lim_{h \to 0} \frac{2}{\sqrt{2x - 3}} = \frac{1}{\sqrt{2x - 3}}. \]

12. 

13. 

14. 

a. This has (D) as its derivative. Note that it consists of two pieces each of which are linear with the same slope. So its derivative is constant — but at \( x = 2 \) the derivative doesn’t exist. We can easily know that this is true because the function isn’t continuous at \( x = 2 \), so it can’t be differentiable there.

b. This has (C) as its derivative. The slope of the tangent line is positive for \( x < 2 \) and negative for \( x > 2 \) and doesn’t exist at \( x = 2 \). Also, near \( x = 2 \) the slope is near zero.

c. This has (B) as its derivative. Note that the slope of the tangent line is always positive, and gets infinitely steep at \( x = 2 \).

d. This has (A) as its derivative. Note that the slope of the tangent line is positive for \( x < 2 \), negative for \( x > 2 \), and is infinitely steep at \( x = 2 \) where the cusp occurs.

15. \( f'(x) = 2x^2 + 2\pi x + 7. \)

16. \( f'(x) = 2\sqrt{x^2 - 2x + 2} + 2x \cdot \frac{1}{2\sqrt{x^2 - 2x + 2}} (2x - 2) = 2 \left( \sqrt{x^2 - 2x + 2} + \frac{x^2 - x}{\sqrt{x^2 - 2x + 2}} \right) = \frac{4x^2 - 6x + 4}{\sqrt{x^2 - 2x + 2}}. \)

17. \( f'(t) = 10t \sin t + 5t^2 \cos t. \)

18. \( f'(x) = 5 + 3 \sin^2 x \cos x + 3x^2 \cos x^3. \)

19. \( f'(\theta) = (8\theta + 12) \sec^2 (\theta^2 + 3\theta + 2). \)

20. \( f'(x) = 5 \csc^4 3x \cdot (-\csc 3x \cot 3x) \cdot 3 = -15 \csc^5 3x \cot 3x. \)

21. \( f'(u) = \frac{(8u+1)(8u+1)-(4u^2+u)(8)}{(8u+1)^2} = \frac{54u^2+16u+1-32u^2-8u}{(8u+1)^2} = \frac{32u^2+8u+1}{(8u+1)^2}. \)

22. \( f'(t) = -3 \left( \frac{3(t^2+1)}{3t^2+1} \right)^{-4} \cdot \frac{(3t^2+1)(6t)-(3t^2-1)(6t)}{(3t^2+1)^2} = -36 \cdot (3t^2+1)^2 \cdot \frac{t}{(3t^2-1)^4}. \)
23. \( f'(\theta) = \sec^2(\sin \theta) \cos \theta \).

24. \( f'(v) = \frac{1}{3} \left( \frac{v}{5v^2+2v+1} \right)^{-2/3} \frac{3v^2+2v+1-v(6v+2)}{(3v^2+2v+1)^{1/3}} = \frac{1}{3} \left( \frac{3v^2+2v+1}{v^{1/3}} \right)^{-2/3} \left( \frac{1-3v^2}{3v^2+2v+1} \right) = \frac{1-3v^2}{3v^2+2v+1} \).

25. \( f'(x) = 2(\sin x)\sqrt{3x-1} + 2x(\cos x)\sqrt{3x-1} + 3x^2 \sin x \sqrt{3x-1} \).

26. \( f'(x) = e^{-10x} + x(-10e^{-10x}) = e^{-10x}(1 - 10x) \).

27. \( f'(x) = \ln^2 x + x \cdot 2 \ln x \cdot \left( \frac{1}{x} \right) = \ln(x \ln x + 2) \).

28. \( f'(w) = -e^{-w} \ln w + e^{-w} \left( \frac{1}{w} \right) = e^{-w} \left( \frac{-1}{w} \ln w \right) \).

29. \( f'(x) = 2x^2-x \cdot \ln 2 \cdot (2x-1) \).

30. \( f'(x) = \frac{1}{(x+6)^3} \).

31. \( f'(x) = \frac{1}{\sqrt{1-x^2}} \cdot \left( -\frac{1}{x^2} \right) = -\frac{1}{|x|\sqrt{x^2-1}} \).

32. \( \frac{d}{dx} x\sin x = \frac{d}{dx} e^{\sin x \ln x} = e^{\sin x \ln x} \left( \cos x \ln x + \frac{\sin x}{x} \right) = x^{\sin x} \left( \cos x \ln x + \frac{\sin x}{x} \right) \).

33. \( \frac{d}{dx} x^{1/2} = \frac{d}{dx} e^{\ln x} = e^{\ln x} \cdot \left( \frac{1}{x} \right) = x^{1/2} \left( \frac{1}{x} \right) \). So \( \frac{d}{dx} x^{1/2} \bigg|_{x=1} = 1 \cdot \frac{1}{1} = 1 \).

34. \( f'(x) = \frac{1}{1+e^{-2x}} \cdot 8x = \frac{8x}{1+e^{-2x}} \). So \( f'(1) = \frac{8}{17} \).

35. \( f'(x) = \sec^{-1} x + \frac{1}{\sqrt{x^2-1}} \). So \( f'(2/\sqrt{3}) = \frac{\pi}{6} + \sqrt{3} \).

36. \( f'(x) = \frac{1}{1+e^{-2x}} \cdot (-e^{-x}) = -\frac{1}{e^{-x}+e^x} \). So \( f'(0) = -\frac{1}{2} \).

37. Since
\[
y' = \frac{(1+\sin x) y' e^y - e^y \cos x}{(1+\sin x)^2},
\]
collecting terms gives
\[
y' \left( 1 - \frac{e^y}{1+\sin x} \right) = -\cos x e^y \left( \frac{1+\sin x}{(1+\sin x)^2} \right) = -\frac{\cos x}{1+\sin x} \cdot \frac{e^y}{1+\sin x}.
\]

Since \( y = \frac{e^y}{1+\sin x} \), substituting gives
\[
y'(1-y) = -\frac{\cos x}{1+\sin x} y, \quad \text{or} \quad y' = \frac{y \cos x}{(y-1)(1+\sin x)}.
\]

38. \( \cos x \cos(y-1) - (\sin x) y' \sin(y-1) = 0 \), so \( y' = \cot x \cot(y-1) \).

39. \( y' \sqrt{x^2+y^2} + y \cdot \frac{x+y y'}{\sqrt{x^2+y^2}} = 0 \), and thus
\[
y' \left( \sqrt{x^2+y^2} + \frac{y^2}{\sqrt{x^2+y^2}} \right) = -\frac{xy}{\sqrt{x^2+y^2}}.
\]
Simplifying the left-hand side gives
\[
y' \left( \frac{x^2+2y^2}{\sqrt{x^2+y^2}} \right) = -\frac{xy}{\sqrt{x^2+y^2}}, \quad \text{so} \quad y' = -\frac{xy}{x^2+2y^2}.
\]
40. 
\[ f'(a) = \lim_{x \to a} \frac{x^2 - a^2}{x - a} = \lim_{x \to a} \frac{(x - a)(x + a)}{x - a} = \lim_{x \to a} (x + a) = 2a. \]

\[ f'(a) = \lim_{h \to 0} \frac{b(a + h)^2 + c(a + h) + d - ba^2 - ca - d}{h} = \lim_{h \to 0} \frac{2ba + bh^2 + ch}{h} = \lim_{h \to 0} (2ba + bh + c) = 2ab + c. \]

41. \( y' = 9x^2 + \cos x. \) At \( x = 0, y' = 1. \) So the tangent line is given by \( y - 0 = 1(x - 0), \) or \( y = x. \)

42. \( y' = \frac{4(x^2 + 3) - 8a^2}{(x + 3)^2}, \) so \( y'(3) = -\frac{1}{5}. \) The tangent line is given by \( y - 1 = -\frac{1}{5}(x - 3), \) or \( y = -\frac{1}{5}x + \frac{8}{5}. \)

43. \( y'' + \frac{y + y'}{x^2 + y^2} = 0. \) At the point \((1, 4), \) we have \( y' + \frac{4 + y'}{4} = 0, \) so \( y' = -\frac{1}{3}. \) The tangent line is given by \( y - 4 = -\frac{1}{3}(x - 1), \) or \( y = -\frac{1}{3}x + \frac{13}{3}. \)

44. \( 2xy + x^2y + 3y^2y' = 0. \) At the point \((4, 3) \) we have \( 24 + 16y' + 27y' = 0, \) so \( y' = -\frac{24}{41}. \) The tangent line is given by \( y - 3 = -\frac{24}{41}(x - 4), \) or \( y = -\frac{24}{41}x + \frac{225}{41}. \)

45. We are looking for values of \( x \) so that \( y'(x) = 0. \) We have \( y' = \sqrt{6 - x} - \frac{x}{2\sqrt{6 - x}}, \) and this quantity is zero when \( 2(6 - x) = x, \) or \( 12 - 3x = 0, \) so when \( x = 4. \) So at the point \((4, 4\sqrt{2}) \) there is a horizontal tangent line. There is a vertical tangent line at \( x = 6, \) because \( \lim_{x \to 6^-} y'(x) = -\infty. \)

46. 
\[ a. \text{ Note that } f'(x) = 2x, \text{ so } f'\left(\frac{x+y}{2}\right) = 2 \cdot \frac{x+y}{2} = x + y. \text{ The quantity } \frac{f(x)-f(y)}{x-y} \text{ can be written as } \frac{x^2-y^2}{x-y} = x + y, \text{ so these quantities are equal for } x \neq y. \]

\[ b. \text{ Yes. Note that } f'(x) = 2ax, \text{ so } f'\left(\frac{x+y}{2}\right) = 2a \cdot \frac{x+y}{2} = a(x + y). \text{ The quantity } \frac{f(x)-f(y)}{x-y} \text{ can be written as } \frac{ax^2-ay^2}{x-y} = a \cdot \frac{(x-y)(x+y)}{x-y} = a(x+y), \text{ so these quantities are equal for } x \neq y. \]

\[ c. \text{ The line through } (x, f(x)) \text{ and } (y, f(y)) \text{ is parallel to the tangent line at the midpoint between } x \text{ and } y. \]

\[ d. \text{ No. For example, consider } a = 1, x = 0, \text{ and } y = 1. \text{ Note that } f'(x) = 3x^2. \text{ Then } f'\left(\frac{x+y}{2}\right) = f'(1/2) = 3/4. \text{ On the other hand, } \frac{f(x)-f(y)}{x-y} = \frac{1-0}{1-0} = 1. \]

47. 
\[ y' = \frac{1}{2}x^{-1/2} \cos \sqrt{x}, \]
\[ y'' = -\frac{1}{4}x^{-3/2} \cos \sqrt{x} - \frac{1}{4}x^{-1} \sin \sqrt{x} = -\frac{1}{4} \left( x^{-3/2} \cos \sqrt{x} + x^{-1} \sin \sqrt{x} \right) \]
\[ y''' = \frac{3}{8}x^{-5/2} \cos \sqrt{x} + \frac{1}{8}x^{-2} \sin \sqrt{x} + \frac{1}{4}x^{-2} \sin \sqrt{x} - \frac{1}{8}x^{-3/2} \cos \sqrt{x} \]
\[ = \frac{1}{8} \left( 3x^{-5/2} \cos \sqrt{x} + 3x^{-2} \sin \sqrt{x} - x^{-3/2} \cos \sqrt{x} \right). \]

48. 
\[ y' = \frac{1}{2} \frac{x - 3}{\sqrt{x + 2}} + \sqrt{x + 2} = \frac{x - 3 + 2(x + 2)}{2\sqrt{x + 2}} = \frac{3x + 1}{2\sqrt{x + 2}} \]
\[ y'' = \frac{1}{2} \frac{1}{\sqrt{x + 2}} - \frac{x - 3}{4(x + 2)^{3/2}} + \frac{1}{2\sqrt{x + 2}} = \frac{2(x + 2) - (x - 3) + 2(x + 2)}{4(x + 2)^{3/2}} = \frac{3x + 1}{4(x + 2)^{3/2}} \]
\[ y''' = -\frac{1}{2(x + 2)^{3/2}} - \frac{1}{4} \left( \frac{1}{(x + 2)^{3/2}} - \frac{3}{2} \frac{x - 3}{(x + 2)^{5/2}} \right) = -\frac{3(x + 7)}{8(x + 2)^{5/2}}. \]

49. \( \frac{d}{dx} [x^2 f(x)] = 2xf(x) + x^2 f'(x). \)
50. \[ \frac{d}{dx} \sqrt{\frac{f(x)}{g(x)}} = \frac{1}{2} \cdot \frac{g(x)f'(x) - f(x)g'(x)}{g(x)^2}. \]

51. \[ \frac{d}{dx} \left( \frac{xf(x)}{g(x)} \right) = \frac{(f(x) + xf'(x))g(x) - xf(x)g'(x)}{g(x)^2}. \]

52. \[ \frac{d}{dx} f \left( \sqrt{g(x)} \right) = f' \left( \sqrt{g(x)} \right) \cdot \frac{1}{2\sqrt{g(x)}} \cdot g'(x). \]

53. 
   a. \[ \frac{d}{dx} [f(x) + 2g(x)]_{x=3} = f'(3) + 2g'(3) = 9 + 2 \cdot 9 = 27. \]
   b. \[ \frac{d}{dx} \left[ \frac{xf(x)}{g(x)^2} \right]_{x=1} = \frac{g(1)(1-f'(1)+f'(1)-1f(1)+g'(1))}{(g(1))^2} = \frac{9 \cdot 7 + 3 - 15}{81} = \frac{25}{27}. \]
   c. \[ \frac{d}{dx} f(g(x^2)) |_{x=3} = f'(g(9)) \cdot g'(9) \cdot 2 = f'(1) \cdot 7 \cdot 6 = 7 \cdot 42 = 294. \]
   d. \[ \frac{d}{dx} (f(x)^3) \bigg|_{x=5} = (3f(x)^2f'(x)) \bigg|_{x=5} = 3f(5)^2f'(5) = 3 \cdot 81 \cdot 5 = 1215. \]
   e. Since \( g(3) = 7 \), we have \( (g^{-1})'(7) = \frac{1}{g'(3)} = \frac{1}{9} \).

54. With \( a = \frac{\pi}{4}, f(x) = \sin^2(x) \) we have

\[ f' \left( \frac{\pi}{4} \right) = \lim_{h \to 0} \frac{f(\pi/4 + h) - f(\pi/4)}{h} \]
\[ = \lim_{h \to 0} \frac{\sin^2(\pi/4 + h) - (1/2)}{h} \]
\[ = 2 \sin \frac{\pi}{4} \cos \frac{\pi}{4} \]
\[ = 2 \cdot \frac{\sqrt{2}}{2} \cdot \frac{\sqrt{2}}{2} = 1. \]

Note that we used the fact that \( \frac{d}{dx} \sin^2(x) = 2 \sin x \cos x \) in the middle of this derivation.

55. Let \( a = 5 \) and \( f(x) = \tan(\pi \sqrt{3x - 11}) \). Note that \( f'(5) = \frac{3\pi}{2} \sec^2(2\pi) = \frac{3\pi}{2} \).

So \( \lim_{x \to 5} \frac{f(x) - f(5)}{x - 5} = \lim_{x \to 5} \frac{\tan(\pi \sqrt{3x - 11}) - 0}{x - 5} = f'(5) = \frac{3\pi}{2} \).

56. \( (f^{-1}(x))' \bigg|_{x=f(0)} = \frac{1}{f'(0)} = -\frac{1}{(0 + 1)^2} = -1. \)

57. Since \( x = 2 \) gives \( y = \sqrt{2^3 + 2 - 1} = \sqrt{3} = 3 \), we get \( (f^{-1})'(3) = \frac{1}{f'(2)} \). Now,

\[ \frac{d}{dx} (\sqrt{x^3 + x - 1}) = \frac{1}{2} (x^3 + x - 1)^{-1/2} (3x^2 + 1), \]

so that \( f'(2) = \frac{1}{2} (2^3 + 2 - 1)^{-1/2} (3 \cdot 2^2 + 1) = \frac{13}{6} \), and thus \( (f^{-1})'(3) = \frac{6}{13} \).

58. \( (f^{-1}(x))' = \frac{1}{f'(f^{-1}(x))} = \frac{1}{12}. \)

59. If \( f(x) = x^{-1/3} \), then \( f^{-1}(x) = x^{-3} \). So \( (f^{-1})'(x) = -3x^{-4} \) for \( x \neq 0 \).
60.  

a.  

\[
\begin{array}{c}
\text{If } y = \frac{x}{x+1}, \text{ then } yx + y = x, \text{ so } y = x - yx, \text{ and } y = x(1 - y), \text{ so } x = \frac{y}{1-y}. \text{ The inverse function is given by } f^{-1}(x) = \frac{x}{1-x}.
\end{array}
\]

b.  

\[
\begin{array}{c}
\text{c. } (f^{-1}(x))' = \frac{1-x+y}{(1-x)^2} = \frac{1}{(1-x)^2}. \text{ So } (f^{-1})'(\frac{1}{2}) = 4.
\end{array}
\]

d.  

61.  

a.  

\[
(f^{-1})'(\frac{1}{\sqrt{2}}) = \frac{1}{f'(\frac{\pi}{4})} = \frac{1}{\cos(\frac{\pi}{4})} = \sqrt{2}.
\]

b.  

\[
\frac{d}{dx} \sin^{-1}(x) \bigg|_{x=\sqrt{2}} = \frac{1}{\sqrt{1-(\sqrt{2})^2}} = \frac{1}{\sqrt{1/2}} = \sqrt{2}.
\]

62.  

a.  

\[
\frac{d}{dx} (xf(x)) \bigg|_{x=2} = (f(x) + xf'(x)) \bigg|_{x=2} = f(2) + 2f'(2) = 5 + 2 \cdot 3 = 11.
\]

b.  

\[
\frac{d}{dx} (f(x)^2) \bigg|_{x=1} = (2xf'(x^2)) \bigg|_{x=1} = 2f'(1) = 2.
\]

c.  

\[
\frac{d}{dx} (f(f(x))) \bigg|_{x=1} = (f'(f(x)) \cdot f'(x)) \bigg|_{x=1} = f'(f(1)) \cdot f'(1) = f'(3) \cdot 1 = 4.
\]

63.  

a.  

Since \( f^{-1}(7) = 3 \), we get \( (f^{-1})'(7) = \frac{1}{f'(3)} = \frac{1}{4} \).

b.  

Since \( f^{-1}(3) = 1 \), we get \( (f^{-1})'(3) = \frac{1}{f'(1)} = 1 \).

c.  

\( (f^{-1})'(f(2)) = \frac{1}{f'(2)} = \frac{1}{3} \).
64. a. The probe climbs quickly, achieving a maximum height of \( \approx 84 \) at about \( t = 0.91 \):

\[ \text{Graph}\]

b. The velocity is

\[
v(t) = s'(t) = \frac{(t^3 + 2)(300 - 100t) - (300t - 50t^2)(3t^2)}{(t^3 + 2)^2}
\]

\[
= \frac{300t^3 - 100t^4 + 600t - 200t^4 + 900t^3 + 150t^4}{(t^3 + 2)^2}
\]

\[
= \frac{50t^4 - 600t^3 - 200t + 600}{(t^3 + 2)^2}.
\]

c. A graph of \( v(t) \) for \( 0 \leq t \leq 6 \) is

\[ \text{Graph}\]

From the graph, the maximum velocity is 150 at \( t = 0 \), and the minimum velocity is \( \approx -50 \) at \( t \approx 1.5 \).

65. a. The average growth rate is \( \frac{p(50) - p(0)}{50} = \frac{407500 - 80000}{50} = 6550 \) people per year.

b. The growth rate in 1990 is \( p'(40) = -5.1(40^2) + 144 \cdot 40 + 7200 = 4800 \) people per year.

66. a. \( v(t) = \pi \cdot 4^2 \cdot \frac{8t}{t^2+1} = \frac{128\pi t}{t^2+1} \) cubic cm.

b. \( v'(t) = 128\pi \cdot \frac{(t+1)-t}{(t+1)^2} = \frac{128\pi}{(t+1)^2}. \)

Because the rate of change of volume is strictly positive, the volume function is increasing for \( t > 0 \).
67. Let $x$ be the distance the eastbound boat has traveled, and $y$ the distance the southbound boat has traveled. By the Pythagorean Theorem, $D^2 = x^2 + y^2$, so $2D \frac{dD}{dt} = 2x \frac{dx}{dt} + 2y \frac{dy}{dt}$, so $\frac{dD}{dt} = \frac{x \frac{dx}{dt} + y \frac{dy}{dt}}{2D}$. We are given that $x' = 40$, $y' = 30$, and at $t = 5$ hours, we have $x = 20$, $y = 15$, and $D = 25$. Thus, $\frac{dD}{dt} = \frac{20 \cdot 40 + 30 \cdot 15}{2 \cdot 25} = 50$ mph.

68. $V = \frac{4}{3} \pi r^3 = \frac{\pi d^3}{6}$, so $V' = \frac{\pi d^3}{2}$. With $V' = 10$ cm$^3$/min and $d = 5$ cm, we have $d' = \frac{20}{5\pi} = \frac{4}{\pi}$ cm/min.

69. Let $h$ be the elevation of the balloon, and $s$ the length of the rope. We have $h = s \sin(65^\circ)$, so $h' = s' \sin(65^\circ) = -5 \cdot \sin(65^\circ) \approx -4.53$ feet per second.

70. \[ \frac{r}{h} = \frac{2}{3}, \text{ so } r = \frac{2}{3} h. \quad V = \frac{1}{3} \pi r^2 h = \frac{4}{27} \pi h^3. \] So \[ \frac{dV}{dt} = \frac{4}{3} \pi h^2 \frac{dh}{dt}. \] When $h = 2$, \[ \frac{dV}{dt} = 2, \text{ so } \frac{dh}{dt} = \frac{2}{\frac{2}{3} \cdot 4} = \frac{9}{8\pi} \text{ feet per minute.} \]

71. Let $x$ be the distance the jet has flown since it went over the spectator. Let $\theta$ be the angle of elevation between the ground and the line from the spectator to the jet. Note that $\theta$ is also the angle pictured, and that \[ \cot \theta = \frac{x}{500}. \] Thus, \[ \theta = \cot^{-1} \left( \frac{x}{500} \right). \] We are given that $x' = 450$ mph $= 660$ ft/sec. Then \[ \theta' = -\frac{x'}{500 \cdot \left(1 + \left(\frac{x}{500}\right)^2\right)} = -\frac{500x'}{250,000 + x^2}. \]

After 2 seconds, $x = 1320$ feet, so at this time \[ \theta' = -\frac{500 \cdot 660}{250,000 + (1320)^2} \approx -0.166 \text{ radians per second.} \]

72. Let $D$ be the distance the man is from the billboard, and let $\alpha$ be the angle between his eye level and the line of sight to the bottom of the billboard, and let $\theta$ be the angle between his line of sight to the bottom of the billboard and his line of sight to the top of the billboard. We have that \[ \cot \alpha = \frac{D}{h}, \text{ so } \alpha = \cot^{-1} \left( \frac{D}{h} \right). \] Also, \[ \cot(\alpha + \theta) = \frac{D}{h}, \text{ so } \theta = \cot^{-1} \left( \frac{D}{h} \right) - \alpha = \cot^{-1} \left( \frac{D}{h} \right) - \cot^{-1} \left( \frac{D}{h} \right). \] So \[ \theta' = -\frac{4D'}{361+D^2} + \frac{4D'}{16+D^2}. \] We are given that $D' = -2$ feet per second, so at $D = 30$ we have \[ \theta' \approx -\frac{38}{1261} + \frac{4(-2)}{916} \approx 0.03 - 0.009 = 0.021 \text{ radians per second.} \]

**AP Practice Questions**

**Multiple Choice**

1. B is correct: \[ \lim_{h \to 0} \frac{3(2+h)^2 - 12}{h} = \lim_{h \to 0} \frac{3(4+4h+h^2) - 12}{h} = \lim_{h \to 0} \frac{3h^2 + 12h}{h} = \lim_{h \to 0} (3h + 12) = 12. \]

2. C is correct. Note that \[ \frac{d}{dx} (\sin x) \big|_{x=\pi} = \lim_{x \to \pi} \frac{\sin x - \sin \frac{\pi}{2}}{x - \frac{\pi}{2}} = \lim_{x \to \pi} \frac{\sin x - \frac{1}{2}}{x - \frac{\pi}{2}}. \]
But
\[
\frac{d}{dx} (\sin x) \bigg|_{x=\frac{\pi}{6}} = (\cos x) \bigg|_{x=\frac{\pi}{6}} = \frac{\sqrt{3}}{2}.
\]

3. C is correct. A graph of \(f(x)\) is

The function is continuous everywhere, but has a corner at \((1, 0)\), so it is not differentiable there.

4. E is correct. We have \(f(x) = \frac{1}{3}x^3 - \frac{1}{3}x^{-3}\), so that by the power rule
\[
f'(x) = \frac{1}{3} \cdot 3x^2 - \frac{1}{3} \cdot (-3x^{-4}) = x^2 + x^{-4}.
\]
Then \(f'(-1) = (-1)^2 + (-1)^{-4} = 2\).

5. E is correct. \(f'(x) = 3e^x - 2\), so at \((0, 7)\) the slope of the tangent to \(f(x)\) is \(f'(0) = 3 - 2 = 1\). The line through \((0, 7)\) with slope 1 is \(y - 7 = x\), or \(y = x + 7\).

6. A is correct. We have
\[
g'(x) = x \cos x + \sin x, \quad \text{so} \quad g' \left(\frac{\pi}{2}\right) = \frac{\pi}{2} \cos \frac{\pi}{2} + \sin \frac{\pi}{2} = 1.
\]

7. B is correct. Since derivatives of \(\sin x\) repeat after four, we know that the eighth derivative of \(\sin x\) is \(\sin x\). The factor of 4 is a constant factor that can be factored out of the derivative operation. Thus the result is \(4 \sin x\).

8. D is correct. Using the product rule,
\[
\frac{d}{dx} \left(\frac{\sin x^2}{x}\right) = \frac{d}{dx} \left(\sin x^2 \cdot \frac{1}{x}\right) = 2x \cos x^2 \cdot \frac{1}{x} + \sin x^2 \cdot \left(-\frac{1}{x^2}\right) = 2 \cos x^2 - \frac{\sin x^2}{x^2}.
\]

9. C is correct. Since \(s'(t) = 8(t - 3)\), the velocity is negative until \(t = 3\), becomes zero momentarily, and then becomes positive for \(t > 3\). Thus the particle is moving in the negative \(s\) direction, stops, and then moves in the positive \(s\) direction. While it seems as though part E should also be true, it is not — the object is moving along a line, so its path is a line segment, not a parabola. The graph of its \(s\) position against time is a parabola.

10. A is correct. Since \(y = \frac{5}{\sqrt{x^2 + 9}} = 5(x^2 + 9)^{-1/2}\), we have
\[
y' = 5 \cdot \left(-\frac{1}{2}\right) (x^2 + 9)^{-3/2} \cdot 2x = -5x(x^2 + 9)^{-3/2} = -\frac{5x}{(x^2 + 9)^{3/2}}.
\]
At \(x = 4\), this evaluates to \(-\frac{5 \cdot 4}{(4^2 + 9)^{3/2}} = -\frac{20}{125} = -\frac{4}{25}\).
11. C is correct. Differentiating implicitly gives $y^3 + 3xy^2y' - 3x^2y - x^3y' = 0$; collecting terms and simplifying gives

$$y' = \frac{y^3 - 3x^2y}{x^3 - 3xy^2}.$$ 

At the point $(1, 2)$, we get

$$\frac{2^3 - 3 \cdot 1^2 \cdot 2}{1^3 - 3 \cdot 1 \cdot 2^2} = \frac{2}{11}.$$ 

12. C is correct. Since $d\left(\tan^{-1} t\right) = \frac{1}{1 + t^2}$, using the chain rule gives

$$f'(x) = \frac{1}{1 + (e^{-x})^2} \cdot (-e^{-x}) = -\frac{e^{-x}}{1 + e^{-2x}} = -\frac{1}{e^x + e^{-x}}.$$ 

13. C is correct. We have $h'(x) = f'(g(x))g'(x) + g'(f(x))f'(x)$ by the chain rule, so that

$h'(1) = f'(g(1))g'(1) + g'(f(1))f'(1) = f'(2)(-4) + g'(2)(-3) = 3(-4) + 6(-3) = -30.$

14. C is correct. Since $f^{-1}(5) = 2$, the inverse function theorem gives $(f^{-1})'(5) = \frac{1}{f'(2)} = \frac{1}{3}$.

15. D is correct. Using the forward difference with $h = 0.001$ gives

$$f'(1) \approx \frac{f(1.001) - f(1)}{0.001} = \frac{-2.805 + 2.800}{0.001} = \frac{-0.005}{0.001} = -5.$$ 

16. The graph is

Since the graph is decreasing for $0 \leq t < \frac{3\pi}{2}$ and increasing for $\frac{3\pi}{2} < t \leq 2\pi$, C is correct. The other four statements are easily seen to be false by examining the graph.

17. B is correct. Differentiating implicitly gives $4y^3y' - 9x^2 = 0$, so that $y' = \frac{9x^2}{4y^3}$. The tangent line is vertical only when the denominator of $y'$ is zero, so at $y = 0$. Setting $y = 0$ in the equation of the curve gives $-3x^3 = 2$, which has only one solution, $x = -\sqrt[3]{\frac{2}{3}}$. Thus the tangent line is vertical only at $\left(-\sqrt[3]{\frac{2}{3}}, 0\right)$.

**Free Response**

1. a. A plot of $f(x)$ is below:
b. From the graph, \( f \) has one zero to the left of \( x = -1 \). For \( x < -1 \), both \( x - 1 \) and \( x + 1 \) are negative, so that if \( x < -1 \), we have
\[
f(x) = |x - 1| + 2|x + 1| - 3 = 1 - x - 2(x + 1) - 3 = -3x - 4,
\]
so that the root is \( x = -\frac{4}{3} \). The second zero of \( f \) is between \( x = -1 \) and \( x = 1 \); in that range \( x - 1 \) is negative but \( x + 1 \) is positive, so that we get
\[
f(x) = |x - 1| + 2|x + 1| - 3 = 1 - x + 2(x + 1) - 3 = x,
\]
so that the root is \( x = 0 \). Note that to the right of \( x = 1 \), both \( x - 1 \) and \( x + 1 \) are positive, so that we have
\[
f(x) = |x - 1| + 2|x + 1| - 3 = x - 1 + 2(x + 1) - 3 = 3x - 2,
\]
which gives the solution \( x = \frac{2}{3} \). This is not a root of \( f(x) \) since \( x = \frac{2}{3} \) is not to the right of \( x = 1 \).

c. From part (a), the slope of \( f(x) \) for \( x < -1 \) is \(-3\); for \(-1 < x < 1 \) it is \(1\), and for \( x > 1 \) it is \(3\). So \( f'(x) \) is

\[
\begin{array}{c}
\text{Graph of } f(x) \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 3 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 2 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 1 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 0 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & -1 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & -2 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & -3 \\
\end{array}
\]

d. Since \( f(x) \) has corners at \( x = -1 \) and at \( x = 1 \), we know that \( f'(x) \) is undefined at those points, as can be seen from the graph.

2. Graphs of \( x(t) \), \( x'(t) \), and \( x''(t) \) are:

\[
\begin{array}{c}
\text{Graph of } x(t) \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 6 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 4 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 2 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 0 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & -2 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & -4 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & -6 \\
\end{array}
\]

\[
\begin{array}{c}
\text{Graph of } x'(t) \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 25 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 20 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 15 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 10 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 5 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & 0 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & -5 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & -10 \\
0.1 & 0.2 & 0.3 & 0.4 & 0.5 & 0.6 & 0.7 \\
\text{ } & \text{ } & \text{ } & \text{ } & \text{ } & \text{ } & -15 \\
\end{array}
\]

a. The average velocity is the difference in its position at the two ends of the interval divided by the length of the interval:
\[
v_{\text{avg}} = \frac{x(\ln 2) - x(0)}{\ln 2 - 0} = \frac{\sin(\pi e^{\ln 2}) - \sin \pi}{\ln 2} = \frac{\sin(2\pi) - \sin \pi}{\ln 2} = 0.
\]

b. The velocity is \( v(t) = x'(t) = \cos(\pi e^t) \cdot \pi e^t = \pi e^t \cos \pi e^t \). The velocity is decreasing when its derivative is negative; its derivative is
\[
v'(t) = x''(t) = \pi e^t \cos \pi e^t + \pi e^t (\cos(\pi e^t) - \pi e^t \sin \pi e^t).
\]

Solving numerically, we find \( v'(t) = 0 \) for \( t \approx 0.087 \). From the graph of \( x''(t) \) above, we see that \( v''(t) < 0 \) for \( t < 0.087 \), so that the velocity is decreasing on \( \approx (0, 0.087) \) (and increasing on \( \approx (0.087, \ln 2) \)).
c. The speed is decreasing when \( v(t) = x'(t) \) is moving towards the \( t \)-axis. Solving \( v(t) = 0 \) numerically gives \( t \approx 0.405 \), so from the graph of \( v(t) = x'(t) \), we see that the speed is decreasing on \( \approx (0.087, 0.405) \).

d. The object changes directions when its velocity changes from negative (moving left) to positive (moving right) or the reverse. From the graph of \( v(t) = x'(t) \) and the numerical solution from part (c), this happens at \( t \approx 0.405 \).

e. The object is furthest from its starting position when \( x(t) \) is farthest from the \( t \)-axis. From the graph of \( x(t) \), this happens when its tangent line is horizontal, so when \( v(t) = x'(t) = 0 \). From the above, this is at \( t \approx 0.405 \).

3. a. Graph A is decreasing for \( x < 0 \) and increasing for \( x = 0 \); since it is doing neither at \( x = 0 \), its derivative should be zero there. This matches derivative c. Curve B is increasing for negative \( x \) until some negative \( x \) value, then decreasing after that; this matches derivative d, which becomes negative at the same point at which curve B starts decreasing. Curve C first decreases, then increases, then decreases again, so its derivative should be first negative, then positive, then negative again; this matches derivative a. Finally, curve D is a line, which has constant slope, so its derivative should be a constant; this matches derivative b.

b. If curve A were either \( f \) or \( f' \), its derivative, which would be either \( f'' \) or \( f''' \), would be zero at the point at which curve A starts increasing. But neither curve B nor curve C has a zero at that point. So curve A must be \( f'' \). Then since A is first positive, then negative, then positive again, we know that \( f'' \) must be first increasing, then decreasing, then increasing again. This matches curve B; note further that the points at which B changes from decreasing to increasing and back again correspond to the zeros of curve A. So B is \( f' \), and C must be \( f \). Note that since \( f'' \) is first positive and then negative, that \( f \) must be first increasing and then decreasing; this does in fact match curve C.

4. The curve is increasing on \([-3, 0) \) and also on \((0, 2) \). To satisfy \( \lim_{x \to -0^+} g'(x) = \infty \) and \( \lim_{x \to 0^+} g'(x) = \infty \), assume that \( x \) has a vertical asymptote at \( x = 0 \) and that \( \lim_{x \to -0^-} g(x) = \infty \) while \( \lim_{x \to 0^+} g(x) = -\infty \). The last three conditions imply that \( g(x) \) is negative but increasing on \((0, 2) \), becoming zero at \( x = 2 \), and then decreasing again. A possible curve is

5. If the hypotenuse of a 45-45-90 right triangle is \( h \), then its legs are each \( \frac{h}{\sqrt{2}} \), so that its area is

\[
A(h) = \frac{1}{2} \cdot \frac{h}{\sqrt{2}} \cdot \frac{h}{\sqrt{2}} = \frac{h^2}{4}.
\]

The chain rule tells us that \( \frac{dA}{dt} = \frac{dA}{dh} \cdot \frac{dh}{dt} \); we want to find \( \frac{dh}{dt} \) when \( h = 10 \). Now, \( \frac{dA}{dt} \) is the rate of change of the area, which is given as \( 3 \cdot \frac{dA}{dh} = \frac{dh}{2} = \frac{h}{2} \); since \( h = 10 \), we have \( \frac{dA}{dt} \big|_{h=10} = 5 \). So \( 3 = 5 \cdot \frac{dh}{dt} \big|_{h=10} \) and thus the rate of change of the length of the hypotenuse is \( \frac{3}{5} \) cm/s when it is 10 cm long.

6. a. We have

\[
\begin{align*}
\lim_{x \to 0^+} f(x) &= \lim_{x \to 0^+} e^{-\pi x} e^{-\pi 0} = 1 \\
\lim_{x \to 0^-} f(x) &= \lim_{x \to 0^-} (1 - \sin \pi x) = 1 - \sin(\pi \cdot 0) = 1.
\end{align*}
\]

Copyright © 2014 Pearson Education, Inc.
Since the two one-sided limits are equal, we have \( \lim_{x \to 0} f(x) = 1 \), and since that is also the value of \( f(0) \), it follows that \( f \) is continuous at \( x = 0 \).

b. We have

\[
\lim_{h \to 0^-} \frac{f(0 + h) - f(0)}{h} = \lim_{h \to 0^-} \frac{e^{-\pi h} - 1}{h} = \lim_{h \to 0^-} \left( -\pi \frac{e^{-\pi h} - 1}{-\pi h} \right) = -\pi \lim_{t \to 0^-} \frac{e^t - 1}{t} = -\pi
\]

\[
\lim_{h \to 0^+} \frac{f(0 + h) - f(0)}{h} = \lim_{h \to 0^+} \frac{(1 - \sin \pi h) - 1}{h} = -\lim_{h \to 0^+} \frac{\sin \pi h}{h} = -\lim_{t \to 0^+} \frac{\pi \sin \pi t}{t} = -\pi.
\]

c. Differentiating \( f(x) \) piecewise gives

\[
f'(x) = \begin{cases} 
-\pi e^{-\pi x} & \text{if } x \leq 0 \\
-\pi \cos \pi x & \text{if } x > 0.
\end{cases}
\]

Since \( e^{-\pi x} \) is never zero, \( f'(x) \) is not zero for \( x \leq 0 \). The smallest positive \( x \) for which \( -\pi \cos \pi x = 0 \) is \( x = \frac{1}{2} \), since \( \cos \frac{\pi}{2} = 0 \).

d. Since the slope of the tangent line at \( x = 0 \) is \( -\pi \), from part (b), and \( f(0) = 1 \), the tangent line at \( x = 0 \) is \( y - 1 = -\pi(x - 0) \), or \( y = -\pi x + 1 \).

7. a. Differentiating implicitly gives \( 2x + 8yy' + 2y + 2xy' = 0 \). Dividing through by 2 and solving for \( y' \) gives

\[
y' = \frac{dy}{dx} = -\frac{x + y}{x + 4y}.
\]

b. Tangent lines have a slope of zero only if the numerator of \( y' \) is zero, so if \( y = -x \). Substituting \(-x\) for \( y \) in the equation of the curve gives \( x^2 + 4x^2 - 2x^2 = 12 \), or \( 3x^2 = 12 \), so that \( x = \pm 2 \). So the tangent to the curve has slope zero at the points \((2, -2)\) and \((-2, 2)\).

c. Tangent lines are vertical only if the denominator of \( y' \) is zero, so if \( x = -4y \). Substituting \(-4y\) for \( x \) in the equation of the curve gives \((-4y)^2 + 4y^2 + 2(-4y)y = 12y^2 = 12 \), so that \( y = \pm 1 \). So the tangent to the curve is vertical at the points \((-4, 1)\) and \((4, -1)\).
Chapter 4

Applications of the Derivative

4.1 Maxima and Minima

4.1.1 A number $M = f(c)$ where $c \in [a, b]$ with the property that $f(x) \leq M$ for all $x \in [a, b]$ is an absolute maximum for $f$ on $[a, b]$, and a number $m = f(d)$ where $d \in [a, b]$ with the property that $f(x) \geq m$ for all $x \in [a, b]$ is an absolute minimum for $f$ on $[a, b]$.

4.1.2 A number $M = f(c)$ is a local maximum for $f$ if there is an interval $(r, s)$ containing $c$ so that $f(x) \leq M$ for all $x \in (r, s)$. A number $m = f(d)$ is a local minimum for $f$ if there is an interval $(r, s)$ containing $d$ so that $f(x) \geq m$ for all $x \in (r, s)$.

4.1.3 The function must be a continuous function defined on a closed interval.

4.1.4 For example, the tangent function on the interval $(-\frac{\pi}{2}, \frac{\pi}{2})$ is continuous but has no maximum or minimum. There are many possible other examples.

4.1.5 The function shown has no absolute minimum on $[0, 3]$ because $\lim_{x \to 0^-} f(x) = -\infty$. It has an absolute maximum near $x = 1$ and a local minimum near $x = 2.5$. 

Copyright © 2014 Pearson Education, Inc.
4.1.6 An interior point \( c \) of the domain of \( f \) at which \( f'(c) = 0 \) or \( f'(c) \) doesn’t exist is a critical point of \( f \).

4.1.7

Note the existence of a horizontal tangent line at \( x = 0 \) where the maximum occurs.

4.1.8

Note that \( \lim_{h \to 0} \frac{f(0 + h) - f(0)}{h} \) is different for \( h \to 0^- \) and \( h \to 0^+ \), so that \( f'(0) \) does not exist, and \( f \) has a minimum at \( x = 0 \).

4.1.9 First find all the critical points by seeking all points \( x \) in the domain of \( f \) so that \( f'(x) = 0 \) or \( f'(x) \) doesn’t exist. Now compare the \( y \)-values of all of these points, together with the \( y \)-values of the endpoints. The largest \( y \)-value from among these is the maximum, and the smallest is the minimum.

4.1.10 If \( a \) is an endpoint of the given interval, and \( f(a) \leq f(x) \) for all \( x \) in the interval, then \( f(a) \) is the absolute minimum. This happens, for example, for a line of positive slope defined on an interval \([a, b]\) – the \( y \)-value at the left endpoint is the smallest \( y \)-value over the interval.

4.1.11 \( y = h(x) \) has an absolute maximum at \( x = b \) and an absolute minimum at \( x = c_2 \).

4.1.12 \( y = f(x) \) has an absolute maximum at \( x = c \) and no absolute minimum.

4.1.13 \( y = g(x) \) has no absolute maximum, but has an absolute minimum at \( x = a \).

4.1.14 \( y = g(x) \) has an absolute maximum at \( x = a \) and an absolute minimum at \( x = c \).

4.1.15 \( y = f(x) \) has an absolute maximum at \( x = b \) and an absolute minimum at \( x = a \). It has local maxima at \( x = p \) and \( x = r \), and local minima at \( x = q \) and \( x = s \).

4.1.16 \( y = f(x) \) has an absolute maximum at \( x = p \), and an absolute minimum at \( x = a \). It has local minima at \( x = q \) and \( x = s \), and local maxima at \( x = r \) and \( x = p \).

4.1.17 \( y = g(x) \) has an absolute minimum at \( x = b \) and an absolute maximum at \( x = p \). It has local maxima at \( x = p \) and \( x = r \). It has a local minimum at \( x = q \).

4.1.18 \( y = h(x) \) has an absolute maximum at \( x = p \) and an absolute minimum at \( x = u \). It has local maxima at \( x = p \), \( x = r \) and \( x = t \). It has local minima at \( x = q \), \( x = s \), and \( x = u \).

Copyright © 2014 Pearson Education, Inc.
4.1.19

Note the horizontal tangent lines at 1 and 2, and the minimum at 0 and the maximum at 4.

4.1.20

Note the minimum at \( x = 1 \), the maximum at \( x = 3 \), and the horizontal tangent lines at 1, 2, and 3.

4.1.21

Note the horizontal tangent line at \( x = 2 \), and the “corners” at \( x = 1 \) and \( x = 3 \). Also note the absolute maximum at \( x = 3 \) and the absolute minimum at \( x = 4 \).

4.1.22

Note the maximum at 2, and the minimum at 3. Note also the horizontal tangent lines at \( x = 1 \) and \( x = 3 \), and the sharp “corner” at \( x = 2 \).
4.1.23

a. \( f'(x) = 6x - 4 \), which is zero when \( x = \frac{2}{3} \).
b. At \( x = \frac{2}{3} \) there is a local minimum.

4.1.24

a. \( f'(x) = \frac{2}{3} x^2 - \frac{1}{2}, \) which is zero when \( 3x^2 - 4 = 0 \), which occurs for \( x = \pm \frac{2}{\sqrt{3}} \). The only critical point on the given interval is at \( x = \frac{2}{\sqrt{3}} \).
b. There is a local minimum at \( x = \frac{2}{\sqrt{3}} \).

4.1.25

a. \( f'(x) = x^2 - 9 \), which is zero for \( x = \pm 3 \).
b. There is a local maximum at \( x = -3 \) and a local minimum at \( x = 3 \).

4.1.26

a. \( f'(x) = x^3 - x^2 - 6x = x(x^2 - x - 6) = x(x - 3)(x + 2), \) which is zero for \( x = 0, 3, \) and \(-2\).
b. There is a local maximum at \( x = 0 \) and local minima at \( x = -2 \) and \( x = 3 \).
4.1.27

a. \( f'(x) = 9x^2 + 3x - 2 = (3x + 2)(3x - 1) \), which is zero for \( x = -\frac{2}{3} \) and \( x = \frac{1}{3} \).

b. There is a local maximum at \( x = -\frac{2}{3} \) and a local minimum at \( x = \frac{1}{3} \).

4.1.28

a. \( f'(x) = 4x^4 - 9x^2 = x^2(4x^2 - 9) = x^2(2x + 3)(2x - 3) \), which is zero for \( x = 0 \) and \( x = \pm \frac{3}{2} \).

b. There is a local maximum at \( x = -\frac{3}{2} \) and a local minimum at \( x = \frac{3}{2} \), and neither is occurring at \( x = 0 \).

4.1.29

a. \( f'(x) = \frac{(x^2+1)(1-x^2)}{(x^2+1)^2} = \frac{1-x^2}{(x^2+1)^2} \). This quantity is zero exactly when \( 1 - x^2 = 0 \), so at \( x = 1 \) and \( x = -1 \).

b. At \( x = 1 \) there is a local maximum (which is also an absolute maximum) and at \( x = -1 \) there is a local minimum (which is also an absolute minimum).

4.1.30

a. \( f'(x) = 60x^4 - 60x^2 = 60x^2(x^2 - 1) \), which is zero on the given interval when \( x = \pm 1 \) and when \( x = 0 \).

b. There is a local minimum at \( x = 1 \) and a local maximum at \( x = -1 \). At \( x = 0 \) there is neither a maximum nor a minimum.
4.1.31

a. \( f'(x) = \frac{e^x - e^{-x}}{2} \), which is zero when \( e^x = e^{-x} \) or \( x = -x \), so only for \( x = 0 \).

b. There is a local (and absolute) minimum at \( x = 0 \).

4.1.32

a. \( f'(x) = \cos x \cos x - \sin x \sin x \), which is zero when \( \sin^2 x = \cos^2 x \), so when \( \sin x = \cos x \) or \( \sin x = -\cos x \). This occurs when \( x = \frac{\pi}{4} + k \frac{\pi}{2} \) where \( k \) is an integer. On \([0, 2\pi]\) this gives us \( x = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \) and \( \frac{7\pi}{4} \).

b. There are local maxima at \( x = \frac{\pi}{4} \) and \( \frac{5\pi}{4} \), and local minima at \( x = \frac{3\pi}{4} \) and at \( x = \frac{7\pi}{4} \).

4.1.33

a. \( f'(x) = -\frac{1}{2}x + \frac{1}{2} = \frac{x-1}{2x} \), which is zero at \( x = 1 \).

b. The critical point at \( x = 1 \) is a local minimum.

4.1.34

a. \( f''(x) = 1 - \frac{1}{1+x^2} = \frac{1+x^2-1}{1+x^2} = \frac{x^2}{1+x^2} \). This is zero for \( x = 0 \).

b. The critical point at \( x = 0 \) is neither a maximum nor a minimum.
4.1.35

a. \( f'(x) = 2x\sqrt{x+1} + x^2 \cdot \frac{1}{2\sqrt{x+1}} = \frac{4x(x+1)}{2\sqrt{x+1}} + \frac{x^2}{2\sqrt{x+1}} \). This is zero when \( 5x^2 + 4x = x(5x + 4) \) is zero, which occurs for \( x = 0 \) and \( x = -\frac{4}{5} \). Thus the critical points are \( x = 0 \) and \( x = -\frac{4}{5} \).

b. There is a local maximum at \( x = -\frac{4}{5} \) and a local minimum at \( x = 0 \).

4.1.36

a. \( f'(x) = \frac{1}{\sqrt{1-x^2}} \cos^{-1}(x) + \sin^{-1}(x) \cdot \frac{-1}{\sqrt{1-x^2}} = \frac{\cos^{-1}(x) - \sin^{-1}(x)}{\sqrt{1-x^2}} \). This is zero when \( \sin^{-1}(x) = \cos^{-1}(x) \), which occurs on the given interval for \( x = \frac{\sqrt{2}}{2} \).

b. There is a local maximum at \( x = \frac{\sqrt{2}}{2} \).

4.1.37

a. \( f'(x) = 2x \), which is zero for \( x = 0 \).

b. We have that \( f(-2) = -6 \), \( f(0) = -10 \), and \( f(3) = -1 \), so the maximum value of \( f \) on this interval is \(-1\) and the minimum is \(-10\).

4.1.38

a. \( f'(x) = \frac{1}{3}(x+1)^{1/3} \), which is zero for \( x = -1 \). So \( x = -1 \) is the only critical point.

b. We have that \( f(-9) = (-9 + 1)^{4/3} = 16 \) and \( f(7) = (7 + 1)^{4/3} = 16 \) as well, so that the minimum of \( f \) on this interval is \( 0 \), achieved at \( x = -1 \), and the maximum is \( 16 \), achieved at \( x = -9 \) and at \( x = 7 \).
4.1.39

a. $f'(x) = -2 \cos x \sin x$, which is zero for $x = 0$, $x = \frac{\pi}{2}$, and $x = \pi$. Because there are endpoints at $x = 0$ and $x = \pi$, the only critical point is $x = \frac{\pi}{2}$.

b. We have that $f(0) = 1$, $f\left(\frac{\pi}{2}\right) = 0$, and $f(\pi) = 1$, so the maximum value of $f$ on this interval is 1 and the minimum is 0.

4.1.40

a. $f'(x) = \frac{(x^3+3x^2-2x)(x^2+3)}{(x^2+3)^2} = \frac{3x^3-3x^2}{(x^2+3)^2}$, which is zero for $x = \pm 1$.

b. We have $f(-2) = -\frac{2}{39} \approx -0.041$ and $f(2) = \frac{2}{39} \approx 0.041$. Since $f(1) = \frac{1}{16} = 0.0625$ and $f(-1) = -\frac{1}{16} = -0.0625$, the maximum value is $\frac{1}{16}$ at $x = 1$ and the minimum value is $-\frac{1}{16}$ at $x = -1$.

4.1.41

a. $f'(x) = 3 \cos 3x$, which is zero when $3x = \ldots, -\frac{\pi}{2}, \frac{\pi}{2}, \frac{3\pi}{2}, \ldots$, so when $x = \ldots, -\frac{x}{6}, \frac{x}{6}, \frac{2x}{6}, \ldots$. The only such values on the given interval are $x = -\frac{x}{6}$ and $x = \frac{x}{6}$.

b. We have $f\left(-\frac{x}{6}\right) = -\frac{\sqrt{3}}{6} \approx -0.707$, $f\left(\frac{x}{6}\right) = -1$, $f\left(\frac{2x}{6}\right) = 1$, and $f\left(\frac{3x}{6}\right) = 0$, so the absolute maximum of $f$ is 1 and the absolute minimum is $-1$.

4.1.42

a. $f'(x) = \frac{2}{3} x^{-1/3} = \frac{2}{3 \sqrt[3]{x}}$, which is never zero. However, there is a point in the domain (namely $x = 0$) where the derivative doesn’t exist. So this is the only critical point.

b. We have $f(-8) = 4 = f(8)$, and $f(0) = 0$. So the absolute maximum of $f$ on this interval is 4 and the absolute minimum is 0.

4.1.43

a. Let $y = (2x)^x$, so that $\ln y = x \ln (2x)$. Then $\frac{1}{y} y' = \ln(2x) + \frac{x}{2x} \cdot 2 = 1 + \ln(2x)$. Thus $y' = (2x)^x (1 + \ln(2x))$. This quantity is zero when $1 + \ln(2x) = 0$, which occurs when $\ln(2x) = -1$, or $x = \frac{1}{2x} \approx .184$.

b. We have $f(0.1) \approx 0.851$, $f\left(\frac{1}{16}\right) = e^{-1(1/2e)} \approx 0.832$, and $f(1) = 2$. So the absolute minimum is $e^{-1(1/2e)}$ and the absolute maximum is 2.
4.1.44

a. \( f'(x) = e^{-x/2} + xe^{-x/2} \cdot \frac{-1}{2} = e^{-x/2} \left( 1 - \frac{x}{2} \right) \). Because the exponential function is never zero, this expression is zero only when \( \frac{x}{2} = 1 \), or \( x = 2 \). So \( x = 2 \) is the only critical point.

b. We have \( f(0) = 0 \) and \( f(2) = \frac{2}{e} \approx 0.736 \), and \( f(5) \approx 0.410 \). So the absolute maximum of \( f \) on this interval is \( \frac{2}{e} \) and the absolute minimum is 0.

c. 

4.1.45

a. \( f'(x) = 2x - \frac{1}{\sqrt{2-x^2}} \cdot \frac{-2x}{2\sqrt{2-x^2}} = \frac{2-2x^2}{\sqrt{2-x^2}} \). This is zero on \((-1,1)\) when the numerator is zero, which is when \( 2x\sqrt{1-x^2} = 1 \), so when \((4x^2)(1-x^2) = 1\), or \( 4x^4 - 4x^2 + 1 = 0 \). This factors as \((2x^2-1)(2x^2-1) = 0\), so we have solutions for \( x = \pm \sqrt{\frac{1}{2}} \). However, the negative square root is a spurious root, introduced by squaring the numerator, so the only solution is \( x = \sqrt{\frac{1}{2}} \).

b. \( f(-1) = 1 + \pi \), \( f\left(\frac{1}{\sqrt{2}}\right) = \frac{1}{2} + \frac{\pi}{2} \), and \( f(1) = 1 \). So the maximum for \( f \) is \( 1 + \pi \) and the minimum is 1.

c. 

c. 

4.1.46

a. \( f'(x) = \sqrt{2-x^2} + x \cdot \frac{-2x}{2\sqrt{2-x^2}} = \frac{2-2x^2}{\sqrt{2-x^2}} \). This is zero on \((-\sqrt{2}, \sqrt{2})\) when \( 2-2x^2 = 0 \), which occurs for \( x = \pm 1 \).

b. \( f(-\sqrt{2}) = 0 = f(\sqrt{2}) \), \( f(-1) = -1 \), and \( f(1) = 1 \), so the absolute maximum of \( f \) is 1 and the absolute minimum is -1.

c. 

c. 

4.1.47

a. \( f \) will be nondifferentiable at \( x = 1 \) and at \( x = -1 \), where the absolute value function will have a “corner.” Writing \( f \) as a piecewise function gives

\[
f(x) = \begin{cases} 
-2x + 2 - (-x - 1) = -x + 3, & x \leq -1, \\
-2x + 2 - (x + 1) = -3x + 1, & -1 < x \leq 1, \\
2x - 2 - (x + 1) = x - 3, & x > 1. 
\end{cases}
\]

Thus where \( f \) is differentiable we have

\[
f'(x) = \begin{cases} 
-1, & x < -1, \\
-3, & -1 < x < 1, \\
1, & x > 1. 
\end{cases}
\]

So \( f'(x) \) is never zero, and the critical points are \( x = -1 \) and \( x = 1 \), where \( f \) is not differentiable.
b. Since \( f(-2) = 5, \) \( f(-1) = 4, \) \( f(1) = -2, \) and \( f(2) = -1, \) we see that \( f \) has an absolute maximum of 5 at \( x = -2 \) and an absolute minimum of -2 at \( x = 1. \)

c. A graph is

4.1.48

a. \( f \) will be nondifferentiable at the zeros of \( 2x - x^2, \) i.e., at \( x = 0 \) and at \( x = 2, \) since the absolute value function will have a “corner” there. Writing \( f \) as a piecewise function gives

\[
f(x) = \begin{cases} 
  x^2 - 2x, & x \leq 0, \\
  2x - x^2, & 0 < x \leq 2, \\
  x^2 - 2x, & x > 2. 
\end{cases}
\]

Thus where \( f \) is differentiable we have

\[
f'(x) = \begin{cases} 
  2x - 2, & x < 0, \\
  2 - 2x, & 0 < x < 2, \\
  2x - 2, & x > 2. 
\end{cases}
\]

So \( f'(x) = 0 \) at \( x = 1, \) and thus the critical points are \( x = 1 \) together with \( x = 0 \) and \( x = 2 \) (where \( f \) is not differentiable).

b. Since

\[
f(-2) = 8, \quad f(0) = 0, \quad f(1) = 1, \quad f(2) = 0, \quad f(3) = 3,
\]

we see that \( f \) has a maximum of 8 at \( x = -2 \) and a minimum of 0 at both \( x = 0 \) and \( x = 2. \)

c. A graph is
4.1.49

a. $f'(x) = 4x^2 + 10x - 6 = 2(2x^2 + 5x - 3) = 2(x + 3)(2x - 1)$. This is zero when $x = -3$ and when $x = \frac{1}{2}$.

b. $f(-3) = 27$ and $f\left(\frac{1}{2}\right) = -\frac{16}{17}$. At the endpoints we have $f(-4) = \frac{56}{3} \approx 18.7$, and $f(1) = \frac{1}{3}$. The absolute maximum is 27 and the absolute minimum is $-\frac{16}{17}$.

4.1.50

a. $f'(x) = 12x^5 - 60x^3 + 48x = 12x(x^4 - 5x^2 + 4) = 12x(x^2 - 4)(x^2 - 1) = 12x(x+2)(x-2)(x+1)(x-1)$. This is zero for $x = 0$, $x = \pm 2$, and $x = \pm 1$. The critical points occur at 0 and $\pm 1$, since the endpoints are $\pm 2$.

b. $f(\pm 2) = -16$, $f(\pm 1) = 11$, and $f(0) = 0$. The absolute maximum is 11 and the absolute minimum is $-16$.

4.1.51 The stone will reach its maximum height when its velocity is zero, which occurs at the only critical point for this inverted parabola. We have that $v(t) = s'(t) = -32t + 64$, which is zero when $t = 2$. The height at this time is $s(2) = 256$, the maximum height.

4.1.52

a. $R'(x) = -120x + 300$, which is zero when $x = 2.5$. This is the only critical point.

b. The maximum must occur at either an endpoint or a critical point. Note that $R(0) = 0$, $R(2.5) = 375$, and $R(5) = 0$, so the maximum revenue is $375$, which occurs when the price is $2.50$.

4.1.53

a. Note that $P(n) = 50n - 0.5n^2 - 100$, so $P'(n) = 50 - n$, which is zero when $n = 50$. It is clear that this is a maximum, since the graph of $P$ is an inverted parabola.

b. Given a domain of $[0, 45]$, since the only critical point is not in the domain, the maximum must occur at an endpoint. Because $P(0) = -100$, and $P(45) = 1137.50$, he should take 45 people on the tour.

4.1.54 $P(x) = 2x + \frac{128}{x}$, $x > 0$, so $P'(x) = 2 - \frac{128}{x^2}$, which is zero when $x^2 = 64$, or when $x = 8$. So $x = 8$ is the only critical point. This does turn out to be a minimum, so the dimensions of the rectangle with minimal perimeter are $8 \times 8$.

4.1.55

a. False. The derivative $f'(x) = \frac{1}{\sqrt{x}}$ is never zero, and the function has no critical points.

b. False. For example, the function $f(x) = \begin{cases} \sin x & \text{if } -5 \leq x \leq 0, \\ -8 & \text{if } 0 < x \leq 5 \end{cases}$ is not continuous on $[-5, 5]$, but has an absolute maximum of 1.

c. False. For example, the function $f(x) = (x - 2)^3$ satisfies $f''(2) = 0$, but it does not have an extreme value at $x = 2$, since if $x$ is less than 2, then $f(x) < 0$, while if $x$ is greater than 2, then $f(x) > 0$. Thus $x = 2$ is neither a local minimum or a local maximum.

d. True. This follows from the theorems in this section.
4.1.56

a. \( f'(x) = \frac{1}{2\sqrt{x-2}} \), which is never zero on \((2, \infty)\), so there are no critical points.

b. \( f(2) = 0 \) and \( f(6) = 2 \), so the absolute maximum of this function on the given interval is 2 and the absolute minimum is 0.

4.1.57

a. \( f'(x) = 2^x \cdot \ln 2 \cdot \sin x + 2^x \cos x = 2^x ((\ln 2) \cdot \sin x + \cos x) \). Because \( 2^x \) is never zero, this expression is zero only when \((\ln 2) \cdot \sin x + \cos x = 0\), or \( \tan x = \frac{-1}{\ln 2} \). So one solution is \( x = \tan^{-1} \left( \frac{-1}{\ln 2} \right) \approx -0.965 \). And since the tangent function is periodic with period \( \pi \), we also have solutions at approximately \(-0.965 + \pi \approx 2.177\), and \(-0.965 + 2\pi \approx 5.319\). These are the only solutions on the given interval.

b. \( f(-2) \approx -0.227 \), \( f(-0.965) \approx -0.421 \), \( f(2.177) \approx 3.716 \), \( f(5.319) \approx -32.797 \), and \( f(6) \approx -17.883 \). Thus the absolute maximum is about 3.716 and the absolute minimum is about -32.797.

c.

4.1.58

a. \( f'(x) = \frac{1}{2\sqrt{x}} \cdot \left( \frac{x^2}{y^2} - 4 \right) + \sqrt{x} \left( \frac{2x}{y} \right) = \frac{x^2 - 8y}{4y^2} + \frac{4x^2}{10y\sqrt{x}} \). On the given domain, this expression is zero only for \( x = 2 \).

b. Checking the critical points and the interval endpoints we get \( f(0) = 0 \), \( f(2) = -\frac{16\sqrt{2}}{5} \approx -4.526 \), and \( f(4) = -\frac{8}{3} \). So the absolute maximum is 0 and the absolute minimum is \(-\frac{16\sqrt{2}}{5} \approx -4.526 \).

4.1.59

a. \( f'(x) = \sec x \tan x \) which is zero when \( \tan x = 0 \) (since \( \sec x \) is never zero). So we are looking for where \( \frac{\sin x}{\cos x} = 0 \), which is when \( \sin x = 0 \), which is at \( x = 0 \).

b. \( f \left(-\frac{\pi}{4}\right) = \sqrt{2} = f \left(\frac{\pi}{4}\right) \) and \( f(0) = 1 \). So the absolute maximum for \( f \) is \( \sqrt{2} \) and the absolute minimum is 1.
4.1.60

a. \( f'(x) = \frac{1}{3} x^{-2/3} \cdot (x + 4) + x^{1/3} = \frac{x + 4}{3x^{2/3}} + \frac{3x}{3x^{2/3}} = \frac{4x + 4}{3x^{2/3}}. \) This expression is zero when \( x = -1, \) and is undefined when \( x = 0 \) (although 0 is in the domain of \( f \)). So \( x = 0 \) and \( x = -1 \) are the critical points.

b. \( f(-27) = 69, \) \( f(-1) = -3, \) \( f(0) = 0, \) and \( f(27) = 93. \) So the absolute maximum is 93 and the absolute minimum is -3.

4.1.61

a. \( f'(x) = 3x^2 e^{-x} + x^3 \cdot (-e^{-x}) = e^{-x} \cdot (3x^2 - x^3) = e^{-x} \cdot x^2 \cdot (3 - x). \) This expression is zero when \( x = 0 \) and when \( x = 3, \) so \( x = 0 \) and \( x = 3 \) are the critical points.

b. \( f(-1) = -e, \) \( f(0) = 0, \) \( f(3) = \frac{27}{e^3} \approx 1.344, \) and \( f(5) \approx 0.8422. \) So the absolute maximum of \( f \) on the given interval is about 1.344, and the absolute minimum is \(-e \approx -2.718.\)

4.1.62

a. \( f'(x) = \ln \frac{x}{5} + \frac{5}{x} \cdot \frac{1}{5} = 1 + \ln \frac{x}{5}. \) This expression is zero when \( \ln \frac{x}{5} = -1, \) or \( x = e^{-1} = \frac{5}{e} \approx 1.839.\)

b. \( f(0.1) \approx -0.391, \) \( f \left( \frac{5}{e} \right) = -\frac{5}{e} \approx -1.839, \) and \( f(5) = 0. \) So the absolute maximum of \( f \) is 0, and the absolute minimum is \(-\frac{5}{e} \approx -1.839.\)

4.1.63

a. \( f'(x) = \frac{\sqrt{x-4} - 1 - \frac{1}{\sqrt{x-4}}}{\sqrt{x-4}} = \frac{x-4 - 1 - \frac{1}{\sqrt{x-4}}}{x-4}. \) This expression is zero when \( x = 8. \) So \( x = 8 \) is the only critical point.

b. \( f(6) = 3\sqrt{2} = f(12), \) and \( f(8) = 4. \) Note that \( 3\sqrt{2} \approx 4.24 > 4. \) So the absolute maximum of \( f \) on this interval is \( 3\sqrt{2}, \) and the absolute minimum is 4.

4.1.64 \( f'(x) = \frac{\sqrt{x-a} - x}{x-a} \cdot \frac{2\sqrt{x-a}}{2\sqrt{x-a}} = \frac{2x - 2a - x}{2(x-a)^{3/2}} = \frac{x - 2a}{2(x-a)^{3/2}}. \) This is zero when \( x = 2a, \) so there is a critical point at \( x = 2a \) for \( a > 0.\)

4.1.65 \( f'(x) = \sqrt{x-a} + \frac{x}{2\sqrt{x-a}} = \frac{2x - 2a + x}{2\sqrt{x-a}} = \frac{3x - 2a}{2\sqrt{x-a}}. \) This expression is zero when \( x = \frac{2a}{3}; \) however, that number is not in the domain of \( f \) if \( a > 0. \) However, if \( a < 0, \) then \( \frac{2a}{3} \) is in the domain, and thus gives a critical point.

4.1.66 \( f'(x) = 3x^2 - 6ax + 3a^2. \) By the quadratic formula, this is zero when \( x = \frac{6a \pm \sqrt{36a^2 - 36a^2}}{6} = a. \) So the point \( x = a \) is a critical point.

Copyright © 2014 Pearson Education, Inc.
4.1.67 \( f'(x) = x^4 - a^4 \), which is zero when \( x^4 = a^4 \), or \( |x| = a \). So there are critical points at \( x = a \) and at \( x = -a \).

4.1.68

a. \( f'(x) = 24x^3 - 48x^2 - 90x + 54 = 6(4x^3 - 8x^2 - 15x + 9) \), which can be written as \( 6(2x + 3)(2x - 1)(x - 3) \). Note: to get this factorization, we used the rational root theorem to establish candidates for roots, then used trial-and-error to find that \( x = 3 \) was one of the roots, which means that \( x - 3 \) is one of the factors of \( f' \). Then we used long division to determine that \( f'(x) = 6(x - 3)(4x^2 + 4x - 3) \), then factored the quadratic. After factoring, it is clear that the roots of \( f' \) are \( 3, -\frac{3}{2}, \) and \( \frac{1}{2} \), so these are the locations of the critical points.

b. From the graph, it appears that there is a local minimum at \( x = -\frac{3}{2} \), a local maximum at \( x = \frac{1}{2} \), and a local minimum at \( x = 3 \).

c. The local minimum at \( x = 3 \) is also an absolute minimum. The value of the absolute minimum is \(-166 \) and the value of the absolute maximum (which occurs at the left endpoint \( x = -5 \)) is 4378.

4.1.69

a. \( f'(\theta) = 2\cos\theta - \sin\theta \), which is zero when \( \tan\theta = 2 \). So one critical point occurs at \( \theta = \tan^{-1}(2) \approx 1.107 \). And since the tangent function is periodic with period \( \pi \), there are will also be solutions at this number plus or minus integer multiples of \( \pi \). On the given interval, these are located at approximately \( 1.107 - 2\pi \approx -5.176 \), at \( 1.107 - \pi \approx -2.034 \), and at \( 1.107 + \pi \approx 4.249 \).

b. From the graph, it appears that there is a local minimum at about \( \theta = -2.034 \) and at \( \theta = 4.249 \), and there is a local maximum at about \( \theta = -5.176 \), and at about \( \theta = 1.107 \).

c. From the graph, it appears that the local minimum at about \( \theta = -2.034 \) is also an absolute minimum, as is the one at \( \theta = 4.249 \). The local maximum at about \( \theta = -5.176 \), and at about \( \theta = 1.107 \) are also absolute maximums. The value of the absolute maximum appears to be about 2.24 and the value of the absolute minimum appears to be about \(-2.24 \).
4.1.70

a. \( f'(x) = x^{2/3}(-2x) + (4-x^2) \cdot \frac{2}{3\sqrt{x}} = \frac{-6x^2 + 8 - 2x^2}{3\sqrt{x}} = \frac{8 - 6x^2}{3\sqrt{x}} \). This quantity is zero when \( x = \pm 1 \) and it doesn’t exist at \( x = 0 \). So there are critical points at \( x = 0 \) and \( x = \pm 1 \).

b. From the graph, it appears that there is a local minimum at \( x = 0 \), and there is a local maximum of 3 at \( x = \pm 1 \).

c. The absolute minimum occurs at the right endpoint \( x = 4 \) where \( f(4) \approx -30.238 \), and the absolute maximum is 3 (at \( x = \pm 1 \)).

4.1.71

a. \( f'(x) = (x - 3)^{5/3} + (x + 2) \cdot \frac{5}{3} (x - 3)^{2/3} = \frac{(x-3)^{2/3}}{3} (3x - 9 + 5x + 10) = \frac{(x-3)^{2/3}}{3} (8x + 1) \). This is zero when \( x = 3 \) and when \( x = -\frac{1}{8} \).

b. From the graph, it appears that there is a local minimum of about \(-12.52 \) at \( x = -\frac{1}{8} \).

c. The local minimum mentioned above is also an absolute minimum. The absolute maximum occurs at the left endpoint \( x = -4 \), where the value of \( f \) is about 51.23.

4.1.72

a. \( f'(t) = \frac{(t^2+1)(3-3t^2)}{(t^3+1)^2} = \frac{3-3t^2}{(t^3+1)^2} \). This quantity is zero when \( t = \pm 1 \). So there are critical points at \( x = \pm 1 \).

b. From the graph, it appears that there is a local minimum at \( t = -1 \), and a local maximum at \( t = 1 \).

c. The local minimum at \( t = -1 \) gives rise to an absolute minimum value of \(-1.5 \) , and the local maximum at \( t = 1 \) gives rise to an absolute maximum value of 1.5.

4.1.73

a. \( h'(x) = (x^2 + 2x - 3)(1 - (5-x)(2x+2)) = \frac{x^2 - 10x - 7}{(x^2 + 2x - 3)^2} \).

By the quadratic formula, the numerator is zero (making the quotient zero) when \( x = \frac{-10 \pm \sqrt{100 - 4(-7)}}{2} = 5 \pm \frac{1}{2} \sqrt{128} = 5 \pm 4\sqrt{2} \). Note that \( 5 + 4\sqrt{2} \) isn’t in the domain, so the only critical point is at \( x = 5 - 4\sqrt{2} \).

b. From the graph, it appears that the one critical point mentioned above yields a local maximum.

c. The function has no absolute maximum and no absolute minimum on the given interval.
4.1.74

Note that
\[ f(x) = \begin{cases} 
3 - x - x - 2 = 1 - 2x, & -4 \leq x \leq -2, \\
3 - x + x + 2 = 5, & -2 \leq x \leq 3, \\
x - 3 + x + 2 = 2x - 1, & 3 \leq x \leq 4.
\end{cases} \]

There is an absolute maximum of 9 and an absolute minimum of 5. The absolute maximum occurs at \( x = -4 \), and the absolute minimum occurs at all of the values of \( x \) in \([-2, 3]\).

4.1.75

Note that
\[ g(x) = \begin{cases} 
3 - x + 2x + 2 = x + 5, & -2 \leq x \leq -1, \\
3 - x - 2x - 2 = 1 - 3x, & -1 \leq x \leq 3.
\end{cases} \]

There is an absolute maximum of 4 and an absolute minimum of -8. The absolute maximum occurs at \( x = -1 \), and the absolute minimum occurs at \( x = 3 \).

4.1.76

\( S'(x) = 4x - \frac{200}{x} = \frac{4x^3 - 200}{x^2}, \) which is zero when \( x^3 = 50 \), so for \( x = \sqrt[3]{50} \approx 3.684 \). This critical point does indeed yield a minimum (which can be determined via a graphing calculator, or by techniques in an upcoming section). So the minimum surface area is given by \( S(\sqrt[3]{50}) \approx 81.433, \) when the box has dimensions \( \sqrt[3]{50} \times \sqrt[3]{50} \times \sqrt[3]{50} \).

4.1.77

a. Because distance is rate times time, the time will be distance over rate. The swim distance is given by \( \sqrt{2500 + x^2} \) meters, so the time for swimming is \( \frac{\sqrt{2500 + x^2}}{2} \). For running, the distance is 50 - \( x \), so the time is \( \frac{50 - x}{4} \). Thus we have \( T(x) = \frac{\sqrt{2500 + x^2}}{2} + \frac{50 - x}{4} \).

b. \( T'(x) = \frac{1}{2} \left( x^2 + 2500 \right)^{-1/2} \cdot 2x - \frac{1}{4} = \frac{x}{\sqrt{x^2 + 2500}} - \frac{1}{4} \). This expression is zero when \( \frac{x^2}{x^2 + 2500} = \frac{1}{4} \), so when \( 4x^2 = x^2 + 2500 \), which occurs when \( x^2 = \frac{2500}{3} \). So \( x = \sqrt[3]{2500} \approx 28.868 \).

c. \( T(0) = 37.5, T(28.868) \approx 34.151, \) and \( T(50) = 25\sqrt{2} \approx 35.355 \). The absolute minimum occurs at the only critical point. The minimal crossing time is approximately 34.151 seconds.
4.1.78

a. \( f'(x) = 2x \), so \( f'(a) = 2a \) is the slope at \( x = a \).
The slope of the line perpendicular is \(-\frac{1}{2a}\).

b. We are looking for a line through \((a, a^2)\) with slope \(-\frac{1}{2a}\), so the equation is given by 
\[
y = -\frac{1}{2a} (x - a) + a^2.
\]

c. To find \( B \)'s position, we find where the parabola and the line from the last part of this problem intersect. So we seek the solution to 
\[
x^2 = -\frac{1}{2a} x + \frac{1}{2} + a^2, \text{ or } x^2 + \frac{1}{2a} x + (-a^2 - \frac{1}{2}) = 0.
\]
By the quadratic formula, we find that one root is of course \( x = a \), while the other is 
\[
x = \frac{-a^2 + 1}{2a}.
\]
Thus \( B \) is the point \((\frac{-a^2 + 1}{2a}, \left(\frac{a^2 + 1}{2a}\right)^2)\).

d. 
\[
F(a) = \left(a - \left(\frac{-2a^2 - 1}{2a}\right)\right)^2 + \left(a^2 - \left(\frac{2a^2 + 1)^2}{4a}\right)\right)^2
\]
\[
= \frac{(4a^2 + 1)^2}{4a^2} + \left(\frac{4a^4 - 4a^2 - 1}{4a^2}\right)^2
\]
\[
= \frac{64a^6 + 48a^4 + 12a^2 + 1}{16a^4}
\]
\[
= \frac{(4a^2 + 1)^3}{16a^4}.
\]

e. \( F'(a) = \frac{16a^4 \cdot 3(4a^2 + 1)^2 \cdot 8a - (4a^2 + 1)^3 \cdot 64a^3}{256a^8} = \frac{64a^3 \cdot (4a^2 + 1)^2 \cdot (6a^2 - (4a^2 + 1))}{256a^8} = \frac{(4a^2 + 1)^2 \cdot (2a^2 - 1)}{4a^8} \).
The critical point of \( F \) for \( a > 0 \) occurs at \( a = \sqrt{0.5} \).

f. The value of \( F \) at the critical point is \( F(\sqrt{0.5}) = \frac{27}{4} \). The points are at \( A = (\sqrt{0.5}, 0.5) \) and \( B = (-\sqrt{2}, 2) \). Finally, with \( a = \sqrt{0.5} \), we have 
\[
L = \sqrt{F(a)} = \frac{\sqrt{27}}{2} = \frac{3\sqrt{3}}{2}.
\]

4.1.79

a. Note that since there is a local extreme value at \( 2 \) for \( f \) and since \( f \) is differentiable everywhere, we must have \( f'(2) = 0 \).
\[
g(2) = 2f(2) + 1 = 1.
\]
\[
h(2) = 2f(2) + 2 + 1 = 3.
\]
\[
g'(2) = 2 \cdot f'(2) + f(2) = 0.
\]
\[
h'(2) = 2f'(2) + f(2) + 1 = 1.
\]

b. \( h \) doesn't, since its derivative isn't zero at \( x = 2 \). However \( g \) might: for example, if \( f(x) = (x - 2)^2 \) 
then \( g(x) = x(x - 2)^2 + 1 \) has a local minimum at \( x = 2 \).

4.1.80 Because a parabola either opens up and has a minimum at its vertex, or open down and has a maximum at its vertex, it will always have exactly one extreme value. We have \( f'(x) = 2ax + b \), which is zero when \( x = -\frac{b}{2a} \), so that one critical point is the location of the vertex which gives the extreme point.
4.1.81
a. Because of the symmetry about the y-axis for an even function, a minimum at \( x = c \) will correspond to a minimum at \( x = -c \) as well.

b. Because of the symmetry about the origin, a minimum at \( x = c \) will correspond to a maximum at \( x = -c \). It is helpful to think about the symmetry about the origin as being the result of flipping about the y-axis and then flipping about the x-axis.

4.1.82
a. \( f(-x) = \frac{-x}{(1-x^2)^n} = -\frac{x}{(x^2+1)^n} = -f(x) \).

b. \( f'(x) = \frac{(x^2+1)^n - x \cdot n(x^2+1)^{n-1} \cdot 2x}{(x^2+1)^{2n}} = \frac{(x^2+1)^{n-1} \cdot [x^2+1 - 2x^2n]}{(x^2+1)^{2n}} = \frac{1-(2n-1)x^2}{(x^2+1)^{n+1}} \). This quantity is zero when \( x^2 = \frac{1}{2n-1} \), so \( x = \pm \frac{1}{\sqrt{2n-1}} \) are critical points.

c. The maximum value occurs at the positive critical number. The value of the maximum is given by \( \frac{1}{(\sqrt{\frac{1}{2n-1}})^{n+1}} = \frac{1}{\sqrt{2n-1}} \cdot (1 - \frac{1}{2n})^n \). As \( n \to \infty \), this quantity has limit 0.

d. Here are the graphs for \( n = 1, n = 2 \), and \( n = 3 \).

4.1.83
a. If \( f(c) \) is a local maximum, then when \( x \) is near \( c \) but not equal to \( c \), \( f(c) \geq f(x) \), so \( f(x) - f(c) \leq 0 \).

b. When \( x \) is near to \( c \) but a little bigger than \( c \), \( x - c > 0 \). So in this case, \( \frac{f(x) - f(c)}{x - c} \leq 0 \), since the numerator is negative (or 0) and the denominator is positive.

Thus, \( \lim_{x \to c^+} \frac{f(x) - f(c)}{x - c} = f'(c) \leq 0 \)

c. When \( x \) is near to \( c \) but a little smaller than \( c \), \( x - c < 0 \). So in this case, \( \frac{f(x) - f(c)}{x - c} \geq 0 \), since the numerator is negative (or 0) and the denominator is negative, making the quotient positive (or 0).

Thus, \( \lim_{x \to c^-} \frac{f(x) - f(c)}{x - c} = f'(c) \geq 0 \).

d. From the above, we have that \( f'(c) \leq 0 \) and \( f'(c) \geq 0 \), so \( f'(c) = 0 \).

4.2 What Derivatives Tell Us
4.2.1 If \( f' \) is positive on an interval, \( f \) is increasing on that interval. If \( f' \) is negative on an interval, \( f \) is decreasing on that interval.

4.2.2 The First Derivative Test can be used to tell whether or not a critical point is a local maximum or minimum, as follows: If \( x = c \) is a critical point, we investigate the sign of \( f' \) for points that are just to the left and just to the right of \( c \). If the sign of \( f' \) changes from positive to negative, then \( f \) is changing from increasing to decreasing at \( c \), so there is a local maximum at \( c \). If the signs of \( f' \) are changing from negative.
to positive, then \( f \) is changing from decreasing to increasing at \( c \), so there is a local minimum at \( c \). If the signs of \( f' \) are the same on either side of \( c \), then there is neither kind of local extremum at \( x = c \).
Note that if we find all of the critical points of \( f \), and if the domain of \( f \) is an interval or union of intervals, then the critical points naturally divide up the domain into intervals on which we can check the sign of \( f' \) and look for places where the sign changes.

4.2.3

One such example is \( f(x) = x^3 \) at \( x = 0 \).

4.2.4
Suppose that \( c \) is the kind of critical point where \( f'(c) = 0 \). We can sometimes tell whether or not there is a local extremum at \( x = c \) by simply looking at the sign of \( f''(c) \). If \( f''(c) > 0 \), we know that \( f(c) \) is a local minimum, and if \( f''(c) < 0 \), we know that \( f(c) \) is a local maximum. One useful way to remember this is to also think about concavity, and imagine a nice parabola. If the second derivative is positive at a critical number, then the graph is concave up there, corresponding to a minimum. If the second derivative is negative, then the graph is concave down, corresponding to a maximum.
Note that if \( f''(c) = 0 \), it does not necessarily follow that there isn’t a local extremum at \( x = c \). The test doesn’t tell us anything for sure in this case.

4.2.5
If \( f'' \) is positive on \( I \), then the slope of the derivative is increasing everywhere on \( I \). Since the derivative is the slope of the tangent lines, this means that the slopes of the tangent lines to the graph of \( f \) are increasing on \( I \).

4.2.6

The second derivative is positive to the left of the inflection point, and negative to the right.

4.2.7
An inflection point is a point on the graph of a function where the concavity changes. Thus, if \( (c, f(c)) \) is an inflection point, either \( f''(x) < 0 \) for \( x \) a little less than \( c \) and \( f''(x) > 0 \) for \( x \) a little bigger than \( c \), or vice versa.

4.2.8

\( f(x) = x^4 \) has this property at 0. Note that \( f''(x) = 12x^2 \), which is 0 at \( x = 0 \), but the function doesn’t have an inflection point there.
4.2.9

Yes, for example, consider \( f(x) = 100 - x^2 \) on the interval \((-8, 0)\). It is above the \( x \) axis, increasing, and concave down on that interval.

4.2.10 Because the Second Derivative Test is inconclusive, the First Derivative Test should be used in this case.

4.2.11

Such a function would be decreasing until \( x = 2 \), then increasing until \( x = 5 \), and then decreasing again after that.

4.2.12

Such a function would be increasing on \((-\infty, -1)\), and decreasing on \((-1, \infty)\). It should have a point of non-differentiability at \( x = -1 \).

4.2.13

Such a function has roots at \( x = 0 \) and \( x = 2 \) and extrema at \( x = 0, 2, \) and 4. The function should never go below the \( x \) axis.
4.2.14

Such a function is never decreasing, but is flat at $-2$, $2$, and $4$.

4.2.15

$f'(x) = -2x$, which is zero exactly when $x = 0$. On $(-\infty, 0)$ we note that $f' > 0$, so that $f$ is increasing on this interval. On $(0, \infty)$, we note that $f' < 0$, so $f$ is decreasing on this interval.

4.2.16

$f'(x) = 2x$, which is zero exactly when $x = 0$. On $(-\infty, 0)$ we note that $f' < 0$, so that $f$ is decreasing on this interval. On $(0, \infty)$, we note that $f' > 0$, so $f$ is increasing on this interval.

4.2.17

$f'(x) = 2(x-1)$, which is zero exactly when $x = 1$. On $(-\infty, 1)$ we note that $f' < 0$, so that $f$ is decreasing on this interval. On $(1, \infty)$, we note that $f' > 0$, so $f$ is increasing on this interval.
4.2.20

\( f'(x) = 3x^2 + 4 \), which is always positive, because it is always 4 or greater. So \( f \) is increasing on \((-\infty, \infty)\).

4.2.21

\( f'(x) = 1 - 2x \), which is 0 when \( x = \frac{1}{2} \). On \((-\infty, \frac{1}{2}) \) \( f' > 0 \) so \( f \) is increasing on this interval, while on \( (\frac{1}{2}, \infty) \) \( f' < 0 \), so \( f \) is decreasing on this interval.

4.2.22

\( f'(x) = 4x^3 - 12x^2 + 8x = 4x(x^2 - 3x + 2) = 4x(x - 2)(x - 1) \), which is 0 when \( x \) is 0, 1, or 2. On \((-\infty, 0) \) \( f' < 0 \) so \( f \) is decreasing. On \((0, 1) \), \( f' > 0 \) so \( f \) is increasing, on \((1, 2) \) \( f' < 0 \) so \( f \) is decreasing, and on \((2, \infty) \) \( f' > 0 \) so \( f \) is increasing.

4.2.23

\( f'(x) = -x^3 + 3x^2 - 2x = -x(x^2 - 3x + 2) = -x(x - 1)(x - 2) \). This is zero when \( x = 0 \), \( x = 1 \), and \( x = 2 \). Note that \( f'(-1) > 0 \), and \( f'(1.5) > 0 \), while \( f'(0.5) < 0 \), and \( f'(3) < 0 \). So \( f \) is increasing on \((-\infty, 0) \) and on \((1, 2) \), while it is decreasing on \((0, 1) \) and on \((2, \infty) \).
4.2.24

\[ f'(x) = 10x^4 - 15x^3 + 5x^2 = 5x^2(2x^2 - 3x + 1) = 5x^2(x - 1)(2x - 1). \]

This is zero when \( x = 0, x = 1 \) and \( x = \frac{1}{2} \). Note that \( f'(-1) > 0 \) and \( f' \left( \frac{1}{2} \right) > 0 \). Because the given function is continuous, we can combine the intervals and conclude that \( f \) is increasing on \(( -\infty, \frac{1}{2} )\). Also, \( f' \left( \frac{1}{2} \right) < 0 \), so \( f \) is decreasing on \( \left( \frac{1}{2}, 1 \right) \), and \( f' (2) > 0 \), so \( f \) is increasing on \( (1, \infty) \).

4.2.25

\[ f'(x) = 2x \ln x^2 + x^2 \cdot \frac{1}{2x} \cdot 2x = 2x(\ln x^2 + 1). \]

This is zero when \( x = 0 \), but 0 is not in the domain of \( f \). Also \( f'(x) = 0 \) when \( \ln x^2 + 1 = 0 \). For \( x > 0 \), this occurs when \( 2 \ln x + 1 = 0 \), which occurs when \( \ln x = -\frac{1}{2} \), or \( x = \frac{1}{\sqrt{e}} \). By symmetry, we also have that \( f'(x) \) is zero for \( x = -\frac{1}{\sqrt{e}} \). Note that \( \frac{1}{\sqrt{e}} \approx 0.6 \), and that \( f'(-1) < 0 \), \( f' \left( \frac{1}{2} \right) > 0 \), \( f' \left( \frac{1}{2} \right) < 0 \), and \( f' (1) > 0 \). Thus, \( f \) is decreasing on \( (-\infty, -\frac{1}{\sqrt{e}}) \) and on \( (0, \frac{1}{\sqrt{e}}) \), and is increasing on \( \left( \frac{1}{\sqrt{e}}, 0 \right) \) and on \( \left( \frac{1}{\sqrt{e}}, \infty \right) \).

4.2.26

\[ f'(x) = \frac{(e^{2x}+1)e^{-x}(2e^{2x})}{(e^{2x}+1)^2} = e^x(1-e^x). \]

This is zero when \( e^x = 1 \), which occurs when \( x = 0 \). Note that \( f'(-1) > 0 \) and \( f'(1) < 0 \), so \( f \) is increasing on \( (-\infty, 0) \) and decreasing on \( (0, \infty) \).

4.2.27 \( f'(x) = -9 \sin 3x \), which is 0 for \( 3x = -3\pi, -2\pi, -\pi, 0, \pi, 2\pi, \) and \( 3\pi \), which corresponds to \( x = -\pi, -\frac{2\pi}{3}, -\frac{\pi}{3}, 0, \frac{\pi}{3}, \frac{2\pi}{3}, \) and \( \pi \). Note that \( f' \left( \frac{3\pi}{2} \right) = 9 > 0 \), \( f' \left( \frac{\pi}{2} \right) = -9 < 0 \), \( f' \left( -\frac{\pi}{2} \right) = 9 > 0 \), \( f' \left( \frac{\pi}{2} \right) = -9 < 0 \). Thus \( f \) is increasing on \( (-\pi, -\frac{3\pi}{2}) \), on \( (-\frac{\pi}{2}, 0) \), and on \( \left( 0, \frac{\pi}{2} \right) \), while \( f \) is decreasing on \( \left( -\frac{\pi}{3}, -\frac{\pi}{2} \right) \), on \( (0, \frac{\pi}{3}) \), and on \( \left( \frac{2\pi}{3}, \pi \right) \).

4.2.28 \( f'(x) = 2(\cos x)(-\sin x) = -\sin 2x \). This is 0 for \( 2x = -2\pi, -\pi, 0, \pi, 2\pi \), which corresponds to \( x = -\pi, -\frac{\pi}{2}, 0, \frac{\pi}{2}, \) and \( \pi \). Note that \( f' \left( \frac{3\pi}{4} \right) = -1 < 0 \), \( f' \left( -\frac{\pi}{4} \right) = 1 > 0 \), \( f' \left( \frac{\pi}{4} \right) = -1 < 0 \), and \( f' \left( \frac{3\pi}{4} \right) = 1 > 0 \). So \( f \) is decreasing on \( (-\pi, -\frac{\pi}{2}) \) and on \( (0, \frac{\pi}{2}) \), and is increasing on \( (-\frac{\pi}{2}, 0) \) and on \( \left( \frac{\pi}{2}, \pi \right) \).

4.2.29 \( f'(x) = \frac{4}{x^{1/3}} \), which is 0 only for \( x = 0 \). Note that \( f'(-1) = -\frac{4}{3} < 0 \) and \( f'(1) = \frac{4}{3} > 0 \), so \( f \) is decreasing on \( (-\infty, 0) \) and increasing on \( (0, \infty) \).

4.2.30 \( f'(x) = 2x \sqrt{9-x^2} + x^2 \cdot \frac{1}{2\sqrt{9-x^2}} \cdot (-2x) = \frac{2x(9-x^2)}{\sqrt{9-x^2}} \). This is zero when \( x = 0 \), and when \( x = \pm \sqrt{9} \). Note that \( \sqrt{9} \approx 2.4 \). Also note that \( f'(-2.7) > 0 \), \( f'(-1) < 0 \), \( f'(1) > 0 \) and \( f'(2.7) < 0 \). Thus, \( f \) is increasing on \( (-3, -\sqrt{9}) \) and on \( (0, \sqrt{9}) \), and is decreasing on \( (-\sqrt{9}, 0) \) and on \( (\sqrt{9}, 3) \).
4.2.31 \( f'(x) = \frac{1}{x^2 + 1} \), which is always positive, so \( f \) is increasing on \((-\infty, \infty)\).

4.2.32 \( f'(x) = \frac{1}{x} \), which is positive on the interval \((0, \infty)\) and which is negative on \((-\infty, 0)\). Thus, \( f \) is increasing on \((0, \infty)\) and decreasing on \((-\infty, 0)\).

4.2.33 \( f'(x) = -60x^4 + 300x^3 - 240x^2 = -60x^2(x^2 - 5x + 4) = -60x^2(x - 4)(x - 1) \). This is 0 for \( x = 0, x = 1, \) and \( x = 4 \). Note that \( f'(-1) = -600 < 0, f' \left( \frac{1}{2} \right) = -26.25 < 0, f'(2) = 480 > 0, \) and \( f'(5) = -6000 < 0. \) Thus \( f \) is increasing on \((1, 4)\) and is decreasing on \((-\infty, 1)\) and on \((4, \infty)\).

4.2.34 \( f'(x) = 2x - \frac{2}{x^2} = \frac{2(x^3 - 1)}{x^2} \) which is 0 for \( x = 1 \). Note that the domain of \( f \) is \((0, \infty)\) and that
\[ f' \left( \frac{1}{2} \right) = -3 < 0 \] and \( f'(2) = 3 > 0, \) so \( f \) is decreasing on \((0, 1)\) and increasing on \((1, \infty)\).

4.2.35 \( f'(x) = -8x^3 + 2x = -2x(4x^2 - 1) = -2x(2x + 1)(2x - 1) \). This is zero for \( x = 0 \) and \( x = \pm \frac{1}{2} \). Note that \( f'(-1) > 0, f' \left( \frac{1}{2} \right) < 0, f' \left( \frac{1}{4} \right) > 0, \) and \( f'(1) < 0, \) so \( f \) is increasing on \((-\infty, -\frac{1}{2})\) and on \((0, \frac{1}{2})\), while it is decreasing on \((-\frac{1}{2}, 0)\) and on \((\frac{1}{2}, \infty)\).

4.2.36 \( f'(x) = x^3 - 8x^2 + 15x = x(x^2 - 8x + 15) = x(x - 5)(x - 3) \). This is zero when \( x = 0, x = 3, \) and \( x = 5 \). Note that \( f'(-1) < 0, f'(1) > 0, f'(4) < 0, \) and \( f'(6) > 0. \) Thus \( f \) is increasing on \((0, 3)\) and on \((5, \infty)\), while it is decreasing on \((-\infty, 0)\) and on \((3, 5)\).

4.2.37 We have \( f'(x) = e^{-x^2/2} + xe^{-x^2/2} - (x) = (1 - x^2)e^{-x^2/2}. \) This is zero only when \( x = \pm 1. \) Note that \( f'(-2) = -3e^{-2} < 0, f'(0) = 1 > 0, \) and \( f'(2) = -3e^{-2} < 0. \) Thus \( f \) is decreasing on \((-\infty, -1)\) and \((1, \infty)\) and increasing on \((-1, 1)\).

4.2.38 \( f'(x) = \frac{\frac{1}{x^2} - \left( \frac{x^2}{x^2 + 2} \right) \cdot \frac{2x}{x^2 + 2} \cdot \frac{2 - x^2}{(x^2 + 2)^2}}{1 + \left( \frac{x}{x^2 + 2} \right)^2} - \frac{1}{x^2 + 2} \). Note that the first factor is always positive, so the expression is zero exactly when \( 2 - x^2 = 0, \) so only at \( \pm \sqrt{2}. \) Note that \( f'(0) > 0 \) while \( f'(\pm 2) < 0, \) so \( f \) is increasing on \((-\sqrt{2}, \sqrt{2})\) and decreasing on \((-\infty, -\sqrt{2})\) and on \((\sqrt{2}, \infty)\).

4.2.39

a. \( f'(x) = 2x, \) so \( x = 0 \) is the only critical point.

b. Note that \( f' < 0 \) for \( x < 0 \) and \( f' > 0 \) for \( x > 0, \) so \( f \) has a local minimum of \( f(0) = 3 \) at \( x = 0. \)

c. Note that \( f(-3) = 12, f(0) = 3 \) and \( f(2) = 7, \) so the absolute maximum is 12 and the absolute minimum is 3.

4.2.40

a. \( f'(x) = -2x - 1, \) which exists everywhere and is zero only for \( x = -\frac{1}{2}, \) so that is the only critical point.

b. Note that \( f'(-2) = 3 > 0 \) and \( f'(0) = -1 < 0, \) so \( f \) has a local maximum of \( f \left( -\frac{1}{2} \right) = \frac{9}{4} \) at \( x = -\frac{1}{2}. \)

c. Note that \( f(-4) = -10 \) and \( f(4) = -18, \) so the absolute maximum is \( \frac{9}{4} \) at \( x = -\frac{1}{2} \) and the absolute minimum is \( -18 \) at \( x = 4. \)

4.2.41

a. \( f'(x) = x \cdot \frac{1}{2} \left( 9 - x^2 \right)^{-1/2} \cdot (-2x) + \sqrt{9 - x^2} \cdot 1 = \frac{9 - 2x^2}{\sqrt{9 - x^2}}, \) which exists everywhere on \((-3, 3)\) and is zero only for \( x = \pm \frac{3}{\sqrt{2}}, \) so those are the only critical points.

b. Note that \( f'(-2.5) < 0, f'(0) > 0, \) and \( f'(2.5) < 0, \) so \( f \) has a local minimum of \( f \left( -\frac{3}{\sqrt{2}} \right) = -4.5 \) and a local maximum of \( f \left( \frac{3}{\sqrt{2}} \right) = 4.5. \)

c. Note that \( f(-3) = 0 = f(3). \) So the absolute maximum is 4.5 at \( x = \frac{3}{\sqrt{2}} \) and the absolute minimum is \(-4.5 \) at \( x = -\frac{3}{\sqrt{2}}. \)
4.2.42
a. \( f'(x) = 6x^2 + 6x - 12 = 6(x + 2)(x - 1), \) which exists everywhere and is 0 at \( x = -2 \) and \( x = 1, \) so those are the critical points.

b. Note that \( f'(-3) > 0, f'(-1.5) < 0, \) and \( f'(2) > 0, \) so \( f \) has a local minimum at \( x = 1 \) of \( f(1) = -6 \) and a local maximum at \( x = -2 \) of \( f(-2) = 21. \)

c. Note that \( f(-2) = 21 \) and \( f(4) = 129, \) so the absolute maximum of \( f \) on \([-2, 4]\) is 129 and the absolute minimum is -6.

4.2.43
a. \( f'(x) = -3x^2 + 9, \) which is zero when \( 9 = 3x^2, \) or \( x^2 = 3. \) So the critical points are at \( x = \pm \sqrt{3}. \)

b. Note that \( f'(-2) < 0, f'(0) > 0, \) and \( f'(2) < 0, \) so there is a local minimum of \( f(-\sqrt{3}) = -6\sqrt{3} \) and a local maximum of \( f(\sqrt{3}) = 6\sqrt{3}. \)

c. There is an absolute maximum of 28 at \( x = -4 \) and an absolute minimum of \(-6\sqrt{3} \) at \( x = -\sqrt{3}. \)

4.2.44
a. \( f'(x) = 10x^4 - 20x^3 - 30x^2 = 10x^2(x^2 - 2x - 3) = 10x^2(x + 1)(x - 3). \) This is zero for \( x = 0, x = -1, \) and \( x = 3. \)

b. Note that \( f'(-2) > 0, f'(0) > 0, \) and \( f'(4) > 0. \) So there is a local maximum of \( f(-1) = 7 \) and a local minimum of \( f(3) = -185. \) There isn't any sort of extremum at \( x = 0. \)

c. The local minimum value of \(-185 \) is an absolute minimum, and the absolute maximum is \( f(4) = 132. \)

4.2.45
a. \( f'(x) = x^{2/3} + (x - 5), \) \( \frac{2}{3}x^{-1/3} = \frac{5x - 10}{3x^{4/3}}, \) which is undefined at \( x = 0 \) and is 0 at \( x = 2. \) So these are the two critical points.

b. Note that \( f'(-1) > 0, f'(1) < 0, \) and \( f'(3) > 0. \) Thus \( f \) has a local maximum at \( x = 0, \) where the value is \( f(0) = 0, \) and a local minimum at \( x = 2, \) where the value is \( f(2) = -3\sqrt[4]{4} \approx -4.762. \)

c. Note that \( f(-5) = -10\sqrt{25}, f(0) = 0, \) and \( f(5) = 0, \) so the absolute maximum of \( f \) on \([-5, 5]\) is 0 and the absolute minimum is \(-10\sqrt{25} \approx -29.240. \)

4.2.46 First note that even though the interval given is \([-4, 4]\), the function isn’t defined at \( x = \pm 1, \) so we will assume that the given domain is \([-4, -1) \cup (-1, 1) \cup (1, 4].\)

a. \( f'(x) = \frac{(x^2 - 1) \ln x - x^2}{(x + 1)^2} = -\frac{2x}{(x + 1)^2}, \) which is 0 only at \( x = 0. \)

b. Note that \( f'(-2) > 0 \) and \( f'\left(-\frac{1}{2}\right) > 0, \) and \( f'(1/2) < 0 \) and \( f'(2) < 0, \) so \( f \) is increasing on \((-4, -1)\) and on \((-1, 0),\) while it is decreasing on \((0, 1)\) and on \((1, 4).\) There is a local maximum of 0 at \( x = 0. \)

c. Because \( f \) becomes arbitrarily large as \( x \) approaches 1 from the left, and arbitrarily large in the negative sense as \( x \) approaches 1 from the right, it has no absolute extrema.

4.2.47
a. \( f'(x) = \frac{\sqrt{x}}{x} + \ln x = \frac{2\ln x}{2\sqrt{x}}. \) This is defined everywhere on \((0, \infty)\) and is 0 only at \( x = e^{-2}. \)

b. Note that \( f' < 0 \) on \((0, \frac{1}{e})\) and \( f' > 0 \) on \((\frac{1}{e}, \infty),\) so there is a local minimum at \( x = \frac{1}{e}. \)

c. Because there is only one critical point, the local minimum at \( x = \frac{1}{e} \) yields an absolute minimum of \( f\left(\frac{1}{e}\right) = -\frac{2}{e} \approx -0.736. \) There is no absolute maximum because \( f \) increases without bound as \( x \to \infty. \)

4.2.48
a. \( f'(x) = \frac{1}{x^2 + 1} - 3x^2 = \frac{-3x^4 - 3x^2 + 1}{x^2 + 1}. \) This is 0 when \(-3x^4 - 3x^2 + 1 = 0. \) Letting \( u = x^2, \) we seek roots of \(-3u^2 - 3u + 1 = 0. \) Using the quadratic formula and solving for \( u, \) and then writing in terms of \( x, \) we have the roots \( x = \pm \sqrt[6]{\frac{1}{6}(\sqrt{21} - 3) \approx \pm 0.514}. \) Let \( r_1 = -\sqrt[6]{\frac{1}{6}(\sqrt{21} - 3)} \) and \( r_2 = \sqrt[6]{\frac{1}{6}(\sqrt{21} - 3)}. \)
b. Note that \( f' < 0 \) on \((-1, r_1)\), \( f' > 0 \) on \((r_1, r_2)\), and \( f' < 0 \) on \((r_2, 1)\). Thus there is a local minimum at \( r_1 \) and a local maximum at \( r_2 \).

c. Note that \( f(-1) = -\frac{\pi}{4} + 1 \approx 0.215 \) and \( f(1) = \frac{\pi}{4} - 1 \approx -0.215 \), and \( f(r_1) \approx -0.339 \) and \( f(r_2) \approx 0.339 \).

The absolute maximum is \( f(r_2) \approx 0.339 \) and the absolute minimum is \( f(r_1) \approx -0.339 \).

### 4.2.49

\( f'(x) = -xe^{-x} + e^{-x} = e^{-x}(1-x) \), which is 0 only for \( x = 1 \). Note that \( f \) is continuous on \((-\infty, \infty)\) and contains only one critical point.

Note that \( f' > 0 \) for \( x < 1 \) and \( f' < 0 \) for \( x > 1 \). So there is a local maximum of \( f(1) = \frac{1}{4} \) at \( x = 1 \). The local maximum of \( \frac{1}{4} \) at \( x = 1 \) is an absolute maximum. There is no absolute minimum, because the function is unbounded in the negative direction as \( x \to -\infty \).

### 4.2.50

Note that \( f \) is continuous on \((0, \infty)\).

\[ f'(x) = 4 - \frac{1}{2x^2} = \frac{8x^{3/2} - 1}{2x^{3/2}} \], which exists for \( x > 0 \). This quantity is 0 for \( x = \frac{1}{2} \). So \( f \) has only one critical point on \((0, \infty)\).

Note that \( f' < 0 \) on \((0, \frac{1}{4})\) and \( f' > 0 \) on \((\frac{1}{4}, \infty)\). So there is a local minimum of \( f \left( \frac{1}{4} \right) = 3 \) at \( x = \frac{1}{4} \).

The local minimum of 3 at \( x = \frac{1}{4} \) is an absolute minimum. There is no absolute maximum, because the function is unbounded as \( x \to \infty \).

### 4.2.51

Note that \( A \) is continuous on \((0, \infty)\).

\[ A'(r) = -\frac{24}{r^2} + 4\pi r = \frac{4\pi r^3 - 24}{r^2} \], which is 0 for \( r = \sqrt[3]{6} \), so there is only one critical point on the stated interval.

Note that \( A' < 0 \) on \((0, \sqrt[3]{6})\) and \( A' > 0 \) on \((\sqrt[3]{6}, \infty)\). So there is a local minimum of \( A \left( \sqrt[3]{6} \right) = 36\sqrt[3]{6} \).

The local minimum of 3 at \( x = \frac{1}{4} \) is an absolute minimum. There is no absolute maximum, because \( A \) is unbounded as \( r \to \infty \).

### 4.2.52

Note that \( f \) is continuous on \((-\infty, 3)\).

\[ f'(x) = -\frac{x}{2\sqrt{3-x}} + \sqrt{3-x} = \frac{-3x + 6}{2\sqrt{3-x}} \], which is 0 only for \( x = 2 \), so there is only one critical point on the stated interval. Note that \( f' > 0 \) for \( x < 2 \) and \( f' < 0 \) on \((2, 3)\). Thus there is a local maximum of \( f(2) = 2 \) which is also an absolute maximum. There is no absolute minimum, because the function is unbounded in the negative direction as \( x \to -\infty \).

### 4.2.53

The function sketched should be increasing and concave up everywhere.

### 4.2.54

The function sketched should be concave up everywhere, decreasing for \( x < 0 \) and increasing for \( x > 0 \).
4.2.55

The function sketched should be decreasing everywhere, concave down for $x < 0$, and concave up for $x > 0$.

4.2.56

The function sketched should be decreasing everywhere, concave up for $x < 0$, and concave down for $x > 0$.

4.2.57 $f'(x) = 4x^3 - 6x^2$, so $f''(x) = 12x^2 - 12x = 12x(x-1)$. Note that $f''$ is zero when $x = 0$ and $x = 1$, so these are potential inflection points. Also note that $f''(-1) > 0$, $f''(0.5) < 0$, and $f''(2) > 0$, so $f$ is concave up on $(-\infty, 0)$ and on $(1, \infty)$, and is concave down on $(0, 1)$. There are inflection points at $(0, 1)$ and $(1, 0)$.

4.2.58 $f'(x) = -4x^3 - 6x^2 + 24x$, so $f''(x) = -12x^2 - 12x + 24 = -12(x^2 + x - 2) = -12(x+2)(x-1)$. Note the $f''$ is zero for $x = -2$ and $x = 1$, so these are potential inflection points. Now note that $f''(-3) < 0$, $f''(0) > 0$, and $f''(2) < 0$. Thus $f$ is concave up on $(-2, 1)$ and is concave down on $(-\infty, -2)$ and on $(1, \infty)$. There are inflection points at $(-2, 48)$ and $(1, 9)$.

4.2.59 $f'(x) = 20x^3 - 60x^2$, and $f''(x) = 60x^2 - 120x = 60(x-2)$. This is 0 for $x = 0$ and for $x = 2$. Note that $f''(-1) > 0$, $f''(1) < 0$, and $f''(3) > 0$. So $f$ is concave up on $(-\infty, 0)$, concave down on $(0, 2)$, and concave up on $(2, \infty)$. There are inflection points at $x = 0$ and $x = 2$.

4.2.60 $f'(x) = -(1 + x^2)^{-2} \cdot 2x = -\frac{2x}{(1 + x^2)^2}$. $f''(x) = \frac{-2(1 + x^2)^2(-2x) - 2(1 + x^2)2x}{(1 + x^2)^4} = \frac{6x^2 - 2}{(1 + x^2)^3}$. Note that $f''$ is 0 for $x = \pm \frac{1}{\sqrt{3}}$. Also, $f''(-1) > 0$, $f''(0) < 0$, and $f''(1) > 0$, so $f$ is concave up on $(-\infty, \frac{1}{\sqrt{3}})$, concave down on $(-\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}})$, and concave up on $\left(\frac{1}{\sqrt{3}}, \infty\right)$. There are inflection points at $x = \pm \frac{1}{\sqrt{3}}$.

4.2.61 $f'(x) = e^x(x-3) + e^x = e^x(x-3+1) = e^x(x-2)$. $f''(x) = e^x(x-2) + e^x = e^x(x-2+1) = e^x(x-1)$. Note that $f''$ is zero only at $x = 1$. Also note that $f''(0) < 0$ and $f''(2) > 0$, so $f$ is concave down on $(-\infty, 1)$ and is concave up on $(1, \infty)$. The point $(1, -2e)$ is an inflection point.

4.2.62 $f'(x) = 4x \ln x + 2x^2 \cdot \frac{1}{x} - 10x = 4x \ln x - 8x$. $f''(x) = 4 \ln x + 4x \cdot \frac{1}{x} - 8 = 4 \ln x - 4$. Note that $f''$ is zero when $\ln x = 1$, which occurs for $x = e$. Also note that $f''(1) < 0$ and $f''(4) > 0$, so $f$ is concave down on $(0, e)$ and is concave up on $(e, \infty)$. There is an inflection point at $(e, -3e^2)$.

4.2.63 $g'(t) = \frac{6t}{3t^2 + 1}$, and $g''(t) = \frac{(3t^2 + 1)6 - 6(6t)}{(3t^2 + 1)^2} = \frac{6 - 18t^2}{(3t^2 + 1)^2}$. Note that $g''$ is 0 for $t = \pm \frac{1}{\sqrt{3}}$. Also, $g''(-1) < 0$, $g''(0) > 0$, and $g''(1) < 0$, so $g$ is concave down on $(-\infty, -\frac{1}{\sqrt{3}})$ and on $\left(\frac{1}{\sqrt{3}}, \infty\right)$, and is concave up on $\left(-\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right)$. There are inflection points at $t = \pm \frac{1}{\sqrt{3}}$. 

Copyright © 2014 Pearson Education, Inc.
4.2.64 \( g'(x) = \frac{1}{3 \sqrt[3]{x-4}} \), and \( g''(x) = -\frac{2}{9 \sqrt[3]{(x-3)^2}} \). Note that \( g'' \) is never zero, but is undefined at \( x = 4 \). On \(( -\infty, 4)\) we have \( g'' > 0 \) so \( g \) is concave up, and on \(( 4, \infty)\) we have \( g'' < 0 \), so \( g \) is concave down. There is an inflection point at \(( 4, 0)\).

4.2.65 \( f'(x) = -xe^{-x^2/2} \), and \( f''(x) = (-x)(-xe^{-x^2/2}) + e^{-x^2/2} \cdot -1 = e^{-x^2/2}(x^2 - 1) \). Note that \( f''(x) \) is 0 for \( x = \pm 1 \). Also note that \( f'' > 0 \) on \((-\infty, -1)\) and on \((1, \infty)\), so \( f \) is concave up there, while on \((-1, 1)\) \( f \) is concave down because \( f'' < 0 \) on that interval. There are inflection points at \( x = \pm 1 \).

4.2.66 \( f'(x) = \frac{1}{\sqrt{1-x}} \), and \( f''(x) = -\frac{2x}{(1-x)^{3/2}} \). Note that \( f'' \) is 0 only at \( x = 0 \). On \(( -\infty, 0)\) we note that \( f''(x) > 0 \) so \( f \) is concave up, and on \((0, \infty)\) we note that \( f''(x) < 0 \) so \( f \) is concave down. There is an inflection point at \((0, 0)\).

4.2.67 \( f'(x) = \sqrt{x} / x + (\ln x) \left( \frac{1}{\sqrt{x}} \right) = \frac{2 + \ln x}{2 \sqrt{x}} \). \( f''(x) = \frac{2\sqrt{x} / x - (2 + \ln x) / \sqrt{x^2}}{(2x)^2} = -\frac{\ln x}{4x^{3/2}} \). Note that \( f'' \) is 0 only at \( x = 1 \). On \((0, 1)\) we note that \( f'' > 0 \) so \( f \) is concave up, and on \((1, \infty)\) we note that \( f'' < 0 \) so \( f \) is concave down. There is an inflection point at \((1, 0)\).

4.2.68 \( h'(t) = -2 \sin 2t \) and \( h''(t) = -4 \cos 2t \), which on the stated domain is 0 when \( 2t = -\frac{3\pi}{4}, -\frac{\pi}{4}, \frac{\pi}{4}, \) and \( 3\pi \), which means for \( t = -\frac{3\pi}{8}, -\frac{\pi}{8}, \frac{\pi}{8}, \) and \( \frac{3\pi}{8} \). \( h'' < 0 \) on \(( -\pi, -\frac{3\pi}{4})\), \(( -\frac{\pi}{4}, \frac{\pi}{4})\), and \(( \frac{3\pi}{4}, \pi)\), so \( h \) is concave down those intervals, while \( h'' > 0 \) on \(( -\frac{3\pi}{4}, -\frac{\pi}{4})\) and \(( \frac{\pi}{4}, \frac{3\pi}{4})\), so \( h \) is concave up on those intervals. There are inflection points at \( t = -\frac{3\pi}{8}, t = -\frac{\pi}{8}, t = \frac{\pi}{8}, \) and \( t = \frac{3\pi}{8} \).

4.2.69 \( g'(t) = 15t^4 - 120t^3 + 240t^2 \), and \( g''(t) = 60t^3 - 360t^2 + 480t = 60(t - 2)(t - 4) \). Note that \( g'' \) is 0 for \( t = 0, 2, \) and \( 4 \). Note also that \( g'' < 0 \) on \((-\infty, 0)\) and on \((2, 4)\), so \( g \) is concave down on those intervals, while \( g'' > 0 \) on \((0, 2)\) and on \((4, \infty)\), so \( g \) is concave up there. There are inflection points at \( t = 0, 2, \) and \( 4 \).

4.2.70 \( f'(x) = 8x^3 + 24x^2 + 24x - 1 \), and \( f''(x) = 24x^2 + 48x + 24 = 24(x + 1)^2 \). Note that this quantity is always greater than 0 for \( x \neq -1 \), and is 0 only at \( x = -1 \). Thus \( f \) is concave up on \((-\infty, -1)\) and on \((-1, \infty)\), and because \( f \) and \( f' \) are continuous at \(-1 \), we can say that \( f \) is concave up on \((-\infty, \infty)\).

4.2.71 \( f'(x) = 3x^2 - 6x = 3(x - 2) \). This is zero when \( x = 0 \) and when \( x = 2 \), and these are the critical points. \( f''(x) = 6x - 6 \). Note that \( f''(0) < 0 \) and \( f''(2) > 0 \). Thus by the Second Derivative Test, there is a local maximum at \( x = 0 \) and a local minimum at \( x = 2 \).

4.2.72 \( f'(x) = 12x - 3x^2 = 3x(4 - x) \). This is zero when \( x = 0 \) and when \( x = 4 \), and these are the critical points. \( f''(x) = 12 - 6x \). Note that \( f''(0) > 0 \) and \( f''(4) < 0 \), so there is a local minimum at 0 and a local maximum at 4.

4.2.73 \( f'(x) = -2x \), so \( x = 0 \) is a critical point. \( f''(x) = -2 \), so \( f''(0) = -2 \) and the critical point yields a local maximum.

4.2.74 \( g'(x) = 3x^2 \), so \( x = 0 \) is a critical point. \( g''(x) = 6x \) so \( g''(0) = 0 \) and the test is inconclusive.

4.2.75 \( f'(x) = e^x(x - 7) + e^x = e^x(x - 6) \). This is zero when \( x = 6 \), and this is a critical point. \( f''(x) = e^x(x - 6) + e^x = e^x(x - 5) \). Note that \( f''(6) > 0 \), so there is a local minimum at \( x = 6 \).

4.2.76 \( f'(x) = e^x(x^2 - 7x - 12) + e^x(2x - 7) = e^x(x^2 - 5x - 19) \). This is zero for \( x = \frac{5 \pm \sqrt{25 - 4(1)(-19)}}{2} = \frac{5 \pm \sqrt{101}}{2} \), so these are critical points. Note that these values are approximately \(-2.52 \) and \( 7.52 \). We have \( f''(x) = e^x(x^2 - 5x - 19) + e^x(2x - 5) = e^x(x^2 - 3x - 24) \). Evaluating \( f'' \) at these points gives \( f'' \left( \frac{5 - \sqrt{101}}{2} \right) < 0 \) and \( f'' \left( \frac{5 + \sqrt{101}}{2} \right) > 0 \), so there is a local maximum at \( \frac{5 - \sqrt{101}}{2} \) and a local minimum at \( \frac{5 + \sqrt{101}}{2} \).

4.2.77 \( f'(x) = 6x^2 - 6x = 6(x - 1) \), so \( x = 0 \) and \( x = 1 \) are critical points. \( f''(x) = 12x - 6 \), so \( f''(1) = 6 > 0 \), so the critical point at \( x = 1 \) yields a local minimum. Also, \( f''(0) = -6 < 0 \), so the critical point at 0 yields a local maximum.

Copyright © 2014 Pearson Education, Inc.
4.2.78 \( f'(x) = 4x^3e^{-x} + x^4e^{-x}(-1) = (4x^3 - x^4)e^{-x} \), so \( x = 0 \) and \( x = 4 \) are critical points. We have

\[
f''(x) = (12x^2 - 4x^3)e^{-x} + (4x^3 - x^4)e^{-x}(-1) = (12x^2 - 8x^3 + x^4)e^{-x},
\]

and then \( f''(4) = (12 \cdot 16 - 8 \cdot 64 + 256)e^{-4} = -64e^{-4} < 0 \), so that \( x = 4 \) corresponds to a local maximum. However, \( f''(0) = 0 \), so the second derivative test yields no information about the point \( x = 0 \). But since \( f'(x) < 0 \) for \( x < 0 \) but close to zero, and \( f'(x) > 0 \) for \( x > 0 \) but close to zero, the first derivative test tells us that \( x = 0 \) is a local minimum.

4.2.79 \( f'(x) = x^2 \cdot (-e^{-x}) + e^{-x} \cdot 2x = e^{-x}(2x - x^2) \), which is zero for \( x = 0 \) and \( x = 2 \), so these are the critical points. \( f''(x) = e^{-x}(2 - 2x) + (2x - x^2)(-e^{-x}) = e^{-x}(2 - 4x + x^2) \). Note that \( f''(0) = 2 > 0 \), so there is a local minimum at \( x = 0 \). Also, \( f''(2) = -2e^{-2} < 0 \), so there is a local maximum at \( x = 2 \).

4.2.80 We have

\[
g'(x) = \frac{(2 - 12x^2)(4x^3) - x^4(-24x)}{(2 - 12x^2)^2} = \frac{-24x^5 + 8x^3}{(2 - 12x^2)^2} = \frac{-3x^5 + x^3}{(1 - 6x^2)^2}.
\]

Then \( g'(0) = 0 \) and \( g'(\pm \frac{1}{\sqrt{3}}) = 0 \), so \( x = 0 \) and \( x = \pm \frac{1}{\sqrt{3}} \) are the critical points. Now,

\[
g''(x) = 2\frac{(1 - 6x^2)^2(-15x^4 + 3x^2) - (-3x^5 + x^3)(2(1 - 6x^2) \cdot (-12x))}{(1 - 6x^2)^4} = 6x^2 - 3x^4 + 4x^6
\]

Then \( g''(\pm \frac{1}{\sqrt{3}}) = -\frac{4}{9} \), so that these two critical points are local maxima. However, \( g''(0) = 0 \), so the second derivative test is inconclusive. Using the first derivative test, note that the denominator of \( g'(x) \) is always positive, while the numerator is \( x^3 - 3x^5 = x^3(1 - 3x^2) \). So for \( x > 0 \) but close to zero, this is positive; since it is an odd function, it is negative for \( x < 0 \) but close to zero. Thus \( x = 0 \) is a local minimum.

4.2.81 \( f'(x) = 4x \ln x + 2x^2 \cdot \frac{1}{2} - 22x = 4x \ln x - 20x = 4x(\ln x - 5) \). This is zero for \( x = e^5 \), so that is the critical point. \( f''(x) = 4 \ln x + 4x \cdot \frac{1}{2} - 20 = 4 \ln x - 16 \). Note that \( f''(e^5) > 0 \), so there is a local minimum at \( e^5 \).

4.2.82 Note that \( f(x) \) can be written as \( f(x) = \frac{1}{4} x^2 \ln^2 x - 4x^{5/2} \). Thus \( f'(x) = 6x^{5/2} - 10x^{3/2} = 2x^{3/2}(3x - 5) \). This is zero on the given interval only at \( x = \frac{5}{3} \), so that is the critical point. \( f''(x) = 15x^{3/2} - 15x^{1/2} \), and \( f'' \left( \frac{5}{3} \right) > 0 \), so there is a local minimum at \( x = \frac{5}{3} \).

4.2.83

a. True. \( f'(x) > 0 \) implies that \( f \) is increasing, and \( f''(x) < 0 \) implies that \( f' \) is decreasing. So \( f \) is increasing, but at a decreasing rate.

b. False. In fact, if \( f'(c) \) exists and isn’t zero, then there isn’t any kind of local extrema at \( x = c \).

c. True. In fact, if two functions differ by a constant, then all of their derivatives are the same.

d. False. For example, consider \( f(x) = x \) and \( g(x) = x - 10 \). Both are increasing, but \( f(x)g(x) = x^2 - 10x \) is decreasing on \( (-\infty, 5) \).

e. False. A continuous function with two local maxima must have a local minimum in between.
4.2.84

\[ y = f''(x) \]
\[ y = f'(x) \]
\[ y = f(x) \]

4.2.85

\[ y = f''(x) \]
\[ y = f'(x) \]
\[ y = f(x) \]

4.2.86

a. Not Possible. The closest thing would be a function like \( f(x) = x^{2/3} \) which is positive and is concave down on \((-\infty, 0)\) and on \((0, \infty)\).

b. This is possible, for example \( y = -e^{-x} \) has this property.

c. This is possible. See graphic pictured.

d. This is not possible. Between every pair of zeros, there must be a maximum or a minimum, so a continuous function with four zeros must have at least three local extrema.

4.2.87 The graphs match as follows: (a) – (f) – (g); (b) – (e) – (i); (c) – (d) – (h). Note that (a) is always increasing, so its derivative must be always positive, and (f) switches from decreasing to increasing at 0, so its derivative must be negative for \( x < 0 \) and positive for \( x > 0 \).

Note that (b) has three extrema where there are horizontal tangent lines, so its derivative must cross the \( x \)-axis three times, and (e) has two extrema, so its derivative must cross the \( x \)-axis two times.

Copyright © 2014 Pearson Education, Inc.
4.2.88 Note that $C$ is increasing where $B$ is positive, and is decreasing where $B$ is negative, so it seems reasonable to assert that $B$ is the derivative of $C$. Also, $B$ is increasing where $A$ is positive and decreasing where $A$ is negative, so it is reasonable to assert that $A$ is the derivative of $B$. So it appears that $C = f(x)$, $B = f'(x)$, and $A = f''(x)$.

4.2.89

The graph sketched must be concave up on $(-\infty, -2)$ and on $(4, \infty)$, and must have a flat tangent line at $x = -1$, $x = 1$, and $x = 3$. A convenient way to ensure that $f''(-2) = f''(2) = 0$ is to have inflection points occur there. The example to the right is only one possible such graph.

4.2.91

The graph sketched must have a flat tangent line at $x = -\frac{3}{2}$, $x = 0$, and $x = 1$, and must contain the points $(-2, 0)$, $(0, 0)$, and $(1, 0)$. The example to the right is only one possible such graph.
4.2.92

The graph must be increasing everywhere, since \( f'(x) > 0 \) everywhere \( f \) is differentiable, but \( f \) is not differentiable at \( x = -2 \) or at \( x = 1 \). Finally, \( f''(0) = 0 \).
A possible graph (there are many others) is

4.2.93

The graph sketched must be concave up on \((-\infty, -2)\) and on \((1,3)\), and concave down on \((-2,1)\) and on \((3,\infty)\). The example to the right is only one possible such graph.

4.2.94

As \( a > 0 \) gets larger, the corresponding graph of the parabola gets narrower.

4.2.95

a. \( f \) is increasing on \((-2,2)\). It is decreasing on \((-3,-2)\).

b. There are critical points of \( f \) at \( x = -2 \) and at \( x = 0 \). There is a local minimum at \( x = -2 \) and no extremum at \( x = 0 \).

c. There are inflection points of \( f \) at \( x = -1 \) and at \( x = 0 \).

d. \( f \) is concave up on \((-3,-1)\) and on \((0,2)\), while it is concave down on \((-1,0)\).
4.2.96 \( p'(t) = 6t^2 + 6t - 36 = 6(t + 3)(t - 2), \) which is 0 at \( t = -3 \) and \( t = 2. \) Note that \( p''(t) = 12t + 6, \) so \( p''(-3) = -30 < 0 \) and \( p''(2) = 30 > 0, \) so there is a local maximum at \( t = -3 \) and a local minimum at \( t = 2. \)

4.2.97 \( f'(x) = x^3 - 5x^2 - 8x + 48 = (x - 4)^2(x + 3). \) (This can be obtained by using trial-and-error to determine that \( x = 4 \) is a root, and then using long division of polynomials to see that \( f'(x) = (x - 4)(x^2 - x - 12)). \) Note that \( f''(x) = 3x^2 - 10x - 8, \) so \( f''(-3) = 49 > 0 \) and \( f''(4) = 0. \) So there is a local minimum at \( x = -3, \) but the test is inconclusive for \( x = 4. \) The first derivative test shows that there is neither a maximum nor a minimum at \( x = 4. \)

4.2.98 \( f'(x) = 4(x + a)^3, \) which is 0 for \( x = -a. \) Note that \( f''(x) = 12(x + a)^2, \) which is 0 at \( x = -a, \) so the test is inconclusive. The first derivative test shows that there is a local minimum at \( x = -a. \)

4.2.99 \( f'(x) = 3x^2 + 4x + 4, \) which is never 0. (Note that the discriminant \( 4^2 - 4 \cdot 3 \cdot 4 < 0, \) so this quadratic has no real roots). So there are no critical points.

4.2.100 \( f'(x) = 2ax + b, \) and \( f''(x) = 2a. \) Note that \( f''(x) \) is positive for \( a > 0 \) and negative for \( a < 0. \) So \( f \) is concave up for \( a > 0 \) and concave down for \( a < 0. \)

4.2.101
a. \( E = \frac{dD}{dp} \cdot \frac{p}{D} = -10 \frac{p}{500 - 10p} = \frac{p}{p - 50}. \)

b. \( E = \frac{12}{(2)^2} \cdot .045 = -1.42%. \)

c. If \( D(p) = a - bp, \) then \( E(p) = -b \cdot \frac{p}{a - bp} = \frac{bp}{bp - a}. \) So \( E'(p) = \frac{(bp - a)b - bpa}{(bp - a)^2} = -\frac{ab}{(bp - a)^2}, \) which is less than 0 for \( a, b > 0 \) and \( p \neq a/b. \)

d. If \( D(p) = \frac{a}{p^2}, \) then \( E(p) = -\frac{ab}{p^{a+1}} \cdot \frac{a}{p^2} = -b. \)

4.2.102 The growth rate is given by the slope of the tangent line to the curve. To the left of the inflection point, the curve is concave up, meaning that the slopes are increasing. To the right of the inflection point, the curve is concave down, meaning that the slopes are decreasing. So the maximum slope occurs at the inflection point.

4.2.103
a. \( \lim_{t \to \infty} \frac{300t^2}{t^2 + 30} = \lim_{t \to \infty} \frac{1/t^2}{1 + (30/t^2)} = 300. \)

b. Note that \( P'(t) = \frac{(t^2 + 30)(6000) - 300t^2(2t)}{(t^2 + 30)^2} = \frac{18000}{(t^2 + 30)^2}. \) We want to maximize this, so we compute its derivative \( P''(t) = \frac{(t^2 + 30)^2(18000) - 18000(2t^2 + 30)(2t)}{(t^2 + 30)^4} = \frac{54000(10 - t^2)}{(t^2 + 30)^3}. \) This is 0 for \( t = \sqrt{10}, \) and an analysis of \( P''(t) \) reveals that \( P''(t) > 0 \) for \( t < \sqrt{10} \) and \( P''(t) < 0 \) for \( t > \sqrt{10} \) so there is a local maximum for \( P'(t) \) at \( t = \sqrt{10}. \)

Copyright © 2014 Pearson Education, Inc.
c. Following the outline from the previous problem, we see that \( P'(t) = \frac{2bKt}{(P^2+b)^{3/2}} \), and \( P''(t) = \frac{2bK(b-3t^2)}{(t^2+b)^{5/2}} \). 

\( P''(t) \) is 0 for \( t = \sqrt{\frac{b}{3}} \), and the first derivative test reveals that this is a local maximum.

4.2.104 If \( f \) is concave up at \( x = c \), then \( f''(c) > 0 \). This means that \( f' \) is increasing in a neighborhood of \( c \). So for \( x < c \), the slope of the function is less than the slope of the tangent line at \( c \), and for \( x > c \) it is greater than the slope of the tangent line. This means that the curve is “bending upward,” away from its tangent line, so the tangent line will be below the curve in a neighborhood of \( c \).

4.2.105

a. \( f'(x) = 3x^2 + 2ax + b \), and \( f''(x) = 6x + 2a \), which is 0 only for \( x = -\frac{a}{3} \). Note that the sign of \( f''(x) \) is different for \( x < -\frac{a}{3} \) and \( x > -\frac{a}{3} \), so this does represent an inflection point.

b. 

\[
f(x^*) - f(x^* + x) = f \left( -\frac{a}{3} \right) - f \left( -\frac{a}{3} + x \right) \\
= \left( -\frac{a}{3} \right)^3 + \frac{a}{3} \left( -\frac{a}{3} \right)^2 + b \left( -\frac{a}{3} \right) + c \\
- \left( \left( -\frac{a}{3} \right)^3 + \frac{a}{3} \left( -\frac{a}{3} + x \right)^2 + b \left( -\frac{a}{3} + x \right) + c \right) \\
= \left( -\frac{a}{3} \right)^3 + \frac{a}{3} \left( -\frac{a}{3} \right)^2 + b \left( -\frac{a}{3} \right) + c \\
- \left( \left( -\frac{a}{3} \right)^3 - 3 \left( -\frac{a}{3} \right)^2 x - 3 \left( -\frac{a}{3} \right) x^2 - x^3 \right) \\
- a \left( -\frac{a}{3} \right)^2 - 2a \left( -\frac{a}{3} \right) x - ax^2 - b \left( -\frac{a}{3} \right) - bx - c \\
= -x^3 + \left( \frac{a^2}{3} - b \right) x.
\]

Also,

\[
f(x^* - x) - f(x^*) = f \left( \frac{a}{3} - x \right) - f \left( \frac{a}{3} \right) \\
= \left( -\frac{a}{3} \right)^3 + 3 \left( -\frac{a}{3} \right)^2 (-x) + 3 \left( -\frac{a}{3} \right) (-x)^2 + (-x)^3 + a \left( -\frac{a}{3} \right)^2 + 2a \left( -\frac{a}{3} \right) (-x) \\
+ a(-x)^2 + b \left( -\frac{a}{3} \right) + b(-x) + c - \left( -\frac{a}{3} \right)^3 - a \left( -\frac{a}{3} \right)^2 - b \left( -\frac{a}{3} \right) - c \\
= -x^3 + \left( \frac{a^2}{3} - b \right) x.
\]

Thus the two expressions are the same for all \( x \).

4.2.106

a. \( f'(x) = 3x^2 + 2ax + b \), which is 0 when \( x = -\frac{2a \pm \sqrt{4a^2 - 12b}}{6} = -\frac{a \pm \sqrt{a^2 - 3b}}{3} \). These solutions represent distinct real numbers when \( a^2 > 3b \). Let the two distinct roots be \( r_1 < r_2 \). Note that \( f'(x) \) is negative on the interval \((r_1, r_2)\) and positive on \((-\infty, r_1)\) and on \((r_2, \infty)\) so there is a maximum at \( r_1 \) and a minimum at \( r_2 \).

b. If \( a^2 < 3b \), then there are no real critical points, so there are no extreme values.

4.2.107

a. \( f(-x) = \frac{1}{((-x)^n + 1)} = \frac{1}{x^n + 1} = f(x) \), so \( f \) is even.

b. Note that \( f(\pm 1) = \frac{1}{((-1)^n + 1)} = \frac{1}{2} \), for all \( n \).
Let \( u = x^2 \), so that \( f(u) = u^2 + bu + d \). The roots of this quadratic are 
\[
   u = \frac{-b \pm \sqrt{b^2 - 4d}}{2}.
\]
In the regions above the parabola, \( 4d > b^2 \), so these do not represent any real solutions. Below the parabola but for \( d > 0 \) and \( b > 0 \), note that \( \sqrt{b^2 - 4d} < b \). So \( -b < -\sqrt{b^2 - 4d} \), so \( -b + \sqrt{b^2 - 4d} < 0 \) (and certainly \( -b - \sqrt{b^2 - 4d} < 0 \)). Thus, there are no real roots in this area either. However, below the parabola when \( d > 0 \) but \( b < 0 \), note that \( -b \pm \sqrt{b^2 - 4d} > 0 \), so all 4 potential roots mentioned above are actual real roots.

When \( d < 0 \), note that \( b^2 < b^2 - 4d \), so \( |b| \sqrt{b^2 - 4d} < b \). So \( -b + \sqrt{b^2 - 4d} > 0 \) but \( -b - \sqrt{b^2 - 4d} < 0 \). So \( -b + \sqrt{b^2 - 4d} > 0 \) and \( -b - \sqrt{b^2 - 4d} < 0 \). In both regions below the \( b \)-axis, the two roots are 
\[
   \pm \sqrt{-\frac{b + \sqrt{b^2 - 4d}}{2}}.
\]

When \( b = 0 \), we have \( f(x) = x^4 + d \), which has no roots for \( d > 0 \), only the root \( x = 0 \) when \( d = 0 \), and the two roots \( x = \pm \sqrt{-d} \) when \( d < 0 \). For the case \( d = 0 \), we have \( f(x) = x^4 + bx^2 = x^2(x^2 + b) \), which has the root \( x = 0 \) for all \( b \), has no other roots for the case \( b > 0 \), and has the two additional roots \( x = \pm \sqrt{-b} \) for the case \( b < 0 \). In the case \( d = b^2/4 \), then there are no roots for \( b > 0 \), but there are the two roots \( \pm \sqrt{-\frac{b}{2}} \) for the case \( b < 0 \).
4.2.109 \( f'(x) = 4x^3 + 3ax^2 + 2bx + c \), and \( f''(x) = 12x^2 + 6ax + 2b = 2(6x^2 + 3ax + b) \). Note that \( f''(x) = 0 \) exactly when \( x = -\frac{3a+\sqrt{9a^2-24b}}{12} \). This represents no real solutions when \( 9a^2 - 24b < 0 \), which occurs when \( b > \frac{3a^2}{8} \). When \( b = \frac{3a^2}{8} \), there is one root, but in this case the sign of \( f'' \) doesn’t change at the double root \( x = -\frac{3}{4} \), so there are no inflection points for \( f \). In the case \( b < \frac{3a^2}{8} \), there are two roots of \( f'' \), both of which yield inflection points of \( f \), as can be seen by the change in sign of \( f'' \) at its two roots.

4.3 Graphing Functions

4.3.1 Because the intervals of increase and decrease and the intervals of concavity must be subsets of the domain, it is helpful to know what the domain is at the outset.

4.3.2 If a function is symmetric, then only one half the function needs to be graphed, and the information about the other half will follow immediately. Also, knowledge about symmetry can help catch mistakes.

4.3.3 No. Polynomials are continuous everywhere, so they have no vertical asymptotes. Also, polynomials in \( x \) always tend to \( \pm\infty \) as \( x \to \pm\infty \).

4.3.4 If a rational function is in simplified form (with no common factors in the numerator and denominator), then there is a vertical asymptote wherever the denominator is zero.

4.3.5 The maximum and minimum must occur at either an endpoint or a critical point. So to find the absolute maximum and minimum, it suffices to find all the critical points, and then compare the values of the function at those points and at the endpoints. The largest such value is the maximum and the smallest is the minimum.

4.3.6 For every polynomial \( p(x) \), \( \lim_{x \to \pm\infty} p(x) = \pm\infty \).

4.3.7 The function sketched should be decreasing and concave down for \( x < 3 \) and decreasing and concave up for \( x > 3 \).

4.3.8 The function sketched should be decreasing on \((-\infty, 2)\) and increasing on \((2, \infty)\). It should be concave down on \((-\infty, -1)\) and on \((8, 10)\). It should be concave up on \((-1, 8)\) and on \((10, \infty)\).

4.3.9 The domain of \( f \) is \((-\infty, \infty)\), and there is no symmetry. The \( y \) intercept is \( f(0) = 0 \), and the \( x \) intercepts are 0 and 3 because \( f(x) = x(x-3)^2 \). \( f'(x) = 3x^2 - 12x + 9 = 3(x^2 - 4x + 3) = 3(x-3)(x-1) \). This is zero when \( x = 1 \) and \( x = 3 \). Note that \( f'(0) > 0, f'(2) < 0 \) and \( f'(4) > 0 \), so \( f \) is increasing on \((-\infty, 1)\) and on \((3, \infty)\). It is decreasing on \((1, 3)\). Note that \( f''(x) = 6x - 12 \) which is zero at \( x = 2 \). Because \( f''(1) < 0 \) and \( f''(3) > 0 \), we conclude that \( f \) is concave down on \((-\infty, 2)\) and concave up on \((2, \infty)\). There is an inflection point at \((2, 2)\), a local maximum at \((1, 4)\) and a local minimum at \((3, 0)\).
4.3.10 The domain of \( f \) is \((-\infty, \infty)\), and there is odd symmetry, because \( f(-x) = 3(-x) - (-x)^3 = -(3x - x^3) = -f(x) \). The \( y \) intercept is \( f(0) = 0 \), and the \( x \)-intercepts are 0 and \( \pm \sqrt{3} \) because \( f(x) = x(3 - x^2) \). \( f'(x) = 3 - 3x^2 = 3(1 - x^2) \), which is zero for \( x = \pm 1 \). Note that \( f'(-2) < 0 \), \( f'(0) > 0 \), and \( f'(2) < 0 \), so \( f \) is decreasing on \((-\infty, -1)\) and on \((1, \infty)\), and is increasing on \((-1, 1)\). There is a local minimum at \((-1, -2)\) and a local maximum at \((1, 2)\).

\( f''(x) = -6x \), which is zero at \( x = 0 \). Note that \( f''(x) > 0 \) for \( x < 0 \) and \( f''(x) < 0 \) for \( x > 0 \), so \( f \) is concave up on \((-\infty, 0)\) and is concave down on \((0, \infty)\). There is an inflection point at \((0, 0)\).

4.3.11 The domain of \( f \) is \((-\infty, \infty)\), and there is even symmetry, because \( f(-x) = f(x) \). \( f'(x) = 4x^3 - 12x = 4x(x^2 - 3) \). This is 0 when \( x = \pm \sqrt{3} \) and when \( x = 0 \). \( f''(x) = 12x^2 - 12 = 12(x^2 - 1) \), which is 0 when \( x = \pm 1 \). Note that \( f'(-2) < 0 \), \( f'(-1) > 0 \), \( f'(1) < 0 \), and \( f'(2) > 0 \). So \( f \) is decreasing on \((-\infty, -\sqrt{3})\) and on \((0, \sqrt{3})\). It is increasing on \((-\sqrt{3}, 0)\) and on \((\sqrt{3}, \infty)\). There is a local maximum of 0 at \( x = 0 \) and local minima of -9 at \( x = \pm \sqrt{3} \). Note also that \( f''(x) > 0 \) for \( x < -1 \) and for \( x > 1 \) and \( f''(x) < 0 \) for \(-1 < x < 1 \), so there are inflection points at \( x = \pm 1 \). Also, \( f \) is concave down on \((-1, 1)\) and concave up on \((-\infty, -1)\) and on \((1, \infty)\). There is a \( y \)-intercept at \( f(0) = 0 \) and \( x \)-intercepts where \( f(x) = x^4 - 6x^2 = x^2(x^2 - 6) = 0 \), which is at \( x = \pm \sqrt{6} \) and \( x = 0 \).
4.3.12 The domain of \( f \) is \((-\infty, \infty)\), and there is even symmetry, because \( f(-x) = f(x) \). \( f'(x) = 12x^5 - 12x^3 = 12x^3(x^2 - 1) \). This is 0 when \( x = \pm 1 \) and when \( x = 0 \). \( f''(x) = 60x^4 - 36x^2 = 12x^2(5x^2 - 3) \), which is 0 when \( x = \pm \sqrt{\frac{3}{5}} \) and when \( x = 0 \). Note that \( f'(-2) < 0, f'(-0.5) > 0, f'(0.5) < 0, \) and \( f'(2) > 0 \). Thus \( f \) is decreasing on \((-\infty, -1)\) and on \((0, 1)\), while it is increasing on \((-1, 0)\) and on \((1, \infty)\).

There is a local maximum at \( x = 0 \) with \( f(0) = 0 \) and local minima at \( x = \pm 1 \) with \( f(\pm 1) = -1 \). Note also that \( f''(x) > 0 \) for \( x < -\sqrt{\frac{3}{5}} \) and for \( x > \sqrt{\frac{3}{5}} \), and \( f''(x) < 0 \) for \(-\sqrt{\frac{3}{5}} < x < \sqrt{\frac{3}{5}} \), so there are inflection points at \( x = \pm \sqrt{\frac{3}{5}} \), and \( f \) is concave up on \((-\infty, -\sqrt{\frac{3}{5}})\) and on \(\left(\sqrt{\frac{3}{5}}, \infty\right)\), and is concave down on \(\left(-\sqrt{\frac{3}{5}}, \sqrt{\frac{3}{5}}\right)\). Since \( f'' \) does not change sign at \( x = 0 \), there is no inflection point there.

4.3.13 The domain of \( f \) is \((-\infty, \infty)\), and there is no symmetry. The \( y \)-intercept is \( f(0) = -216 \). The \( x \)-intercepts are 6 and \(-6 \).

\( f'(x) = (x + 6)^2 + (x - 6)(x + 6) = (x + 6)(x + 6 + 2x - 12) = (x + 6)(3x - 6) = 3(x + 6)(x - 2) \). The critical points are \( x = -6 \) and \( x = 2 \). Note that \( f'(-7) > 0, f'(-2) < 0, \) and \( f'(3) > 0 \), so \( f \) is increasing on \((-\infty, -6)\) and on \((2, \infty)\). It is decreasing on \((-6, 2)\). There is a local maximum of 0 at \(-6 \) and a local minimum of \(-256 \) at \( x = 2 \).

\( f''(x) = 3(x - 2) + 3(x + 6) = 3(x - 2 + x + 6) = 3(2x + 4) = 6(x + 2), \) which is zero for \( x = -2 \). Note that \( f''(x) < 0 \) for \( x < -2 \) and \( f''(x) > 0 \) for \( x > -2 \), so \( f \) is concave down on \((-\infty, -2)\) and concave up on \((-2, \infty)\). The point \((-2, -128)\) is an inflection point.

4.3.14 The domain of \( f \) is \((-\infty, \infty)\) and there is no symmetry. The \( y \)-intercept is \( f(0) = 216 \) and the \( x \)-intercepts are \( \pm 2 \). We have

\[
\begin{align*}
f'(x) &= 27 \cdot 2(x - 2)(x + 2) + 27(x - 2)^2 = 27(x - 2)(2x + 4 + x - 2) = 27(x - 2)(3x + 2) \\
f''(x) &= 27(3x + 2) + 27(x - 2) \cdot 3 = 27(3x + 2 + 3x - 6) = 27(6x - 4) = 54(3x - 2).
\end{align*}
\]

Then \( f'(x) = 0 \) for \( x = 2 \) and \( x = -\frac{2}{3} \). Note that \( f'(-1) > 0, f'(0) < 0, \) and \( f'(3) > 0 \). Thus \( f \) is increasing on \((-\infty, -\frac{2}{3})\) and on \((2, \infty)\), and it is decreasing on \((-\frac{2}{3}, 2)\). There is a local maximum of 256 at \( x = -\frac{2}{3} \) and a local minimum of 0 at \( x = 2 \). Finally, \( f''(x) = 0 \) when \( x = \frac{2}{3} \). Note that \( f''(x) < 0 \) for \( x < \frac{2}{3} \) and \( f''(x) > 0 \) for \( x > \frac{2}{3} \), so \( f \) is concave down on \((-\infty, \frac{2}{3})\) and concave up on \(\left(\frac{2}{3}, \infty\right)\). There is an inflection point at \(\left(\frac{2}{3}, 128\right)\).
4.3.15 The domain of \( f \) is \((\infty, 2) \cup (2, \infty)\), and there is no symmetry. Note that \( \lim_{x \to 2^+} f(x) = \infty \) and \( \lim_{x \to 2^-} f(x) = -\infty \), so there is a vertical asymptote at \( x = 2 \). There isn’t a horizontal asymptote, because \( \lim_{x \to \pm \infty} f(x) = \pm \infty \). We have
\[
    f'(x) = \frac{(x-2) \cdot 2x - x^2}{(x-2)^2} = \frac{x(x-4)}{(x-2)^2} \\
    f''(x) = \frac{(x-2)^2(2x-4) - (x^2-4x) \cdot 2(x-2)}{(x-2)^4} = \frac{8}{(x-2)^3}.
\]
Then \( f'(x) = 0 \) for \( x = 4 \) and \( x = 0 \), while \( f''(x) \) is never zero. Note that \( f'(-1) > 0, f'(1) < 0, f'(3) < 0 \) and \( f'(5) > 0 \). So \( f \) is decreasing on \((0, 2)\) and on \((2, 4)\). It is increasing on \((-\infty, 0)\) and on \((4, \infty)\). There is a local maximum of 0 at \( x = 0 \) and a local minimum of 8 at \( x = 4 \).
Note that \( f''(x) > 0 \) for \( x > 2 \) and \( f''(x) < 0 \) for \( x < 2 \), So \( f \) is concave up on \((2, \infty)\) and concave down on \((-\infty, 4)\). There are no inflection points, because the only change in concavity occurs at a vertical asymptote. The only intercept is \((0, 0)\).

4.3.16 The domain of \( f \) is \((-\infty, -2) \cup (-2, 2) \cup (2, \infty)\), and there is even symmetry because \( f(-x) = \frac{(-x)^2}{(-x)^2-4} = \frac{x^2}{x^2-4} = f(x) \). Because \( \lim_{x \to \pm \infty} \frac{1}{x^2} = \lim_{x \to \pm \infty} \frac{1}{1-(4/x^2)} = 1 \), there is a horizontal
asymptote at \( y = 1 \). Also, because \( \lim_{x \to -2} f(x) = -\infty \), \( \lim_{x \to -2^+} f(x) = -\infty \), \( \lim_{x \to 2^-} f(x) = -\infty \) and \( \lim_{x \to 2^+} f(x) = \infty \), there are vertical asymptotes at \( x = -2 \) and \( x = 2 \). We have

\[
\begin{align*}
  f'(x) &= \frac{(x^2 - 4)(2x) - x^2 \cdot 2x}{(x^2 - 4)^2} = -\frac{8x}{(x^2 - 4)^2}, \\
  f''(x) &= \frac{(x^2 - 4)^2(-8) - (8x) \cdot 2(x^2 - 4) \cdot 2x}{(x^2 - 4)^4} = \frac{8(x^2 + 4)}{(x^2 - 4)^3}.
\end{align*}
\]

Then \( f'(x) = 0 \) when \( x = 0 \), and \( f''(x) \) is never zero. Now, \( f'(x) > 0 \) on \( (-\infty, -2) \) and on \( (2, \infty) \), while \( f'(x) < 0 \) on \( (0, 2) \) and on \( (-2, \infty) \). So \( f \) is increasing on \( (-\infty, -2) \) and on \( (0, 2) \), and is decreasing on \( (2, \infty) \). There is a local maximum of 0 at \( x = 0 \). Finally, \( f''(x) > 0 \) for \( x < -2 \), and \( f''(x) > 0 \) for \( x > 2 \), while \( f''(x) < 0 \) for \( -2 < x < 2 \). So \( f \) is concave up on \( (-\infty, -2) \) and on \( (2, \infty) \), while it is concave down on \( (-2, 2) \). There are no inflection points because the only changes in concavity occur at asymptotes.

4.3.17 The domain of \( f \) is \( (-\infty, -1) \cup (-1, 1) \cup (1, \infty) \), and there is odd symmetry, because \( f(-x) = \frac{3(-x)}{(-x)^2 - 1} = -\frac{3x}{x^2 - 1} = -f(x) \). The only intercept is \((0, 0)\) which is both the \( y\)- and \( x\)-intercept. Note that \( \lim_{x \to -1^+} f(x) = \infty \) and \( \lim_{x \to -1^-} f(x) = -\infty \), so there is a vertical asymptote at \( x = -1 \). Also, \( \lim_{x \to 1^+} f(x) = \infty \) and \( \lim_{x \to 1^-} f(x) = -\infty \), so there is a vertical asymptote at \( x = 1 \). Note that

\[
\lim_{x \to \pm \infty} \frac{3x}{x^2 - 1} \cdot \frac{1/x^2}{1/1} = \lim_{x \to \pm \infty} \frac{3/x}{1 - (1/x^2)} = 0,
\]

so \( y = 0 \) is a horizontal asymptote. Now,

\[
\begin{align*}
  f'(x) &= \frac{(x^2 - 1) \cdot 3 - 3x \cdot 2x}{(x^2 - 1)^2} = -\frac{3x^2 - 3}{(x^2 - 1)^2} = -\frac{3(x^2 + 1)}{(x^2 - 1)^2}, \\
  f''(x) &= \frac{(x^2 - 1)^2(-6x) + 3(x^2 + 1) \cdot 2(x^2 - 1) \cdot 2x}{(x^2 - 1)^4} = -\frac{6x^3 + 6x + 12x^3 + 12x}{(x^2 - 1)^3} = \frac{6(x^2 + 3)}{(x^2 - 1)^3}.
\end{align*}
\]

Then \( f'(x) \) is never 0, and is in fact negative wherever it is defined. Thus, \( f \) is decreasing on \( (-\infty, -1) \), on \( (-1, 1) \), and on \( (1, \infty) \). There are no extrema. Next, \( f''(x) = 0 \) for \( x = 0 \). The point \((0, 0)\) is a point of inflection, because it is an interior point on the domain, and the second derivative changes from positive to negative there. The other concavity changes take place at the asymptotes. Note that \( f \) is concave down on \( (-\infty, -1) \) and on \( (0, 1) \), and concave up on \( (-1, 0) \) and on \( (1, \infty) \).
4.3. GRAPHING FUNCTIONS

4.3.18 The domain of $f$ is $(-\infty, 4) \cup (4, \infty)$, and there is no symmetry.

Because $\lim_{x \to \pm \infty} \frac{2x - 3}{2x - 8} = \frac{1}{1} = 1$, there is a horizontal asymptote of $y = 1$. Also, because $\lim_{x \to 4^-} f(x) = -\infty$ and $\lim_{x \to 4^+} f(x) = \infty$, there is a vertical asymptote at $x = 4$. $f'(x) = \frac{(2x-8)2-(2x-3)2}{(2x-8)^2} = -\frac{10}{(2x-8)^2}$. This is never 0. $f''(x) = \frac{40}{(2x-8)^3}$ which is also never 0.

Note that $f'(x) < 0$ on $(-\infty, 4)$ and on $(4, \infty)$. So $f$ is decreasing on $(-\infty, 4)$ and on $(4, \infty)$. There are no extrema.

Note also that $f''(x) < 0$ for $x < 4$, and $f''(x) > 0$ for $x > 4$, so $f$ is concave down on $(-\infty, 4)$ and is concave up on $(4, \infty)$. There are no inflection points because the only change in concavity occurs at the vertical asymptote. The $x$-intercept is $x = \frac{3}{2}$ and the $y$-intercept is $f(0) = \frac{3}{8}$.

4.3.19 The domain of $f$ is $(-\infty, -\frac{1}{2}) \cup (-\frac{1}{2}, \infty)$, and there is no symmetry.

Because $\lim_{x \to \pm \infty} \frac{x^2 + 12}{2x + 1} = \lim_{x \to \pm \infty} \frac{x + (12/x)}{2 + (1/x)} = \pm \infty$, there is no horizontal asymptote. Also, because $\lim_{x \to (-1/2)^-} f(x) = -\infty$ and $\lim_{x \to (-1/2)^+} f(x) = \infty$, there is a vertical asymptote at $x = -\frac{1}{2}$. We have

$$f'(x) = \frac{(2x+1) \cdot 2x - (x^2 + 12)}{(2x+1)^2} = \frac{2x^2 + 2x - 24}{(2x+1)^2} = \frac{2(x+4)(x-3)}{(2x+1)^2}$$

$$f''(x) = \frac{(2x+1)^2(4x+2) - (2x^2 + 2x - 24) \cdot 2(2x+1) \cdot 2}{(2x+1)^4} = \frac{98}{(2x+1)^3}.$$

Then $f'(x) = 0$ for $x = -4$ and $x = 3$, while $f''(x)$ is never 0.

Note that $f'(x) > 0$ on $(-\infty, -4)$ and on $(3, \infty)$. So $f$ is increasing on $(-\infty, -4)$ and on $(3, \infty)$. Also, $f'(x) < 0$ on $(-4, -\frac{1}{2})$ and on $(-\frac{1}{2}, 3)$. So $f$ is decreasing on those intervals. There is a local maximum of $-4$ at $x = -4$ and a local minimum of $3$ at $x = 3$.

Note also that $f''(x) < 0$ for $x < -\frac{1}{2}$, and $f''(x) > 0$ for $x > -\frac{1}{2}$, so $f$ is concave down on $(-\infty, -\frac{1}{2})$ and is concave up on $(-\frac{1}{2}, \infty).$ There are no inflection points because the only change in concavity occurs at the vertical asymptote. There are no $x$-intercepts because $x^2 + 12 > 0$ for all $x$, and the $y$-intercept is $f(0) = 12$. 

Copyright © 2014 Pearson Education, Inc.
4.3.20 The domain of $f$ is $(-\infty, \infty)$, there is no symmetry, and $f$ has no vertical asymptotes. Note that

$$\lim_{x \to \pm \infty} \frac{4x + 4}{x^2 + 3} \cdot \frac{1}{x^2} = \lim_{x \to \pm \infty} \frac{4x + 4/x^2}{1 + (3/x^2)} = 0,$$

so there is a horizontal asymptote of $y = 0$. Next,

$$f'(x) = \frac{(x^2 + 3) \cdot 4 - (4x + 4) \cdot 2x}{(x^2 + 3)^2} = \frac{4(x^2 + 2x - 3)}{(x^2 + 3)^2} = \frac{4(x + 3)(x - 1)}{(x^2 + 3)^2},$$

$$f''(x) = \frac{(x^2 + 3)^2(-8 - 8x) - (12 - 8x - 4x^2) \cdot 2(x^2 + 3) \cdot 2x}{(x^2 + 3)^4} = \frac{8(x^3 + 3x^2 - 9x - 3)}{(x^3 + 3)^3}.$$

Then $f'(x) = 0$ for $x = -3$ and $x = 1$. The numerator of $f''(x)$ has three roots, which we will call $r_1$, $r_2$, and $r_3$. Note that $r_1 \approx -4.76$, $r_2 \approx -0.31$, and $r_3 \approx 2.06$.

Note that $f'(x) < 0$ on $(-\infty, -3)$ and on $(1, \infty)$. So $f$ is decreasing on those intervals, while $f'(x) > 0$ on $(-3, 1)$, so $f$ is increasing there. $f$ has a local maximum of 2 at $x = 1$ and a local minimum of $-\frac{2}{3}$ at $x = -3$.

Note also that $f''(x) < 0$ for $x < r_1$, and for $r_2 < x < r_3$, so $f$ is concave down on $(-\infty, r_2)$ and on $(r_2, r_3)$. However, $f''(x) > 0$ for $r_1 < x < r_2$ and for $x > r_3$, so $f$ is concave up on $(r_1, r_2)$ and on $(r_3, \infty)$. There are inflection points at each of $r_1$, $r_2$, and $r_3$. The $x$-intercept is $x = -1$ and the $y$-intercept is $f(0) = \frac{4}{3}$.

4.3.21 The domain of $f$ is $(-\infty, \infty)$, and $f$ is symmetric about the $y$-axis, because $f(-x) = \tan^{-1}((-x)^2) = \tan^{-1} x^2 = f(x)$. The only intercept is $(0, 0)$.
Note that \( \lim_{x \to \pm \infty} \tan^{-1}(x^2) = \frac{\pi}{2} \), so \( y = \frac{\pi}{2} \) is a horizontal asymptote in both directions. Now,

\[
\begin{align*}
f'(x) &= \frac{2x}{1 + x^4} \\
f''(x) &= \frac{(1 + x^4) \cdot 2 - 2x \cdot 4x^3}{(1 + x^4)^2} = \frac{2 - 6x^4}{(1 + x^4)^2} = \frac{2(1 - 3x^4)}{(1 + x^4)^2}
\end{align*}
\]

Then \( f'(x) = 0 \) for \( x = 0 \). Note that \( f' \) is negative when \( x \) is negative and positive when \( x \) is positive, so \( f \) is decreasing on \(( -\infty, 0) \) and increasing on \(( 0, \infty) \), and there is a local (in fact, absolute) minimum at \(( 0, 0) \). Also, \( f''(x) = 0 \) for \( x = \pm \sqrt[4]{\frac{1}{3}} \). Also note that \( f''(-2) < 0, f''(0) > 0, \) and \( f''(2) < 0, \) so \( f \) is concave down on \(( -\infty, -\sqrt[4]{\frac{1}{3}}) \) and on \(( \sqrt[4]{\frac{1}{3}}, \infty) \), and is concave up on \(( -\sqrt[4]{\frac{1}{3}}, \sqrt[4]{\frac{1}{3}}) \). There are inflection points at \((-\sqrt[4]{\frac{1}{3}}, \frac{\pi}{3}) \) and \(( \sqrt[4]{\frac{1}{3}}, \frac{\pi}{3}) \).

\draw[domain=-4:4, smooth, variable=x] plot ({x}, {pi/2 - atan(x^2) + atan(pi/2 - pi/2) - atan(x^2)});\node at (0,0) {\( (0, 0) \)};
\node at (-1,0) {\( -\frac{1}{\sqrt[4]{3}} \)};
\node at (1,0) {\( \frac{1}{\sqrt[4]{3}} \)};
\end{scope}
\end{tikzpicture}
\end{center}

4.3.22 The domain of \( f \) is \(( -\infty, \infty) \), and \( f \) is symmetric about the \( y \)-axis, because \( f(-x) = \ln((-x)^2 + 1) = f(x) \). The only intercept is \(( 0, 0) \).

Note that \( \lim_{x \to \pm \infty} \ln(x^2 + 1) = \infty \), so there are no horizontal asymptotes.

\( f'(x) = \frac{2x}{1 + x^4} \), which is zero for \( x = 0 \). Note that \( f' \) is negative when \( x \) is negative and positive when \( x \) is positive, so \( f \) is decreasing on \(( -\infty, 0) \) and increasing on \(( 0, \infty) \), and there is a local (in fact, absolute) minimum at \(( 0, 0) \).

\( f''(x) = \frac{(1 + x^2) \cdot 2 - 2x \cdot 2x}{(1 + x^2)^2} = \frac{2(1 - x^2)}{(1 + x^2)^2} \). This is zero for \( x = \pm 1 \). Also note that \( f''(-2) < 0, f''(0) > 0, \) and \( f''(2) < 0, \) so \( f \) is concave down on \(( -\infty, -1) \) and on \(( 1, \infty) \), and is concave up on \(( -1, 1) \). There are inflection points at \((-1, \ln 2) \) and \(( 1, \ln 2) \).

Copyright © 2014 Pearson Education, Inc.
4.3.23 The domain of \( f \) is given to be \([-2\pi, 2\pi]\), and there is no symmetry, and no vertical asymptotes. There are no horizontal asymptotes to consider on this restricted domain.

\[ f'(x) = 1 - 2\sin x \]. This is 0 when \( \sin x = \frac{1}{2} \), which occurs on the given interval for \( x = -\frac{11\pi}{6}, -\frac{7\pi}{6}, \frac{\pi}{6}, \) and \( \frac{5\pi}{6} \). \( f''(x) = -2\cos x \), which is 0 for \( x = -\frac{3\pi}{2}, -\frac{\pi}{2}, \) and \( \frac{3\pi}{2} \).

Note that \( f'(x) > 0 \) on \((-2\pi, -\frac{11\pi}{6})\), and on \((-\frac{\pi}{2}, \frac{\pi}{2})\), and on \((\frac{5\pi}{6}, 2\pi)\). So \( f \) is increasing on those intervals, while \( f'(x) < 0 \) on \((-\frac{11\pi}{6}, -\frac{7\pi}{6})\) and on \((\frac{\pi}{6}, \frac{5\pi}{6})\), so \( f \) is decreasing there. \( f \) has local maxima at \( x = -\frac{11\pi}{6} \) and at \( x = \frac{\pi}{6} \) and local minima at \( x = -\frac{\pi}{2} \) and at \( x = \frac{5\pi}{6} \). Note also that \( f''(x) < 0 \) on \((-2\pi, -\frac{3\pi}{2})\) and on \((-\frac{\pi}{2}, \frac{\pi}{2})\) and on \((\frac{3\pi}{6}, 2\pi)\), so \( f \) is concave down on those intervals, while \( f''(x) > 0 \) on \((-\frac{3\pi}{2}, -\frac{\pi}{2})\) and on \((\frac{3\pi}{6}, 2\pi)\), so \( f \) is concave up there and there are inflection points at \( x = \pm\frac{3\pi}{2} \) and \( x = \pm\frac{\pi}{2} \). The y-intercept is \( f(0) = 2 \) and the x-intercept is at approximately \(-1.030\).

4.3.24 The domain of \( f \) is \((-\infty, \infty)\). There are no asymptotes. There are x-intercepts at \((0,0)\) and \((27,0)\).

\[ f'(x) = 1 - \frac{2}{\sqrt{x}} = \frac{3\sqrt{x} - 2}{\sqrt{x}} \]. This is undefined at \( x = 0 \), and is equal to zero at \( x = 8 \). Note that \( f'(-1) > 0 \), \( f'(1) < 0 \), and \( f'(27) > 0 \), so \( f \) is increasing on \((-\infty, 0)\), decreasing on \((0,8)\), and increasing on \((8,\infty)\).

There is a local maximum at \((0,0)\) and a local minimum at \((8,-4)\).

\[ f''(x) = \frac{2}{3\sqrt{x}^3} \], which is never zero, but is undefined at \( x = 0 \). Because this is always positive, \( f \) is concave up on \((-\infty, 0)\) and on \((0,\infty)\). There are no inflection points.
4.3.25 The domain of \( f \) is \((-\infty, \infty)\). There are no asymptotes. There are \( x \)-intercepts at \((0, 0)\) and \((\pm 3\sqrt{3}, 0)\). \( f \) does have odd symmetry, because \( f(-x) = -x - 3((-x)^{1/3}) = -(x - 3x^{1/3}) = -f(x) \).

\[
f'(x) = 1 - \frac{1}{\sqrt[3]{x^2}} = \frac{\sqrt[3]{x^2} - 1}{\sqrt[3]{x^2}}.
\]

This is undefined at \( x = 0 \), and is equal to zero at \( \pm 1 \). Note that \( f'(-2) > 0 \), \( f'(-1/2) < 0 \), \( f'(1/2) < 0 \), \( f'(2) > 0 \). Thus, \( f \) is increasing on \((-\infty, -1)\) and on \((1, \infty)\). Because \( f \) is continuous at 0 (even though \( f' \) doesn’t exist there), we can combine the intervals \((-1, 0)\) and \((0, 1)\) and state that \( f \) is decreasing on \((-1, 1)\). There is a local maximum at \((-1, 2)\) and a local minimum at \((1, -2)\).

\[
f''(x) = \frac{2}{3\sqrt[3]{x^2}},
\]

which is never zero, but is undefined at \( x = 0 \). Note that \( f''(x) < 0 \) for \( x < 0 \) and \( f''(x) > 0 \) for \( x > 0 \), so \( f \) is concave down on \((-\infty, 0)\) and is concave up on \((0, \infty)\). There is an inflection point at \((0, 0)\).

4.3.26 The domain of \( f \) is \((-\infty, \infty)\). There are no asymptotes, nor \( x \)-intercepts. \( f \) does have even symmetry, because \( f(-x) = 2 - (-x)^{2/3} + (-x)^{4/3} = 2 - x^{2/3} + x^{4/3} = f(x) \). We have

\[
f'(x) = \frac{-2}{3x^{1/3}} + \frac{4}{3}x^{1/3} = \frac{4x^{2/3} - 2}{3x^{1/3}}
\]

\[
f''(x) = \frac{2}{9x^{4/3}} + \frac{4}{9} \frac{1}{x^{2/3}} = \frac{4x^{2/3} + 2}{9x^{4/3}}.
\]

Then \( f'(x) \) is undefined at \( x = 0 \), and is equal to zero when \( x^{2/3} = \frac{1}{2} \), which is when \( x = \pm \frac{1}{\sqrt[3]{2}} \approx \pm 0.354 \). Note that \( f'(-1) < 0 \), \( f'(-0.1) > 0 \), \( f'(0.1) < 0 \), and \( f'(1) > 0 \), so \( f \) is decreasing on \((-\infty, -\frac{1}{\sqrt[3]{2}})\) and on \((0, \frac{1}{\sqrt[3]{2}})\), and is increasing on \((-\frac{1}{\sqrt[3]{2}}, 0)\) and on \((\frac{1}{\sqrt[3]{2}}, \infty)\). There are local minima at \( \left(\pm \frac{1}{\sqrt[3]{2}}, 1.75\right)\) and a local maximum at \((0, 2)\). Finally, \( f''(x) \) is undefined at \( x = 0 \), but otherwise is always positive. So \( f \) is concave up on \((-\infty, 0)\) and on \((0, \infty)\). There are no inflection points.
4.3.27 The domain of \( f \) is given to be \([0, 2\pi]\), so questions about symmetry and horizontal asymptotes aren’t relevant. There are no vertical asymptotes.

\[ f'(x) = \cos x - 1 \]

This is never 0 on \((0, 2\pi)\). \( f''(x) = -\sin x \), which is 0 on the given interval only for \( x = \pi \).

Note that \( f'(x) < 0 \) on \((0, 2\pi)\), so \( f \) is decreasing on the given interval and there are no relative extrema.

Note also that \( f''(x) < 0 \) on \((0, \pi)\) and \( f''(x) > 0 \) on \((\pi, 2\pi)\), so \( f \) is concave down on \((0, \pi)\) and is concave up on \((\pi, 2\pi)\), and there is an inflection point at \( x = \pi \). The only intercept is the origin \((0, 0)\).

4.3.28 The domain of \( f \) is \((-3, \infty)\), there is no symmetry, and there are no vertical asymptotes. Note that \( \lim_{x \to \infty} f(x) = \infty \), so there are no horizontal asymptotes. Now,

\[
\begin{align*}
    f'(x) &= x \cdot \frac{1}{2} \cdot (x + 3)^{-1/2} + (x + 3)^{1/2} = \frac{3x + 6}{2\sqrt{x + 3}} \\
    f''(x) &= \frac{2(x + 3)^{1/2} \cdot 3 - (3x + 6)(x + 3)^{-1/2}}{4(x + 3)} = \frac{3x + 12}{4(x + 3)^{3/2}}.
\end{align*}
\]

Note that \( f'(x) = 0 \) for \( x = -2 \). Since \( f'(x) < 0 \) on \((-3, -2)\) and \( f'(x) > 0 \) on \((-2, \infty)\), we see that \( f \) is decreasing on \((-3, -2)\) and increasing on \((-2, \infty)\), and there is a local (and absolute) minimum of \(-2\) at \( x = -2 \). Finally, the numerator of \( f''(x) \) is zero for \( x = -4 \), but that number isn’t in the domain of \( f \).
Note also that \( f''(x) > 0 \) for all \( x \) in the domain of \( f \), so \( f \) is concave up on its domain, and there are no inflection points. The function is equal to zero at the \( x \)-intercepts \((-3, 0)\) and \((0, 0)\), and the latter is also the \( y \)-intercept.

\[
g'(t) = e^{-t} \cos t + \sin t \cdot (-e^{-t}) = e^{-t} (\cos t - \sin t)
g''(t) = e^{-t}(- \sin t - \cos t) + (\cos t - \sin t)(-e^{-t}) = -2e^{-t} \cos t.
\]

\( g'(t) = 0 \) on the given interval for \( t = -\frac{3\pi}{4} \) and \( t = \frac{\pi}{4} \). Further, \( g'(t) < 0 \) on \((-\pi, -\frac{3\pi}{4})\) and on \( \left(\frac{\pi}{4}, \pi\right)\), so \( g \) is decreasing on those intervals. On \( (-\frac{3\pi}{4}, \frac{\pi}{4}) \) we have \( g'(t) > 0 \) and so \( g \) is increasing. There is a local minimum of about \(-7.460\) at \( t = -3\pi/4 \) and a local maximum of about \(0.322\) at \( t = \frac{\pi}{4} \). Finally, \( g''(t) = 0 \) for \( t = -\frac{\pi}{2} \) and \( t = \frac{\pi}{2} \). Note also that \( g''(t) > 0 \) on \((-\pi, -\frac{\pi}{2})\) and on \( \left(\frac{\pi}{2}, \pi\right)\), while \( g''(t) < 0 \) on \( (-\frac{\pi}{2}, \frac{\pi}{2})\), so \( g \) is concave down on \( (-\frac{\pi}{2}, \frac{\pi}{2})\) and is concave up on \( \left(\frac{\pi}{2}, \pi\right)\) and on \( (-\pi, -\frac{\pi}{2})\). There are inflection points at \( t = \pm\frac{\pi}{2} \). The origin is both the \( y \)-intercept and an \( x \)-intercept. The endpoints are \( x \)-intercepts as well.
4.3.30 The domain of \( g \) is \((0, \infty)\), and there is no symmetry, and there are no vertical asymptotes. Note that \( \lim_{x \to \infty} g(x) = \infty \), so there are no horizontal asymptotes. Now,

\[
g'(x) = x^2 \cdot \frac{1}{x} + \ln x \cdot 2x = x(1 + 2 \ln x), \quad g''(x) = x(2/x) + (1 + 2 \ln x) = 3 + 2 \ln x.
\]

\( g'(x) = 0 \) for \( x = e^{-1/2} \), and further, \( g'(x) < 0 \) on \((0, e^{-1/2}) \) and \( g'(x) > 0 \) on \((e^{-1/2}, \infty) \), so \( g \) is decreasing on \((0, e^{-1/2}) \) and increasing on \((e^{-1/2}, \infty) \), and there is a local (and absolute) minimum at \( x = e^{-1/2} \). Finally, \( g''(x) = 0 \) for \( x = e^{-3/2} \), and \( g''(x) < 0 \) for \( 0 < x < e^{-3/2} \) and \( g''(x) > 0 \) for \( x > e^{-3/2} \), so \( g \) is concave down on \((0, e^{-3/2}) \) and concave up on \((e^{-3/2}, \infty) \); there is an inflection point at \( x = e^{-3/2} \). The only \( x \)-intercept is \((1, 0)\).

![Graph of the function g(x) with inflection points and local minima labeled.]

4.3.31 Note that \( f(x) \) is not defined at \( x = \pm \frac{\pi}{2} \). Since \( f(-x) = -x + \tan(-x) = -x - \tan x = -(x + \tan x) = -f(x) \), we see that \( f \) has odd symmetry. \( f \) has vertical asymptotes at \( x = \pm \frac{\pi}{2} \) and at \( x = \pm \frac{3\pi}{2} \), because the tangent function increases or decreases without bound as \( x \) approaches these values. Now, \( f'(x) = 1 + \sec^2 x \geq 0 \), so that \( f \) is increasing on each interval on which it is defined, and it has no extrema. \( f''(x) = 2 \sec x \cdot \sec x \tan x = 2 \sec^2 x \tan x \). This is 0 at \( x = \pm \pi \) and \( x = 0 \). Note that \( f''(x) \) is positive on \((-\pi, -\frac{\pi}{2})\), on \((0, \frac{\pi}{2})\) and on \((\pi, \frac{3\pi}{2})\), so \( f \) is concave up on these intervals. Also, \( f''(x) \) is negative on \((-\frac{3\pi}{2}, -\pi)\), on \((-\frac{\pi}{2}, 0)\), and on \((\frac{\pi}{2}, \pi)\), so \( f \) is concave down on these intervals. There are points of inflection at \( x = \pm \pi \) and at \( x = 0 \). The other changes in concavity occur at the vertical asymptotes.

![Graph of the function f(x) with inflection points and local extrema labeled.]

4.3.32 The domain of \( f \) is \((0, \infty)\). Note that \( \lim_{x \to 0^+} \frac{\ln x}{x^2} = -\infty \), so \( x = 0 \) is a vertical asymptote. Questions about symmetry aren’t relevant. Later in this chapter we will show that \( \lim_{x \to \infty} \frac{\ln x}{x^2} = 0 \), so \( y = 0 \) is a
4.3. GRAPHING FUNCTIONS

horizontal asymptote. We have

\[ f'(x) = \frac{x^2 \cdot (1/x) - \ln x \cdot 2x}{x^4} = \frac{1 - 2 \ln x}{x^3}, \quad f''(x) = \frac{x^3(-2/x) - (1 - 2 \ln x) \cdot 3x^2}{x^6} = \frac{6 \ln x - 5}{x^4}. \]

\( f'(x) = 0 \) for \( x = e^{1/2} \); further, \( f'(x) > 0 \) for \( 0 < x < e^{1/2} \) and \( f'(x) < 0 \) for \( x > e^{1/2} \), so \( f \) is increasing on \((0, e^{1/2})\) and decreasing on \((e^{1/2}, \infty)\), and there is a local maximum (which is actually an absolute maximum) at \( x = e^{1/2} \) of about 0.184. Finally, \( f''(x) = 0 \) for \( x = e^{5/6} \). Note that \( f''(x) < 0 \) for \( 0 < x < e^{5/6} \) and \( f''(x) > 0 \) for \( x > e^{5/6} \), so there is a point of inflection at \( e^{5/6} \) where the concavity changes from down (to the left) to up (to the right).

4.3.33 The domain of \( f \) is \((0, \infty)\), so questions about symmetry aren’t relevant. There are no asymptotes. We have

\[ f'(x) = x \cdot \frac{1}{x} + \ln x = 1 + \ln x, \quad f''(x) = \frac{1}{x}. \]

\( f'(x) = 0 \) for \( x = \frac{1}{e} \), and \( f'(x) < 0 \) for \( 0 < x < \frac{1}{e} \) while \( f'(x) > 0 \) for \( x > \frac{1}{e} \), so \( f \) is decreasing on \((0, \frac{1}{e})\) and increasing on \((\frac{1}{e}, \infty)\) and there is a local minimum (which is also an absolute minimum) at \( x = \frac{1}{e} \). Finally, \( f''(x) \) is always positive on the domain, so \( f \) is concave up on its domain and there are no inflection points. There is an \( x \)-intercept at \( x = 1 \).
4.3.34 The domain of $g$ is $(-\infty, \infty)$. Note that $g(-x) = e^{-(x^2)/2} = e^{-x^2/2} = g(x)$, so $g$ has even symmetry. There are no vertical asymptotes, but $\lim_{x \to \pm \infty} \frac{1}{e^{x^2}} = 0$, so the $x$-axis is a horizontal asymptote. We have

$$g'(x) = -xe^{-x^2/2}, \quad g''(x) = -x \cdot (-xe^{-x^2/2}) + e^{-x^2/2}(-1) = e^{-x^2/2}(x^2 - 1).$$

g'(x) = 0 only for $x = 0$, and it is positive on $(-\infty, 0)$ and negative on $(0, \infty)$, so $g$ is increasing on $(\infty, 0)$ and is decreasing on $(0, \infty)$, so there is a local maximum (which is actually an absolute maximum) of $g(0) = 1$ at $x = 0$. Finally, $g''(x) = 0$ only for $x = \pm 1$. Note that $g''(x) < 0$ on $(-1, 1)$ (so $g$ is concave down there) and $g''(x) > 0$ on $(-\infty, -1)$ and on $(1, \infty)$, where $g$ is concave up. There are inflection points at $x = \pm 1$, and there are no $x$-intercepts. There is a $y$-intercept at $(0, 1)$.

4.3.35 The domain of $p$ is $(-\infty, \infty)$. There are no vertical asymptotes. Note that $p(-x) = -xe^{-(x^2)} = -p(x)$, so $p$ has odd symmetry. Later in this chapter show that $\lim_{x \to \pm \infty} p(x) = 0$, so $y = 0$ is a horizontal asymptote. Now,

$$p'(x) = x \cdot (-2xe^{-x^2} + e^{-x^2} \cdot 1) = e^{-x^2}(1 - 2x^2),$$

$$p''(x) = e^{-x^2}(4x) + (1 - 2x^2)(-2x)e^{-x^2} = 2x(2x^2 - 3)e^{-x^2}.$$  

$p'(x) = 0$ for $x = \pm \sqrt{2}/2$; further, $p'(x) < 0$ on $(-\infty, -\sqrt{2}/2)$ and on $\sqrt{2}/2, \infty)$, so $p$ is decreasing on those intervals, and $p'(x) > 0$ on $(-\sqrt{2}/2, \sqrt{2}/2)$, so $p$ is increasing on that interval. There is a local maximum at $x = \sqrt{2}/2$ and a local minimum at $x = -\sqrt{2}/2$. Finally, $p''(x) = 0$ at $x = 0$ and at $x = \pm \sqrt{2}$. Note that $p''(x) > 0$ on $(-\sqrt{3}/2, 0)$ and on $\left(\sqrt{3}/2, \infty\right)$, so $p$ is concave up on those intervals, while $p''(x) < 0$ on $(-\infty, -\sqrt{3}/2)$ and on $\left(0, \sqrt{3}/2\right)$, so $p$ is concave down on those intervals. There are inflection points at each of $x = \pm \sqrt{3}/2$ and at $x = 0$. There is an $x$-intercept at $(0, 0)$, which is also the $y$-intercept.
4.3.36 The domain of $g$ is $(-\infty, 0) \cup (0, \infty)$, and $g$ has no symmetry. Note that $\lim_{x \to \infty} \frac{1}{e^{-x} - 1} = \frac{1}{0-1} = -1$, so $y = -1$ is a horizontal asymptote as $x \to \infty$. Also, $\lim_{x \to -\infty} \frac{1}{e^{-x} - 1} = 0$, so $y = 0$ is a horizontal asymptote as $x \to -\infty$. Now,

$$g'(x) = -(e^{-x} - 1)^{-2}(-e^{-x}) = \frac{e^{-x}}{(e^{-x} - 1)^2}.$$  

$$g''(x) = \frac{(e^{-x} - 1)^2(-e^{-x}) - e^{-x} \cdot 2(e^{-x} - 1)(-e^{-x})}{(e^{-x} - 1)^4} = \frac{e^{-x}(e^{-x} + 1)}{(e^{-x} - 1)^3}.$$  

$g'(x)$ is never 0, and is positive on $(-\infty, 0)$ and on $(0, \infty)$, so $g$ is increasing on $(-\infty, 0)$ and is increasing on $(0, \infty)$. Thus $g$ has no extrema. Further, $g''(x)$ is also never 0. It is positive on $(-\infty, 0)$ and negative on $(0, \infty)$, so there are no inflection points as the only change in concavity occurs at the vertical asymptote, where the concavity changes from concave up (for $x < 0$) to concave down (for $x > 0$).

4.3.37 The domain of $f$ is $(-\infty, \infty)$, and there is no symmetry. $f'(x) = x^2 - 4x - 5 = (x - 5)(x + 1)$. This is 0 when $x = -1, 5$. $f''(x) = 2x - 4$, which is 0 when $x = 2$. Note that $f'(-2) > 0$, $f'(0) < 0$, and $f'(6) > 0$. So $f$ is increasing on $(-\infty, -1)$ and on $(5, \infty)$. It is decreasing on $(-1, 5)$. There is a local maximum of $\frac{14}{3}$ at $x = -1$ and a local minimum of $-\frac{94}{3}$ at $x = 5$. Note also that $f''(x) < 0$ for $x < 2$ and $f''(x) > 0$ for $x > 2$, so there is an inflection point at $(2, -\frac{40}{3})$, and $f$ is concave down on $(-\infty, 2)$ and concave up on $(2, \infty)$. The $y$ intercept is $f(0) = 2$. 

Copyright © 2014 Pearson Education, Inc.
4.3.38 The domain of $f$ is $(-\infty, \infty)$, and there is no symmetry. $f'(x) = \frac{1}{2}x^2 - 1$. This is 0 when $x = \pm \sqrt{5}$. $f''(x) = \frac{2}{x}$, which is 0 when $x = 0$. Note that $f'(-3) > 0$, $f'(0) < 0$, and $f'(3) > 0$. So $f$ is increasing on $(-\infty, -\sqrt{5})$ and on $(\sqrt{5}, \infty)$. It is decreasing on $(-\sqrt{5}, \sqrt{5})$. There is a local maximum of $\frac{3+2\sqrt{5}}{3}$ at $x = -\sqrt{5}$ and a local minimum of $\frac{1-2\sqrt{5}}{3}$ at $x = \sqrt{5}$. Note also that $f''(x) < 0$ for $x < 0$ and $f''(x) > 0$ for $x > 0$, so there is an inflection point at the $y$-intercept $(0, 1)$, and $f$ is concave down on $(-\infty, 0)$ and concave up on $(0, \infty)$.

4.3.39 The domain of $f$ is $(-\infty, \infty)$, and there is no symmetry. We have

$$f'(x) = 12x^3 + 12x^2 - 24x = 12x(x+2)(x-1), \quad f''(x) = 36x^2 + 24x - 24 = 12(3x^2 + 2x - 2).$$

$f'(x) = 0$ when $x = -2$, when $x = 1$, and when $x = 0$, while $f''(x) = 0$ for $x = \frac{1+\sqrt{7}}{3} \approx -1.215$, 0.549. Note that $f'(-3) < 0$, $f'(-1) > 0$, $f'(0.5) < 0$, and $f'(2) > 0$. So $f$ is decreasing on $(-\infty, -2)$ and on $(0, 1)$. It is increasing on $(-2, 0)$ and on $(1, \infty)$. There is a local maximum of 0 at $x = 0$ and a local minimum of $-32$ at $x = -2$ and a local minimum of $-5$ at $x = 1$. Let $r_1 < r_2$ be the two roots of $f''(x)$ mentioned above. Note that $f''(x) > 0$ for $x < r_1$ and for $x > r_2$ and $f''(x) < 0$ for $r_1 < x < r_2$, so there are inflection points at $x = r_1$ and at $x = r_2$. Also, $f$ is concave down on $(r_1, r_2)$ and concave up on $(-\infty, r_1)$ and on $(r_2, \infty)$. There is a $y$-intercept at $f(0) = 0$ and $x$-intercepts where $f(x) = 3x^4 + 4x^3 - 12x^2 = x^2(3x^2 + 4x - 12) = 0$, which is at $x = \frac{-2\pm2\sqrt{10}}{3}$ and $x = 0$.

4.3.40 The domain of $f$ is $(-\infty, \infty)$, and there is no symmetry. $f'(x) = 3x^2 - 66x + 216 = 3(x-4)(x-18)$. This is 0 when $x = 4$ and when $x = 18$. $f''(x) = 6x - 66 = 6(x-11)$, which is 0 when $x = 11$. Note that
4.3.41 The domain of \( f \) is \((-\infty, -1) \cup (-1, 1) \cup (1, \infty)\), and there is no symmetry. Note that \( \lim_{x \to -1^+} f(x) = \infty \) and \( \lim_{x \to -1^-} f(x) = -\infty \), so there is a vertical asymptote at \( x = -1 \). Also, \( \lim_{x \to 1^+} f(x) = -\infty \) and \( \lim_{x \to 1^-} f(x) = \infty \), so there is a vertical asymptote at \( x = 1 \). Note that \( \lim_{x \to \pm \infty} \frac{3x - 5}{x^2 - 1} = \lim_{x \to \pm \infty} \frac{3/x}{1 - (1/x^2)} = 0 \), so \( y = 0 \) is a horizontal asymptote. Now,

\[
f'(x) = \frac{(x^2 - 1) \cdot 3 - (3x - 5) \cdot 2x}{(x^2 - 1)^2} = \frac{-3x^3 + 10x - 3}{(x^2 - 1)^2} = \frac{-3x + 1)(x - 3}{(x^2 - 1)^2}
\]

\[
f''(x) = \frac{(x^2 - 1)^2(-6x + 10) - (-3x^2 + 10x - 3) \cdot 2(x^2 - 1) \cdot 2x}{(x^2 - 1)^4} = \frac{2(3x^3 - 15x^2 + 9x - 5)}{(x^2 - 1)^3}.
\]

\( f'(x) = 0 \) when \( x = 3 \) and when \( x = \frac{1}{3} \). Since \( f'(-2) < 0, f'(-\frac{1}{2}) < 0, f'(\frac{1}{2}) > 0, f'(2) > 0 \) and \( f'(4) < 0 \), we see that \( f \) is decreasing on \((-\infty, -1)\), on \((-1, \frac{1}{3})\) and on \((3, \infty)\). It is increasing on \((\frac{1}{3}, 1)\) and on \((1, 3)\). There is a local maximum of \( \frac{1}{2} \) at \( x = 3 \) and a local minimum of \( \frac{1}{3} \) at \( x = \frac{1}{3} \). Finally, \( f''(x) = 0 \) for \( x \approx 4.405 \); call this \( r \). Now, \( f''(x) < 0 \) for \( x < -1 \) and for \( 1 < x < r \), while \( f''(x) > 0 \) for \(-1 < x < 1 \) and for \( x > r \). Thus \( f \) is concave up on \((-1, 1)\) and on \((r, \infty)\) and concave down on \((-\infty, -1)\) and on \((1, r)\). There is an inflection point at \( r \). There is a \( y \)-intercept at \( f(0) = 5 \) and an \( x \)-intercept at \( \left( \frac{5}{3}, 0 \right) \).
4.3.42 The domain of \( f \) is \((-\infty, \infty)\), and there is no symmetry, and no vertical asymptotes. Note that 
\[
\lim_{x \to \pm \infty} f(x) = \pm \infty,
\]
so there are no horizontal asymptotes. Now,
\[
\begin{align*}
f'(x) &= (x - 2)^{1/3} \cdot 2(x - 2) + (x - 2)^2(1/3)x^{-2/3} = \frac{(x - 2)(7x - 2)}{3x^{2/3}} \\
f''(x) &= \frac{3x^{2/3}(14x - 16) - (7x^2 - 16x + 4)(2x^{-1/3})}{9x^{4/3}} = \frac{4(7x^2 - 4x - 2)}{9x^{5/3}}.
\end{align*}
\]

\( f'(x) = 0 \) for \( x = 2 \) and \( x = \frac{2}{7} \), and \( f'(x) \) does not exist for \( x = 0 \). Since \( f'(x) > 0 \) on \((-\infty, 0)\), on \( (0, \frac{2}{7}) \), and on \( (2, \infty)\), we see that \( f \) is increasing on those intervals, while \( f'(x) < 0 \) on \( (\frac{2}{7}, 2) \), so \( f \) is decreasing there. \( f \) has a local maximum at \( x = \frac{2}{7} \) and a local minimum of 0 at \( x = 2 \). Finally, the numerator of \( f''(x) \) has two roots, \( r_1 \approx -0.320 \) and \( r_2 \approx 0.892 \). Note also that \( f''(x) \) does not exist for \( x = 0 \). Since \( f''(x) < 0 \) for \( x < r_1 \), and for \( 0 < x < r_2 \), we have that \( f \) is concave down on \((-\infty, r_1)\) and on \( (0, r_2) \). However, \( f''(x) > 0 \) for \( r_1 < x < 0 \) and for \( x > r_2 \), so \( f \) is concave up on \((r_1, 0)\) and on \((r_2, \infty)\). There are inflection points at each of \( r_1, r_2, \) and 0. The inflection point \((0, 0)\) serves also as the \( x- \) and \( y- \) intercept.

4.3.43

a. False. Maxima and minima can also occur at points where \( f'(x) \) doesn’t exist. Also, it is possible to have a zero of \( f' \) which isn’t an extreme point.

b. False. Inflection points can also occur at points where \( f''(x) \) doesn’t exist, and a zero of \( f'' \) might not lead to an inflection point.

c. False. For example, \( f(x) = \frac{(x^2-9)(x^2-16)}{(x+3)(x-4)} \) doesn’t have a vertical asymptote at \( x = -3 \) or \( x = 4 \).

d. True. The limit of a rational function as \( x \to \infty \) is a finite number when the degree of the denominator is greater than or equal to that of the numerator. If they both have the same degree, the limit is the ratio of the leading coefficients, and this is also true of the limit as \( x \to -\infty \). In the case where the denominator has greater degree than the numerator, the limit as 0 as \( x \to -\infty \) and as \( x \to \infty \).

4.3.44 \( f'(x) = 0 \) at \( x = -4, x = -2, \) and \( x = 1 \). \( f'(x) > 0 \) on \((-4, -2)\) and on \((1, \infty)\), so \( f \) is increasing there, while \( f'(x) < 0 \) on \((-\infty, -4)\) and on \((-2, 1)\), so \( f \) is decreasing on those intervals. There must be a local maximum at \( x = -2 \) and local minima at \( x = -4 \) and \( x = 1 \). An example of such a function is sketched.

Copyright © 2014 Pearson Education, Inc.
4.3.45 $f'(x)$ is 0 on the interior of the given interval at $x = \pm \frac{3\pi}{2}$, $x = \pm \pi$, $x = \pm \frac{\pi}{2}$, and at $x = 0$. $f'(x) > 0$ on $(-2\pi, -\frac{3\pi}{2})$, on $(-\pi, -\frac{\pi}{2})$, and on $(0, \frac{\pi}{2})$, and on $(\pi, \frac{3\pi}{2})$, so $f$ is increasing on those intervals. $f'(x) < 0$ on $(-\frac{3\pi}{2}, -\pi)$, on $(-\frac{\pi}{2}, 0)$, on $(\frac{\pi}{2}, \pi)$, and on $(\frac{3\pi}{2}, 2\pi)$, so $f$ is decreasing on those intervals. There are local maxima at $x = \pm \frac{3\pi}{2}$ and $x = \pm \frac{\pi}{2}$, and local minima at $x = 0$ and at $x = \pm \pi$. An example of such a function is sketched.

4.3.46 $f'(x) = 0$ at $x = -1$, $x = 2$, and $x = 3$. Since $f'(x) > 0$ on $(-\infty, -1)$ and on $(3, \infty)$, we know that $f$ is increasing there. $f'(x) < 0$ on $(-1, 2)$ and on $(2, 3)$, so $f$ is decreasing there. Thus $x = -1$ must be a local maximum, while $x = 3$ is a local minimum. $x = 2$ is neither, since the first derivative does not change sign there.

4.3.47 $f'(x) = 0$ at $x = 0$, $x = -2$, and $x = 1$. Since $f'(x) > 0$ on $(-\infty, -2)$ and on $(1, \infty)$, we know that $f$ is increasing there. Since $f'(x) < 0$ on $(-2, 0)$ and on $(0, 1)$, we know that $f$ is decreasing there. Thus
$x = -2$ must be a local maximum, while $x = 1$ is a local minimum. $x = 0$ is neither, since the first derivative does not change sign there.

4.3.48 $f'(x) > 0$ on $(-\infty, 1)$ and on $(1, \infty)$, so $f$ should be increasing on both of those intervals. There should be an inflection point at $x = 1$, because the 2nd derivative changes from negative to positive there, so $f$ should change from concave down to concave up at that point.

4.3.49 $f'(x)$ is 0 at $x = 1$ and $x = 3$. $f'(x) > 0$ on $(0, 1)$ and on $(3, 4)$, so $f$ is increasing on those intervals. $f'(x) < 0$ on $(1, 3)$, so $f$ is decreasing on that interval. There is a local maximum at $x = 1$ and a local minimum at $x = 3$.

$f''(x)$ changes sign at $x = 2$ from negative to positive, so $x = 2$ is an inflection point where the concavity of $f$ changes from down to up. An example of such a function is sketched.

4.3.50 The domain of $f$ is $(-\infty, \infty)$ and there is no symmetry. There are no asymptotes because $f$ is a polynomial. The $y$-intercept is 1 and the $x$-intercepts are $\approx -20.912$, $\approx 12.911$, and $\approx \pm 0.061$. We have

$$f''(x) = 12x^2 + 48x - 540 = 12(x - 5)(x + 9).$$
Then \( f'(x) = 0 \) for \( x = 9, x = -15, \) and \( x = 0 \). Since \( f'(x) > 0 \) on \((-15, 0)\) and on \((9, \infty)\), we see that \( f \) is increasing on those intervals. \( f'(x) < 0 \) on \((-\infty, -15)\) and on \((0, 9)\), so \( f \) is decreasing on those intervals. There is a local maximum at \( x = 0 \) and local minima at \( x = -15 \) and \( x = 9 \). Finally, \( f''(x) = 0 \) for \( x = 5 \) and \( x = -9 \). Since \( f''(x) > 0 \) on \((-\infty, -9)\) and on \((5, \infty)\), we know that \( f \) is concave up on those intervals. \( f''(x) < 0 \) on \((-9, 5)\), so \( f \) is concave down on that interval. There are points of inflection at \( x = -9 \) and \( x = 5 \).

4.3.51 The domain of \( f \) is \((-\infty, \infty)\) and there is no symmetry. There are no asymptotes because \( f \) is a polynomial. The \( y \)-intercept is \( 0 \) and the \( x \)-intercepts are \(-9 \) and \( 15 \). Now,

\[
f'(x) = 3x^2 - 12x - 135 = 3(x - 9)(x + 5), \quad f''(x) = 6x - 12.
\]

Then \( f'(x) = 0 \) for \( x = 9 \) and \( x = -5 \). Also, \( f'(x) > 0 \) on \((-\infty, -5)\) and on \((9, \infty)\), so \( f \) is increasing on those intervals. \( f'(x) < 0 \) on \((-5, 9)\), so \( f \) is decreasing on that interval. There is a local maximum at \( x = -5 \) and a local minimum at \( x = 9 \). Finally, \( f''(x) = 0 \) when \( x = 2 \). Since \( f''(x) > 0 \) on \((2, \infty)\), we see that \( f \) is concave up on that interval. \( f''(x) < 0 \) on \((-\infty, 2)\), so \( f \) is concave down on that interval. There is a point of inflection at \( x = 2 \).

4.3.52 The domain of \( f \) is \((-\infty, \infty)\) and there is no symmetry. There are no asymptotes because \( f \) is a polynomial. The \( y \)-intercept is \( 286 \) and the \( x \)-intercepts are at \(-13, 2, \) and \( 11 \). Now,

\[
f'(x) = 3x^2 - 147 = 3(x + 7)(x - 7), \quad f''(x) = 6x.
\]

\( f'(x) = 0 \) for \( x = 7 \) and \( x = -7 \). Also, \( f'(x) > 0 \) on \((-\infty, -7)\) and on \((7, \infty)\), so \( f \) is increasing on those intervals. \( f'(x) < 0 \) on \((-7, 7)\), so \( f \) is decreasing on that interval. There is a local maximum at \( x = -7 \) and a local minimum at \( x = 7 \). Finally, \( f''(x) = 0 \) only when \( x = 0 \). Since \( f''(x) > 0 \) on \((0, \infty)\), we know that \( f \) is concave up on that interval. \( f''(x) < 0 \) on \((-\infty, 0)\), so \( f \) is concave down on that interval. There is a point of inflection at \( x = 0 \).
4.3.53 The domain of \( f \) is \((-\infty, \infty)\) and there is no symmetry. There are no asymptotes because \( f \) is a polynomial. The \( y \)-intercept is \(-140\) and the \( x \)-intercepts are at \(-10, -1, 14\). Now,

\[
f'(x) = 3x^2 - 6x - 144 = 3(x + 6)(x - 8), \quad f''(x) = 6x - 6.
\]

\( f'(x) = 0 \) when \( x = -6 \) and \( x = 8 \). Since \( f'(x) > 0 \) on \((-\infty, -6)\) and on \((8, \infty)\), we see that \( f \) is increasing on those intervals. \( f'(x) < 0 \) on \((-6, 8)\), so \( f \) is decreasing on that interval. There is a local maximum at \( x = -6 \) and a local minimum at \( x = 8 \). Finally, \( f''(x) = 0 \) only for \( x = 1 \). Also, \( f''(x) > 0 \) on \((1, \infty)\), so \( f \) is concave up on that interval. \( f''(x) < 0 \) on \((-\infty, 1)\), so \( f \) is concave down on that interval. There is a point of inflection at \( x = 1 \).

4.3.54

\[ a. \quad f'(x) = -\sin(\ln x) \cdot \frac{1}{x} = -\frac{\sin(\ln x)}{x}, \] which is 0 when \( \ln x = k\pi \) for an integer \( k \), which occurs for \( x = e^{k\pi} \). On the given interval, this occurs for \( x = 1, x = e^{-\pi}, x = e^{-2\pi}, \ldots \).

\[ b. \quad f''(x) = \frac{x(-\cos(\ln x) - (1/x)) - (-\sin(\ln x))}{x^2} = \frac{\sin(\ln x) - \cos(\ln x)}{x}. \] This is 0 when \( \ln x = \frac{4k+1}{4} \pi \) where \( k \) is an integer. For our domain, this occurs for \( x = e^{\pi/4}, x = e^{-3\pi/4}, x = e^{-7\pi/4}, \ldots \).

\[ c. \quad \text{Using a computer algebra system, the three smallest zeroes on } (0.1, \infty) \text{ are at } \approx 0.208, \approx 4.810, \text{ and } \approx 111.318. \]
4.3. GRAPHING FUNCTIONS

4.3.55 \( f \) can be written as \( f(x) = e^{(\ln x)/x} \). \( f'(x) = e^{(\ln x)/x} \left( \frac{1 - \ln x}{x^2} \right) \). This is 0 for \( x = e \), and is positive on \((0, e)\) and negative on \((e, \infty)\). There is a local maximum at \( x = e \) of \( e^{1/e} \).

4.3.56 \( f \) can be written as \( f(x) = e^{x \ln x} \). \( f'(x) = e^{x \ln x} (1 + \ln x) \). This is 0 for \( x = \frac{1}{e} \), and is positive on \((\frac{1}{e}, \infty)\) and negative on \((0, \frac{1}{e})\). There is a local minimum at \( x = \frac{1}{e} \) of \( \frac{1}{e^{1/e}} \).
4.3.61 The domain of \( f \) is \((-\infty, -2) \cup (2, \infty)\) and there is no symmetry. There is a vertical asymptote at \( x = 2 \) because \( \lim_{x \to 2^+} \frac{-x\sqrt{x^2-4}}{x-2} = -\infty \). There are no horizontal asymptotes. Now,

\[
f'(x) = \frac{(x-2)(-x^2(x^2-4)^{-1/2} + (x^2-4)^{1/2}(-1)) - ((-x)(x^2-4))^{1/2}}{(x-2)^2} = \frac{-x^2 + 2x + 4}{(x-2)\sqrt{x^2-4}}
\]

\[
f''(x) = -\frac{4(x+4)}{(x-2)^2(x+2)\sqrt{x^2-4}}
\]

(after some calculation). \( f'(x) = 0 \) on the given domain only for \( x = 1 + \sqrt{5} \approx 3.236 \). However, \( f'(x) > 0 \) on \((-\infty, -2)\) and on \((2, 1+\sqrt{5})\), so \( f \) is increasing on those intervals. \( f'(x) < 0 \) on \((1+\sqrt{5}, \infty)\), so \( f \) is decreasing on that interval. There is a local maximum at \( x = 1 + \sqrt{5} \). Finally, \( f''(x) = 0 \) only at \( x = -4 \). Further, \( f''(x) > 0 \) on \((-4, -2)\), so \( f \) is concave up on that interval. \( f''(x) < 0 \) on \((-\infty, -4)\) and on \((1+\sqrt{5}, \infty)\), so \( f \) is concave down on those intervals. There is a point of inflection at \( x = -4 \).

4.3.62 The domain of \( f \) is \([0, \infty)\) and there is no symmetry. There are no asymptotes. Now,

\[
f'(x) = \frac{3}{4}x^{-3/4} - \frac{1}{2}x^{-1/2} = \frac{3 - 2x^{1/4}}{4x^{3/4}}, \quad f''(x) = -\frac{9}{16}x^{-7/4} + \frac{1}{4}x^{-3/2} = \frac{4x^{1/4} - 9}{16x^{7/4}}.
\]

\( f'(x) = 0 \) when \( x = \frac{81}{16} \). Since \( f'(x) > 0 \) on \((0, \frac{81}{16})\), we know that \( f \) is increasing on that interval. \( f'(x) < 0 \) on \((\frac{81}{16}, \infty)\), so \( f \) is decreasing on that interval. There is a local maximum at \( x = \frac{21}{16} \) (which also gives an absolute maximum). Finally, \( f''(x) = 0 \) at \( x = \frac{6561}{256} \). Since \( f''(x) > 0 \) to the right of that point, and \( f''(x) < 0 \) to the left, we have that \( f \) is concave up on \((\frac{6561}{256}, \infty)\) and concave down on \((0, \frac{6561}{256})\). There is an inflection point at \( \frac{6561}{256} \).
The domain of \( f \) is \((-\infty, \infty)\) and there is no symmetry. There are no asymptotes because \( f \) is a polynomial. We have

\[
f'(x) = 12x^3 - 132x^2 + 120x = 12x(x - 10)(x - 1) \\
f''(x) = 36x^2 - 264x + 120 = 12(3x^2 - 22x + 10).
\]

\( f'(x) = 0 \) for \( x = 0, x = 1, \) and \( x = 10, \) and \( f'(x) > 0 \) on \((0,1)\) and on \((10,\infty),\) while it is negative on \((-\infty,0)\) and on \((1,10).\) Thus \( f \) is increasing on \((0,1)\) and on \((10,\infty),\) and decreasing on \((-\infty,0)\) and on \((1,10).\) Finally, \( f''(x) = 0 \) for \( x \approx 0.487 \) and \( x \approx 6.846. \) Call these two roots \( r_1 \) and \( r_2 \) respectively. \( f''(x) > 0 \) on \((-\infty,r_1)\) and on \((r_2,\infty),\) so \( f \) is concave up on those intervals. \( f''(x) < 0 \) on \((r_1,r_2),\) so \( f \) is concave down on that interval. There are points of inflection at \( x = r_1 \) and \( x = r_2.\)
4.3.65 The domain of \( f \) is \((-\infty, \infty)\) and there is no symmetry. There are no asymptotes because \( f \) is a polynomial. We have

\[
f'(x) = 60x^5 - 180x^4 - 300x^3 + 900x^2 + 240x - 720 = 60(x+2)(x+1)(x-1)(x-2)(x-3) \\
f''(x) = 300x^4 - 720x^3 - 900x^2 + 1800x + 240 = 60(5x^4 - 12x^3 - 15x^2 + 30x + 4).
\]

Now, \( f'(x) = 0 \) for \( x = -2, x = -1, x = 1, x = 2, x = 3 \), and it is positive on \((-2, -1)\), on \((1, 2)\), and on \((3, \infty)\), so \( f \) is increasing on those intervals. \( f'(x) < 0 \) on \((-\infty, -2)\), on \((-1, 2)\), and on \((2, 3)\), so \( f \) is decreasing on those intervals. There are local minima at \( x = -2, x = 1, x = 3 \), and local maxima at \( x = -1 \) and \( x = 2 \). Finally, solving numerically, we find that \( f''(x) \) has four real roots, which are \( r_1 \approx -1.605, r_2 \approx -0.126, r_3 \approx 1.502, \) and \( r_4 \approx 2.629 \). Further, \( f''(x) > 0 \) on \((r_1, r_2)\), on \((r_2, r_3)\), and on \((r_3, \infty)\), so \( f \) is concave up on those intervals. \( f''(x) < 0 \) on \((r_1, r_2)\) and on \((r_3, r_4)\), so \( f \) is concave down on those intervals. There are points of inflection at each \( r_i \) for \( i \) from 1 to 4.

4.3.66 The domain of \( f \) is \((0, \frac{3}{2})\) \(\cup\) \((\frac{3}{2}, 2)\) and there is no symmetry. There is a vertical asymptote at \( x = \frac{3}{2} \), because \( \lim_{x \to \frac{3}{2}^-} f(x) = -\infty \).

\[
f'(x) = \frac{(1 + \sin \pi x) \cos(\pi x) - \pi - \sin(\pi x) \cos(\pi x) \cdot \pi}{(1 + \sin \pi x)^2} = \frac{\pi \cos \pi x}{(1 + \sin \pi x)^2},
\]

which is 0 for \( x = \frac{1}{2} \); further, \( f'(x) > 0 \) on \((0, \frac{1}{2})\) and on \((\frac{3}{2}, 2)\), so \( f \) is increasing on those intervals. \( f'(x) < 0 \) on \((\frac{1}{2}, \frac{3}{2})\), so \( f \) is decreasing on that interval. There is a local maximum at \( x = \frac{1}{2} \). Finally, \( f''(x) \) is never zero on the given interval. Since \( f''(x) < 0 \) on both \((0, 3/2)\) and on \((3/2, 2)\), it follows that \( f \) is concave down on those intervals. There are no points of inflection.
4.3.67 The domain of $f$ is $(-\infty, \infty)$ and there is odd symmetry, because $f(-x) = -f(x)$. There are no vertical asymptotes, but $y = 0$ is a horizontal asymptote, because

$$\lim_{x \to \infty} \frac{x\sqrt{|x^2 - 1|}}{x^4 + 1} \cdot \frac{1/x^4}{1/x^4} = \lim_{x \to \infty} \frac{\sqrt{1/x^4} - (1/x^6)}{1 + (1/x^4)} = 0.$$ 

Note that

$$f(x) = \begin{cases} \frac{x\sqrt{x^2 - 1}}{x^4 + 1} & \text{if } |x| \geq 1; \\ \frac{x\sqrt{1 - x^2}}{x^4 + 1} & \text{if } |x| < 1. \end{cases}$$

Differentiating each part of the above and simplifying yields

$$f'(x) = \begin{cases} \frac{-2x^6 + 3x^4 + 2x^2 - 1}{(x^4 + 1)^2\sqrt{x^2 - 1}} & \text{if } |x| > 1; \\ \frac{2x^6 - 3x^4 - 2x^2 + 1}{(x^4 + 1)^2\sqrt{1 - x^2}} & \text{if } |x| < 1. \end{cases}$$

The roots of this expression (on the respective domains) are approximately $-1.37, -0.6, 0.6,$ and $1.37$. Also, this derivative doesn’t exist at $x = \pm 1$. Let the roots of $f'$ be $\pm r_1$ and $\pm r_2$ where $0 < r_1 < r_2$. An analysis of the sign of $f'$ shows that $f$ is increasing on $(-r_2, -1)$, on $(-1, r_1)$, and on $(1, r_2)$, while $f$ is decreasing on $(-\infty, -r_2)$, on $(-1, -r_1)$, on $(r_1, 1)$, and on $(r_2, \infty)$, so there are local maxima at $x = -1$, $x = r_1$, and $x = r_2$, and local minima at $x = -r_1$, $x = -r_2$, and $x = 1$.

An analysis without computer of $f''(x)$ is not for the fainthearted. In the case $|x| > 1$ the second derivative is given by

$$x \cdot \frac{(6x^{10} - 19x^8 - 12x^6 + 42x^4 - 18x^2 - 3)}{(x^2 - 1)^{3/2}(x^4 + 1)^3},$$

and for the case $|x| < 1$ we have

$$x \cdot \frac{(6x^{10} - 19x^8 - 12x^6 + 42x^4 - 18x^2 - 3)}{(1 - x^2)^{3/2}(x^4 + 1)^3}.$$ 

There is a root of approximately $\pm 1.79$, and 0 is a root as well. Let the non-zero roots be $\pm r_3$ where $r_3 > 0$. An analysis of the sign of $f''$ reveals that $f$ is concave down on $(-\infty, -r_3)$ and on $(0, 1)$ and on $(1, r_3)$, while it is concave up on $(-r_3, -1)$ and on $(-1, 0)$, and on $(r_3, \infty)$. There are inflection points at $\pm r_3$ and at 0. The $x$-intercepts are $\pm 1$ and 0.
4.3.68 The given domain is \([-\frac{\pi}{2}, \frac{\pi}{2}]\), and because \(f(-x) = \sin(3\pi \cos(-x)) = \sin(3\pi \cos x) = f(x)\), the function has even symmetry. There are no asymptotes.

\[
f'(x) = \cos(3\pi \cos x)(-3\pi \sin x)
\]

which has 7 roots on the given interval, at 0, at \(r_1 \approx 0.586\), at \(r_2 \approx 1.047\), and at \(r_3 \approx 1.403\), and also at the negatives of these numbers. These roots can best be found with the aid of a computer. An analysis of the sign of \(f'\) reveals that \(f\) is increasing on \((-\frac{\pi}{2}, -r_3)\), on \((-r_3, -r_1)\), on \((0, r_1)\), and on \((r_2, r_3)\), while \(f\) is decreasing on the complementary intervals. There are thus local maxima at \(\pm r_3\) and \(\pm r_1\), and local minima at \(\pm r_2\) and 0. All the local maxima have value 1, and the local minima have value \(-1\), except for \(x = 0\) where the value is 0.

\[
f''(x) = -3\pi \sin x(-\sin(3\pi \cos x))(-3\pi \sin x) + \cos(3\pi \cos x)(-3\pi \cos x) = -9\pi^2 \sin^2 x \sin(3\pi \cos x) - 3\pi \cos x \cos(3\pi \cos x)
\]

This is 0 at \(r_4 \approx 0.372\), \(r_5 \approx 0.858\), and \(r_6 \approx 1.235\) and their negatives. An analysis of \(f''\) reveals that there is a concavity change at each of the induced intervals, starting with downward concavity on \((-\frac{\pi}{2}, -r_6)\). Each of \(\pm r_4\), \(\pm r_5\) and \(\pm r_6\) are inflection points. The values of \(f\) at the inflection points are \(f(\pm r_4) \approx 0.601\), \(f(\pm r_5) \approx -0.120\), and \(f(\pm r_6) \approx 0.036\).

4.3.69

a. \(f\) has even symmetry, so we will analyze the function on \((0, 2\pi]\), and use the symmetry to graph the function over \([-2\pi, 0)\).

\[
f'(x) = \frac{x^2(-3\cos^2 x(-\sin x)) - (1 - \cos^3 x) \cdot 2x}{x^4} = \frac{3x \sin x \cos^2 x - 2(1 - \cos^3 x)}{x^3}
\]

This has no roots on \((0, 2\pi]\), and in fact is always negative, so \(f\) is decreasing on \((0, 2\pi]\).
4.3. GRAPHING FUNCTIONS 359

\[ f''(x) \text{ when simplified is given by} \]
\[ \frac{3 \left( (x^2 - 2) \cos^3(x) - 2x^2 \sin^2(x) \cos(x) - 4x \sin(x) \cos^2(x) + 2 \right)}{x^4}. \]

The roots of \( f'' \) on \((0, 2\pi)\) are \( r_1 \approx 0.89, \) \( r_2 \approx 2.47, \) \( r_3 \approx 3.48, \) \( r_4 \approx 4.76, \) and \( r_5 \approx 5.5. \) An analysis of the sign of \( f'' \) reveals that there is a change in concavity at each of these roots, starting with concavity downward on \((-r_1, r_1)\). So each of \( \pm r_i \) is an inflection point.

b. \( f \) has even symmetry, so we will analyze the function on \((0, 2\pi)\), and use the symmetry to graph the function over \([-2\pi, 0)\).

\[ f'(x) = \frac{x^2(-5 \cos^4 x - (1 - \cos^5 x) \cdot 2x)}{x^4} = \frac{5x^3 \cos^4 x \sin x - 2(1 - \cos^5 x)}{x^3}. \]

This has roots on \((0, 2\pi)\) of \( r_1 \approx 2.41 \) and \( r_2 \approx 2.83. \) An analysis of the sign of \( f' \) shows that \( f \) is decreasing on \((0, r_1)\), increasing on \((r_1, r_2)\), decreasing on \((r_2, 2\pi)\), so there is a local minimum at \( r_1 \) and a local maximum at \( r_2. \)

\[ f''(x) \text{ when simplified is given by} \]
\[ \frac{(5x^2 - 6) \cos^5 x - 20x^2 \sin^2 x \cos^3 x - 20x \sin x \cos^4 x + 6}{x^4}. \]

The roots of \( f'' \) on \((0, 2\pi)\) are \( r_3 \approx 0.63, \) \( r_4 \approx 2.62, \) \( r_5 \approx 3.45, \) \( r_6 \approx 4.96, \) and \( r_7 \approx 5.74. \) An analysis of the sign of \( f'' \) reveals that there is a change in concavity at each of these roots, starting with concavity downward on \((-r_3, r_3)\). So each of \( \pm r_i \) is an inflection point for \( i = 3, 4, 5, 6 \) and \( 7. \)
4.3.70 First note that \( f'(x) = 3x^2 - 6bx + 3a^2 \), which is zero for \( x = b \pm \sqrt{b^2 - a^2} \) by the quadratic formula.

a. Suppose \(|a| < |b|\). There is a max for \( f \) at \( x = b - \sqrt{b^2 - a^2} \) and a minimum at \( x = b + \sqrt{b^2 - a^2} \).

b. Suppose \(|b| < |a|\). Then \( f' \) has no roots, and there are no extrema.

c. If \(|a| = |b|\), the \( f' \) has a double root at \( x = b \), but \( f \) has no extrema.

4.3.71

a. The water is being poured in at a constant rate, so the depth is always increasing, so \( y = h(t) \) is an increasing function.

c. (a) No concavity  
   (b) Always concave down.  
   (c) Always concave up.  
   (d) Concave down for the first half and concave up for the second half.  
   (e) At the beginning, in the middle, and at the end, there is no concavity. In the lower middle it is concave down and in the upper middle it will be concave up.  
   (f) This is concave down for the first half, and concave up for the second half.

d. (a) \( h'(t) \) is constant, so every point is an absolute maximum (and minimum).  
   (b) \( h'(t) \) is maximal at \( t = 0 \).  
   (c) \( h'(t) \) is maximal at \( t = 10 \).  
   (d) \( h'(t) \) is maximal at \( t = 0 \) and \( t = 10 \).  
   (e) \( h'(t) \) is maximal on the first and last straight parts of \( h(t) \).  
   (f) \( h'(t) \) is maximal at \( t = 0 \) and \( t = 10 \).
As \( s \) increases, the man reaches the dog faster.

If \( f''(x) > 0 \) on \( (-\infty, 0) \) and on \( (0, \infty) \), then \( f'(x) \) is increasing on both of those intervals. But if there is a local max at 0, the function \( f \) must be switching from increasing to decreasing there. This means that \( f' \) must be switching from positive to negative. But if \( f' \) is switching from positive to negative, but increasing, there must be a cusp at \( x = 0 \), so that \( f'(0) \) does not exist.

Let \( f(x) = \ln x \). \( f'(x) = \frac{1}{x} - \frac{1}{x} y \), which is 0 at \( x = e \). Note that \( f'(x) > 0 \) on \( (0, e) \) and \( f'(x) < 0 \) on \( (e, \infty) \), so \( f(x) \) has its maximal value at \( x = e \). Thus, \( f(\pi) < f(e) \), so \( \frac{\ln \pi}{\pi} < \frac{1}{e} \), so \( \ln \pi < \pi/e \), so \( e \ln \pi < \pi \). Thus \( \ln \pi/e < \pi \), and so \( \pi/e < \pi \).

The equation is valid on only for \(|x| \leq 1\) and \(|y| \leq 1\). Using implicit differentiation, we have
\[
\frac{2}{3}x^{-1/3} + \frac{2}{3}y^{-1/3}y' = 0, \text{ so } y' = -\frac{y^{1/3}}{x^{1/3}}.
\]
This is 0 for \( y = 0 \) (in which case \( x = \pm 1 \)) and doesn’t exist for \( x = 0 \) (in which case \( x = \pm 1 \)). In the first quadrant the curve is decreasing, in the 2nd it is increasing, in the 3rd it is decreasing, and in the 4th it is increasing. Differentiating \( y' \) yields \( y'' = \frac{x^{1/3}(-1/3)y^{-2/3}y' + y^{1/3}(1/3)(x^{-2/3})}{x^{2/3}y^{2/3}} = \frac{y^{2/3} + x^{2/3}}{3x^{2/3}y^{2/3}}, \) which is positive when \( y \) is positive and negative when \( y \) is negative, so the curve is concave up in the first and 2nd quadrants, and concave down in the 3rd and 4th.
4.3.76

The domain of \( f \) is \((-\infty, \infty)\) and \( f \) has even symmetry, because \( f(-x) = f(x) \). Note that 
\[
\lim_{x \to \infty} \frac{8}{x^2+4} = 0,
\]
so \( y = 0 \) is a horizontal asymptote.

\[
f'(x) = -\frac{16x}{(x^2+4)^2},
\]
which is negative for \( x > 0 \) and positive for \( x < 0 \), so \( f \) is increasing on \((-\infty, 0)\) and decreasing on \((0, \infty)\), and there is a local maximum of 2 at \( x = 0 \).

\[
f''(x) = \frac{(x^2 + 4)^2(-16) - (16x)(2)(x^2 + 4)(2x)}{(x^2 + 4)^4}
\]
which is 0 for \( x = \pm \sqrt{\frac{2}{3}} \). Note that \( f'' < 0 \) on \((-\sqrt{\frac{2}{3}}, \frac{2}{\sqrt{3}})\), and is positive elsewhere, so \( f \) is concave up on \((-\infty, -\frac{2}{\sqrt{3}})\) and on \(\left(\frac{2}{\sqrt{3}}, \infty\right)\), and is concave down on \(\left( -\frac{2}{\sqrt{3}}, \frac{2}{\sqrt{3}} \right)\). There are inflection points at \( x = \pm \frac{2}{\sqrt{3}} \).

4.3.77

First note that the expression is symmetric when \( x \) and \( y \) are switched, so the curve should be symmetric about the line \( y = x \). Also, if \( y = x \), then \( 2x^3 = 3x^2 \), so either \( x = 0 \) or \( x = \frac{2}{3} \), so this is where the curve intersects the line \( y = x \).

Differentiating implicitly yields \( 3x^2 + 3y^2 y' = 3xy' + 3y \), so \( y' = \frac{y-x^2}{y^2} \). This is 0 when \( y = x^2 \), but this occurs on the curve when \( x^3 + x^6 = 3x^3 \), which yields \( x = 0 \) (and \( y = 0 \)), or \( x^3 = 2 \), so \( x = \sqrt[3]{2} \approx 1.260 \).

Note also that the derivative doesn’t exist when \( x = y^2 \), which again yields \( (0, 0) \) and \( y^6 + y^3 = 3y^3 \), or \( y = \sqrt[3]{2} \). So there should be a flat tangent line at approximately \((1.260, 1.587)\) and a vertical tangent line at about \((1.587, 1.260)\).

Differentiating again and solving for \( y'' \) yields \( y''(x) = \frac{2xy(x^3-3xy+y^3+1)}{(x-y^2)^3} = \frac{2xy}{(x-y^2)^3} \). In the first quadrant, when \( x > y^2 \), the curve is concave up, when \( x < y^2 \), the curve is concave down. In both the 2nd and 4th quadrants, the curve is concave up.
4.3.78

Note that the equation requires $0 \leq x < 2$, and that the curve is symmetric about the $x$ axis, because replacing $y$ by $-y$ yields the same curve. Writing the curve in the form $2y^2 - xy^2 = x^3$ and differentiating implicitly yields $4yy' - 2xyy' - y^2 = 3x^2$, so $y' = \frac{3x^2 + y^2}{2y(2-x)}$. Note that this is 0 only at the origin. Also note that in the first quadrant this is positive, so the curve is increasing, while in the 4th quadrant, this is negative, so the curve is decreasing. Differentiating again and solving for $y''$ yields $y''(x) = \frac{3(-3x^4 - 2(2-2x)y^2 + y^4)}{4(x-2)y^4}$, which can be written as $y'' = \frac{3(y^4 + 2xy^2 + x^2y^2)}{4(x-2)y^4}$ (by replacing $x^4$ in the numerator by $x(x^3) = xy^2(2-x)$).

In the first quadrant, this is positive so the curve is concave up, in the 4th quadrant, this is negative, so the curve is concave down.

4.3.79

Note that the curve is symmetric about both the $x$-axis and the $y$-axis, so we can just consider the first quadrant, and obtain the rest by reflection. Differentiating implicitly and solving for $y'$ yields $y'(x) = \frac{2x^3 - 5x}{2y(y-\sqrt{2})}$. The numerator is negative on $(0, \sqrt{2})$ and positive on $(\sqrt{2}, \infty)$, while the denominator is negative for $0 < y < \sqrt{2}$ and positive for $y > \sqrt{2}$. Thus the relation is increasing in the rectangle $(0, \sqrt{2}) \times (0, \sqrt{2})$ and in the region $(\sqrt{2}, \infty) \times (\sqrt{2}, \infty)$, while it is decreasing in the other regions in the first quadrant. There are vertical tangent lines when $y = \sqrt{2}$. When $y = 2$ and $x = 0$ there is a horizontal tangent line.

Note that when $x = 0$, we have $y = 0$ or $y = \pm 2$, while if $y = 0$, we have $x = 0$ or $x = \pm \sqrt{5}$. Also, if $y = \sqrt{2}$ then $x = 1$ or $x = 2$. So some sample points to plot are $(0,0)$, $(\pm \sqrt{2},0)$, $(0, \pm 2)$, $(\pm 1, \pm \sqrt{2})$, and $(\pm \sqrt{5}, \pm \sqrt{2})$. Also, when $1 < x < 2$, there are no corresponding $y$ values on the curve.

Copyright © 2014 Pearson Education, Inc.
4.3.80

Note that the curve requires $0 \leq x < 1$.
Note also that the curve is symmetric about the $x$-axis, so we can just consider the first quadrant, and obtain the rest by reflection.
Differentiating implicitly and solving for $y'$ yields $y'(x) = \frac{3x^2 - 4x^3}{2y}$. This quantity is positive on the first quadrant for $0 < x < \frac{3}{4}$ and negative for $\frac{3}{4} < x < 1$, so $f$ is increasing in the first quadrant for $0 < x < \frac{3}{4}$ and decreasing for $\frac{3}{4} < x < 1$. There is a maximum at $x = \frac{3}{4}$.

Differentiating again and solving for $y''$ yields

$$y''(x) = \frac{x(3 - 4x)^2 x^3 + 12(2x - 1)y^2}{4y^3}.$$ 

Rewriting and simplifying yields $y''(x) = \frac{x^4(8x^2 - 12x + 3)}{4y^2}$ which is positive in the first quadrant for $0 < x < r_1$ where $r_1 \approx .317$, and negative for $r_1 < x < 1$. So the function in the first quadrant is concave up for $0 < x < r_1$ and concave down for $r_1 < x < 1$, and there is a point of inflection at $r_1$.

4.3.81

Note that the curve requires $-1 \leq x < 1$.
Note also that the curve is symmetric about both the $x$-axis and the $y$-axis, so we can just consider the first quadrant, and obtain the rest by reflection.
Differentiating implicitly yields $4x^3 - 2x + 2yy' = 0$, so $y' = \frac{x - 2x^3}{y}$. This is 0 in the first quadrant for $x = \sqrt{2} \over 2$.
Note also that there is a vertical tangent line at the point $(1,0)$. The derivative is positive on $\left(0, \sqrt{2} \over 2\right)$ and negative on $\left(\sqrt{2} \over 2, 1\right)$, so in the first quadrant the curve is increasing on that first interval and decreasing on the second.
Differentiating again and solving for $y''$ (and rewriting) yields $y''(x) = \frac{x^5(2x^2 - 3)}{y}$, which is negative in the first quadrant for $0 < x < 1$, so this curve is concave down in the first quadrant.
The rest of the curve can be found by reflection.

4.3.82

a. 

b. 

c. This occurs for $a \approx 3.931$. 

Copyright © 2014 Pearson Education, Inc.
As \( n \) increases, the curves retain their symmetry, but move "outward." That is, the curves enclose a greater area. It appears that the figures approach the \( 2 \times 2 \) square centered at the origin with sides parallel to the coordinate axes.

\[ f'(x) = \frac{(1+x^6 \sin^2 x) - x(x^6(2 \sin x \cos x + \sin^2 x(6x^5)))}{(1+x^6 \sin^2 x)^2} \]

which can be written as \( \frac{1+(a^6-6x^5)\sin^2 x-x^7 \sin 2x}{(1+x^6 \sin^2 x)^2} \). A graph of \( f'(x) \) with a plot range of \(-0.001 < y < 0.001\) is shown. The roots are approximately 0.813, 2.380, 3.142, 5.163, 6.283, 8.152, and 9.425. These roots can be found using numerical methods -- a computer is helpful. The roots of \( f' \) at 0.813, 3.142, 6.283, and 9.425 yield local maxima for \( f \).

4.3.85

a. The domain is \(( -\infty, a ] \), because the base must be non-negative.

b. \( \lim_{x \to a^-} f(x) = f(a) = 0, \lim_{x \to -\infty} f(x) = 0. \)

c. Write \( f(x) = e^{x \ln(a-x)} \). Then \( f'(x) = e^{x \ln(a-x)} \left( x \cdot \frac{-1}{a-x} + \ln(a - x) \right) = (a - x)^x \left( -\frac{x}{a-x} + \ln(a - x) \right) \)
d. $f'(x) = (a-x)^x \left( -\frac{x}{a-x} + \ln(a-x) \right) = -\frac{(x+(x-a)\ln(a-x))}{(a-x)^{x-1}}$. The numerator is 0 when $x = (a-x)(\ln(a-x))$. If $z$ is a solution to the above, note that $z$ gives a maximum, because $f$ is continuous and positive, and the end behavior of the function is 0 at each end of its domain.

e. As $a$ increases, the value of $z$ increases, and the value of $f(z)$ increases as well, as demonstrated in the above graphs.

4.3.86 Consider the function $w = \frac{\ln z}{z}$. This curve is pictured below. Note that on $(1, \infty)$ the curve is positive, has $\lim_{z \to \infty} (\ln z)/z = 0$, and has range $(0, 1/e]$. Also note that every horizontal line $w = w_0$ for $0 < w_0 < 1/e$ hits the curve once for a value of $z$ between 1 and $e$ and once for $z > e$. Let $z_1$ and $z_2$ be these two numbers. Then $\frac{\ln z_1}{z_1} = \frac{\ln z_2}{z_2}$, so $z_2 \ln z_1 = z_1 \ln z_2$, so $z_1^2 = z_2^2$.

Thus the equation $y^x = x^y$ has solutions along the line $y = x$, but also solutions along a curve which is asymptotic to $x = 1$ and $y = 1$, and goes through the point $(e,e)$, and for every $x$ value with $1 < x < e$ there is a corresponding $y$ value with $e < y$, and vice-versa. The curve and the line $y = x$ where $x^y = y^x$ are shown below. The 1st quadrant is thus divided up into regions where either $x^y < y^x$ or $y^x < x^y$. The regions where $x^y < y^x$ are shown shaded gray.
4.3.87 The domain of \( p \) is \((-\infty, \infty)\). There are no vertical asymptotes. Note that \( f(-x) = \tan^{-1}(x) = -\tan^{-1}(x) \), so \( f \) has odd symmetry. Because \( \lim_{x \to \pm \infty} \tan^{-1}(x) = \pm \pi/2 \), \( \lim_{x \to \pm \infty} f(x) = 0 \), so \( y = 0 \) is a horizontal asymptote.

\[
f'(x) = \frac{(x^2 + 1)(1/(x^2 + 1) - \tan^{-1} x \cdot 2x}{(x^2 + 1)^2} = 1 - 2x \tan^{-1} x.(x^2 + 1)^2.
\]

Using a computer algebra system shows that the numerator has two roots at approximately \( \pm 0.765 \). Let the roots be \( \pm r_1 \) where \( r_1 > 0 \). Note that \( f'(x) < 0 \) on \((-\infty, -r_1)\) and on \((r_1, \infty)\), so \( f \) is decreasing there, while \( f'(x) > 0 \) on \((-r_1, r_1)\), so \( f \) is increasing on that interval. There is a local minimum at \(-r_1\) and a local maximum at \( r_1 \).

\[
f''(x) = \frac{(6x^2 - 2) \tan^{-1} x - 6x}{(x^2 + 1)^3}.
\]

Again, using a computer algebra system reveals roots at approximately \( \pm 1.330 \) in addition to the root at 0. Let the non-zero roots of the numerator be \( \pm r_2 \) where \( r_2 > 0 \). We see that \( f''(x) < 0 \) on \((-\infty, -r_2)\), and on \((0, r_2)\), \( f \) is concave down on those intervals, while \( f''(x) > 0 \) on \((-r_2, 0)\) and on \((r_2, \infty)\), so \( f \) is concave up on those intervals, and there are points of inflection at \(-r_2, 0\), and \( r_2 \). There is an \( x \)-intercept at \((0, 0)\), which is also the \( y \)-intercept.

4.3.88 The domain of \( f \) is \((-\infty, \infty)\). Note that \( f(-x) = \frac{\sqrt{4(-x)^2 + 1}}{(-x)^2 + 1} = \frac{\sqrt{4x^2 + 1}}{x^2 + 1} = f(x) \), so \( f \) has even symmetry. Since

\[
\lim_{x \to \infty} \frac{\sqrt{4x^2 + 1}}{x^2 + 1} \cdot \frac{\sqrt{1/x^4}}{1/x^2} = \lim_{x \to \infty} \frac{\sqrt{4/x^2} + (1/x^4)}{1 + (1/x^2)} = 0,
\]

\( y = 0 \) is a horizontal asymptote as \( x \to \infty \), and by symmetry it is a horizontal asymptote as \( x \to -\infty \) as well. Next,

\[
f'(x) = \frac{(x^2 + 1) \cdot 4x(4x^2 + 1)^{-1/2} - \sqrt{4x^2 + 1} \cdot 2x}{(x^2 + 1)^2} = \frac{4x^3 + 4x - 8x^3 - 2x}{(x^2 + 1)^2} = \frac{2x}{(x^2 + 1)^2} \cdot \sqrt{4x^2 + 1} = \frac{2x(1 - 2x^2)}{(x^2 + 1)^2} \cdot \sqrt{4x^2 + 1}.
\]

Copyright © 2014 Pearson Education, Inc.
This expression is 0 for \( x = 0 \) and \( x = \pm \sqrt{\frac{1}{2}} \). Note that \( f'(x) > 0 \) on the interval \((-\infty, -\sqrt{\frac{1}{2}})\) and on \((0, \sqrt{\frac{1}{2}})\), so \( f \) is increasing on those intervals, while \( f'(x) < 0 \) on \((-\sqrt{\frac{1}{2}}, 0)\) and on \(\left(\sqrt{\frac{1}{2}}, \infty\right)\), so \( f \) is decreasing on those intervals. There is a local minimum at \((0, 1)\) and local maxima at approximately \((\pm \sqrt{\frac{1}{2}}, 1.155)\). Finally, \( f''(x) \) is

\[
\frac{(4x^2+1)^{1/2}(x^2+1)^2(2-12x^2)-(2x-4x^3)((4x^2+1)^{1/2}(2)(x^2+1)(2x)+(x^2+1)^2(4x)(4x^2+1)^{-1/2})}{(4x^2+1)(x^2+1)^4} = \frac{2(16x^6-30x^4-9x^2+1)}{(4x^2+1)^{3/2}(x^2+1)^3}.
\]

Using a computer algebra system, the roots of the polynomial are determined to be approximately \( \pm 1.458 \) and \( \pm 0.295 \). We will refer to these roots as \( \pm r_1 \) and \( \pm r_2 \) where \( 0 < r_1 < r_2 \). Note that \( f''(x) < 0 \) on \((-r_2, -r_1)\) and on \((r_1, r_2)\), so \( f \) is concave down there, while \( f''(x) > 0 \) on \((-\infty, -r_2)\), and on \((-r_1, r_1)\), and on \((r_2, \infty)\), so \( f \) is concave up on these intervals, and there are inflection points at each of \( \pm r_1 \) and \( \pm r_2 \). The \( y \)-intercept is \((0, 1)\).

4.3.89 The domain of \( f \) is given to be \([-2\pi, 2\pi]\). There are no vertical asymptotes. Note that \( f(-x) = \frac{(-x)\sin(-x)}{((-x)^2+1)} = -\frac{\sin x}{x^2+1} = f(x) \). \( f \) has even symmetry. Questions about horizontal asymptotes aren’t relevant because the given domain is an interval with finite length. There is an \( x \)-intercept at \((0, 0)\), which is also the \( y \)-intercept, as well as \( x \)-intercepts at \( \pm 2\pi \).

\[
f'(x) = \frac{(x^2+1)(x \cos x + \sin x) - x \sin x \cdot (2x)}{(x^2+1)^2} = \frac{x(x^2-1) \cos x + (1-x^2) \sin x}{(x^2+1)^2}.
\]

With the aid of a computer algebra system, the roots of this expression can be found to be approximately \( \pm 4.514 \) and \( \pm 1.356 \), as well as \( x = 0 \). We will call the non-zero roots \( \pm r_1 \) and \( \pm r_2 \) where \( 0 < r_1 < r_2 \). Note that \( f'(x) < 0 \) on \((-2\pi, -r_2)\) and on \((-r_1, 0)\) and \((r_1, r_2)\), so \( f \) is decreasing there, while \( f'(x) > 0 \) on \((-r_2, -r_1)\), on \((0, r_1)\), and on \((r_2, 2\pi)\), so \( f \) is increasing on these intervals. There are local maxima at \( x = \pm r_1 \) and local minima at \( x = 0 \) and at \( x = \pm r_2 \).

\[
f''(x) = \frac{(x^2+1)^2((x^3+x)(-\sin x)+\cos x(3x^2+1)+(1-x^2)\cos x)+\sin x(-2x))-(x^3+x)\cos x+(1-x^2)\sin x)(4x)(x^2+1)(2x^2+1)}{(x^2+1)^4}
\]

\[
f''(x) = \frac{-(x^5-7x)\sin x+(2x^4+2)\cos x}{(x^2+1)^3}.
\]

\( f''(x) = 0 \) at approximately \( \pm 5.961, \pm 2.561 \) and \( \pm 0.494 \). We will call these 6 roots \( \pm r_3, \pm r_4 \) and \( \pm r_5 \) where \( 0 < r_3 < r_4 < r_5 \). Note that \( f''(x) < 0 \) on \((-2\pi, -r_3)\) and on \((-r_4, -r_3)\), and on \((r_3, r_4)\), and on \((r_5, 2\pi)\), so \( f \) is concave down on these intervals, while \( f''(x) > 0 \) on \((-r_5, -r_4)\), and on \((-r_3, r_3)\), and on \((r_4, r_5)\), so \( f \) is concave up on these intervals. There are points of inflection at each of \( \pm r_3, \pm r_4 \), and \( \pm r_5 \).
4.3.90 The domain of $f$ is $(0, 1) \cup (1, \infty)$. There is no symmetry. There is a vertical asymptote at $x = 1$, because $\lim_{x \to 1^+} f(x) = \infty$ and $\lim_{x \to 1^-} f(x) = -\infty$. There are no horizontal asymptotes, as the function increases without bound as $x \to \infty$.

$$f'(x) = \frac{\ln x - 1}{(\ln x)^2},$$

which is 0 for $x = e$. Note that $f'(x) < 0$ on $(0, 1)$ and on $(1, e)$ (so $f$ is decreasing there), while $f'(x) > 0$ on $(e, \infty)$. There is a local minimum at $x = e$.

$$f''(x) = \frac{(\ln x)^2 \cdot 1/x - (\ln x - 1) \cdot 2 \ln x \cdot 1/x}{(\ln x)^4} = \frac{2 - \ln x}{x(\ln x)^3}.$$  

This is 0 for $x = e^2$. Note that $f''(x) < 0$ on $(0, 1)$ and on $(e^2, \infty)$ (so $f$ is concave down there), while $f''(x) > 0$ and thus $f$ is concave up on $(1, e^2)$. The only inflection point is $(e^2, e^2/2)$. There are no intercepts.

4.4 Optimization Problems

4.4.1 The goal of an optimization problem is to find the maximum or minimum value of the objective function subject to the constraints.

4.4.2 The constraints are used to express all but one of the variables in terms of one independent variable.

4.4.3 The constraint is $x + y = 10$, so we can express $y = 10 - x$ or $x = 10 - y$. Therefore the objective function can be expressed $Q = x^2(10 - x)$ or $Q = (10 - y)^2y$.

4.4.4 The minimum occurs at one of the endpoints of the closed interval.
4.4.5 Let $x$ and $y$ be the dimensions of the rectangle. The perimeter is $2x + 2y$, so the constraint is $2x + 2y = 10$, which gives $y = 5 - x$. The objective function to be maximized is the area of the rectangle, $A = xy$. Thus we have $A = xy = x(5 - x) = 5x - x^2$. We have $x, y \geq 0$, which also implies $x \leq 5$ (otherwise $y < 0$). Therefore we need to maximize $A(x) = 5x - x^2$ for $0 \leq x \leq 5$. The critical points of the objective function satisfy $A'(x) = 5 - 2x = 0$, which has the solution $x = \frac{5}{2}$. To find the absolute maximum of $A$, we check the endpoints of $[0, 5]$ and the critical point $x = \frac{5}{2}$. Because $A(0) = A(5) = 0$ and $A\left(\frac{5}{2}\right) = \frac{25}{4}$, the absolute maximum occurs when $x = y = \frac{5}{2}$, so width = length = $\frac{5}{2}$ m.

4.4.6 Let $x$ and $y$ be the dimensions of the rectangle. The perimeter is $2x + 2y$, so the constraint is $2x + 2y = P$, which gives $y = \frac{P}{2} - x$. The objective function to be maximized is the area of the rectangle, $A = xy$. Thus we have $A = xy = x\left(\frac{P}{2} - x\right) = \frac{P}{2}x - x^2$. We have $x, y \geq 0$, which also implies $x \leq \frac{P}{4}$ (otherwise $y < 0$). Therefore we need to maximize $A(x) = \frac{P}{2}x - x^2$ for $0 \leq x \leq \frac{P}{4}$. The critical points of the objective function satisfy $A'(x) = \frac{P}{2} - 2x = 0$, which has the solution $x = \frac{P}{4}$. To find the absolute maximum of $A$, we check the endpoints of $[0, \frac{P}{4}]$ and the critical point $x = \frac{P}{4}$. Because $A(0) = A\left(\frac{P}{4}\right) = 0$ and $A\left(\frac{P}{4}\right) = \frac{P^2}{16} - \frac{P^2}{32} = \frac{P^2}{16}$, the absolute maximum occurs when $x = y = \frac{P}{4}$, so width = length = $\frac{P}{4}$.

4.4.7 Let $x$ and $y$ be the dimensions of the rectangle. The area is $xy = 100$, so the constraint is $y = \frac{100}{x}$. The objective function to be minimized is the perimeter of the rectangle, $P = 2x + 2y$. Using $y = \frac{100}{x}$, we have $P = 2x + 2y = 2x + \frac{200}{x}$. Because $xy = 100 > 0$ we must have $x > 0$, so we need to minimize $P(x) = 2x + \frac{200}{x}$ on the interval $(0, \infty)$. The critical points of the objective function satisfy $P'(x) = 2 - \frac{200}{x^2} = 0$, which has the solution $x = \sqrt{A}$. By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval $(0, \infty)$. Therefore the dimensions of the rectangle with minimum perimeter are $x = 10$ and $y = \frac{100}{10} = 10$, so width = length = 10.

4.4.8 Let $x$ and $y$ be the dimensions of the rectangle. The area is $xy = A$ and $A$ is fixed, so the constraint is $xy = A$, which gives $y = \frac{A}{x}$. The objective function to be minimized is the perimeter of the rectangle, $P = 2x + 2y$. Using $y = \frac{A}{x}$, we have $P = 2x + 2y = 2x + \frac{2A}{x}$. Because $xy = A > 0$ we must have $x > 0$, so we need to minimize $P(x) = 2x + \frac{2A}{x}$ on the interval $(0, \infty)$. The critical points of the objective function satisfy $P'(x) = 2 - \frac{2A}{x^2} = 0$, which has the solution $x = \sqrt{A}$. By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval $(0, \infty)$. Therefore the dimensions of the rectangle with minimum perimeter are $x = \sqrt{A}$ and $y = \frac{A}{\sqrt{A}} = \sqrt{A}$, so width = length = $\sqrt{A}$.

4.4.9 Let $x$ and $y$ be the two non-negative numbers. The constraint is $x + y = 23$, which gives $y = 23 - x$. The objective function to be maximized is the product of the numbers, $P = xy$. Using $y = 23 - x$, we have $P = xy = x(23 - x) = 23x - x^2$. Now $x$ must be at least 0, and cannot exceed 23 (otherwise $y < 0$). Therefore we need to maximize $P(x) = 23x - x^2$ for $0 \leq x \leq 23$. The critical points of the objective function satisfy $P'(x) = 23 - 2x = 0$, which has the solution $x = \frac{23}{2}$. To find the absolute maximum of $P$, we check the endpoints of $[0, 23]$ and the critical point $x = \frac{23}{2}$. Because $P(0) = P(23) = 0$ and $P\left(\frac{23}{2}\right) = \left(\frac{23}{2}\right)^2$, the absolute maximum occurs when $x = y = \frac{23}{2}$.

4.4.10 Let $a$ and $b$ be the two non-negative numbers. The constraint is $a + b = 23$, which gives $b = 23 - a$. The objective function to be maximized/minimized is the quantity $Q = a^2 + b^2$. Using $b = 23 - a$, we have $Q = a^2 + b^2 = a^2 + (23 - a)^2 = 2a^2 - 46a + 529$. Now $a$ must be at least 0, and cannot exceed 23 (otherwise $b < 0$). Therefore we need to maximize $Q(a) = 2a^2 - 46a + 529$ for $0 \leq a \leq 23$. The critical points of the objective function satisfy $Q'(a) = 4a - 46 = 0$, which has the solution $a = \frac{23}{2}$. To find the absolute maximum/minimum of $Q$, we check the endpoints of $[0, 23]$ and the critical point $a = \frac{23}{2}$. Observe that $Q(0) = Q(23) = 529$ and $Q\left(\frac{23}{2}\right) = \frac{529}{2}$, so the absolute maximum occurs when $a, b = 0, 23$ or 23,0 and the absolute minimum occurs when $a = b = \frac{23}{2}$.

4.4.11 Let $x$ and $y$ be the two positive numbers. The constraint is $xy = 50$, which gives $y = \frac{50}{x}$. The objective function to be minimized is the sum of the numbers, $S = x + y$. Using $y = \frac{50}{x}$, we have $S = x + y = x + \frac{50}{x}$. Now $x$ can be any positive number, so we need to maximize $S(x) = x + \frac{50}{x}$ on the interval $(0, \infty)$. The critical
4.4.12 We seek to maximize $P = xy$ subject to the constraint $y = 12 - 3x$. Substituting gives $P = x(12 - 3x) = 12x - 3x^2$. Then $P'(x) = 12 - 6x$, which is zero for $x = 2$. Because $P'(x) > 0$ for $0 < x < 2$ and $P'(x) < 0$ for $x > 2$, we have a maximum at $x = 2$. When $x = 2$, we have $y = 12 - 3x = 6$. So the two numbers are 2 and 6.

4.4.13 We seek to minimize $S = 2x + y$ subject to the constraint $y = \frac{12}{x}$. Substituting gives $S = 2x + \frac{12}{x}$, so $S'(x) = 2 - \frac{12}{x^2}$. This is zero when $x^2 = 6$, or $x = \sqrt{6}$. Note that for $0 < x < \sqrt{6}$ we have $S'(x) < 0$, and for $x > \sqrt{6}$ we have $S'(x) > 0$, so we have a minimum at $x = \sqrt{6}$. Note that when $x = \sqrt{6}$, we have $y = \frac{12}{\sqrt{6}} = 2\sqrt{6}$.

4.4.14 a. Let $x$ and $y$ be the lengths of the sides of the pen, with $y$ the side parallel to the barn. Then the constraint is $2x + y = 200$, which gives $y = 200 - 2x$. The objective function to be maximized is the area of the pen, $A = xy$. Using $y = 200 - 2x$, we have $A = xy = x(200 - 2x) = 200x - 2x^2$. The length $x$ must be at least 0, and cannot exceed 100 (otherwise $y < 0$). Therefore we need to maximize $A(x) = 200x - 2x^2$ for $0 \leq x \leq 100$. The critical points of the objective function satisfy $A'(x) = 200 - 4x = 0$, which has the solution $x = 50$. To find the absolute maximum of $A$, we check the endpoints of $[0, 100]$ and the critical point $x = 50$. Because $A(0) = A(100) = 0$ and $A(50) = 5000$, the absolute maximum occurs when $x = 50$ m and $y = 200 - 2 \cdot 50 = 100$ m.

b. Let $x$ and $y$ be the lengths of the sides of each individual rectangular pen, with $y$ the side parallel to the barn. Then the constraint is $xy = 100$, which gives $y = \frac{100}{x}$. The objective function to be minimized is the total amount of fencing required, which is $Q = 5x + 4y$. Using the constraint, we have $Q = 5x + 4y = 5x + \frac{400}{x}$. Now $x$ can be any positive number, so we need to minimize $Q(x) = 5x + \frac{400}{x}$ on the interval $(0, \infty)$. The critical points of the objective function satisfy $Q'(x) = 5 - \frac{400}{x^2} = 0$, which has the solution $x = \sqrt{80} = 4\sqrt{5}$. By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval $(0, \infty)$. Therefore the dimensions which require the least fencing are $x = 4\sqrt{5}$ m and $y = \frac{100}{4\sqrt{5}} = 5\sqrt{5}$ m.

4.4.15 Let $x$ be the length of the sides of the base of the box and $y$ be the height of the box. The volume is $x \cdot x \cdot y = 100$, so the constraint is $x^2y = 100$, which gives $y = \frac{100}{x^2}$. The objective function to be minimized is the surface area $S$ of the box, which consists of $2x^2$ (for the top and base) + $4xy$ (for the 4 sides); therefore

\[
S = 2x^2 + 4xy.
\]

Using $y = \frac{100}{x^2}$, we have $S = 2x^2 + 4xy = 2x^2 + 4x \cdot \frac{100}{x^2} = 2x^2 + \frac{400}{x}$. The base side length can be any $x > 0$, so we need to maximize $S(x) = 2x^2 + \frac{400}{x}$ on the interval $(0, \infty)$. The critical points of the objective function satisfy $S'(x) = 4x - \frac{400}{x^2} = 0$; clearing denominators gives $4x^3 = 400$ so $x = \sqrt[3]{100}$. By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval $(0, \infty)$. Therefore the dimensions of the box with minimum surface area are $x = \sqrt[3]{100}$ and $y = \frac{100}{\sqrt[3]{100^2}} = \sqrt[3]{100}$, so length = width = height = $\sqrt[3]{100}$ m.

4.4.16 Let $x$ be the length of the sides of the base of the box and $y$ be the height of the box. The constraint is $2x + y = 108$, which gives $y = 108 - 2x$. The objective function to be maximized is the volume $V$ of the box, which is given by $V = x \cdot x \cdot y = x^2y$. Using $y = 108 - 2x$, we have $V = x^2y = x^2(108 - 2x) = 108x^2 - 2x^3$. The length $x$ must be at least 0, and cannot exceed $\frac{108}{2} = 54$ (otherwise $y < 0$). Therefore we need to maximize $V(x) = 108x^2 - 2x^3$ for $0 \leq x \leq 54$. The critical points of the objective function satisfy $V'(x) = 216x - 6x^2 = 0$, which has solutions $x = 0$ and $x = \frac{216}{6} = 36$. To find the absolute maximum of $V$, we check the endpoints of $[0, 54]$ and the critical point $x = 36$. Because $V(0) = V(54) = 0$ and $V(36) = 36^3$, the absolute maximum occurs when $x = 36$ in and $y = 108 - 2 \cdot 36 = 36$ in.

Copyright © 2014 Pearson Education, Inc.
Let $x$ be the length of the sides of the base of the box and $y$ be the height of the box. The volume of the box is $x \cdot x \cdot y = x^2y$, so the constraint is $x^2y = 16$, which gives $y = \frac{16}{x^2}$. Let $c$ be the cost per square foot of the material used to make the sides. Then the cost to make the base is $2cx^2$, the cost to make the 4 sides is $4cxy$, and the cost to make the top is $\frac{1}{2}cx^2$. The objective function to be minimized is the total cost, which is $C = 2cx^2 + 4cxy + \frac{1}{2}cx^2 = \frac{5}{2}cx^2 + 4cx \cdot \frac{16}{x^2} = c \left(\frac{5x^2}{2} + \frac{64}{x} \right)$. The base side length can be any $x > 0$, so we need to maximize $C(x) = c \left(\frac{5x^2}{2} + \frac{64}{x} \right)$ on the interval $(0, \infty)$. The critical points of the objective function satisfy $5x - \frac{64}{x^2} = 0$, which gives $x^3 = \frac{64}{5}$ or $x = \frac{4}{\sqrt{5}}$. By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval $(0, \infty)$. Therefore the box with minimum cost has base $\frac{4}{\sqrt{5}}$ ft by $\frac{4}{\sqrt{5}}$ ft and height $y = \frac{16}{(4/\sqrt{5})^2} = 5^{2/3}$ ft.

4.4.18

a. Label the starting point, finishing point and transition point $P$ as in Figure 4.55 in the text. In terms of the angle $\theta$, the swimming distance is $\frac{2 \sin \theta}{2}$ and the walking distance is $\pi - \theta$, as derived in Example 3. So the time for the swimming leg is $\frac{\text{distance}}{\text{rate}} = \frac{2 \sin \theta}{2} = \sin \theta$ and the time for the walking leg is $\frac{\text{distance}}{\text{rate}} = \frac{\pi - \theta}{v}$. The total travel time for the trip is the objective function $T(\theta) = \sin \theta + \frac{\pi - \theta}{v}$, $0 \leq \theta \leq \pi$. The critical points of $T$ satisfy $\frac{dT}{d\theta} = \frac{1}{2} \cos \frac{\theta}{2} - \frac{1}{v} = 0$ or $\cos \frac{\theta}{2} = \frac{1}{v}$. Because $0 \leq \theta \leq \pi$, the only solution is given by $\frac{\theta}{2} = \frac{\pi}{4}$, or $\theta = \frac{\pi}{2}$. Evaluating the objective function at the critical point and the endpoints, we find that $T(0) = \frac{\pi}{4} \approx 0.785$ hr and $T(\pi) = 1$ hr. Therefore the minimum travel time is $T(0) \approx 0.785$ hr when the entire trip is done swimming, and the maximum travel time is $T(\pi) = 1$ hr when the entire trip is done walking. The maximum travel time, corresponding to $\theta = 120^\circ$, is $T \approx 1.128$ hr.

b. In this case the time for the walking leg is $\frac{\text{distance}}{\text{rate}} = \frac{\pi - \theta}{v}$, so the total travel time for the trip is now given by $T(\theta) = \sin \theta + \frac{\pi - \theta}{v}$, $0 \leq \theta \leq \pi$. The critical points of $T$ satisfy $\frac{dT}{d\theta} = \frac{1}{2} \cos \frac{\theta}{2} - \frac{1}{v} = 0$ or $\cos \frac{\theta}{2} = \frac{1}{v}$. Therefore in this case there are no critical points. Evaluating the objective function at the endpoints, we find that $T(0) = \pi/1.5 \approx 2.094$ hr and $T(\pi) = 1$ hr. Therefore the minimum travel time is $T(\pi) = 1$ hr when the entire trip is done swimming, and the maximum travel time is $T(0) \approx 2.094$ hr when the entire trip is done walking.

c. Denote the walking speed by $v > 0$. Then the time for the walking leg is $\frac{\text{distance}}{\text{rate}} = \frac{\pi - \theta}{v}$, so the total travel time for the trip is now given by $T(\theta) = \sin \theta + \frac{\pi - \theta}{v}$, $0 \leq \theta \leq \pi$. Observe that $\frac{dT}{d\theta} = -\frac{1}{2} \sin \frac{\theta}{2} < 0$ on the interval $(0, \pi)$, and so the minimum travel time must occur either at $\theta = 0$ (all walking) or $\theta = \pi$ (all swimming) in all cases. Evaluating the objective function at the endpoints, we find that $T(0) = \frac{\pi}{2}$ and $T(\pi) = 1$. In the case $v > \pi$ we have $T(0) < 1$ and the minimum corresponds to all walking; when $v < \pi$ we have $T(0) > 1$ and the minimum corresponds to all swimming (and when $v = \pi$ the travel time is 1 hr for both all walking and all swimming). Hence the minimum walking speed for which it is quickest to walk the entire distance is $v = \pi$ m/hr.

4.4.19

The distance between $(x, 3x)$ and $(50, 0)$ is $d(x) = \sqrt{(3x - 0)^2 + (x - 50)^2}$. Instead of working with the distance, we can instead work with the square of the distance, because these two functions have minima which occur at the same place. So consider

$$d(x)^2 = D(x) = (3x)^2 + (x - 50)^2 = 9x^2 + x^2 - 100x + 2500 = 10(x^2 - 10x + 250).$$

$$\frac{dD}{dx} = 10(2x - 10),$$

which is zero for $x = 5$. Because $\frac{d^2D}{dx^2} = 20 > 0$, we see that the critical point at $x = 5$ is a minimum. So the minimum of $D$ (and $d$) occurs at $x = 5$. The value of $d$ at the point $(5, 15)$, is $d(5) = \sqrt{15^2 + (-45)^2} = 15\sqrt{10} \approx 47.434$.

4.4.20

The distance between $(x, x^2)$ and $(18, 0)$ is $d(x) = \sqrt{(x^2 - 0)^2 + (x - 18)^2}$. Instead of working with the distance, we can instead work with the square of the distance, because these two functions have minima which occur at the same place. So consider

$$(d(x))^2 = D(x) = (x^2)^2 + (x - 18)^2 = x^4 + x^2 - 36x + 324.$$
Let $x$ be the distance from the point on the shoreline nearest to the boat to the point where the woman lands on shore; then the remaining distance she must travel on shore is $6 - x$. By the Pythagorean theorem, the distance the woman must row is $\sqrt{x^2 + 16}$ and the time for the rowing leg is $\frac{\text{distance}}{\text{rate}} = \frac{x}{\sqrt{x^2 + 16}}$. The total travel time for the trip is

$$T(x) = \sqrt{x^2 + 16} + \frac{6-x}{3}.$$  

We wish to minimize this function for $0 \leq x \leq 6$. The critical points of the objective function satisfy $T'(x) = \frac{x}{2\sqrt{x^2 + 16}} - \frac{1}{3} = 0$, which when simplified gives $5x^2 = 64$, so $x = \frac{8}{\sqrt{5}}$ is the only critical point in $(0,6)$. From the First Derivative Test we see that $T$ has a local minimum at this point, so $x = \frac{8}{\sqrt{5}}$ must give the minimum value of $T$ on $[0,6]$.

b. Let $v > 0$ be the woman’s rowing speed. Then the total travel time is now given by $T(x) = \sqrt{x^2 + 16} + \frac{6-x}{3}$. The derivative of the objective function is $T'(x) = \frac{x}{v\sqrt{x^2 + 16}} - \frac{1}{3}$. If we try to solve the equation $T'(x) = 0$ as in part (a) above, we see that there is at most one solution $x > 0$. Therefore there can be at most one critical point of $T$ in the interval $(0,6)$. Observe also that $T'(0) = -\frac{1}{3} < 0$ so the absolute minimum of $T$ on $[0,6]$ cannot occur at $x = 0$. So one of two things must happen: there is a unique critical point for $T$ in $(0,6)$ which is the absolute minimum for $T$ on $[0,6]$, and then $T'(6) > 0$; or, $T$ is decreasing on $[0,6]$, and then $T'(6) \leq 0$ (the quickest way to the restaurant is to row directly in this case). The condition $T'(6) \leq 0$ is equivalent to $\frac{6}{v^2 + 16} \leq \frac{1}{5}$ which gives $v \geq \frac{9}{\sqrt{13}}$ mi/hr.

4.4.23 Let $L$ be the ladder length and $x$ be the distance between the foot of the ladder and the fence. We wish to minimize the function $L^2 = (x + 4)^2 + b^2$, where $b$ is the height of the top of the ladder. The Pythagorean theorem gives the relationship $L^2 = (x + 4)^2 + b^2$, where $b$ is the height of the top of the ladder. We see that $\frac{b}{x+4} = \frac{10}{x}$ by similar triangles, which gives $b = \frac{10(x+4)}{x}$. Substituting in the expression for $L^2$ above gives $L^2 = (x + 4)^2 + 100\left(\frac{x+4}{x}\right)^2 = (x + 4)^2 \left(1 + \frac{100}{x^2}\right)$. It suffices to minimize $L^2$ for $x > 0$ because $L$ and $L^2$ have the same local extrema ($L$ is positive). We have $\frac{d}{dx} L^2 = (x + 4)^2 \left(\frac{100}{x^2}\right) + 2(x + 4) \left(1 + \frac{100}{x^2}\right) = \frac{2(x+4)(x^2+400)}{x^3}$. Because $x > 0$, the only critical point is $x = \sqrt[4]{400} \approx 7.386$. By the First Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval $(0, \infty)$. Substituting $x \approx 7.386$ in the expression for $L^2$ we find the length of the shortest ladder $L \approx 19.165$ ft.

4.4.24 Let $L$ be the ladder length and $x$ be the distance between the foot of the ladder and the fence. The Pythagorean theorem gives the relationship $L^2 = (x + 5)^2 + b^2$, where $b$ is the height of the top of the ladder. We see that $\frac{b}{x+5} = \frac{8}{x}$ by similar triangles, which gives $b = \frac{8(x+5)}{x}$. Substituting in the expression for $L^2$ above gives $L^2 = (x + 5)^2 + 64\left(\frac{x+5}{x}\right)^2 = (x + 5)^2 \left(1 + \frac{64}{x^2}\right)$. It suffices to minimize $L^2$ instead of $L$. However in this case $x$ and $b$ must satisfy $x, b \leq 5$. Solving $20 = \frac{8(x+5)}{x}$ for $x$ gives $x = \frac{10}{3}$, so the condition $b \leq 20$ corresponds to $x \geq \frac{10}{3}$, and we see that we must minimize $L^2$ for $\frac{10}{3} \leq x \leq 20$. We have $\frac{d}{dx} L^2 = (x + 5)^2 \left(-\frac{128}{x^2}\right) + 2(x + 5) \left(1 + \frac{64}{x^2}\right) = \frac{2(x+5)(x^3-320)}{x^4}$. Because $x > 0$, the only critical point is $x = \sqrt[4]{320} \approx 6.40$. By the First Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval $\left[\frac{10}{3}, 20\right]$. Substituting $x \approx 6.40$ in the expression for $L^2$ we find the length of the shortest ladder $L \approx 18.220$ ft.

4.4.25 Let the coordinates of the base of the rectangle be $(x,0)$ and $(-x,0)$ where $0 \leq x \leq 4$. Then the width of the rectangle is $2x$ and the height is $16 - x^2$, so the area $A$ is given by $A(x) = 2x(16 - x^2) = 2(16x - x^3)$. The critical points of this function satisfy $A'(x) = 2(16 - 3x^2) = 0$, which has unique solution $x = \frac{4}{\sqrt{3}}$ in $(0,4)$. We have $A(0) = A(4) = 0$, so the rectangle of maximum area has width $2x = \frac{8}{\sqrt{3}}$ and area $A \left(\frac{4}{\sqrt{3}}\right) = \frac{256\sqrt{3}}{9}$.  

Copyright © 2014 Pearson Education, Inc.
4.4.25 Let the coordinates of the base of the rectangle be \((x, 0)\) and \((-x, 0)\) where \(0 \leq x \leq 5\). Then the width of the rectangle is \(2x\) and the height is \(\sqrt{25 - x^2}\), so the area \(A\) is given by \(A(x) = 2x\sqrt{25 - x^2}\). The critical points of this function satisfy \(A'(x) = 2\sqrt{25 - x^2} + \frac{2x(-x)}{\sqrt{25 - x^2}} = \frac{2(25 - 2x^2)}{\sqrt{25 - x^2}} = 0\) which has unique solution \(x = \frac{5}{\sqrt{2}}\) in \((0, 5)\). We have \(A(0) = A(5) = 0\), so the rectangle of maximum area has width \(2x = \frac{10}{\sqrt{2}}\) cm, height \(y = \sqrt{25 - \frac{25}{2}} = \frac{5}{\sqrt{2}}\) cm.

4.4.26 Let \(x\) be the length of the piece of wire used to make the circle; then \(60 - x\) is the length of the piece used to make the square. Let \(r\) be the radius of the circle and \(s\) the side length of the square. The circle has circumference \(2\pi r\) so we have \(x = 2\pi r\) or \(r = \frac{x}{2\pi}\); the square has perimeter \(4s\) so \(60 - x = 4s\) which gives \(s = \frac{60 - x}{4}\). The objective function to be maximized/minimized is the combined area of the circle and square given by \(A = \pi r^2 + s^2 = \pi \left(\frac{x}{2\pi}\right)^2 + \left(\frac{60-x}{4}\right)^2 = \left(\frac{1}{4\pi} + \frac{1}{16}\right)x^2 - \frac{15}{2}x + 225\). The critical points of this function satisfy \(A'(x) = \left(\frac{1}{2\pi} + \frac{1}{8}\right)x - \frac{15}{2} = \left(\frac{4+8\pi}{8\pi}\right)x - \frac{15}{2} = 0\), which has unique solution \(x = \frac{60\pi}{4+8\pi}\approx 26.394\).

a. By the First (or Second) Derivative test, the critical point \(x = \frac{60\pi}{4+8\pi}\approx 26.394\) gives a local minimum, which by Theorem 4.5 must be the absolute minimum of \(A\) over the interval \([0, 60]\). So the area is minimized by using 26.394 cm of wire for the circle and 33.606 cm of wire for the square.

b. The maximum area must therefore occur at the endpoints, since the only critical point is a minimum. Because \(A(0) = 225\), \(A(60) \approx 286.479\), the maximum area occurs when all 60 cm of wire is used to make the circle.

4.4.27 If we remove a sector of angle \(\theta\) from a circle of radius 20, the remaining circumference is \(2\pi \cdot 20 - \theta \cdot 20 = 20(2\pi - \theta)\), so the base of the cone formed has radius \(r = \frac{20(2\pi - \theta)}{2\pi} = \frac{10(2\pi - \theta)}{\pi}\) (using the formula for the circumference of a circle). As \(\theta\) varies from 0 to \(2\pi\), the radius ranges from 0 to 20, but each cone formed has side length 20. The height \(h\) of the cone is given by the Pythagorean theorem: \(h^2 + r^2 = 20^2\), so \(h = \sqrt{400 - r^2}\). Then the volume of the cone is

\[
V(r) = \frac{1}{3} \pi r^2 h = \frac{\pi}{3} r^2 \sqrt{400 - r^2}.
\]

Thus

\[
V'(r) = \frac{2\pi}{3} \sqrt{400 - r^2} + \frac{\pi}{3} r^2 (400 - r^2)^{-1/2} \cdot \frac{1}{2} \cdot (-2r) = \frac{\pi}{3} \cdot 2r(400 - r^2) - r^3 \cdot \frac{3}{\sqrt{400 - r^2}} = \frac{\pi}{3} \cdot \frac{800r - 3r^3}{\sqrt{400 - r^2}}.
\]

The only positive critical point occurs where \(r = \sqrt{\frac{800}{3}} = 20\sqrt{\frac{2}{3}}\). An application of the First Derivative Test shows that this is a maximum. So

\[
h = \sqrt{400 - \left(20\sqrt{\frac{2}{3}}\right)^2} = \sqrt{400 - 400 \cdot \frac{2}{3}} = 20\sqrt{\frac{1}{3}}.
\]

4.4.28 If we fill the pot with just enough water to cover the marble, the water in the pot will have height \(2r\). Because the pot has radius 4, the water and marble together have volume \(\pi \cdot 4^2 \cdot 2r = 32\pi r\). The marble has volume \(\frac{4}{3}\pi r^3\), so the volume of water needed to cover the marble is \(V(r) = 32\pi r - \frac{4}{3}\pi r^3\). The critical points of this function satisfy \(V'(r) = 32\pi - 4\pi r^2 = 0\), which has unique solution \(r = \sqrt[3]{8} = 2\sqrt{2}\) cm. By the First (or Second) Derivative test, this critical point gives a local maximum, which by Theorem 4.5 must be the absolute maximum of \(A\) over the interval \([0, 4]\).

4.4.29 Let \(x\) and \(y\) be the dimensions of the flower garden; the area of the flower garden is 30, so we have the constraint \(xy = 30\) which gives \(y = \frac{30}{x}\). The dimensions of the garden and borders are \(x + 4\) and \(y + 2\),
so the objective function to be minimized for $x > 0$ is $A = (x + 4)(y + 2) = (x + 4)\left(\frac{30}{x} + 2\right) = 2x + \frac{120}{x} + 38$.

The critical points of $A(x)$ satisfy $A'(x) = 2 - \frac{120}{x^2} = 0$, which has unique solution $x = \sqrt{60} = 2\sqrt{15}$. By the First (or Second) Derivative test, this critical point gives a local minimum, which by Theorem 4.5 must be the absolute minimum of $A$ over $(0, \infty)$. The corresponding value of $y$ is $\frac{30}{2\sqrt{15}} = \sqrt{15}$, so the dimensions are $\sqrt{15}$ by $2\sqrt{15}$ m.

4.4.30

a. Suppose the side on the $x$-axis extends to the point $(a, 0)$ and the side on the $y$-axis to $(0, b)$. Then $b = 10 - 2a$ and the rectangle has area $A = ab = a(10 - 2a) = 10a - 2a^2$. We must have $0 \leq a \leq 5$ to ensure that both $a, b \geq 0$. The critical points of $A(a)$ satisfy $A'(a) = 10 - 4a = 0$, which has unique solution $a = \frac{5}{2}$. Because $A(0) = A(5) = 0$, $a = \frac{5}{2}$ gives the maximum area. The corresponding $b$ value is 5, and the maximum area is $\frac{25}{2}$.

b. Let $(a, 0)$ be the vertex on the $x$-axis and $(0, b)$ the vertex on the $y$-axis, and label the two vertices on the line $y = 10 - 2x$ as $P$ and $Q$. The line joining $(a, 0)$ and $(0, b)$ must be parallel to the line $y = 10 - 2x$, which has slope $-2$. This gives the constraint $\frac{b-a}{a-0} = -\frac{b}{a} = -2$, so $b = 2a$. The segment joining $(a, 0)$

4.4.31

The radius $r$ and height $h$ of the barrel satisfy the constraint $r^2 + h^2 = d^2$, which we can rewrite as $r^2 = d^2 - h^2$. The volume of the barrel is given by $V = \pi r^2 h = \pi(d^2 - h^2)h = \pi(d^2 h - h^3)$. The height $h$ must satisfy $0 \leq h \leq d$, so we need to maximize $V(h)$ on the interval $[0, d]$. The critical points of $V$ satisfy $V'(h) = \pi(d^2 - 3h^2) = 0$. The only critical point in $(0, d)$ is $h = \frac{\sqrt{3}d}{3}$, which gives the maximum volume because at the endpoints $V(0) = V(d) = 0$. The corresponding $r$ value satisfies $r^2 = d^2 - \frac{d^2}{3} = \frac{2d^2}{3}$, so $r = \frac{d\sqrt{6}}{\sqrt{3}}$ and we see that the ratio $\frac{r}{h}$ that maximizes the volume is $\sqrt{\frac{2}{3}}$.

4.4.32

a. The dimensions of the box are $3 - 2x$, $4 - 2x$ and $x$, so the volume is given by $V(x) = x(3-2x)(4-2x) = 4x^3 - 14x^2 + 12x$. The dimensions cannot be negative, so we must have $0 \leq x \leq \frac{3}{2}$. The critical points of $V(x)$ satisfy $V'(x) = 12x^2 - 28x + 12 = 4(3x^2 - 7x + 3) = 0$. This quadratic equation has roots $x = \frac{7 - \sqrt{37}}{6} \approx 0.566$ and $x = \frac{7 + \sqrt{37}}{6} \approx 1.768$, so the only critical point in $(0, \frac{3}{2})$ is $x = \frac{7 - \sqrt{37}}{6} \approx 0.566$. We have $V(0) = V\left(\frac{3}{2}\right) = 0$, so the maximum volume is $V(0.566) \approx 3.032$ ft$^3$.

b. In this case the dimensions of the box are $l - 2x$, $l - 2x$ and $x$, so the volume is given by $V(x) = x(l - 2x)^2 = 4x^3 - 4lx^2 + l^2x$. The dimensions cannot be negative, so we must have $0 \leq x \leq \frac{l}{2}$. The critical points of $V(x)$ satisfy $V'(x) = 12x^2 - 8lx + l^2 = (6x - l)(2x - l) = 0$. This quadratic equation has roots $x = \frac{l}{6}$ and $\frac{l}{2}$, so the only critical point in $(0, \frac{l}{2})$ is $x = \frac{l}{6}$. We have $V(0) = V\left(\frac{l}{2}\right) = 0$, so the maximum volume is $V\left(\frac{l}{6}\right) = \frac{l^3}{27}$.

c. In this case the dimensions of the box are $l - 2x$, $L - 2x$ and $x$, so the volume is given by $V(x) = x(l - 2x)(L - 2x) = 4x^3 - 2(l + L)x^2 + Llx$. The dimensions cannot be negative, so we must have $0 \leq x \leq \frac{l}{2}$ (because we are letting $L \rightarrow \infty$, we may assume that $l \leq L$). The critical points of $V(x)$ satisfy $V'(x) = 12x^2 - 4(l + L)x + Ll = 0$, and this quadratic equation has roots $x = \frac{L + \sqrt{L^2 - 4ll}}{2l}$ and so has exactly one critical point between $0$ and $\frac{l}{2}$, which gives the maximum of $V(x)$ on the interval $[0, \frac{l}{2}]$. This critical point is given by the
smaller root of the quadratic above:

\[ x = \frac{L + l - \sqrt{L^2 - 2L + l^2}}{6} \]

\[ = \frac{L + l - \sqrt{L^2 - 2L + l^2} \left( L + l + \sqrt{L^2 - 2L + l^2} \right)}{6(L + l + \sqrt{L^2 - 2L + l^2})} \]

\[ = \frac{(L + l)^2 - (L^2 - 2L + l^2)}{6(L + l + \sqrt{L^2 - 2L + l^2})} \]

\[ = \frac{l}{6(L + l + \sqrt{L^2 - 2L + l^2})} \]

\[ = \frac{2}{6} \left( 1 + \frac{L}{x} + \sqrt{1 - \frac{l^2}{x}} \right) \]

(for the last step, divide all terms by \( L \)). As \( L \to \infty \) with \( l \) fixed, \( \frac{L}{x} \to 0 \) so the size \( x \) of the corner squares that maximizes the volume has limit \( \frac{1}{3} \) as \( L \to \infty \).

4.4.33 Let \( h \) be the height of the cylindrical tower and \( r \) the radius of the dome. The cylinder has volume \( \pi r^2 h \), and the hemispherical dome has volume \( \frac{2}{3} \pi r^3 \) (half the volume of a sphere of radius \( r \)). The total volume is 750, so we have the constraint \( \pi r^2 h + \frac{2}{3} \pi r^3 = 750 \) which gives \( h = \frac{750}{\pi r^2} - \frac{2}{3} \). We must have \( h \geq 0 \), which is equivalent to \( r \leq \sqrt[3]{\frac{1125}{\pi}} \). The objective function to be maximized is the cost of the metal to make the silo, which is proportional to the surface area of the cylinder (\( = 2\pi rh \)) plus 1.5 times the surface area of the hemisphere (\( = 2\pi r^2 \)). So we can take as objective function \( C = 2\pi rh + 1.5 \cdot 2\pi r^2 = 2\pi r \left( \frac{750}{\pi r^2} - \frac{2}{3} \right) + 3\pi r^2 = \frac{1500}{r} + \frac{5}{3} \pi r^2 \). The critical points of \( C(r) \) satisfy \( C'(r) = -\frac{1500}{r^2} + \frac{10}{3} \pi r = 0 \), which gives \( \pi r^3 = 450 \) and hence \( r = \sqrt[3]{\frac{450}{\pi}} \). The corresponding value of \( h \) is \( h = \frac{750}{\pi} - \frac{2}{3} = \frac{750r}{\pi} \frac{r}{3} - \frac{2}{3} = \left( \frac{750}{450} - \frac{2}{3} \right) r = r \). By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval \( \left[ 0, \sqrt[3]{\frac{1125}{\pi}} \right] \). Therefore the dimensions that minimize the cost are \( r = h = \sqrt[3]{\frac{450}{\pi}} \) m.

4.4.34 The two cables joined to the ceiling each have length \( \sqrt{x^2 + 1} \) by the Pythagorean theorem, and the vertical cable has length \( 6 - x \). The objective function to be minimized is the total length of the three cables, given by \( L(x) = 2\sqrt{x^2 + 1} + 6 - x \). Because the lengths cannot be negative, we must have \( 0 \leq x \leq 6 \). The critical points of \( L(x) \) satisfy \( L'(x) = \frac{2x}{\sqrt{x^2 + 1}} - 1 = 0 \), which occurs when \( 3x^2 = 1 \), so \( x = \frac{1}{\sqrt[3]{3}} = \frac{\sqrt[3]{3}}{3} \) is the unique critical point in \( (0, 6) \). By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval \( [0, 6] \). Therefore the cables should be joined at distance \( x = \frac{\sqrt{3}}{3} \) m below the ceiling.

4.4.35 Let \( x \) be the distance between the point and the weaker light source; then \( 12 - x \) is the distance to the stronger light source. The intensity is proportional to \( I(x) = \frac{1}{x^2 + \frac{2}{(12-x)^2}} \), so we can take this as our objective function to be minimized for \( 0 < x < 12 \). The critical points of \( I(x) \) satisfy \( I'(x) = -\frac{2}{x^3} + \frac{4}{(12-x)^3} = 0 \) which gives \( (\frac{12-x}{x})^3 = 2 \); or \( 12-x = \sqrt[3]{2} \), or \( x = \frac{12}{\sqrt[3]{2}+1} \approx 5.310 \). By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval \( (0, 12) \). Therefore the intensity is weakest at the point \( \frac{12}{\sqrt[3]{2}+1} \approx 5.310 \) m from the weaker source.

4.4.36 Let \( x \) and \( y \) be the base and height of the triangle that is folded over, and \( z \) the height of point \( P \) above the base (see figure in the text). The Pythagorean theorem gives \( z^2 = x^2 - (a - x)^2 = 2ax - a^2 \), so \( z = \sqrt{2ax - a^2} \). The Pythagorean theorem also gives \( (y - \sqrt{2ax - a^2})^2 + a^2 = y^2 \), which can be simplified to \( 2y\sqrt{2ax - a^2} = 2ax \), so \( y = \frac{ax}{\sqrt{2ax - a^2}} \). The length \( L \) of the crease satisfies \( L^2 = x^2 + y^2 = x^2 + \frac{a^2}{2ax - a^2} = \)
4.4.37 Let \( x \) be the distance from the point on shore nearest the island to the point where the underwater cable meets the shore, and let \( y \) be the be the length of the underwater cable. By the Pythagorean theorem, \( y = \sqrt{x^2 + 3.5^2} \). The objective function to be minimized is the cost given by \( C(x) = 2400\sqrt{x^2 + 3.5^2} + 1200 \cdot (8 - x) = 2400\sqrt{x^2 + 3.5^2} - 1200x + 9600 \). We wish to minimize this function for \( 0 \leq x \leq 8 \). The critical points of \( C(x) \) satisfy \( C'(x) = \frac{2400x}{\sqrt{x^2 + 3.5^2}} - 1200 = 1200\left(\frac{2x}{\sqrt{x^2 + 3.5^2}} - 1\right) = 0 \), which we solve to obtain \( x = \frac{\sqrt{3}}{6} \). By the First Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval \([0, 8]\). Therefore the optimal point on shore has distance \( x = \frac{\sqrt{3}}{6} \) mi from the point on shore nearest the island, in the direction of the power station.

4.4.38 Let \( x \) be the distance from the point on shore nearest the island to the point where the underwater cable meets the shore, and let \( y \) be the be the length of the underwater cable. In terms of the angle \( \theta \) in the figure, \( \tan \theta = \frac{\frac{\sqrt{3}}{6}}{x} \) so \( x = 3.5\cot \theta \), and \( \sin \theta = \frac{\frac{\sqrt{3}}{6}}{y} \) so \( y = 3.5\csc \theta \). The objective function to be minimized is the cost given by \( C(\theta) = 2400 \cdot 3.5 \csc \theta + 1200 \cdot (8 - 3.5\cot \theta) = 8400 \csc \theta - 4200\cot \theta + 9600 \). The angle \( \theta \) must be between \( \tan^{-1} \frac{\frac{\sqrt{3}}{6}}{x} \approx 0.412 \) and \( \frac{\pi}{2} \). The critical points of \( C(\theta) \) satisfy \( C'(\theta) = 8400(-\csc \theta\cot \theta - 4200(-\csc^2 \theta))(1 - 2\cos \theta) \), which has unique solution \( \theta = \frac{\pi}{4} \) in the interval under consideration. By the First Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval \([\tan^{-1} \frac{\frac{\sqrt{3}}{6}}{x}, \frac{\pi}{2}]\). Therefore the optimal point on shore has distance \( x = 3.5\cot \frac{\pi}{4} = \frac{7\sqrt{3}}{6} \) mi from the point on shore nearest the island, in the direction of the power station.

4.4.39

a. Using the Pythagorean theorem, we find that the height of this triangle is 2. Let \( x \) be the distance from the point \( P \) to the base of the triangle; then the distance from \( P \) to the top vertex is \( 2 - x \) and the distance to each of the base vertices is \( \sqrt{x^2 + 4} \), again by the Pythagorean theorem. Therefore the sum of the distances to the three vertices is given by \( S(x) = 2\sqrt{x^2 + 4} + 2 - x \). We wish to minimize this function for \( 0 \leq x \leq 2 \). The critical points of \( S(x) \) satisfy \( S'(x) = \frac{4x}{\sqrt{x^2 + 4}} - 1 = 0 \), which has unique solution \( x = \frac{\sqrt{3}}{2} \) in \((0, 2)\). By the First Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval \([0, 2]\). Therefore the optimal location for \( P \) is \( \frac{\sqrt{3}}{2} \) units above the base.

b. In this case the objective function to be minimized is \( S(x) = 2\sqrt{x^2 + 4} + h - x \) where \( 0 \leq x \leq h \). Exactly as above, we find that the only critical point \( x > 0 \) is \( x = \frac{\sqrt{3}}{h} \). This will give the absolute minimum on \([0, h]\) as long as \( h \geq \frac{2}{\sqrt{3}} \). When \( h < \frac{2}{\sqrt{3}} \), \( S(x) \) is decreasing on \([0, h]\) and the minimum occurs at the endpoint \( x = h \).

4.4.40 The radius \( r \) of a circle inscribed in a triangle is given by the formula \( r = 2A/P \), where \( A \) is the area and \( P \) the perimeter of the triangle. Let \( x \) be the length of the base of the isosceles triangle. The height is then \( \sqrt{1 - \left(\frac{x}{2}\right)^2} \) by the Pythagorean theorem, and therefore the area is given by \( A = \frac{1}{2}x\sqrt{1 - \frac{x^2}{4}} = \frac{1}{2}x\sqrt{4 - x^2} \). The perimeter is \( x + 2 \), so the radius of the inscribed triangle is \( r = \frac{2A}{x+2} = \frac{1}{2} \cdot \frac{\sqrt{4 - x^2}}{x+2} \). The possible \( x \) values here satisfy \( 0 \leq x \leq 2 \), so we need to maximize the function \( r(x) \) on \([0, 2]\). We have \( r'(x) = \frac{1}{2} \left( \frac{4 - x^2}{x+2} + \frac{x}{x+2} \left( \frac{x}{\sqrt{4 - x^2}} - \frac{x\sqrt{4 - x^2}}{(x+2)^2} \right) \right) \), which simplifies to \( r'(x) = \frac{4 - x^2 - x^2}{2(x+2)\sqrt{4 - x^2}} \). Thus the critical
points satisfy \( x^2 + 2x - 4 = 0 \). This equation has roots \(-1 \pm \sqrt{5}\), so the only critical point in \((0, 2)\) is \( x = \sqrt{5} - 1 \). Because \( r(0) = r(2) = 0 \), the maximum radius must occur at \( x = \sqrt{5} - 1 \). For this value of \( x \) we have \( r = \frac{\sqrt{5}}{8} (\sqrt{5} - 1)^{1/2} \approx 0.300 \), \( r^2 = \frac{x}{2\pi} (\sqrt{5} - 1)^{5/2} \approx 0.283 \).

4.4.41 Let \( r \) and \( h \) be the radius and height of the cone; then we have the constraint \( r^2 + h^2 = 3^2 = 9 \), which gives \( r = \sqrt{9 - h^2} \). The objective function to be maximized is the volume of the cone, given by \( V = \frac{\pi}{3} r^2 h = \frac{\pi}{3} (9 - h^2)h = \frac{\pi h (9h - h^3)}{3} \). Because \( r, h \geq 0 \) we must have \( 0 \leq h \leq 3 \). Therefore we need to maximize \( V(h) \) over \([0, 3]\). The critical points of \( V(h) \) satisfy \( V'(h) = \frac{\pi}{3} (9 - 3h^2) = \pi (3 - h^2) = 0 \), so \( h = \sqrt{3} \) is the only critical point in \([0, 3]\). Because \( V(0) = V(3) = 0 \), the cone of maximum volume has height \( h = \sqrt{3} \) and radius \( r = \sqrt{6} \).

4.4.42 The objective function to be minimized is the average number of tests required, given by \( A(x) = N \left( 1 - q^2 + \frac{1}{x} \right) \) where \( x \) is the group size, \( N = 10,000 \) and \( q = 0.95 \). We may assume that \( 1 \leq x \leq 10,000 \). The critical points of this function satisfy \( A'(x) = N \left( - \ln q q^2 - \frac{1}{x^2} \right) = 0 \), which is equivalent to the equation \( (0.95)^{-\omega} + \ln(0.95) x^2 = 0 \). Using a numerical solver, we find that this equation has one root between 5 and 6, and one between 132 and 133. By the First Derivative Test, we see that the smaller of these roots gives a local minimum and the larger a local maximum. Therefore the minimum value of \( A(x) \) for \( 1 \leq x \leq 10,000 \) occurs either at the smaller root or at the endpoint 10,000. The group size \( x \) must be an integer, so the possible optimal choices are \( x = 5,6,10,000 \); comparing the value of \( A(x) \) at these points shows that \( x = 5 \) is the optimal group size.

4.4.43 The critical points of the function \( a(\theta) \) satisfy
\[
a'(\theta) = \frac{\omega^2 r}{L} \left( -\sin \theta - \frac{2 r \sin 2\theta}{L} \right) = -\omega^2 \sin \theta \left( 1 + \frac{4r \cos \theta}{L} \right) = 0,
\]
using the identity \( \sin 2\theta = 2 \sin \theta \cos \theta \). There are two cases to consider separately: (a) \( 0 < L \leq 4r \) and (b) \( L \geq 4r \). In case (a) the critical points in \([0, 2\pi]\) are \( \theta = 0, \pi, 2\pi \) and also \( \theta = \cos^{-1} \left( -\frac{L}{4r} \right) \) and \( 2\pi - \cos^{-1} \left( -\frac{L}{4r} \right) \). Comparing the values of \( a(\theta) \) at these points shows that the maximum acceleration occurs at \( \theta = 0 \) and \( 2\pi \) and the minimum occurs at \( \theta = \cos^{-1} \left( \frac{L}{4r} \right) \) and \( 2\pi - \cos^{-1} \left( \frac{L}{4r} \right) \). (There is a local maximum at \( \theta = \pi \).) In case (b) the only critical points are \( \theta = 0, \pi, 2\pi \), and comparing the values of \( a(\theta) \) at these points shows that the maximum acceleration occurs at \( \theta = 0 \) and \( 2\pi \) as in case (a), whereas the minimum occurs at \( \theta = \pi \) in this case.

4.4.44 The cross-section is a trapezoid with height \( 3 \sin \theta \); the larger of the parallel sides has length \( 3 + 2 \cdot 3 \cos \theta = 3 + 6 \cos \theta \) and the smaller parallel side has length 3. The area of this trapezoid is given by
\[
A(\theta) = \frac{1}{2} (3 + (3 + 6 \cos \theta)) \cdot 3 \sin \theta = 9 (1 + \cos \theta) \sin \theta = 9 \left( \sin \theta + \frac{\sin 2\theta}{2} \right),
\]
using the identity \( \sin 2\theta = 2 \sin \theta \cos \theta \). We wish to maximize this function for \( 0 \leq \theta \leq \pi/2 \). The critical points of \( A(\theta) \) satisfy \( \cos \theta + \cos 2\theta = \cos \theta + 2 \cos^2 \theta - 1 = 0 \), using the identity \( \cos 2\theta = 2 \cos^2 \theta - 1 \). Therefore \( x = \cos \theta \) satisfies the quadratic equation \( 2x^2 + x - 1 = 0 \), which has roots \( x = -\frac{1}{2} \) and \( -1 \). So the only critical point in \((0, \pi/2)\) is \( \theta = \cos^{-1} \frac{1}{2} = \frac{\pi}{3} \), which by the First (or Second) Derivative Test and Theorem 4.5 gives the maximum area.

4.4.45 a. Let \( r \) and \( h \) be the radius and height of the can. The volume of the can is \( V = \pi r^2 h \), which gives the constraint \( \pi r^2 h = 354 \) or \( h = \frac{354}{\pi r^2} \). The objective function to be minimized is the surface area, which consists of \( 2\pi r^2 \) (for the top and bottom of the can) and \( 2\pi r h \) (for the side of the can). Therefore the objective function to be minimized is \( A = 2\pi r^2 + 2\pi rh = 2\pi \left( r^2 + r \left( \frac{354}{\pi r^2} \right) \right) = 2\pi \left( r^2 + \frac{354}{\pi r} \right) \). We need to minimize \( A(r) \) for \( r > 0 \). The critical points of \( A(r) \) satisfy \( A'(r) = 2\pi (2r - \frac{354}{\pi r}) = 0 \), which gives \( r = \sqrt{\frac{177}{\pi}} \approx 3.834 \) cm. The corresponding value of \( h \) is \( h = \frac{354}{\pi r^2} = \frac{354}{\pi \left( \frac{177}{\pi} \right)} = 2r \cdot \frac{177}{\pi^2} = 2r \), so \( h = 2\sqrt{\frac{177}{\pi}} \approx 7.667 \) cm. By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval \((0, \infty)\).
b. We modify the objective function in part (a) above to account for the fact that the top and bottom of the can have double thickness: \( A = 4\pi r^2 + 2\pi rh = 2\pi \left( 2r^2 + r \left( \frac{\pi}{2} \right) \right) = 4\pi \left( r^2 + \frac{177}{2\pi} \right) \). We need to minimize \( A(r) \) for \( r > 0 \). The critical points of \( A(r) \) satisfy \( \frac{dA}{dr} = 4\pi (2r - \frac{177}{\pi r^2}) = 0 \), which gives \( r = \sqrt{\frac{177}{2\pi}} \approx 3.043 \text{ cm} \). The corresponding value of \( h \) is \( h = \frac{354}{\pi^2} = \frac{354r}{\pi^2} = 4r \cdot \frac{177}{2\pi^2} = 4r \), so \( h = 4\sqrt{\frac{177}{2\pi}} \approx 12.171 \text{ cm} \). These dimensions are closer to those of a real soda can.

4.4.46 Let \( r \) and \( h \) be the radius and height of both the cylinder and cones. The surface area of each cone is \( \pi r \sqrt{r^2 + h^2} \) and the surface area of the cylinder is \( 2\pi rh \), so we have the constraint \( 2\pi r \sqrt{r^2 + h^2} + 2\pi rh = A \), which we rewrite as \( h + \sqrt{r^2 + h^2} = \frac{A}{2\pi r} \). Square to obtain \( h^2 + 2h \sqrt{r^2 + h^2} + r^2 + h^2 = \left( \frac{A}{2\pi r} \right)^2 \), and substitute \( \sqrt{r^2 + h^2} = A/(2\pi r) - h \) in this equation to obtain \( h^2 + 2h \left( \frac{A}{2\pi r} - h \right) + r^2 + h^2 = \left( \frac{A}{2\pi r} \right)^2 \). Solving for \( h \) yields \( h = \frac{\pi r}{A} \left( A^2/4\pi^2 - r^2 \right) = \frac{A}{4\pi r} - \frac{\pi^3}{A} \).

We must have \( h \geq 0 \), which is equivalent to the condition \( r \leq \frac{\sqrt{A}}{\sqrt{2\pi}} \). So the possible \( r \) under consideration satisfy \( 0 \leq r \leq \frac{\sqrt{A}}{\sqrt{2\pi}} \). The objective function to be maximized is the combined volume of the cylinder and cones, which is given by

\[
V = \pi r^2 h + 2 \cdot \frac{\pi}{3} h^2 = \frac{5\pi}{3} h^2 = \frac{5\pi}{3} r^2 \left( \frac{A}{4\pi r} - \frac{r^3}{A} \right) = \frac{5A}{12} - \frac{5\pi^2 r^5}{3A}.
\]

The critical points of \( V(r) \) satisfy \( V'(r) = \frac{5A}{12} - \frac{25\pi^2 r^4}{3A^2} = 0 \), which has unique positive solution \( r = \frac{\sqrt{A}}{\sqrt{20\pi}} \).

To find the corresponding value of \( h \), observe that \( \frac{r^3}{A} = \frac{A}{20\pi r} \), so \( h = \frac{A}{4\pi r} - \frac{r^3}{A} = \frac{A}{4\pi r} - \frac{A}{20\pi r} = \frac{A}{5\pi r} \) which gives \( h = \frac{\sqrt{A}}{\sqrt{20\pi}} \). Note that \( V(r) = 0 \) at the endpoints of the interval \( \left[ \frac{\sqrt{A}}{\sqrt{20\pi}}, \frac{\sqrt{A}}{\sqrt{2\pi}} \right] \), so the maximum volume must occur at the values of \( r \) and \( h \) given above.

4.4.47 The viewing angle \( \theta \) is given by \( \theta = \cot^{-1} \left( \frac{h}{r} \right) - \cot^{-1} \left( \frac{r}{h} \right) \), and we wish to maximize this function for \( x > 0 \). The critical points satisfy \( \theta'(x) = -\frac{1}{1 + \left( \frac{h}{r} \right)^2} \cdot \frac{1}{10} - (-\frac{1}{1 + \left( \frac{r}{h} \right)^2}) \cdot \frac{1}{3} = \frac{3}{x^2+3^2} - \frac{10}{x^2+10^2} = 0 \) which simplifies to \( 3(x^2 + 100) = 10(x^2 + 9) \) or \( x^2 = 30 \). Therefore \( x = \sqrt{30} \approx 5.477 \text{ ft} \) is the only critical point in \( (0, \infty) \). By the First (or Second) Derivative Test, this critical point corresponds to a local maximum, and by Theorem 4.5, this solitary local maximum must be the absolute maximum on the interval \( (0, \infty) \).

4.4.48 We have \( x = 100\tan \theta \), so the rate at which the beam sweeps along the highway is

\[
\frac{dx}{dt} = 100\sec^2 \theta \frac{d\theta}{dt} = 100\sec^2 \theta \cdot \frac{\pi}{6} = \frac{50\pi}{3} \sec^2 \theta.
\]

The beam meets the highway provided that the angle \( \theta \) satisfies \( -\frac{\pi}{2} < \theta < \frac{\pi}{2} \). The function \( \sec^2 \theta \) is unbounded on this interval, and so has no maximum. The minimum value occurs at \( \theta = 0 \), because everywhere else \( \sec^2 \theta > 1 \). Therefore the minimum rate is \( 50\frac{\pi}{3} \approx 52.360 \text{ m/s} \), and there is no maximum rate.

4.4.49 Let the radius of the ferris wheel have length \( r \), and let \( \alpha \) be the angle the specific seat on the ferris wheel makes with the center of the wheel (see figure in the text). This point has coordinates \( (r \cos \alpha, r + r \sin \alpha) \) so the distance from the seat to the base of the wheel is

\[
d = \sqrt{r^2 \cos^2 \alpha + r^2 (1 + \sin \alpha)^2} = \sqrt{2r \sqrt{1 + \sin \alpha}}.
\]

Therefore the observer’s angle satisfies \( \tan \theta = \frac{\sqrt{2} r}{20} \sqrt{1 + \sin \alpha} \). Think of \( \theta \) and \( \alpha \) as functions of time \( t \) and differentiate: \( \sec^2 \theta \frac{d\theta}{dt} = \frac{\sqrt{2} r}{20} \frac{\cos \alpha}{\sqrt{1 + \sin \alpha}} \), so \( \frac{d\theta}{dt} = \frac{\pi r \sqrt{2} \cos^2 \theta \cos \alpha}{40 \sqrt{1 + \sin \alpha}} \).
Observe that \( \frac{dV}{d\theta} = \frac{\pi r^2}{40} \cos^2 \theta \sin \alpha \sqrt{1 - \sin \alpha} \), which can be written as \( \frac{\pi \sqrt{2} r^2}{40} \cos^2 \theta \sqrt{1 - \sin \alpha} \). When the seat on the Ferris wheel is at its lowest point we have \( \theta = 0 \) and \( \alpha = -\frac{\pi}{2} \), which gives \( \cos^2 \theta = 1 \) and \( \sqrt{1 - \sin \alpha} = \sqrt{2} \). At any other point on the wheel we have \( \cos^2 \theta \leq 1 \) and \( \sqrt{1 - \sin \alpha} < \sqrt{2} \), so \( \theta \) is changing most rapidly when the seat is at its lowest point.

**4.4.50**

Let \( \alpha \) and \( \beta \) be the angles labeled below (see figure). Then \((\frac{\pi}{2} - \alpha) + \theta + (\frac{\pi}{2} - \beta) = \pi \) so \( \theta = \alpha + \beta \). We have \( \tan \alpha = \frac{a}{b} \) and \( \tan \beta = \frac{4-a}{3} \), so we can express \( \theta \) in terms of \( x \) as \( \theta(x) = \tan^{-1} \left( \frac{a}{x} \right) + \tan^{-1} \left( \frac{4-a}{x} \right) \). We wish to maximize this function for \( 0 \leq x \leq 4 \). The critical points of \( \theta(x) \) satisfy

\[
\theta'(x) = \frac{1}{1 + \left( \frac{x}{3} \right)^2} \cdot \frac{1}{3} + \frac{1}{1 + \left( \frac{4-x}{3} \right)^2} \cdot \left( -\frac{1}{3} \right)
\]

which can be written as \( \frac{3}{x^2 + 9} - \frac{3}{(4-x)^2 + 9} \).

This is equal to zero for \( x^2 = (4-x)^2 \) and because \( x, 4-x \geq 0 \) we must have \( x = 4-x \), so \( x = 2 \) is the only critical point. We compare \( \theta(x) \) at \( x = 2 \) and the endpoints \( x = 0, 4 \): \( \theta(2) = 2 \tan^{-1} \left( \frac{a}{2} \right) \approx 1.176 \), \( \theta(0) = \theta(4) = \tan^{-1} \left( \frac{a}{2} \right) \approx 0.927 \). Therefore the maximum angle occurs when \( x = 2 \).

**4.4.51** Let \( r \) and \( h \) be the radius and height of the cylinder. The distance \( d \) from the centroid of the cylinder (the midpoint of the cylinder’s axis of rotation) to any point on the top or bottom edge satisfies \( d^2 = r^2 + \left( \frac{h}{2} \right)^2 \) so the constraint is \( r^2 + \left( \frac{h}{2} \right)^2 = R^2 \). The volume of the cylinder is given by \( V = \pi r^2 h = \pi \left( R^2 - \left( \frac{h}{2} \right)^2 \right) h = \pi \left( R^2 h - \frac{h^3}{4} \right) \). Because \( r, h \geq 0 \) we must have \( 0 \leq h \leq 2R \). We wish to maximize \( V(h) \) on this interval. The critical points of \( V(h) \) satisfy \( V'(h) = \pi \left( R^2 - \frac{3h^2}{4} \right) = 0 \) which gives \( h = \frac{2R}{\sqrt{3}} \), and from the constraint we obtain \( r = \frac{R\sqrt{3}}{3} \). The volume \( V(h) = 0 \) at the endpoints \( h = 0 \) and \( h = 2R \), so the maximum volume must occur at this critical point.

**4.4.52**

a. Let \( a \) and \( b \) be the side lengths of a particular right triangle with hypotenuse \( L \), and let \( x \) and \( y \) be the side lengths of an inscribed rectangle (see figure). Then using similar triangles we see that \( \frac{y}{a-x} = \frac{b}{a} \), so \( y = \frac{b}{a} (a-x) \). The area to be maximized is \( A(x) = \frac{b}{a} x (a-x) \) over \( 0 \leq x \leq a \). This function has unique critical point \( x = \frac{a}{2} \) and is 0 at the endpoints \( x = 0 \) and \( x = a \); hence the maximum occurs when \( x = \frac{a}{2} \). The other side of the rectangle has length \( y = \frac{b}{2} \), so the maximum area is \( A \left( \frac{a}{2} \right) = \frac{ab}{4} \). Note: We could also consider inscribing the rectangle so that one side rests on the hypotenuse. The maximum area is also \( \frac{ab}{4} \) using this configuration. Now consider all possible right triangles with hypotenuse \( L \). The side lengths \( a \) and \( b \) must satisfy \( a, b \geq 0 \) and \( a^2 + b^2 = L^2 \), which gives \( b = \sqrt{L^2 - a^2} \). For each triangle, the largest area of an inscribed rectangle is \( A = \frac{ab}{4} = \frac{a}{2} \sqrt{L^2 - a^2} \), which now we must maximize over \( 0 \leq a \leq L \). This function has unique critical point \( a = \frac{L}{\sqrt{2}} \), and is 0 at the endpoints \( a = 0 \) and \( a = L \). The constraint gives \( b = a \), so the optimal triangle is an isosceles right triangle, and the largest inscribed rectangle is a square with side length \( \frac{L}{\sqrt{2}} \) and area \( \frac{L^2}{4} \).

Copyright © 2014 Pearson Education, Inc.
4.4. OPTIMIZATION PROBLEMS

b. Let \( x \) and \( y \) be the dimensions of a rectangle inscribed in an equilateral triangle with side length \( L \) (see figure). Then \( \tan \frac{\pi}{3} = \frac{y}{\frac{1}{2}(L-x)} = \sqrt{3} \) so \( y = \frac{\sqrt{3}}{2}(L-x) \). The area to be maximized is \( A = xy = \frac{\sqrt{3}}{2}x(L-x) \) over \( 0 \leq x \leq L \). This function has unique critical point \( x = \frac{L}{2} \), and is 0 at the endpoints \( x = 0 \) and \( x = L \); hence the maximum occurs when \( x = \frac{L}{2} \). The other side of the rectangle has length \( y = \frac{L\sqrt{3}}{4} \), so the maximum area is \( A = \frac{L^2\sqrt{3}}{8} \).

c. Let \( a \) and \( b \) be the (non-hypotenuse) side lengths of a right triangle; then as shown in part (a) above, the inscribed rectangle of maximum area has side lengths \( \frac{a}{2} \) and \( \frac{b}{2} \) and area \( \frac{ab}{4} = \frac{A}{2} \).

d. Let \( b \) and \( h \) be the base and height of the triangle, assume the angles to the base are both less than or equal to 90°, and let \( x \) and \( y \) be the side lengths of an inscribed rectangle (see figure). Then by similar triangles \( \frac{b-x}{h} = \frac{\frac{1}{2}}{\frac{h}{2}} \) so \( y = h \left( 1 - \frac{x}{b} \right) \). The rectangle has area \( xy = \frac{h}{b}x(b-x) \), and the maximum value of this function over \( 0 \leq x \leq b \) occurs at \( x = \frac{b}{2} \), which gives \( y = \frac{h}{2} \) and area \( \frac{bh}{4} = \frac{A}{2} \) if the triangle has area \( A \). (Note that if a rectangle is inscribed in a triangle, then two of the vertices of the rectangle must lie on the same side of the triangle, so the rectangle must rest on one of the sides of the triangle, and therefore the angles to that side must both be less than or equal to 90°. So the maximum area of an inscribed rectangle is \( \frac{A}{2} \) in all cases).

Copyright © 2014 Pearson Education, Inc.
4.4.53

a. Let \( r \) and \( h \) be the radius and height of the inscribed cylinder. The region that lies above the cylinder inside the cone is a cone with radius \( r \) and height \( H - h \); by similar triangles we have \( \frac{H-h}{r} = \frac{H}{R} \) so \( h = \frac{H}{R} (R - r) \). The volume of the cylinder is \( V = \pi r^2 h = \frac{\pi H}{r} (R r^2 - r^3) \), which we must maximize over \( 0 \leq r \leq R \). The critical points of \( V(r) \) satisfy \( V'(r) = \frac{\pi H}{r} (2R r - 3r^2) = 0 \), which has unique solution \( r = \frac{2R}{3} \) in \( (0, R) \). Because \( V(r) = 0 \) at the endpoints \( r = 0 \) and \( r = R \), the cylinder with maximum volume has radius \( r = \frac{2R}{3} \), height \( h = \frac{H}{3} \) and volume \( V = \pi r^2 h = \frac{4}{9} \pi R^2 H = \frac{4}{9} \pi R^2 H \); i.e., \( \frac{4}{9} \) the volume of the cone.

b. The lateral surface area of the cylinder is \( A = 2\pi r h = 2\pi r \cdot \frac{H}{R} (R - r) = \frac{2\pi H}{R} (R - r) \). This function takes its maximum over \( 0 \leq r \leq R \) at \( r = \frac{R}{2} \), so the cylinder with maximum lateral surface area has dimensions \( r = \frac{R}{2} \) and \( h = \frac{H}{2} \).

4.4.54 Let \( x \) be the number of tickets sold. The cost per ticket is \( 30 - 0.25x \), and the fixed expenses are 200, so the profit is \( P(x) = x(30 - 0.25x) - 200 = -0.25x^2 + 30x - 200 \). We wish to maximize this function for \( 20 \leq x \leq 70 \). The critical points of \( P(x) \) satisfy \( P'(x) = -0.5x + 30 = 0 \) so \( x = 60 \) is the only critical point. By the First (or Second) Derivative Test, this critical point corresponds to a local maximum, and by Theorem 4.5, this solitary local maximum is also the absolute maximum on the interval \([20, 70]\). Therefore the profit is maximized by selling 60 tickets.

4.4.55 Let \( R \) and \( H \) be the radius and height of the larger cone and let \( r \) and \( h \) be the radius and height of the smaller inscribed cone. The region that lies above the smaller cone inside the larger cone is a cone with radius \( r \) and height \( H - h \); by similar triangles we have \( \frac{H-h}{r} = \frac{H}{R} \) so \( h = \frac{H}{R} (R - r) \). The volume of the smaller cone is \( V = \frac{\pi}{3} r^2 h = \frac{\pi H}{3R} (R^2 r^2 - r^3) \), which we must maximize over \( 0 \leq r \leq R \). The critical points of \( V(r) \) satisfy \( V'(r) = \frac{\pi H}{3R} (2R r - 3r^2) = 0 \) which has unique solution \( r = \frac{2R}{3} \) in \( (0, R) \). Because \( V(r) = 0 \) at the endpoints \( r = 0 \) and \( r = R \), the smaller cone with maximum volume has radius \( r = \frac{2R}{3} \) and height \( h = \frac{H}{3} \), so the optimal ratio of the heights is 3:1.

4.4.56

a. Referring to the diagram in the text, note that if we drop a perpendicular from the 150\degree angle, the trapezoid is divided into a 30–60–90 triangle and an \( x \times y \) rectangle. The slanted side has length \( y \sec 60^\circ = 2y \), and the base of the trapezoid has length \( x + 2y \cos 30^\circ = x + \sqrt{3}y \). The perimeter of the trapezoid is 1000, so we get the constraint \( P = 2x + (3 + \sqrt{3})y = 1000 \), which gives \( x = 500 - \frac{(3 + \sqrt{3})y}{2} \). The objective function to be maximized is the area of the trapezoid, which is \( A = \frac{1}{2} \left( x + (x + \sqrt{3}y) \right) y = \left( x + \frac{\sqrt{3}y}{2} \right) y = (500 - \frac{3}{2}y)y = 500y - \frac{3}{2}y^2 \). Because we need both \( x, y \geq 0 \), we also must have \( y \leq \frac{1000}{3 + \sqrt{3}} \approx 211.325 \). The maximum value of the quadratic function \( A(y) \) occurs at \( y = \frac{500}{3} \approx 166.667 \) ft, which is in the interval under consideration; the corresponding value of \( x \) is \( 250 \frac{3 - \sqrt{3}}{2} \approx 105.662 \) ft.

b. In this case we do not use fencing for the slanted side with length \( 2y \), so we modify the constraint to be \( 2x + (1 + \sqrt{3})y = 1000 \), which gives \( x = 500 - \frac{(1 + \sqrt{3})y}{2} \). The area of the trapezoid is \( A = ...
\[
\frac{1}{2} (x + (x + \sqrt{3}y)) y = (x + \frac{\sqrt{3}}{2}y) y = (500 - \frac{1}{2}y)y = 500y - \frac{1}{2}y^2.
\]
Because we need both \(x, y \geq 0\) we also must have \(y \leq 1000 \div 1 + \sqrt{3} \approx 366.025\). But the maximum value of the quadratic function \(A(y)\) occurs at \(y = 500\), which is outside the interval under consideration. Hence \(A(y)\) is increasing over the interval \([0, \frac{1000}{1 + \sqrt{3}}]\) and the maximum area occurs when \(y = \frac{1000}{1 + \sqrt{3}} \approx 366.025\) ft and \(x = 0\).

4.4.57 Following the hint, place two points \(P\) and \(Q\) above the midpoint of the base of the square, at distances \(x\) and \(y\) to the sides (see figure), where \(0 \leq x, y \leq \frac{1}{2}\).

Then join the bottom vertices of the square to \(P\), the upper vertices to \(Q\) and join \(P\) to \(Q\). This road system has total length \(L = 2\sqrt{x^2 + \frac{1}{4}} + 2\sqrt{(1 - x - y)^2 + (1 - x - y)} = 1 + \sqrt{4x^2 + 1} - x + \left(\sqrt{4y^2 + 1} - y\right)\). We can minimize the contributions from \(x\) and \(y\) separately: the critical points of the function \(f(x) = \sqrt{4x^2 + 1} - x\) satisfy \(f'(x) = \frac{4x}{\sqrt{4x^2 + 1}} - 1 = 0\) which gives \(4x^2 + 1 = 4x\), so \(12x^2 = 3\) and \(x = \frac{1}{2}\). By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval \([0, \frac{1}{2}]\). The minimum value of \(f(x)\) on this interval is \(f\left(\frac{1}{2}\right) = \frac{\sqrt{2}}{2}\), so the shortest road system has length \(L = 1 + 2 \cdot \frac{\sqrt{2}}{2} = 1 + \sqrt{3} \approx 2.732\) mi.

4.4.58 Suppose that the base of the rectangle has dimension \(x\) and the side of the rectangle has dimension \(y\). The semicircular pane has radius \(x/2\), so the perimeter of the window is \(P = 2y + x + \frac{\pi}{2} \cdot \frac{x}{2} = 2y + \left(1 + \frac{x}{2}\right) x\) which gives the constraint \(y = \frac{P - x}{2} - \left(\frac{x}{2} + \frac{x^2}{2}\right) x\). The rectangular pane has area \(xy\) and the semicircular pane has area \(\frac{1}{2} \pi \left(\frac{x}{2}\right)^2\), so the amount of light transmitted through the window is proportional to \(L = 2xy + \frac{\pi x^2}{8} = 2x \left(\frac{P - x}{2} - \left(\frac{x}{2} + \frac{x^2}{2}\right) x\right) + \frac{\pi x^2}{8} = Px - \left(1 + \frac{\pi x}{2}\right)x^2\). Because \(x, y \geq 0\) we must have \(0 \leq x \leq \frac{P}{1 + \frac{\pi x}{2}} \approx 0.389P\). The quadratic function \(L(x)\) has maximum at \(x = \frac{P}{2 + (3\pi/4)/4} = \frac{4P}{8 + 3\pi} \approx 0.230P\), which is in the interval under consideration. The corresponding value of \(y\) is \(y = \frac{P}{2} - \left(\frac{x}{2} + \frac{x^2}{2}\right) \frac{4P}{8 + 3\pi} = \frac{4 + \pi}{16 + 6\pi} P \approx 0.205P\).

4.4.59 Let \(x\) be the distance between the point on the track nearest your initial position to the point where you catch the train. If you just catch the back of the train, then the train will have travelled \(x + \frac{1}{4}\) miles, which will require time \(T = \frac{\text{distance}}{\text{rate}} = \frac{x + \frac{1}{4}}{20}\). The distance you must run is \(\sqrt{x^2 + 1/(16)}\), so your running speed must be \(v = \frac{\text{distance}}{\text{time}} = \frac{20\sqrt{x^2 + 1/16}}{x + \frac{1}{4}}\). We wish to minimize this function for \(x \geq 0\). The derivative of \(v(x)\) can be written \(v'(x) = \left(\frac{x}{x^2 + \frac{1}{16}} - \frac{1}{x^2 + \frac{1}{4}}\right) v(x)\), so the critical points of \(v(x)\) satisfy \(\frac{x}{x^2 + \frac{1}{16}} = \frac{1}{x^2 + \frac{1}{4}}\) so \(x \left(x + \frac{1}{4}\right) = x^2 + \frac{1}{16}\) which gives \(x = \frac{3}{8}\) mi. By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval \([0, \infty)\). The minimum running speed is \(v\left(\frac{3}{8}\right) = \frac{20\sqrt{\left(\frac{1}{16}\right)^2 + \frac{1}{16}}}{\frac{1}{16} + \frac{1}{4}} = \frac{60\sqrt{\pi/16}}{9/16} = 12\) mph.

4.4.60 a. Let \(x\) be the diameter of the smaller semicircle joining points \(A\) and \(B\); then the other smaller semicircle has diameter \(1 - x\). The area of a semicircle with diameter \(d\) is \(\frac{\pi}{8} d^2\), so the area of the arbelos is given by

\[
A(x) = \frac{\pi}{8} (1 - x^2 - (1 - x)^2) = \frac{\pi}{8} (2x - 2x^2) = \frac{\pi}{4} x(1 - x).
\]
The quadratic function \( x(1 - x) \) takes its maximum at \( x = \frac{1}{2} \), so the largest area is obtained when we position point \( B \) at the center of the larger semicircle.

b. Point \( B \) has distance \( |x - \frac{1}{2}| \) to the center of the larger semicircle, so the length \( l \) of the segment \( BD \) can be found using the Pythagorean theorem: \( l^2 = \frac{1}{4} - (x - \frac{1}{2})^2 = x(1 - x) \), so \( l = \sqrt{x(1 - x)} \) and a circle with diameter \( l \) has area \( \pi \left( \frac{1}{2} \right)^2 = \frac{\pi}{4} x(1 - x) \), which is the area of the arbelos.

4.4.61

a. A point on the line \( y = 3x + 4 \) has the form \( (x, 3x + 4) \), which has distance \( L \) to the origin given by \( L^2 = x^2 + (3x + 4)^2 = 10x^2 + 24x + 16 \). Because \( L \) is positive, it suffices to minimize \( L^2 \). The quadratic function \( 10x^2 + 24x + 16 \) takes its minimum at \( x = -\frac{24}{20} = -\frac{6}{5} \), and the corresponding value of \( y = \frac{2}{5} \). Therefore the point closest to the origin on this line is \((-\frac{6}{5}, \frac{2}{5})\).

b. A point on the parabola \( y = 1 - x^2 \) has the form \( (x, 1 - x^2) \), which has distance \( L \) to the point \( (1,1) \) given by \( L^2 = (x-1)^2 + (1 - (1 - x^2))^2 = x^4 + x^2 - 2x + 1 \). Because \( L \) is positive, it suffices to minimize \( L^2 \). The critical points of \( L^2 \) satisfy \( \frac{dL^2}{dx} = 4x^3 + 2x - 2 = 2(2x^3 + x - 1) = 0 \). This cubic equation has a unique root \( x \approx 0.590 \), so the point closest to \((1,1)\) on this parabola is approximately \((0.590, 0.652)\).

c. A point on the curve \( y = \sqrt{x} \) has the form \( (x, \sqrt{x}) \), which has distance \( L \) to the point \( (p,0) \) given by \( L^2 = (x - p)^2 + \sqrt{x}^2 = x^2 + (1 - 2p)x + p^2 \). Because \( L \) is positive, it suffices to minimize \( L^2 \) for \( x \geq 0 \). This quadratic function takes its minimum at \( x = -\frac{1 - 2p}{2} = p - \frac{1}{2} \), so in case (i) the minimum occurs at the point \((p - \frac{1}{2}, \sqrt{p - \frac{1}{2}})\) and in case (ii) there are no critical points for \( x > 0 \), the function \( L^2 \) is increasing on \([0, \infty)\) so the minimum occurs at \((0,0)\).

4.4.62

a. The length of the longest pole that can be carried around the corner is equal to the shortest length of a segment that joins the outer walls of the corridor while touching the inner corner (see figure). Using similar triangles, we can express this length in terms of the length \( x \) in the figure:

\[
L(x) = \sqrt{x^2 + 4^2} + \frac{3}{x} \sqrt{x^2 + 4^2} = \left(1 + \frac{3}{x}\right) \sqrt{x^2 + 16}.
\]

We wish to minimize this function for \( x > 0 \). The critical points of \( L(x) \) satisfy

\[
L'(x) = \left(1 + \frac{3}{x}\right) \frac{x}{\sqrt{x^2 + 16}} - \frac{3}{x^2} \sqrt{x^2 + 16} = 0
\]

which simplifies to \((x^2 + 3x)x = 3(x^2 + 16)\) or \(x^3 = 48\). This gives a unique critical point \( x = \sqrt[3]{48} \) in the interval \((0, \infty)\). By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval \((0, \infty)\). The length of the longest pole is therefore \( L(\sqrt[3]{48}) \approx 9.866 \text{ ft.} \)

b. For this case we replace 4 with \( a \) and 3 with \( b \) in the objective function from part \( a \) above, so we need to minimize the function \( L(x) = (1 + \frac{b}{x}) \sqrt{x^2 + a^2} \) for \( x > 0 \). The critical points of \( L(x) \) satisfy

\[
L'(x) = \left(1 + \frac{b}{x}\right) \frac{x}{\sqrt{x^2 + a^2}} - \frac{b}{x^2} \sqrt{x^2 + a^2} = 0
\]
4.4. OPTIMIZATION PROBLEMS 385

d. We have 

\[ L(a^2b^3) = \left(1 + b^2 - a^2 \right)^{\frac{3}{2}} \v a^2b + a^2 \] 

which simplifies to \((x^2 + bx)x = b(x^2 + a^2)\) or \(x^3 = ba^2\). As above, this gives a unique critical point \(x = \sqrt{ba^2}\) in the interval \((0, \infty)\) which minimizes \(L(x)\). The length of the longest pole is therefore

\[ L(a^2b^3) = \left(1 + b^2 - a^2 \right)^{\frac{3}{2}} \v a^2b + a^2 \]

c. As above, we need to minimize the length \(L = y + z\) as shown in the figure for \(x > 0\). Note that \(c = 5 \cos 60^\circ = \frac{10}{\sqrt{3}}\) and by the law of cosines, \(y^2 = x^2 + c^2 - 2cx \cos 120^\circ = x^2 + cx + c^2\). By similar triangles \(\frac{y}{c} = \frac{z}{x}\), so we have \(L(x) = y + z = (1 + \frac{c}{x}) \sqrt{x^2 + cx + c^2}\). The critical points of \(L(x)\) satisfy

\[ L'(x) = \left(1 + \frac{c}{x}\right) \frac{2x + c}{2\sqrt{x^2 + cx + c^2}} - \frac{c}{x^2} \sqrt{x^2 + cx + c^2} = 0, \]

which simplifies to \((x^2 + cx)(2x + c) = 2c(x^2 + cx + c^2)\) or \(2x^2 + 3cx + 2c^2 = 0\). The quadratic equation \(2x^2 + 3cx + 2c^2 = 0\) has discriminant \(-7c^2 < 0\), so \(x = c\) is the only critical point in \((0, \infty)\). By the First (or Second) Derivative Test, this critical point corresponds to a local minimum, and by Theorem 4.5, this solitary local minimum is also the absolute minimum on the interval \((0, \infty)\).

The length of the longest pole is therefore \(L(c) = 2\sqrt{3c} = 20\) ft.

---

d. Imagine a pole in any position in this corridor, and form a right triangle by dropping a segment perpendicular to the floor from the highest point on the pole down to the height of the lowest point on the pole. The base of this triangle can be no longer than the maximum length for the two-dimensional corridor in part (b), and the height is at most 8, so the maximum length \(L\) is given by combining the result from part (b) with the Pythagorean theorem:

\[ L = \sqrt{64 + \left( a^2 + b^2 \right)^3}. \]

4.4.63

a. We find \(g(0) = 0, g(40) = 30\) and \(g(60) = 25\) miles per gallon. The value at \(v = 0\) is reasonable because when a car first starts moving it needs a lot of power from its engine, so the gas mileage is very low. The decline from 30 to 25 mi/gal as \(v\) increases from 40 mi/hr to 60 mi/hr reflects the fact that gas mileage tends to decrease at speeds over 55 mi/hr.

b. The quadratic function \(g(v) = (85v - v^2)/60\) takes its maximum value at \(v = \frac{85}{2} = 42.5\) mi/hr.

c. At speed \(v\) the amount of gas needed to drive one mile is \(\frac{1}{g(v)}\), and the time it takes is \(\frac{1}{v}\). Hence the cost of gas for one mile is \(\frac{1}{g(v)}\) and the cost for the driver is \(\frac{w}{v}\), and so the cost for \(L\) miles is \(C(v) = \frac{L}{g(v)} + \frac{Lw}{v}\).

d. We have \(C(v) = 400 \left( \frac{4}{g(v)} + \frac{20}{v} \right) = 1600 \left( \frac{1}{g(v)} + \frac{5}{v} \right).\) The critical points of \(C(v)\) satisfy \(\frac{g'(v)}{g(v)} + \frac{5}{v} = 0\), which simplifies to \(v^2 g'(v) + 5g(v)^2 = 0\). Substituting the formula for \(g(v)\) above and using \(g'(v) = \frac{85 - 2v}{60}\), we can factor out \(v^2\) and reduce to the quadratic equation \(v^2 - 19v + 8245 = 0\), which has roots \(v \approx 62.883, 131.117\). The First (or Second) Derivative Test shows that \(C(v)\) has a local minimum at \(v \approx 62.883\), which is the unique critical point for \(0 \leq v \leq 131\). Therefore the cost is minimized at this value of \(v\).
e. Because $L$ is a constant factor in the cost function $C(v)$, changing $L$ will not change the critical points of $C(v)$.

f. The critical points of $C(v)$ now satisfy the equation $\frac{x^2g'(v)}{g(v)^2} = \frac{200}{v^2} = 0$, which simplifies to $4.2v^2 g'(v) + 20g(v)^2 = 0$. As above, substituting the formula for $g(v)$ above and using $g'(v) = 8\sqrt{v} - \frac{2v}{\sqrt{v}}$, we can factor out $v^2$ and reduce to the quadratic equation $v^2 - 195.2v + 8296 = 0$, which has roots $v \approx 62.532, 132.668$.

As in part (d), the minimum cost occurs for $v \approx 62.532$, slightly less than the speed in part (d).

g. The critical points of $C(v)$ now satisfy the equation $\frac{4x^2g'(v)}{g(v)^2} + \frac{15}{v^2} = 0$, which simplifies to $4v^2 g'(v) + 15g(v)^2 = 0$. As above, substituting the formula for $g(v)$ above and using $g'(v) = 8\sqrt{v} - \frac{2v}{\sqrt{v}}$, we can factor out $v^2$ and reduce to the quadratic equation $v^2 - 202v + 8585 = 0$, which has roots $v \approx 60.800, 141.200$.

As in part (d), the minimum cost occurs for $v \approx 60.800$, less than the speed in part (d).

4.4.64

a. The dog runs distance $z - y$ and swims distance $\sqrt{x^2 + y^2}$. Using time = distance/speed, we see that the total time it takes the dog to get to the tennis ball is $T(y) = \frac{z - y}{r} + \frac{\sqrt{x^2 + y^2}}{s}$.

b. The critical points of $T(y)$ satisfy $T'(y) = -\frac{1}{r} + \frac{y}{s\sqrt{x^2 + y^2}} = 0$, which simplifies to $\frac{\sqrt{x^2 + y^2}}{y} = \frac{r}{s}$ so $\left(\frac{r^2}{s^2} - 1\right)y^2 = x^2$, so $y = \frac{x}{\sqrt{r^2 + 1}}$. The First (Or Second) Derivative Test shows that a local minimum occurs for this value of $y$, which by Theorem 4.5 must give the absolute minimum of $T(y)$ for $y > 0$. If $y \leq z$ then $T(y)$ is minimized for this value of $y$; otherwise, the minimum occurs at $y = z$ (all swimming).

c. The ratio is $\frac{y}{x} = \frac{1}{\sqrt{r^2 + 1} - 1} = \frac{1}{\sqrt{0.033 + 1}\sqrt{0.033 - 1}} \approx 0.144$, so Elvis appears to know calculus!

4.4.65

a. Let $x, d - x$ be the distances from the point where the rope meets the ground to the poles of height $m, n$ respectively. Then the rope has length $L(x) = \sqrt{x^2 + m^2} + \sqrt{(d - x)^2 + n^2}$. We wish to minimize this function for $0 \leq x \leq d$. The critical points of $L(x)$ satisfy $L'(x) = \frac{x}{\sqrt{x^2 + m^2}} - \frac{d - x}{\sqrt{(d - x)^2 + n^2}} = 0$, which is equivalent to $\frac{x}{\sqrt{x^2 + m^2}} = \frac{d - x}{\sqrt{(d - x)^2 + n^2}}$, or in terms of the angles $\theta_1$ and $\theta_2$ in the figure, $\sec \theta_1 = \sec \theta_2$ and therefore $\theta_1 = \theta_2$. Observe that $L'(0) < 0$ and $L'(d) > 0$, so the minimum value of $L(x)$ must occur at some $x \in (0, d)$. There must be exactly one critical point, because as $x$ ranges from 0 to $d$, $\theta_1$ decreases and $\theta_2$ increases, and so $\theta_1 = \theta_2$ can occur for at most one value of $x$.

b. Because the speed of light is constant, travel time is minimized when distance is minimized, which we saw in part (a) occurs when $\theta_1 = \theta_2$.

4.4.66

Let $x, d, m, n$ be the distances labeled in the figure below. Then using time = distance/speed, we see that the time for light to travel from $A$ to $B$ is $T(x) = \frac{\sqrt{x^2 + m^2}}{v_1} + \frac{\sqrt{(d - x)^2 + n^2}}{v_2}$. We wish to minimize this function for $0 \leq x \leq d$. The critical points of $T(x)$ satisfy $T'(x) = \frac{x}{v_1\sqrt{x^2 + m^2}} - \frac{d - x}{v_2\sqrt{(d - x)^2 + n^2}} = 0$, which is equivalent to $\frac{x}{v_1\sqrt{x^2 + m^2}} = \frac{d - x}{v_2\sqrt{(d - x)^2 + n^2}}$, or in terms of the angles $\theta_1$ and $\theta_2$ in the figure, $\frac{\sin \theta_1}{v_1} = \frac{\sin \theta_2}{v_2}$ (Snell’s Law).

Observe that $T'(0) < 0$ and $T'(d) > 0$, so the minimum value of $T(x)$ must occur at some $x \in (0, d)$. There must be exactly one critical point, because as $x$ ranges from 0 to $d$, $\sin \theta_1$ decreases and $\sin \theta_2$ increases, so Snell’s Law can hold for at most one value of $x$.

Copyright © 2014 Pearson Education, Inc.
4.4.67 Let the angle of the cuts with the horizontal be \( \phi_1 \) and \( \phi_2 \), where \( \phi_1 + \phi_2 = \theta \). The volume of the notch is proportional to \( \tan \phi_1 + \tan \phi_2 = \tan \phi_1 + \tan(\theta - \phi_1) \), so it suffices to minimize the objective function \( V(\phi_1) = \tan \phi_1 + \tan(\theta - \phi_1) \) for \( 0 \leq \phi_1 \leq \theta \). The critical points of \( V(\phi_1) \) satisfy \( \sec^2 \phi_1 - \sec^2(\theta - \phi_1) = 0 \), which is equivalent to the condition \( \cos \phi_1 = \cos(\theta - \phi_1) \). This is satisfied if \( \phi_1 = \theta - \phi_1 \) which gives \( \phi_1 = \frac{\theta}{2} \). There are no other solutions in \((0, \theta)\), because \( \cos \phi_1 \) is decreasing and \( \cos(\theta - \phi_1) \) is increasing on \((0, \theta)\) and therefore can intersect at most once. So the only critical point occurs when \( \phi_1 = \phi_2 = \frac{\theta}{2} \), and the First Derivative Test shows that this critical point is a local minimum; by Theorem 4.5, this must be the absolute minimum on \([0, \theta]\).

4.4.68

a. Gliding is more efficient if \( S > 0 \); substituting \( m = 200 \) in the equation for \( S(m, \theta) \) gives

\[
S > 0 \iff 8.46 \cdot 200^{2/3} - 1.36 \cdot 200 \tan \theta > 0 \iff \tan \theta < 1.064
\]

so \( \theta < \tan^{-1} 1.064 \approx 46.768^\circ \).

b. We solve \( S(m, \theta) = 0 \) for \( \theta \), which gives \( \tan \theta \approx 6.22m^{-1/3} \), so \( \theta = g(m) \approx \tan^{-1}(6.22m^{-1/3}) \). This is a decreasing function of body mass.

c. Because \( \theta = g(m) \) is a decreasing function of body mass, larger gliders have a smaller selection of glide angles for which gliding is more efficient than walking.

d.

Gliding is more efficient when \( S(m, 25^\circ) > 0 \), which is true if and only if \( 8.46m^{2/3} > 1.36m \tan 25^\circ \), which is true if and only if \( m^{1/3} > \frac{1.36 \tan 25^\circ}{8.46} \approx 13.34 \), which again is true if and only if \( m < 2374 \) g.

e. We have \( \frac{d}{dm} S(m, \theta) = 5.64m^{-1/3} - 1.36 \tan \theta \), which is 0 for \( m^* \approx 71.32 \cot^3 \theta \). For \( \theta = 25^\circ \) this gives \( m^* \approx 703 \) g. The First Derivative Test shows that \( m^* \) is a local maximum, which by Theorem 4.5 is the absolute maximum for \( m \geq 0 \).

f. Because \( \cot \theta \) is a decreasing function on \( 0 < \theta < 90^\circ \), we see that \( m^* \) decreases with increasing \( \theta \).
g. From part (b) we have \( g(10^6) \approx \tan^{-1}(6.22m^{-1/3}) \approx 3.56^\circ \), so any angle \( \theta < 3.56^\circ \).

4.4.69 Let \( x \) and \( y \) be the lengths of the sides of the pen, with \( y \) the side parallel to the barn. The diagonal has length \( \sqrt{x^2 + y^2} \), by the Pythagorean theorem. Therefore the constraint is \( 2x + y + \sqrt{x^2 + y^2} = 200 \), which we rewrite as \( 2x + y = 200 - \sqrt{x^2 + y^2} \). Square both sides to obtain \( 4x^2 + 4xy + y^2 = 40000 - 400\sqrt{x^2 + y^2} + x^2 + y^2 \), which simplifies to \( 3x^2 + 4xy = 40000 - 400\sqrt{x^2 + y^2} \). Now substitute \( \sqrt{x^2 + y^2} = 200 - 2x - y \) in this equation and simplify to obtain \( (3x - 200)(x - 200) = 4(100 - x)y \) so \( y = \frac{(3x - 200)(x - 200)}{4(100 - x)} \). The objective function to be maximized is the area of the pen, \( A = xy \). Using the expression above for \( y \) in terms of \( x \), we have

\[
A = xy = \frac{x(3x - 200)(x - 200)}{4(100 - x)} = -\frac{1}{4} x(3x - 200)(x - 200) \frac{(x - 100)}{(x - 100)}.
\]

The length \( x \) must be at least 0, and because the diagonal is at least as long as \( x \), we must have \( 3x \leq 200 \); so \( x \) cannot exceed \( \frac{200}{3} \). Therefore we need to maximize the function \( A(x) \) defined above for \( 0 \leq x \leq \frac{200}{3} \). We have

\[
A'(x) = -\frac{1}{4} \left( \frac{(3x - 200)(x - 200)}{(x - 100)} + x \cdot 3(x - 200) - \frac{x(3x - 200)(x - 200)}{(x - 100)} \frac{(x - 100)}{(x - 100)} \right)
\]

\[
= \left( \frac{1}{x} + \frac{3}{3x - 200} + \frac{1}{x - 200} - \frac{1}{x - 100} \right) A(x).
\]

Because \( A(x) > 0 \) for \( 0 < x < \frac{200}{3} \), the critical points of the objective function satisfy \( \frac{1}{x} + \frac{3}{3x - 200} + \frac{1}{x - 200} = \frac{1}{x - 100} \), which when simplified gives the equation \( 6x^3 - 1700x^2 + 160,000x - 4,000,000 = 0 \). Using a numerical solver, we find that this equation has exactly one solution in the interval \( (0, \frac{200}{3}) \), which is \( x \approx 38.81 \). To find the absolute maximum of \( A \), we check the endpoints of \( [0, \frac{200}{3}] \) and the critical point \( x \approx 38.81 \). We have \( A(0) = A \left( \frac{200}{3} \right) = 0 \), so the absolute maximum occurs when \( x \approx 38.814 \) m; using the formula for \( y \) in terms of \( x \) above gives \( y \approx 55.030 \) m.

4.4.70

a. \( f'(x) = 2(x - 1) + 2(x - 5) = 4x - 12 \). This is zero for \( x = \frac{12}{4} = 3 \). Because \( f'(x) < 0 \) for \( x < 3 \) and \( f'(x) > 0 \) for \( x > 3 \), we have a minimum at \( x = 3 \).

b. \( f'(x) = 2(x - a) + 2(x - b) = 4x - 2(a + b) \). This is zero for \( x = \frac{2a + 2b}{4} = \frac{a + b}{2} \). Because \( f'(x) < 0 \) for \( x < \frac{a + b}{2} \) and \( f'(x) > 0 \) for \( x > \frac{a + b}{2} \), we have a minimum at \( x = \frac{a + b}{2} \).

c. \( f'(x) = 2 \sum_{k=1}^{n} (x - a_k) = 2nx - 2 \sum_{k=1}^{n} a_k \). This is zero when \( x = \frac{\sum_{k=1}^{n} a_k}{n} \). An application of the First Derivative Test shows that this value of \( x \) yields a minimum.

4.5 Linear Approximation and Differentials

4.5.1

4.5.2 The derivative of a function is 0 at a local maximum, so the linear approximation is a horizontal line.

4.5.3 If \( f \) is differentiable at the point, then near that point, \( f \) is approximately linear, so the function nearly coincides with the tangent line at that point.

4.5.4 The change in \( y = f(x) \) may be approximated by the formula \( \Delta y \approx f'(x) \Delta x \).
4.5.5 The relationship is given by $dy = f'(x)dx$, which is the linear approximation of the change $\Delta y$ in $y = f(x)$ corresponding to a change $dx$ in $x$.

4.5.6 The differential $dy$ is precisely the change in the linear approximation to $f$, which is an approximation of the change in $f$ for small changes $dx$ in $x$.

4.5.7 The approximate average speed is $L(-1) = 60 - (-1) = 61$ miles per hour. The exact speed is $\frac{3600}{59}$ miles per hour which is about 61.017 miles per hour.

4.5.8 The approximate average speed is $L(3) = 60 - (3) = 57$ miles per hour. The exact speed is $\frac{3600}{63}$ miles per hour which is about 57.143 miles per hour.

4.5.9 Let $T(x) = \frac{60D}{60+x}$. Then $T'(x) = -\frac{60D}{(60+x)^2}$, so $T'(0) = -\frac{D}{60}$. The linear approximation is given by $L(x) = T(0) - \frac{D}{60}(x - 0)$, or $L(x) = D\left(1 - \frac{x}{60}\right)$.

4.5.10 With $D = 45$, we have $T(2) \approx L(2) = 45(1 - \frac{2}{60}) = 45 - (3/2) = 43.5$ minutes. The exact time required is $T(2) = \frac{60+45}{60+2} \approx 43.548$ minutes.

4.5.11 With $D = 80$, we have $T(-3) \approx L(-3) = 80(1 - \frac{3}{60}) = 80 + 4 = 84$ minutes. The exact time required is $T(-3) = \frac{60+80}{60-3} \approx 84.211$ minutes.

4.5.12 With $D = 93$, we have $T(3) \approx L(3) = 93(1 - \frac{3}{60}) = 93 - \frac{93}{20} = 88.35$ minutes. The exact time required is $T(3) = \frac{60+93}{60+3} \approx 88.571$ minutes.

4.5.13

a. Note that $f(a) = f(2) = 8$ and $f'(a) = -2a = -4$, so the linear approximation has equation $y = L(x) = f(a) + f'(a)(x-a) = 8 + (-4)(x-2) = -4x + 16$.

b. The percentage error is $100 \cdot \frac{|7.6 - 7.59|}{7.59} \approx 0.13\%$.

c. We have $f(2.1) \approx L(2.1) = 7.6$.

d. The percentage error is $100 \cdot \frac{|7.6 - 7.59|}{7.59} \approx 0.13\%$.

4.5.14

a. Note that $f\left(\frac{x}{4}\right) = \sin \frac{x}{4} = \frac{\sqrt{2}}{2}$ and $f'(a) = \cos a = \frac{\sqrt{2}}{2}$, so the linear approximation has equation $y = L(x) = f(a) + f'(a)(x-a) = \sin \frac{x}{4} + \frac{\sqrt{2}}{2}(x - \frac{x}{4}) = \frac{\sqrt{2}}{2}\left(x + 1 - \frac{x}{4}\right)$.

b. The percentage error is $100 \cdot \frac{|\sqrt{2}(1.75 - \frac{1}{4}) - \sin 0.75|}{\sin 0.75} \approx 0.0642\%$.

4.5.15

a. Note that $f(a) = f(0) = \ln 1 = 0$ and $f'(a) = \frac{1}{1+a} = 1$, so the linear approximation has equation $y = L(x) = f(a) + f'(a)(x-a) = x$.

b. The percentage error is $100 \cdot \frac{|0.9 - \ln 1.9|}{\ln 1.9} \approx 40\%$.

Copyright © 2014 Pearson Education, Inc.
4.5.16

a. Note that \( f(a) = \frac{a}{a+1} = \frac{1}{2} \) and \( f'(a) = \frac{1}{(a+1)^2} = \frac{1}{4} \), so the linear approximation has equation \( y = L(x) = f(a) + f'(a)(x-a) = \frac{1}{2} + \frac{1}{4}(x-1) = \frac{1}{4}(x+1) \).

c. We have \( f(1.1) \approx L(1.1) = 0.525 \).

d. The percentage error is \( 100 \cdot \left| \frac{0.525 - 1.1/2.1}{1.1/2.1} \right| \approx 0.227\% \).

4.5.17

a. Note that \( f(a) = f(0) = \cos 0 = 1 \) and \( f'(a) = -\sin a = 0 \), so the linear approximation has equation
\[
y = L(x) = f(a) + f'(a)(x-a) = 1.
\]
c. We have \( f(-0.01) \approx L(-0.01) = 1 \).

d. The percentage error is \( 100 \cdot \left| \frac{1 - \cos(-0.01)}{\cos(-0.01)} \right| \approx 0.005\% \).

4.5.18

a. Note that \( f(a) = e^a = e^0 = 1 \) and \( f'(a) = e^a = 1 \), so the linear approximation has equation
\[
y = L(x) = f(a) + f'(a)(x-a) = 1 + x.
\]
c. We have \( f(0.05) \approx L(0.05) = 1.05 \).

d. The percentage error is \( 100 \cdot \left| \frac{1.05 - e^{0.05}}{e^{0.05}} \right| \approx 0.121\% \).

4.5.19

a. Note that \( f(a) = 8^{-1/3} = \frac{1}{2} \) and \( f'(a) = -\frac{1}{3}(8)^{-4/3} = -\frac{1}{48} \), so the linear approximation has equation
\[
y = L(x) = f(a) + f'(a)(x-a) = \frac{1}{2} - \frac{1}{48}x.
\]
c. We have \( f(-0.1) \approx L(-0.1) \approx 0.502 \).

d. The percentage error is \( 100 \cdot \left| \frac{2.9^{-1/3} - 0.502}{(7.9)^{-1/3}} \right| \approx 0.003\% \).
4.5.20

a. Note that \( f(a) = \sqrt[8]{81} = 3 \) and \( f'(a) = \frac{1}{4}(81)^{-3/4} = \frac{1}{108} \), so the linear approximation has

\[ y = L(x) = f(a) + f'(a)(x-a) = 3 + \frac{1}{108}(x-81). \]

c. We have \( f(85) \approx L(85) = 3 + \frac{4}{108} = 3 + \frac{1}{27} \approx 3.037 \).

d. The percentage error is 100 \( \frac{\text{3.037} - 3}{3} \times 100 \% \approx 0.0220\% \).

4.5.21 Let \( f(x) = \frac{1}{x} \), \( a = 200 \). Then \( f(a) = 0.005 \) and \( f'(a) = -\frac{1}{100} = -0.000025 \), so the linear approximation of \( f \) near \( a = 200 \) is \( L(x) = f(a) + f'(a)(x-a) = 0.005 - 0.000025(x-200) \). Therefore \( \frac{1}{200} = f(200) \approx L(200) = 0.004925 \).

4.5.22 Let \( f(x) = \tan x \), \( a = 0 \). Then \( f(a) = 0 \) and \( f'(a) = \sec^2 a = 1 \), so the linear approximation to \( f \) near \( a = 0 \) is \( L(x) = f(a) + f'(a)(x-a) = x \). Therefore \( \tan 3^\circ = \tan \frac{\pi}{180} \approx L \left( \frac{\pi}{180} \right) \approx 0.0524 \). Note that we must convert 3° to radians before applying the linear approximation formula.

4.5.23 Let \( f(x) = \sqrt{x} \), \( a = 144 \). Then \( f(a) = 12 \) and \( f'(a) = \frac{1}{2\sqrt{a}} = \frac{1}{24} \), so the linear approximation to \( f \) near \( a = 144 \) is \( L(x) = f(a) + f'(a)(x-a) = 12 + \frac{1}{24}(x-144) \). Therefore \( \sqrt{65} = f(65) \approx L(65) = 4.12 \).

4.5.24 Let \( f(x) = x^{1/3} \), \( a = 64 \). Then \( f(a) = 4 \) and \( f'(a) = \frac{1}{3}a^{-2/3} = \frac{1}{24} \), so the linear approximation to \( f \) near \( a = 144 \) is \( L(x) = f(a) + f'(a)(x-a) = 4 + \frac{1}{24}(x-64) \). Therefore \( \sqrt[3]{65} = f(65) \approx L(65) = 4.021 \).

4.5.25 Let \( f(x) = \ln x \), \( a = 1 \). Then \( f(a) = 0 \) and \( f'(a) = \frac{1}{a} = 1 \), so the linear approximation to \( f \) near \( a = 1 \) is \( L(x) = f(a) + f'(a)(x-a) = x-1 \). Therefore \( \ln(1.05) \approx f(1.05) = 0.05 \).

4.5.26 Let \( f(x) = \sqrt[3]{x} \), \( a = 0.16 \) (note that \( \frac{5}{24} \approx 0.17 \)). Then \( f(a) = 0.4 \) and \( f'(a) = \frac{1}{3\sqrt{a}} = 1.25 \), so the linear approximation to \( f \) near \( a = 0.16 \) is \( L(x) = f(a) + f'(a)(x-a) = 0.4 + 1.25(x-0.16) \). Therefore \( \sqrt[3]{16} \approx f \left( \frac{5}{24} \right) \approx L \left( \frac{5}{24} \right) \approx 0.416 \).

4.5.27 Let \( f(x) = e^x \), \( a = 0 \). Then \( f(a) = 1 \) and \( f'(a) = e^a = 1 \), so the linear approximation to \( f \) near \( a = 0 \) is \( L(x) = f(a) + f'(a)(x-a) = 1 + x \). Therefore \( e^{0.06} \approx f(0.06) \approx L(0.06) \approx 1.060 \).

4.5.28 Let \( f(x) = \frac{1}{\sqrt{x}} \), \( a = 121 \). Then \( f(a) = \frac{1}{11} \) and \( f'(a) = -\frac{1}{2a\sqrt{a}} = -\frac{1}{222} \), so the linear approximation to \( f \) near \( a = 121 \) is \( L(x) = f(a) + f'(a)(x-a) = \frac{1}{11} - \frac{1}{222}(x-121) \). Therefore \( \frac{1}{\sqrt{119}} \approx f(119) \approx L(119) \approx 0.0917 \).

4.5.29 Let \( f(x) = \frac{1}{\sqrt{x}} \), \( a = 512 \). Then \( f(a) = \frac{1}{8} \) and \( f'(a) = -\frac{1}{32\sqrt{a}} = -\frac{1}{122.88} \), so the linear approximation to \( f \) near \( a = 512 \) is \( L(x) = f(a) + f'(a)(x-a) = \frac{1}{8} - \frac{1}{122.88}(x-512) \). Therefore \( \frac{1}{\sqrt{510}} \approx f(510) \approx L(510) = \frac{769}{615} \approx 0.125 \).

4.5.30 Let \( f(x) = \cos x \), \( a = \frac{\pi}{6} = 30^\circ \). Then \( f(a) = \frac{\sqrt{3}}{2} \) and \( f'(a) = -\sin a = -\frac{1}{2} \), so the linear approximation to \( f \) near \( a = 0 \) is \( L(x) = f(a) + f'(a)(x-a) = \frac{\sqrt{3}}{2} - \frac{1}{2}(x-\frac{\pi}{6}) \). Therefore \( \cos 31^\circ = \cos \frac{31\pi}{180} = f \left( \frac{31\pi}{180} \right) \approx L \left( \frac{31\pi}{180} \right) \approx 0.857 \). Note that we must convert 31° to radians before applying the linear approximation formula.

4.5.31 Note that \( V'(r) = 4\pi r^2 \), so \( \Delta V \approx V'(a) \Delta r = 4\pi a^2 \Delta r \). Substituting \( a = 5 \) and \( \Delta r = 0.1 \) gives \( \Delta V \approx 4\pi \cdot 25 \cdot 0.1 = \pi \approx 31.416 \text{ ft}^3 \).

4.5.32 Note that \( P'(z) = -100e^{-z/10} \), so \( \Delta P \approx P'(a) \Delta z = -100e^{-a/10} \Delta z \). Substituting \( a = 2 \) and \( \Delta z = 0.01 \) gives \( \Delta P \approx -100e^{-0.2} \cdot 0.01 = -0.819 \).
4.5.33 Note that $V$ is a linear function of $h$ with $V'(h) = \pi r^2 = 400\pi$, so $\Delta V = V'(a)\Delta r = 400\pi\Delta r$. Substituting $\Delta r = -0.1$ gives $\Delta V = -40\pi \approx -125.664$ cm$^3$.

4.5.34 Note that $V'(r) = \frac{2\pi rh}{3}$, so $\Delta V \approx V'(a)\Delta h = \frac{8\pi a}{3}\Delta h$. Substituting $a = 3$ and $\Delta h = 0.05$ gives $\Delta V \approx 8\pi \cdot (0.05) = 0.4\pi \approx 1.257$ cm$^3$.

4.5.35 Note that $S'(r) = \pi \sqrt{r^2 + h^2} + \pi r \cdot \frac{r}{\sqrt{r^2 + h^2}} = \pi \frac{2a^2 + h^2}{\sqrt{a^2 + h^2}}$, so $\Delta S \approx S'(a)\Delta r = \pi \frac{2a^2 + h^2}{\sqrt{a^2 + h^2}} \Delta r$. Substituting $h = 6$, $a = 10$ and $\Delta r = -0.1$ gives $\Delta S \approx \pi \frac{2 \cdot 10^2 + 6^2}{\sqrt{10^2 + 6^2}} (-0.1) \approx \frac{50\pi}{\sqrt{164}} \approx -6.358$ m$^2$.

4.5.36 Note that $F'(r) = -0.02r^{-3}$, so $\Delta F \approx F'(a)\Delta r = -0.02a^{-3}\Delta r$. Substituting $a = 20$ and $\Delta r = 1$ gives $\Delta F \approx -0.02 \cdot 20^{-3} \cdot 1 = -2.5 \cdot 10^{-6}$.

4.5.37

a. With $f(x) = \frac{2}{x}$ and $a = 1$, we have $f(a) = 2$ and $f'(a) = -\frac{2}{a^2} = -2$. Thus the linear approximation to $f(x)$ at $x = 1$ is $L(x) = f(a) + f'(a)(x - 1) = -2x + 4$.

b. A plot of $f(x)$, together with $L(x)$ in gray, is

c. The linear approximation in part (b) appears to be an underestimate everywhere, since it lies below the graph of $f(x)$.

d. Since $f'(x) = -\frac{2}{x^2}$, we have $f''(x) = \frac{4}{x^3}$, so that $f''(a) = 4$. The fact that $f''(a) > 0$ is consistent with $L(x)$ being an underestimate.

4.5.38

a. With $f(x) = 5 - x^2$ and $a = 2$, we have $f(a) = 1$ and $f'(a) = -2a = -4$. Thus the linear approximation to $f(x)$ at $x = 2$ is $L(x) = f(a) + f'(a)(x - a) = -4x + 9$.

b. A plot of $f(x)$, together with $L(x)$ in gray, is

c. The linear approximation in part (b) appears to be an overestimate everywhere, since it lies above the graph of $f(x)$.

Copyright © 2014 Pearson Education, Inc.
4.5. LINEAR APPROXIMATION AND DIFFERENTIALS

4.5.39

a. With \( f(x) = e^{-x} \) and \( a = \ln 2 \), we have \( f(a) = \frac{1}{2} \) and \( f'(a) = -e^{-a} = -\frac{1}{2} \). Thus the linear approximation to \( f(x) \) at \( x = \ln 2 \) is

\[
L(x) = f(a) + f'(a)(x - a) = \frac{1}{2} - \frac{1}{2}(x - \ln 2) = -\frac{1}{2}x + \frac{1}{2}(1 + \ln 2).
\]

b. A plot of \( f(x) \), together with \( L(x) \) in gray, is

![Plot of f(x) and L(x)]

c. The linear approximation in part (b) appears to be an underestimate everywhere, since it lies below the graph of \( f(x) \).

d. Since \( f'(x) = -e^{-x} \), we have \( f''(x) = e^{-x} \), so that \( f''(a) = \frac{1}{2} \). The fact that \( f''(a) > 0 \) is consistent with \( L(x) \) being an underestimate.

4.5.40

a. With \( f(x) = \sqrt{2} \cos x \) and \( a = \frac{\pi}{4} \), we have \( f(a) = \sqrt{2} \cdot \frac{\sqrt{2}}{2} = 1 \) and \( f'(a) = -\sqrt{2} \sin a = -1 \). Thus the linear approximation to \( f(x) \) at \( x = \frac{\pi}{4} \) is \( L(x) = f(a) + f'(a)(x - a) = -x + 1 + \frac{\pi}{4} \).

b. A plot of \( f(x) \), together with \( L(x) \) in gray, is

![Plot of f(x) and L(x)]

c. The linear approximation in part (b) appears to be an overestimate everywhere, since it lies above the graph of \( f(x) \).

d. Since \( f'(x) = -\sqrt{2} \sin x \), we have \( f''(x) = -\sqrt{2} \cos x \), so that \( f''(a) = -1 \). The fact that \( f''(a) < 0 \) is consistent with \( L(x) \) being an overestimate.

4.5.41 We have \( f'(x) = 2 \), so \( dy = 2 \, dx \).
4.5.42 We have \( f'(x) = 2 \sin x \cos x \), so \( dy = 2 \sin x \cos x \, dx \).

4.5.43 We have \( f'(x) = -\frac{3}{x} \), so \( dy = -\frac{3}{x^2} \, dx \).

4.5.44 We have \( f'(x) = 2e^{2x} \), so \( dy = 2e^{2x} \, dx \).

4.5.45 We have \( f'(x) = a \sin x \), so \( dy = a \sin x \, dx \).

4.5.46 We have \( f'(x) = \frac{4(4-x)-1(4-x)\cdot(1)}{(4-x)^2} = \frac{8}{(x-4)^2} \), so \( dy = \frac{8}{(x-4)^2} \, dx \).

4.5.47 We have \( f'(x) = 9x^2 - 4 \), so \( dy = (9x^2 - 4) \, dx \).

4.5.48 We have \( f'(x) = \frac{1}{\sqrt{1-x^2}} \), so \( dy = \frac{1}{\sqrt{1-x^2}} \, dx \).

4.5.49 We have \( f'(x) = \sec^2 x \), so \( dy = \sec^2 x \, dx \).

4.5.50 We have \( f'(x) = -\frac{1}{1-x} = \frac{1}{x-1} \), so \( dy = \frac{1}{x-1} \, dx \).

4.5.51
\begin{enumerate}
    
    \item a. True. Note that \( f(0) = 0 \) and \( f'(0) = 0 \), so the linear approximation at 0 is in fact \( L(x) = 0 \).
    
    \item b. False. The function \( f(x) = |x| \) is not differentiable at \( x = 0 \), so there is no good linear approximation at 0.
    
    \item c. True. For linear functions, the linear approximation at any point and the function are equal.
    
    \item d. True. Since \( f'(x) = \frac{1}{x} \) and thus \( f''(x) = -\frac{1}{x^2} \), we see that \( f''(e) = -\frac{1}{e^2} < 0 \), so the linear approximation is an overestimate.
\end{enumerate}

4.5.52 We have \( L(x) = f(5) + f'(5)(x - 5) = 10 - 2(x - 5) \). So \( f(5.1) \approx L(5.1) = 10 - 2(1) = 9.8 \).

4.5.53 We have \( L(x) = f(4) + f'(4)(x - 4) = 3 + 2(x - 4) \). So \( f(3.85) \approx L(3.85) = 3 + 2(3.85 - 4) = 3 - 0.3 = 2.7 \).

4.5.54
\begin{enumerate}
    
    \item a. Note that \( f(a) = \tan 0 = 0 \) and \( f'(a) = \sec^2 0 = 1 \), so the linear approximation has equation \( y = L(x) = f(a) + f'(a)(x - a) = x \).
    
    \item b. The linear approximation to \( \tan 3^\circ \) is \( \tan \frac{\pi}{180} \approx L \left( \frac{\pi}{180} \right) = \frac{\pi}{180} \approx 0.0524 \). Note that we must convert \( 3^\circ \) to radians before applying the linear approximation formula.
    
    \item c. The percentage error is \( 100 \cdot \left| \frac{\pi - \tan \frac{\pi}{180}}{\pi} \right| \approx 0.991\% \).
    
    \item d. The percentage error is \( 100 \cdot \left| \frac{0.9 - \frac{\pi}{180}}{\pi} \right| = 1\% \).
\end{enumerate}
4.5. LINEAR APPROXIMATION AND DIFFERENTIALS

4.5.56
a. Note that \( f(a) = \cos \left( \frac{x}{2} \right) = \frac{\sqrt{2}}{2} \) and \( f'(a) = -\sin \left( \frac{x}{2} \right) = -\frac{\sqrt{2}}{2} \), so the linear approximation has equation \( y = L(x) = f(a) + f'(a)(x - a) = \frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2} \left( x - \frac{\pi}{4} \right) = \frac{\sqrt{2}}{2} \left( 1 + \frac{\pi}{4} - x \right) \).

b. 

\[
\begin{array}{cc}
  x & y \\
  0.5 & 1.2 \\
  1.0 & 0.5 \\
  1.5 & 0.2 \\
\end{array}
\]

c. The linear approximation to \( \cos(0.8) \) is \( \cos(0.8) \approx L(0.8) = \frac{\sqrt{2}}{2} (0.2 + \frac{\pi}{4}) \approx 0.697 \).

d. The percentage error is \( 100 \cdot \frac{|\frac{\sqrt{2}}{2} (0.2 + \frac{\pi}{4}) - \cos(0.8)|}{\cos(0.8)} \approx 0.011\% \).

4.5.57
a. Note that \( f(a) = f(0) = 1 \) and \( f'(a) = -e^{-a} = -1 \), so the linear approximation has equation \( y = L(x) = f(a) + f'(a)(x - a) = 1 - x \).

b. 

\[
\begin{array}{cc}
  x & y \\
  -1.0 & 3.5 \\
  -0.5 & 3.0 \\
  0.5 & 1.5 \\
  1.0 & 1.0 \\
\end{array}
\]

c. The linear approximation to \( e^{-0.03} \) is \( e^{-0.03} \approx L(0.03) = 0.97 \).

d. The percentage error is \( 100 \cdot \frac{|0.97 - e^{-0.03}|}{e^{-0.03}} \approx 0.046\% \).

4.5.58
a. We have \( P = \frac{T}{V} \) with \( V \) held constant, which is a linear function of \( T \). Hence \( \Delta P = \frac{\Delta T}{V} = \frac{0.05}{V} \). Because this is greater than 0, the pressure increases.

b. If \( T \) is held constant then \( dP = -\frac{T}{V^2}dV \), and the approximate change in pressure is \( \Delta P \approx dP = -0.1 \frac{T}{V^2} < 0 \), so the pressure decreases.

c. We have \( T = PV \) with \( P \) held constant, which is a linear function of \( V \). Hence \( \Delta T = P\Delta V = 0.1P > 0 \), so the temperature increases.

4.5.59 If you travel one mile in \( x \) seconds more than 60 miles per hour, then your time to travel the one mile is \( 60 + \frac{3600}{x} \) hours. So the average rate is \( \frac{1}{\frac{3600}{x} + \frac{1}{60}} = \frac{3600}{60 + x} \) mph.

4.5.60 Because \( T = \frac{D}{\text{speed}} \), we have \( T = \frac{D}{60 + x} \) hours which is \( \frac{60D}{60 + x} \) minutes.

4.5.61 Note that \( f(a) = f(8) = 2 \) and \( f'(a) = \frac{1}{3}a^{-2/3} = \frac{1}{12} \), so the linear approximation has equation \( y = L(x) = f(a) + f'(a)(x - a) = 2 + \frac{1}{12} \left( x - 8 \right) = \frac{x}{12} + \frac{4}{3} \).

The percentage errors become extremely small as $x$ approaches 8. In fact, each time we decrease $\Delta x$ by a factor of 10, the percentage error decreases by a factor of 100.

4.5.62 Note that $f(a) = f(0) = 1$ and $f'(a) = -1(1 + a)^2 = -1$, so the linear approximation has equation $y = L(x) = f(a) + f'(a)(x - a) = 1 - x$.

The percentage errors become extremely small as $x$ approaches 0. In fact, each time we decrease $\Delta x$ by a factor of 10, the percentage error decreases by a factor of 100.

4.5.63

a. The linear approximation near $x = 1$ is more accurate for $f$ because the rate at which $f'$ is changing at 1 is smaller than the rate at which $g'$ is changing at 1. The graph of $f$ bends away from the linear function more slowly than the graph of $g$.

b. The larger the value of $|f''(a)|$, the greater the deviation of the curve $y = f(x)$ from the tangent line at points near $x = a$.

4.6 Mean Value Theorem

4.6.1

If $f$ is a continuous function on the closed interval $[a, b]$ and is differentiable on $(a, b)$ and the slope of the secant line that joins $(a, f(a))$ and $(b, f(b))$ is zero, then there is at least one value $c$ in $(a, b)$ at which the slope of the line tangent to $f$ at $(c, f(c))$ is also zero.
4.6.2 We seek a function over an interval for which it isn’t true that there is a horizontal tangent line to the function.

4.6.3 The function \( f(x) = |x| \) is not differentiable at 0.

4.6.4 If \( f \) is a continuous function on the closed interval \([a, b]\) and is differentiable on \((a, b)\), then there is at least one value \( c \) in \((a, b)\) at which the slope of the line tangent to \( f \) at \((c, f(c))\) is equal to the slope of the secant line that joins \((a, f(a))\) and \((b, f(b))\).

4.6.5 We seek a function over an interval for which it isn’t true that there is a tangent line parallel to the secant line between the endpoints.

4.6.6 The average rate of change of \( f \) on the interval \([-10, 10]\) is 
\[
\frac{f(10) - f(-10)}{10 - (-10)} = \frac{10^3 - (-10)^3}{20} = 100.
\]
We wish to find a point \( x \) in \((-10, 10)\) such that \( f'(x) = 100 \), or equivalently \( 3x^2 = 100 \), which gives \( x = \pm \frac{10}{\sqrt{3}} \).

4.6.7 The function \( f \) is differentiable on \([0, 1]\) and \( f(0) = f(1) = 0 \), so Rolle’s theorem applies. We wish to find a point \( x \) in \((0, 1)\) such that \( f'(x) = 0 \); we have 
\[
f''(x) = (x - 1)^2 + 2x(x - 1) = (x - 1)(3x - 1),
\]
so \( x = \frac{1}{3} \) satisfies the conclusion of Rolle’s theorem.

4.6.8 The function \( f \) is differentiable on \([0, \frac{\pi}{2}]\) and \( f(0) = f \left( \frac{\pi}{2} \right) = 0 \), so Rolle’s theorem applies. We wish to find a point \( x \) in \((0, \frac{\pi}{2})\) such that \( f'(x) = 0 \); we have 
\[
f'(x) = 2 \cos 2x,
\]
so \( x = \frac{\pi}{4} \) satisfies the conclusion of Rolle’s theorem.

4.6.9 The function \( f \) is differentiable on \([\frac{\pi}{6}, \frac{2\pi}{3}]\) and \( f \left( \frac{\pi}{6} \right) = f \left( \frac{2\pi}{3} \right) = 0 \), so Rolle’s theorem applies. We wish to find a point \( x \) in \( \left( \frac{\pi}{6}, \frac{2\pi}{3} \right) \) such that \( f'(x) = 0 \); we have 
\[
f'(x) = -4 \sin 4x,
\]
so \( x = \frac{\pi}{4} \) satisfies the conclusion of Rolle’s theorem.

4.6.10 The function \( f \) is not differentiable at \( x = 0 \), so Rolle’s theorem does not apply.

4.6.11 The function \( f \) is not differentiable at \( x = 0 \), so Rolle’s theorem does not apply.
4.6.12 The function \( f \) is differentiable on \([-2,4]\) and \( f(-2) = f(4) = 0 \), so Rolle’s theorem does apply. 
\[ f'(x) = 3x^2 - 4x - 8 \text{, which is zero at } x = \frac{4 \pm \sqrt{16 + 96}}{6} = \frac{4 \pm \sqrt{112}}{6} = 2 \left( \frac{1 \pm \sqrt{7}}{3} \right) \text{.} \] Both of these values lie between \(-2\) and \(4\), so both satisfy the conclusion of Rolle’s theorem.

4.6.13 \( g \) is differentiable on \([-1,3]\) and \( g(-1) = 0 = g(3) \), so Rolle’s theorem does apply. 
\[ g'(x) = 3x^2 - 2x - 5 = (x+1)(3x-5) \text{. This is zero for } x = -1 \text{ (which is not in } (-1,3)) \text{ and for } x = \frac{5}{3} \text{ (which is in } (-1,3)) \text{. So } x = \frac{5}{3} \text{ satisfies the conclusion of Rolle’s theorem.} \]

4.6.14 \( h \) is differentiable on \([-a,a]\) and \( h(-a) = e^{-a^2} = h(a) \), so Rolle’s theorem does apply. 
\[ h'(x) = -2xe^{-x^2} \text{, which is zero at } x = 0 \text{. So } x = 0 \text{ satisfies the conclusion of Rolle’s theorem.} \]

4.6.15 The average rate of change of the temperature from 3.2 km to 6.1 km is \( \frac{-10.3-8.0}{6.1-3.2} \approx -6.3^\circ / \text{km} \). Based on this, we cannot conclude that the lapse rate exceeds the critical value of \( 7^\circ / \text{km} \).

4.6.16 The average acceleration over the 4.45 seconds is \( \frac{330-0}{4.45-0} \approx 74.157 \text{mi/hr}/ \text{s} \), so at some point during the race, the maximum acceleration of the drag racer is at least 74.157 mi/hr/s.

4.6.17

a. The function \( f \) is differentiable on \([-1,2]\) so the mean value theorem applies.

b. The average rate of change of \( f \) on \([-1,2]\) is 
\[ \frac{f(2)-f(-1)}{2-(-1)} = \frac{3-6}{3} = -1 \text{.} \] We wish to find a point \( c \) in \((-1,2)\) such that \( f'(c) = -1 \), or equivalently \( -2c = -1 \) which gives \( c = \frac{1}{2} \).

4.6.18

a. The function \( f \) is differentiable on \([0,\frac{\pi}{4}]\) so the mean value theorem applies.

b. The average rate of change of \( f \) on \([0,\frac{\pi}{4}]\) is 
\[ \frac{f(\pi/4)-f(0)}{\pi/4-0} = \frac{3\sin \frac{\pi}{4}}{\frac{\pi}{4}} = \frac{12}{\pi} \text{.} \] We wish to find a point \( c \) in \((0,\frac{\pi}{4})\) such that \( f'(c) = \frac{12}{\pi} \), or equivalently \( 6\cos 2c = \frac{12}{\pi} \) which gives \( c = \frac{1}{2}\cos^{-1}\frac{2}{\pi} \).

4.6.19

a. The function \( f \) is differentiable on \([0,\ln 4]\) so the mean value theorem applies.

b. The average rate of change of \( f \) on \([0,\ln 4]\) is 
\[ \frac{f(\ln 4)-f(0)}{\ln 4-0} = \frac{4-1}{\ln 4} = \frac{3}{\ln 4} \text{.} \] We wish to find a point \( c \) in \((0,\ln 4)\) such that \( f'(c) = \frac{3}{\ln 4} \), or equivalently \( e^c = \frac{3}{\ln 4} \) which gives \( c = \ln \left( \frac{3}{\ln 4} \right) \).
4.6.20

a. The function \( f \) is differentiable on \([1,e]\) so the mean value theorem applies.

b. The average rate of change of \( f \) on \([1,e]\) is

\[
\frac{f(e)-f(1)}{e-1} = \frac{\ln e + \ln 2 - \ln 2}{e-1} = \frac{1}{e-1}.
\]

We wish to find a point \( c \) in \((1,e)\) such that \( f'(c) = \frac{1}{e-1} \), or equivalently \( \frac{1}{c} = \frac{1}{e-1} \) which gives \( c = e-1 \).

c.  

4.6.21

a. The function \( f \) is differentiable on \([0, \frac{1}{2}]\) so the mean value theorem applies.

b. The average rate of change of \( f \) on \([0, \frac{1}{2}]\) is

\[
\frac{f(\frac{1}{2})-f(0)}{\frac{1}{2}-0} = \frac{\pi/2 - 0}{\frac{1}{2}} = \frac{\pi}{3}.
\]

We wish to find a point \( c \) in \((0, \frac{1}{2})\) such that \( f'(c) = \frac{\pi}{3} \), or equivalently \( \frac{1}{\sqrt{1-c^2}} = \frac{\pi}{3} \), so \( c = \sqrt{1 - \frac{9}{\pi^2}} \).

c.  

4.6.22

a. The function \( f \) is differentiable on \([1,3]\) so the mean value theorem applies.

b. The average rate of change of \( f \) on \([1,3]\) is

\[
\frac{f(3)-f(1)}{3-1} = \frac{\frac{2}{3} - 2}{2} = \frac{2}{3}.
\]

We wish to find a point \( c \) in \((1,3)\) such that \( f'(c) = \frac{2}{3} \), or equivalently \( 1 - \frac{1}{c^2} = \frac{2}{3} \), so \( c = \sqrt{3} \).

c.  

4.6.23

a. The mean value theorem does not apply because the function \( f \) is not differentiable at \( x = 0 \).

b. Even though the mean value theorem doesn’t apply, it still happens to be the case that there is a number \( c \) between \(-8\) and \(8\) where the tangent line has slope \( \frac{f(8)-f(-8)}{8-(-8)} = \frac{1}{2} \). This occurs where \( \frac{2}{3} c^{-2/3} = 1/2 \), which gives \( c = \pm \frac{8}{3} \cdot \sqrt{3} \).

c.  

4.6.24

a. The function \( f \) is differentiable on \([-1,2]\) so the mean value theorem applies.

b. The average rate of change of \( f \) on \([-1,2]\) is

\[
\frac{f(2)-f(-1)}{2-(-1)} = \frac{\frac{1}{2} - (-1)}{3} = \frac{1}{2}.
\]

We wish to find a point \( c \) in \((-1,2)\) such that \( f'(c) = \frac{1}{2} \), or equivalently \( \frac{2}{(c+2)^2} = \frac{1}{2} \), so \( c = 0 \).
4.6.25
a. False. The function \( f \) is not differentiable at \( x = 0 \).
b. True. If \( f(x) - g(x) = c \) is constant, then \( f'(x) - g'(x) = 0 \).
c. False. If \( f'(x) = 0 \) then we can conclude that \( f(x) = c \) for some constant.

4.6.26 Observe that \( \ln 2x = \ln 2 + \ln x \) and \( \ln 10x^2 = \ln 10 + \ln x^2 \), so the pairs \( f(x), g(x) \) and \( h(x), p(x) \) have the same derivative.

4.6.27 The functions \( h(x) \) and \( p(x) \) have the same derivative as \( f(x) \) because they differ from \( f(x) \) by a constant.

4.6.28 One example of a function \( f \) with \( f'(x) = x + 1 \) is \( f(x) = \frac{x^2}{2} + x \); therefore the most general function with derivative \( x + 1 \) is \( f(x) = \frac{x^2}{2} + x + C \) where \( C \) is a constant.

4.6.29 The secant line between the endpoints has slope \( \frac{f(4) - f(-4)}{4 - (-4)} = \frac{4 - 1}{8} = \frac{3}{8} \).

4.6.30 Since \( f(3) = f(1) \approx 2 \), the average rate of change of \( f \) on \([1, 3] \) is \( \frac{f(3) - f(1)}{3 - 1} = 0 \). However, there is no point in \((1, 3) \) such that the slope of the tangent to \( f \) at that point is zero. This does not contradict the Mean Value Theorem since \( f \) is not differentiable everywhere on \((1, 3) \); in particular, it is not differentiable at \( x = 2 \).

4.6.31 Since \( f(1) \approx 2 \) and \( f(3) \approx 2 \), the average rate of change of \( f \) on \([1, 3] \) is \( \frac{f(3) - f(1)}{3 - 1} = 0 \). However, the tangent to \( f \) between \( x = 1 \) and \( x = 2 \) is the graph of \( f \) itself, which has slope 2, and the tangent to \( f \) between \( x = 2 \) and \( x = 3 \) is also the graph of \( f \), which has slope 1. So there is no point in \((1, 3) \) where the tangent line has slope 0. This does not contradict the Mean Value Theorem since \( f \) is not continuous everywhere on \([1, 3] \), nor differentiable everywhere on \((1, 3) \) — both of these hypotheses fail at \( x = 2 \).

4.6.32
a. The average temperature gradient from \( h = 0 \) to \( h = 1.1 \) m is \( \frac{2\pi - 1.2}{1.1 - 0} \approx 12.7^\circ /m \), so by the mean value theorem the temperature gradient must equal \( 12.7^\circ /m \) somewhere in the snowpack, and the formation of a weak layer is likely.
b. The average temperature gradient from \( h = 0 \) to \( h = 1.4 \) m is \( \frac{-1\pi - (-1.2)}{1.4 - 0} \approx 7.86^\circ /m \). While it is still possible that the temperature gradient exceeds \( 10^\circ /m \) somewhere in the snowpack, one may suspect that the formation of a weak layer is not likely in this case.
c. If the surface temperature and temperature at the bottom of the snowpack are both roughly constant, then the temperature gradient will be larger in areas where the snowpack is less deep.
d. If all layers of the snowbank are the same temperature, then the temperature gradient is 0 and a weak layer is not likely to form.

4.6.33 The average speed of the car over the 28 minute period (= \( \frac{28}{60} \) hr) is \( \frac{30 - 0}{28/60} \approx 64.3 \) mi/hr, so the officer can conclude by the mean value theorem that at some point the car exceeded the speed limit.

4.6.34 The average speed of the car over the 30 minute period (= \( \frac{1}{2} \) hr) is exactly 60 mi/hr. But because the car started from rest, the average speed for the first few seconds of the trip is less than 60 mi/hr, and therefore the average speed for the remainder of the trip must exceed 60 mi/hr, and the officer can conclude that the driver exceeded the speed limit.

4.6.35 The runner’s average speed is \( \frac{62/60}{32/60} \approx 11.6 \) mi/hr. By the mean value theorem, the runner’s speed was 11.6 mi/hr at least once. By the intermediate value theorem, all speeds between 0 and 11.6 mi/hr were reached. Because the initial and final speed was 0 mi/hr, the speed of 11 mi/hr was reached at least twice.
4.6.36 For linear functions \( f(x) \) the average rate of change of \( f \) on any interval \([a, b]\) is the same as the slope \( f'(c) \) for any point \( c \) in \((a, b)\).

4.6.37 Observe that 
\[
\frac{f(b) - f(a)}{b - a} = \frac{A(b^2 - a^2) + B(b - a)}{b - a} = A(b + a) + B
\]
and \( f'(c) = 2Ac + B \), so the point \( c \) that satisfies the conclusion of the mean value theorem is \( c = \frac{a+b}{2} \).

4.6.38

a. Observe that 
\[
\frac{f(b) - f(a)}{b - a} = \frac{b^2 - a^2}{b - a} = a + b \quad \text{and} \quad f'(c) = 2c,
\]
so the point \( c \) that satisfies the conclusion of the mean value theorem is \( c = \frac{a+b}{2} \).

b. Observe that 
\[
\frac{f(b) - f(a)}{b - a} = \frac{1}{b} - \frac{1}{a} = \frac{a - b}{ab(b - a)} = -\frac{1}{ab}
\]
and \( f'(c) = -\frac{1}{c^2} \), so the point \( c \) that satisfies the conclusion of the mean value theorem is \( c = \sqrt{ab} \).

4.6.39 Note that \( f'(x) = 2 \tan x \sec^2 x \) and \( g'(x) = 2 \sec x \sec x \tan x = 2 \tan x \sec^2 x \), so \( f'(x) = g'(x) \). This implies that \( f - g \) is a constant, which also follows from the trigonometric identity \( \sec^2 x = \tan^2 x + 1 \).

4.6.40 Note that 
\[
f'(x) = 2 \sin x \cos x \quad \text{and} \quad g'(x) = -2 \cos x (-\sin x) = 2 \sin x \cos x,
\]
so \( f'(x) = g'(x) \). This implies that \( f - g \) is a constant, which also follows from the trigonometric identity \( \sin^2 x + \cos^2 x = 1 \).

4.6.41 Bolt’s average speed during the race was \( \frac{100}{0.58} \) m/s = \( \frac{100}{0.58} \cdot \frac{3600}{1000} \) km/hr \( \approx 37.58 \) km/hr, so by the mean value theorem he must have exceeded \( 37 \) km/hr during the race.

4.6.42 Observe that \( f' \) is positive and decreasing for \( x > a \) (because \( f'' < 0 \) for \( x > a \)). Fix some \( b > a \) and let \( a < x < b \). Then by the mean value theorem \( \frac{f(x) - f(a)}{x - a} = f'(c) \) for some \( c \) in \((a, x)\). We have \( f'(c) > f'(b) > 0 \), so therefore if \( f'(a) = \lim_{x \to a} \frac{f(x) - f(a)}{x - a} \) exists, we must have \( f'(a) \geq f'(b) > 0 \). On the other hand \( f' \) is negative for \( x < a \) so the mean values theorem implies \( \frac{f(x) - f(a)}{x - a} < 0 \) for \( x < a \), and so if \( f'(a) \) exists we must have \( f'(a) \leq 0 \). This gives a contradiction, so we conclude that \( f'(a) \) does not exist. More generally, if \( f' \) and \( f'' \) both change signs at some point \( a \), then one of the functions \( f(x) \), \( -f(x) \), \( f(-x) \) or \( -f(-x) \) satisfies the hypotheses above, and so \( f'(a) \) does not exist.

4.6.43

a. If \( g(x) = x \) then \( g'(x) = 1 \) and hence 
\[
\frac{f(b) - f(a)}{g(b) - g(a)} = \frac{f(b) - f(a)}{b - a} = \frac{f'(c)}{g'(c)} = f'(c).
\]

b. We have 
\[
\frac{f(b) - f(a)}{g(b) - g(a)} = \frac{0 - (-1)}{6 - 2} = \frac{1}{4}; \quad \frac{f'(c)}{g'(c)} = \frac{2c}{4} = \frac{c}{2}; \quad \text{so} \quad c = \frac{1}{2}.
\]

4.7 L’Hôpital’s Rule

4.7.1 If \( \lim_{x \to a} f(x) = 0 \) and \( \lim_{x \to a} g(x) = 0 \), then we say \( \lim_{x \to a} \frac{f(x)}{g(x)} \) is of indeterminate form \( \frac{0}{0} \).

4.7.2 In general, limits with the form \( \frac{0}{0} \) or \( \frac{\infty}{\infty} \) can have any value, and so cannot be evaluated by direct substitution.

4.7.3 Take the limit of the quotient of the derivatives of the numerator and denominator.

4.7.4 L’Hôpital’s rule applies directly to limits of the form \( \frac{0}{0} \) and \( \frac{\infty}{\infty} \).
4.7.5 If \( \lim_{x \to a} f(x)g(x) \) has the form \( 0 \cdot \infty \), then \( \lim_{x \to a} \frac{f(x)}{g(x)} \) has the indeterminate form \( 0/0 \) or \( \infty/\infty \).

4.7.6 A simple example is \( \lim_{x \to 0} \frac{1}{x^2} \).

4.7.7 If \( \lim_{x \to a} f(x) = 1 \) and \( \lim_{x \to a} g(x) = \infty \), then \( f(x)g(x) \to \infty \) as \( x \to a \), which is meaningless; so direct substitution does not work.

4.7.8 First, evaluate \( L = \lim_{x \to a} g(x)/f(x) \), which can usually be handled by l'Hôpital's rule. Then we have \( \lim_{x \to a} f(x)g(x) = e^L \).

4.7.9 This means \( \lim_{x \to \infty} g(x) = 0 \).

4.7.10 This means \( \lim_{x \to \infty} f(x) = M \) where \( 0 < M < \infty \).

4.7.11 By Theorem 4.15, we have \( \ln x, x^3, 2x, x^x \) in order of increasing growth rates.

4.7.12 By Theorem 4.15, we have \( \ln x^{10}, x^{100}, 10^x, x^x \) in order of increasing growth rates.

4.7.13 L'Hôpital's rule gives \( \lim_{x \to 0} \frac{x^2 - 2x}{8 - 6x + x^2} = \lim_{x \to 0} \frac{2x - 2}{-6 + 2x} = \frac{2}{-2} = -1 \).

4.7.14 L'Hôpital's rule gives \( \lim_{x \to 0} \frac{x^4 + x^3 + 2x + 2}{x + 1} = \lim_{x \to 0} \frac{4x^3 + 3x^2 + 2}{1} = -4 + 3 + 2 = 1 \).

4.7.15 L'Hôpital's rule gives \( \lim_{x \to 1} \ln x \frac{e^x - 1}{4x - x^2 - 3} = \lim_{x \to 1} \frac{1/x}{e - 4x} = \frac{1}{2} \).

4.7.16 L'Hôpital's rule gives \( \lim_{x \to 0} \frac{e^x}{x^2 + 3x} = \lim_{x \to 0} \frac{e^x}{2x + 3} = \frac{1}{3} \).

4.7.17 L'Hôpital's rule gives \( \lim_{x \to -e} \frac{\ln x - 1}{x - e} = \lim_{x \to -e} \frac{1/x}{1} = \frac{1}{e} \).

4.7.18 L'Hôpital's rule gives \( \lim_{x \to 1} \frac{4\tan^{-1} x - \pi}{x - 1} = \lim_{x \to 1} \frac{4/(1 + x^2)}{1} = 2 \).

4.7.19 L'Hôpital's rule gives \( \lim_{x \to 0} \frac{3\sin 4x}{5x} = \lim_{x \to 0} \frac{12\cos 4x}{5} = \frac{12}{5} \).

4.7.20 L'Hôpital's rule gives \( \lim_{x \to 2\pi} \frac{\sin x + x^2 - 4\pi^2}{x - 2\pi} = \lim_{x \to 2\pi} \frac{x\cos x + \sin x + 2x}{1} = 2\pi + 0 + 4\pi = 6\pi \).

4.7.21 L'Hôpital's rule gives \( \lim_{u \to \pi/4} \frac{\tan u - \cot u}{u - \pi/4} = \lim_{u \to \pi/4} \frac{\sec^2 u + \csc^2 u}{1} = 2 + 2 = 4 \).

4.7.22 L'Hôpital's rule gives \( \lim_{x \to 0} \frac{\tan 4x}{\tan 7x} = \lim_{x \to 0} \frac{4\sec^2 4x}{7\sec^2 7x} = \frac{4}{7} \).

4.7.23 Apply l'Hôpital's rule twice: \( \lim_{x \to 0} \frac{1 - \cos 3x}{8x^2} = \lim_{x \to 0} \frac{3\sin 3x}{16x} = \lim_{x \to 0} \frac{9\cos 3x}{16} = \frac{9}{16} \).

4.7.24 Observe that \( \lim_{x \to 0} \frac{\sin^2 3x}{x^2} = \left( \lim_{x \to 0} \frac{\sin 3x}{x} \right)^2 = 3 \), and apply l'Hôpital's rule to obtain \( \lim_{x \to 0} \frac{\sin 3x}{x} = \lim_{x \to 0} \frac{3\cos 3x}{x} = 3 \). Therefore \( \lim_{x \to 0} \frac{\sin^2 3x}{x^2} = 9 \).
4.7.25 Apply l'Hôpital's rule twice:
\[ \lim_{x \to \pi} \frac{\cos x + 1}{(x - \pi)^2} = \lim_{x \to \pi} \frac{-\sin x}{2(x - \pi)} = \lim_{x \to \pi} \frac{-\cos x}{2} = \frac{1}{2}. \]

4.7.26 Apply l'Hôpital's rule twice:
\[ \lim_{x \to 0} \frac{e^x - x - 1}{5x^2} = \lim_{x \to 0} \frac{e^x - 1}{10x} = \lim_{x \to 0} \frac{e^x}{10} = \frac{1}{10}. \]

4.7.27 Apply l'Hôpital's rule twice:
\[ \lim_{x \to 0} \frac{e^x - \sin x - 1}{x^4 + 8x^3 + 12x^2} = \lim_{x \to 0} \frac{e^x - \cos x}{4x^3 + 24x^2} = \lim_{x \to 0} \frac{e^x + \sin x}{12x^2 + 48x + 24} = \frac{1}{24}. \]

4.7.28 Apply l'Hôpital's rule three times:
\[ \lim_{x \to 0} \frac{\sin x - x}{7x^3} = \lim_{x \to 0} \frac{\cos x - 1}{21x^2} = \lim_{x \to 0} \frac{-\sin x}{42x} = \lim_{x \to 0} \frac{-\cos x}{42} = -\frac{1}{42}. \]

4.7.29 L'Hôpital's rule gives:
\[ \lim_{x \to \infty} \frac{e^{1/x} - 1}{1/x} = \lim_{x \to \infty} \frac{e^{1/x}(-1/x^2)}{(-1/x^2)} = \lim_{x \to \infty} e^{1/x} = 1. \]

4.7.30 Apply l'Hôpital's rule twice:
\[ \lim_{x \to \infty} \frac{\tan^{-1} x - \pi/2}{1/x} = \lim_{x \to \infty} \frac{1/(1 + x^2)}{(-1/x^2)} = \lim_{x \to \infty} \frac{-x^2}{x^2 + 1} = \lim_{x \to \infty} \frac{-2x}{2x} = -1. \]

4.7.31 Apply l'Hôpital's rule twice:
\[ \lim_{x \to -1} \frac{x^3 - x^2 - 5x - 3}{x^4 + 2x^3 - x^2 - 4x - 2} = \lim_{x \to -1} \frac{3x^2 - 2x - 5}{4x^3 + 6x^2 - 2x - 4} = \lim_{x \to -1} \frac{6x - 2}{12x^2 + 12x - 2} = 4. \]

4.7.32 L'Hôpital's rule gives \( \lim_{x \to 1} \frac{x^n - 1}{x - 1} = \lim_{x \to 1} \frac{nx^{n-1}}{1} = n. \)

4.7.33 L'Hôpital's rule gives \( \lim_{v \to 3} \frac{v - 1 - \sqrt{v^2 - 5}}{v - 3} = \lim_{v \to 3} \frac{1 - \sqrt{v^2 - 5}}{1} = -\frac{1}{2}. \)

4.7.34 L'Hôpital's rule gives \( \lim_{y \to 2} \frac{y^2 + y - 6}{\sqrt{8 - y^2} - y} = \lim_{y \to 2} \frac{2y + 1}{\sqrt{8 - y^2} - 1} = -\frac{5}{2}. \)

4.7.35 Apply l'Hôpital's rule twice:
\[ \lim_{x \to 2} \frac{x^2 - 4x + 4}{\sin^2 \pi x} = \lim_{x \to 2} \frac{2x - 4}{2\pi \sin(\pi x)(\cos \pi x)} = \lim_{x \to 2} \frac{2x - 4}{\pi \sin 2\pi x} = \lim_{x \to 2} \frac{2}{2\pi^2 \cos 2\pi x} = \frac{2}{2\pi^2} = \frac{1}{\pi^2}. \]

4.7.36 L'Hôpital's rule gives \( \lim_{x \to 2} \frac{(3x + 2)^{1/3} - 2}{x - 2} = \lim_{x \to 2} \frac{(3x + 2)^{-2/3}}{1} = 8^{-2/3} = \frac{1}{4}. \) (Notice that this limit is the derivative of \((3x + 2)^{1/3}\) at \(x = 2\).)

4.7.37 Apply l'Hôpital's rule three times:
\[ \lim_{x \to \infty} \frac{3x^4 - x^2}{6x^4 + 12} = \lim_{x \to \infty} \frac{12x^3 - 2x}{24x^3} = \lim_{x \to \infty} \frac{36x^2 - 2}{72x^2} = \lim_{x \to \infty} \frac{72x}{144x} = \frac{1}{2}. \]
4.7.38 Apply l'Hôpital's rule three times:

\[
\lim_{x \to \infty} \frac{4x^3 - 2x^2 + 6}{\pi x^3 + 4} = \lim_{x \to \infty} \frac{12x^2 - 4x}{3\pi x^2} = \lim_{x \to \infty} \frac{24x - 4}{6\pi x} = \lim_{x \to \infty} \frac{24}{6\pi} = \frac{4}{\pi}.
\]

4.7.39 Apply l'Hôpital's rule three times:

\[
\lim_{x \to \pi/2^-} \frac{\tan x}{3/(2x - \pi)} = \lim_{x \to \pi/2^-} \frac{\sec^2 x}{-6/(2x - \pi)^2} = -\frac{1}{6} \lim_{x \to \pi/2^-} \frac{2x - \pi}{\cos^2 x} = -\frac{1}{6} \lim_{x \to \pi/2^-} \frac{4(2x - \pi)}{2\cos x(-\sin x)} = -\frac{1}{6} \lim_{x \to \pi/2^-} \frac{8x - 4\pi}{-\sin(2x)} = -\frac{1}{6} \lim_{x \to \pi/2^-} \frac{8}{-2\cos(2x)} = -\frac{2}{3}.
\]

4.7.40 Applying l'Hôpital's rule gives:

\[
\lim_{x \to \infty} \frac{3e^{3x}}{3e^{3x} + 5} = \lim_{x \to \infty} \frac{3e^{3x}}{9e^{3x}} = \frac{3}{9} = \frac{1}{3}.
\]

4.7.41 Applying l'Hôpital's rule twice gives:

\[
\lim_{x \to \infty} \frac{\ln(3x + 5)}{\ln(7x + 3) + 1} = \lim_{x \to \infty} \frac{3/(3x + 5)}{7/(7x + 3)} = \frac{3}{7} \lim_{x \to \infty} \frac{7x + 3}{3x + 5} = \frac{3}{7} \lim_{x \to \infty} 3 = 1.
\]

4.7.42 Applying l'Hôpital's rule numerous times gives:

\[
\lim_{x \to \infty} \frac{\ln(3x + 5e^x)}{\ln(7x + 3e^{2x})} = \lim_{x \to \infty} \frac{(3 + 5e^x)/(3x + 5e^x)}{(7 + 6e^{2x})/(7x + 3e^{2x})} = \lim_{x \to \infty} \frac{3 + 5e^x}{3x + 5e^x} \cdot \lim_{x \to \infty} \frac{7x + 3e^{2x}}{7 + 6e^{2x}} = \lim_{x \to \infty} \frac{5e^x}{3 + 5e^x} \cdot \lim_{x \to \infty} \frac{7x + 3e^{2x}}{12e^{2x}} = \lim_{x \to \infty} \frac{5e^x}{5e^x} \cdot \lim_{x \to \infty} \frac{7x + 3e^{2x}}{24e^{2x}} = \frac{1}{2}.
\]

4.7.43 Applying l'Hôpital's rule twice gives:

\[
\lim_{x \to \infty} \frac{x^2 - \ln(2/x)}{3x^2 + 2x} = \lim_{x \to \infty} \frac{2x + (1/x)}{6x + 2} = \lim_{x \to \infty} \frac{2 - 1/x^2}{6} = \frac{2}{6} = \frac{1}{3}.
\]

4.7.44 L'Hôpital's rule gives \( \lim_{x \to \pi/2} \frac{2\tan x}{\sec^2 x} = \lim_{x \to \pi/2} \frac{2\sec^2 x}{2\sec x \sec x \tan x} = \lim_{x \to \pi/2} \cot x = 0 \).

4.7.45 Observe that \( \lim_{x \to 0} \frac{x}{\csc x} = \lim_{x \to 0} \frac{x}{\sin x} = \lim_{x \to 0} \frac{1}{\cos x} = 1 \), by l'Hôpital's rule.

4.7.46 Observe that \( \lim_{x \to 1^-} (1 - x) \tan \left( \frac{\pi x}{2} \right) = \lim_{x \to 1^-} \frac{1 - x}{\cot \left( \frac{\pi x}{2} \right)} = \lim_{x \to 1^-} \frac{-1}{\left( \frac{\pi}{2} \right) \csc^2 \left( \frac{\pi x}{2} \right)} = \frac{2}{\pi} \) by l'Hôpital's rule.
4.7.47 Observe that the given limit can be written \[ \lim_{x \to 0} \frac{\sin 7x}{\sin 6x} = \lim_{x \to 0} \frac{7 \cos 7x}{6 \cos 6x} = \frac{7}{6}. \]

4.7.48 Observe that the given limit can be written \[ \lim_{x \to \infty} \frac{e^{1/x} - 1}{\sin(1/x)} = \lim_{x \to \infty} \frac{e^{1/x} - (1/x^2)}{\cos(1/x)}/(-1/x^2) = \frac{1}{1} = 1. \]

4.7.49 Observe that \[ \lim_{x \to (\pi/2)^-} \frac{(\pi/2 - x)}{\sec x} = \lim_{x \to (\pi/2)^-} \frac{\pi/2 - x}{\cos x} = \lim_{x \to (\pi/2)^-} \frac{-1}{-\sin x} = 1 \text{ by l'Hôpital's rule.} \]

4.7.50 Observe that \[ \lim_{x \to 0^+} \left( \sin \sqrt{1 - \frac{x}{x}} \right) = \lim_{x \to 0^+} \left( \sin \sqrt{\frac{x(1-x)}{x^2}} \right) = \lim_{x \to 0^+} \sin \frac{x}{x} \cdot \lim_{x \to 0^+} \sqrt{x(1-x)} = 1 \cdot 0 = 0, \] where we use l'Hôpital's rule for \( x \to 0^+ \sin \frac{x}{x} = 1. \)

4.7.51 Observe that \[ \lim_{x \to 0} \left( \cot x - \frac{1}{x} \right) = \lim_{x \to 0} \left( \frac{\cos x}{x} - \frac{1}{x} \right) = \lim_{x \to 0} \frac{x \cos x - x}{x \sin x}. \] Apply l'Hôpital's rule twice:
\[ \lim_{x \to 0} \frac{x \cos x - x}{x \sin x} = \lim_{x \to 0} \frac{\cos x - x \sin x - x \cos x}{\sin x + x \cos x} \]
\[ = -\lim_{x \to 0} \frac{\sin x + x \cos x}{\sin x + x \cos x} \]
\[ = -\lim_{x \to 0} \frac{\sin x + x \cos x}{\sin x + x \cos x} \]
\[ = \frac{0}{2} = 0. \]

4.7.52 Observe that \[ \lim_{x \to \infty} \left( x - \sqrt{x^2 + 1} \right) = \lim_{x \to \infty} x \left(1 - \sqrt{1 + 1/x^2} \right). \] Make the change of variables \( t = 1/x: \)
\[ \lim_{x \to \infty} x \left(1 - \sqrt{1 + 1/x^2} \right) = \lim_{t \to 0^+} \frac{1 - \sqrt{1 + t^2}}{t} = \lim_{t \to 0^+} \frac{-t}{1 + t^2} = 0. \]

4.7.53 Observe that \[ \lim_{\theta \to (\pi/2)^-} \left( \frac{\tan \theta - \sec \theta}{\theta - (\pi/2)^-} \right) = \lim_{\theta \to (\pi/2)^-} \left( \frac{\sin \theta}{\cos \theta} - \frac{1}{\cos \theta} \right) = \lim_{\theta \to (\pi/2)^-} \frac{\sin \theta - 1}{\cos \theta}. \] By l'Hôpital's rule \[ \lim_{\theta \to (\pi/2)^-} \frac{\sin \theta - 1}{\cos \theta} = \lim_{\theta \to (\pi/2)^-} \frac{\cos \theta}{-\sin \theta} = \frac{0}{1} = 0. \]

4.7.54 Observe that \[ \lim_{x \to \infty} \left( x - \sqrt{x^2 + 4x} \right) = \lim_{x \to \infty} x \left(1 - \sqrt{1 + 4/x} \right). \] Make the change of variables \( t = 1/x: \)
\[ \lim_{x \to \infty} x \left(1 - \sqrt{1 + 4/x} \right) = \lim_{t \to 0^+} \frac{1 - \sqrt{1 + 4t}}{t} = \lim_{t \to 0^+} \frac{-4}{2\sqrt{1 + 4t}} = -2. \]

4.7.55 Note that \( \ln x^2 = 2 \ln x, \) so we evaluate \( L = \lim_{x \to 0^+} 2 \ln x = 2 \lim_{x \to 0^+} \ln x = 2 \lim_{x \to 0^+} \frac{1/x}{1/x} = 2 \lim_{x \to 0^+} (1/x) = 0 \) by l'Hôpital's rule. Therefore \( \lim_{x \to 0^+} x^{2x} = e^L = 1. \)

4.7.56 Note that \( \ln(1 + 4x)^{3/2} = \frac{3 \ln(1 + 4x)}{x}, \) so we evaluate \( L = \lim_{x \to 0^+} \frac{3 \ln(1 + 4x)}{x} = 3 \lim_{x \to 0^+} \frac{4/(1 + 4x)}{1} = 12 \) by l'Hôpital's rule. Therefore \( \lim_{x \to 0^+} (1 + 4x)^{3/2} = e^L = e^{12}. \)

4.7.57 Note that \( \ln(\tan \theta) \cos \theta = \cos \theta \ln \tan \theta, \) so we evaluate \( L = \lim_{\theta \to \pi/2^-} \cos \theta \ln \tan \theta = \lim_{\theta \to \pi/2^-} \frac{\ln \tan \theta}{\sec \theta}. \)
L'Hôpital's rule gives \( \lim_{\theta \to \pi/2^-} \frac{\ln \tan \theta}{\sec \theta} = \lim_{\theta \to \pi/2^-} \frac{\sec^2 \theta / \tan \theta}{\sec \theta} = \lim_{\theta \to \pi/2^-} \frac{\sec \theta}{\sec \theta} = \lim_{\theta \to \pi/2^-} \frac{\cos \theta}{\sin^2 \theta} = 0, \) so \( \lim_{\theta \to \pi/2^-} (\tan \theta)^{\cos \theta} = e^L = 1. \)
4.7.58 Note that \( \ln(\sin \theta)^{\tan \theta} = \tan \theta \ln \sin \theta \), so we evaluate \( L = \lim_{\theta \to 0^+} \tan \theta \ln \sin \theta = \lim_{\theta \to 0^+} \frac{\ln \sin \theta}{\cot \theta} \).

L'Hôpital's rule gives \( \lim_{\theta \to 0^+} \frac{\ln \sin \theta}{\cot \theta} = \lim_{\theta \to 0^+} \frac{\cos \theta / \sin \theta}{-\csc^2 \theta} = -\lim_{\theta \to 0^+} \cos \theta \sin \theta = 0 \), so \( \lim_{\theta \to 0^+} (\tan \theta)^{\cos \theta} = e^L = 1 \).

4.7.59 Note that \( \ln(1 + x)^{\cot x} = \cot x \ln(1 + x) \), so we evaluate \( L = \lim_{x \to 0^+} \cot x \ln(1 + x) = \lim_{x \to 0^+} \frac{\ln(1 + x)}{\tan x} = \lim_{x \to 0^+} \frac{1/(1 + x)}{\sec^2 x} = \lim_{x \to 0^+} \frac{\cos^2 x}{x} = 1 \) by L'Hôpital's rule. Therefore \( \lim_{x \to 0^+} (1 + x)^{\cot x} = e^L = e \).

4.7.60 Note that \( \ln(1 + 1/x)^{\ln x} = \ln x \ln(1 + 1/x) \), so we evaluate

\[
L = \lim_{x \to \infty} \ln x \ln(1 + 1/x) = \lim_{x \to \infty} \frac{\ln(1 + 1/x)}{1/x} = \lim_{x \to \infty} \frac{\ln x}{x} = \lim_{x \to \infty} \frac{(\ln x)^2}{x + 1} = 0
\]

by L'Hôpital's rule (the last limit is 0 because \( x + 1 \) grows faster than \( \ln^2 x \) as \( x \to \infty \)). Therefore \( \lim_{x \to \infty} (1 + 1/x)^{\ln x} = e^L = 1 \).

4.7.61 Note that \( \ln(1 + a/x)^x = x \ln(1 + a/x) \), so we evaluate

\[
L = \lim_{x \to \infty} x \ln(1 + a/x) = \lim_{x \to \infty} \frac{\ln(1 + a/x)}{1/x} = \lim_{x \to \infty} \frac{\ln x}{\frac{a}{x}} = \lim_{x \to \infty} \frac{a}{1 + a/x} = a
\]

by L'Hôpital's rule. Therefore \( \lim_{x \to \infty} (1 + a/x)^x = e^L = e^a \).

4.7.62 Note that \( \ln(e^{5x} + x)^{1/x} = \frac{1}{x} \ln(e^{5x} + x) \), so we evaluate

\[
L = \lim_{x \to 0} \frac{\ln(e^{5x} + x)}{x} = \lim_{x \to 0} \frac{(5e^{5x} + 1)/(e^{5x} + x)}{1} = 6/1 = 6
\]

Therefore, \( \lim_{x \to 0} (e^{5x} + x)^{1/x} = e^6 \).

4.7.63 Note that \( \ln(e^{ax} + x)^{1/x} = \frac{1}{x} \ln(e^{ax} + x) \), so we evaluate

\[
L = \lim_{x \to 0} \frac{\ln(e^{ax} + x)}{x} = \lim_{x \to 0} \frac{(ae^{ax} + 1)/(e^{ax} + x)}{1} = \frac{a + 1}{1} = a + 1
\]

Therefore, \( \lim_{x \to 0} (e^{ax} + x)^{1/x} = e^{a+1} \).

4.7.64 Note that \( \ln(2^{ax} + x)^{1/x} = \frac{1}{x} \ln(2^{ax} + x) \), so we evaluate

\[
L = \lim_{x \to 0} \frac{\ln(2^{ax} + x)}{x} = \lim_{x \to 0} \frac{(a2^{ax} \ln 2 + 1)/(2^{ax} + x)}{1} = \frac{a \ln 2 + 1}{1} = a \ln 2 + 1
\]

Therefore, \( \lim_{x \to 0} (2^{ax} + x)^{1/x} = e^{a \ln 2 + 1} = e^1 \cdot e^{a \ln 2} = e \cdot 2^a \).

4.7.65 Note that \( \ln(\tan x)^x = x \ln \tan x \), so we evaluate

\[
L = \lim_{x \to 0^+} x \ln \tan x = \lim_{x \to 0^+} \frac{\ln \tan x}{1/x} = \lim_{x \to 0^+} \frac{\sec^2 x / \tan x}{-1/x^2} = -\lim_{x \to 0^+} \frac{x^2}{\sin x \cos x}
\]

by L'Hôpital's rule. Next, observe that \( \lim_{x \to 0^+} \frac{x^2}{\sin x \cos x} = \lim_{x \to 0^+} \frac{x}{\sin x} \cdot \lim_{x \to 0^+} \frac{x}{\cos x} = 1 \cdot 0 = 0 \). Therefore \( L = 0 \) and \( \lim_{x \to 0^+} (\tan x)^x = e^L = 1 \).
4.7.66 Note that \( \ln(1 + 10/z^2)z^2 = z^2 \ln(1 + 10/z^2) \), so we evaluate

\[
L = \lim_{z \to \infty} z^2 \ln \left(1 + \frac{10}{z^2}\right) = \lim_{z \to \infty} \frac{\ln (1 + 10/z^2)}{1/z^2} = \lim_{z \to \infty} \frac{-\frac{20}{z^2} + \frac{1}{1 - \frac{20}{z^2}}}{-\frac{2}{z^3}} = \lim_{z \to \infty} \frac{10z^2}{2z^2 + 10} = 10
\]

by l'Hôpital's rule. Therefore \( \lim_{z \to \infty} \left(1 + \frac{10}{z^2}\right)^{z^2} = e^L = e^{10} \).

4.7.67 Note that \( \ln(x + \cos x)^{1/x} = \frac{\ln(x + \cos x)}{x} \), so we evaluate

\[
L = \lim_{x \to 0} \frac{\ln(x + \cos x)}{x} = \lim_{x \to 0} \frac{(x + \cos x)^{-1}(1 - \sin x)}{1} = 1
\]

by l'Hôpital's rule. Therefore \( \lim_{x \to 0} (x + \cos x)^{1/x} = e^L = e \).

4.7.68 Note that \( \ln \left(\frac{1}{3} \cdot 3^x + \frac{2}{3} \cdot 2^x\right)^{1/x} = \frac{\ln \left(\frac{1}{3} \cdot 3^x + \frac{2}{3} \cdot 2^x\right)}{x} \), so we evaluate

\[
L = \lim_{x \to 0^+} \frac{\ln \left(\frac{1}{3} \cdot 3^x + \frac{2}{3} \cdot 2^x\right)}{x} = \lim_{x \to 0^+} \frac{\left(\frac{1}{3} \cdot 3^x + \frac{2}{3} \cdot 2^x\right)^{-1} \cdot \frac{\ln \left(\frac{1}{3} \cdot 3^x + \frac{2}{3} \cdot 2^x\right)}{1}}{1} = \frac{\ln 12}{3}
\]

by l'Hôpital's rule. Therefore \( \lim_{x \to 0^+} \left(\frac{1}{3} \cdot 3^x + \frac{2}{3} \cdot 2^x\right)^{1/x} = e^L = \sqrt[3]{12} \).

4.7.69 By Theorem 4.15, \( e^{0.01x} \) grows faster than \( x^{10} \) as \( x \to \infty \).

4.7.70 Observe that \( \lim_{x \to \infty} \frac{x^2 \ln x}{(\ln x)^2} = \lim_{x \to \infty} \frac{x^2}{\ln x} = \infty \), so \( x^2 \ln x \) grows faster than \( (\ln x)^2 \) as \( x \to \infty \).

4.7.71 Note that \( \ln x^{20} = 20 \ln x \), so \( \ln x^{20} \) and \( \ln x \) have comparable growth rates as \( x \to \infty \).

4.7.72 Make the substitution \( y = \ln x \); then \( y \to \infty \) if \( x \to \infty \) and \( \lim_{x \to \infty} \frac{\ln(x)}{\ln x} = \lim_{y \to \infty} \frac{\ln y}{y} = 0 \). Therefore \( \ln x \) grows faster than \( \ln(\ln x) \) as \( x \to \infty \).

4.7.73 By Theorem 4.15, \( x^x \) grows faster than \( 100^x \) as \( x \to \infty \).

4.7.74 Observe that \( \lim_{x \to \infty} \frac{x^2 \ln x}{x^3} = \lim_{x \to \infty} \frac{\ln x}{x} = 0 \), so \( x^3 \) grows faster than \( x^2 \ln x \) as \( x \to \infty \).

4.7.75 By Theorem 4.15, \( 1.00001^x \) grows faster than \( x^{20} \) as \( x \to \infty \).

4.7.76 Observe that \( \lim_{x \to \infty} \frac{x^{10} \ln x^{10}}{x^{11}} = \lim_{x \to \infty} \frac{\ln x}{x} = 0 \) by Theorem 4.15, so \( x^{11} \) grows faster than \( x^{10} \ln x \) as \( x \to \infty \).

4.7.77 Observe that \( \lim_{x \to \infty} \frac{\ln (x/2)^x}{x^2} = \lim_{x \to \infty} 2^{-x} = 0 \), so \( x^x \) grows faster than \( (x/2)^x \) as \( x \to \infty \).

4.7.78 Observe that \( \ln \sqrt{x} = \frac{\ln x}{x} \), so that \( \lim_{x \to \infty} \frac{\ln^2 x}{\ln \sqrt{x}} = \lim_{x \to \infty} \frac{\ln^2 x}{(\ln x)/2} = \lim_{x \to \infty} (2 \ln x) = \infty \). Thus \( \ln^2 x \) grows faster than \( \ln \sqrt{x} \).

4.7.79 Note that \( \lim_{x \to \infty} \frac{e^{x^2}}{e^{10x}} = \lim_{x \to \infty} e^{x^2-10x} = \infty \), so \( e^{x^2} \) grows faster than \( e^{10x} \) as \( x \to \infty \).

4.7.80 Observe that \( \lim_{x \to \infty} \frac{x^{10}/x^{11/10}}{e^{x^2}} = \lim_{x \to \infty} \left(\frac{x^{1/10}}{e^x}\right)^x = 0 \) by Theorem 4.15, so \( e^{1/10} \) grows faster than \( x^{1/10} \) as \( x \to \infty \).
4.7.82 Observe that \( \lim_{x \to \infty} \frac{100x^3 - 3}{x^4 - 2} = 0 \) because the denominator has larger degree than the numerator (Theorem 2.7). We can also use l’Hôpital’s rule: \( \lim_{x \to \infty} \frac{100x^3 - 3}{x^4 - 2} = \lim_{x \to \infty} \frac{300x^2}{4x^3} = \lim_{x \to \infty} \frac{75}{x} = 0. \)

4.7.83 Observe that \( \lim_{x \to \infty} \frac{2x^3 - x^2 + 1}{5x^3 + 2x} = \frac{2}{5} \) by Theorem 2.7. We can also use l’Hôpital’s rule:

\[
\lim_{x \to \infty} \frac{2x^3 - x^2 + 1}{5x^3 + 2x} = \lim_{x \to \infty} \frac{6x^2 - 2x}{15x^2 + 2} = \lim_{x \to \infty} \frac{12x - 2}{30x} = \lim_{x \to \infty} \frac{12}{30} = \frac{2}{5}.
\]

4.7.84 By l’Hôpital’s rule, \( \lim_{x \to a} \frac{\sqrt{2ax - x^4} - a\sqrt{a^3}}{x - a} = \lim_{x \to a} \frac{2a^3 - 4ax^3 - 3a^5/3x^{-2/3}}{-2a^{1/4}x^{-1/4} - \frac{2}{3}a^{1/4}x^{-2/3}} = -\frac{a}{3} = \frac{16}{9}a. \)

4.7.85 By l’Hôpital’s rule, \( \lim_{x \to 0} \frac{5x + 2}{x^2 - 4} = \lim_{x \to 0} \frac{5x + 2}{-x} = -\frac{9}{4}. \)

4.7.86 Note that \( \tan \frac{3t}{\sec 5t} = \sin 3t \cdot \cos 5t \); we have \( \lim_{x \to \pi/2} \sin 3t = \sin 3\pi/2 = -1 \), and \( \lim_{x \to \pi/2} \cos 3t = 1 \), so \( \lim_{x \to \pi/2} \tan 3t = \frac{5}{3} \) by l’Hôpital’s rule. Therefore \( \lim_{x \to \pi/2} \frac{\tan 3t}{\sec 5t} = \frac{5}{3}. \)

4.7.87 Observe that \( \sqrt{x - 2} - \sqrt{x - 4} = \frac{x - 2 - (x - 4)}{\sqrt{x - 2} + \sqrt{x - 4}} = \frac{2}{\sqrt{x - 2} + \sqrt{x - 4}} \), so

\[
\lim_{x \to \infty} \sqrt{x - 2} - \sqrt{x - 4} = \lim_{x \to \infty} \frac{2}{\sqrt{x - 2} + \sqrt{x - 4}} = 0.
\]

4.7.88 Note that \( \lim_{x \to \pi/2} \frac{\pi - 2x}{\tan x} = \lim_{x \to \pi/2} \frac{\pi - 2x}{\cos x} \); we have \( \lim_{x \to \pi/2} \frac{\pi - 2x}{\cos x} = 2 \), so \( \lim_{x \to \pi/2} \frac{\pi - 2x}{\cos x} = 2. \)

4.7.89 Make the substitution \( t = 1/x \); then \( \lim_{x \to \infty} x^3 \left( 1 - \sin \frac{1}{x} \right) = \lim_{t \to 0^+} \frac{t - \sin t}{t^3} = \lim_{t \to 0^+} \frac{1 - \cos t}{3t^2} = \lim_{t \to 0^+} \frac{\sin t}{6t} = \frac{1}{6} \), using l’Hôpital’s rule.

4.7.90 Make the substitution \( t = 1/x \); then \( \lim_{x \to \infty} (x^2 e^{1/x} - x^2 - 1) = \lim_{t \to 0^+} \frac{e^t - 1 - t}{t^2} = \lim_{t \to 0^+} \frac{e^t - 1}{2t} = \lim_{t \to 0^+} \frac{e^t}{2} = \frac{1}{2} \), using l’Hôpital’s rule.

4.7.91 Observe that \( \lim_{x \to 1^+} \left( \frac{1}{x - 1} - \frac{1}{\sqrt{x - 1}} \right) = \lim_{x \to 1^+} \frac{1 - \sqrt{x - 1}}{x - 1} = \frac{1}{0} = \infty. \)
4.7.92 Observe that \( \lim_{x \to 0^+} x^{\ln x} = \lim_{x \to 0^+} \left( \frac{1}{x} \right)^{-\ln x} = \infty^{\infty} = \infty. \)

4.7.93 Note that \( \log_2 x = \ln x/\ln 2 \) and \( \log_3 x = \ln x/\ln 3 \); therefore \( \lim_{x \to \infty} \frac{\log_2 x}{\log_3 x} = \frac{\ln 3}{\ln 2}. \)

4.7.94 Note that \( \log_2 x = \ln x/\ln 2 \) and \( \log_3 x = \ln x/\ln 3 \); therefore
\[
\lim_{x \to \infty} (\log_2 x - \log_3 x) = \lim_{x \to \infty} \left( \frac{1}{\ln 2} - \frac{1}{\ln 3} \right) \ln x = \infty.
\]

4.7.95 Use the identity \( 1 + 2 + \cdots + n = \frac{n(n+1)}{2} \); then
\[
\lim_{n \to \infty} \frac{1 + 2 + \cdots + n}{n^2} = \lim_{n \to \infty} \frac{n(n+1)}{2n^2} = \lim_{n \to \infty} \frac{n+1}{2n} = \frac{1}{2}.
\]

4.7.96 Note that
\[
\ln \left( \frac{\sin x}{x} \right)^{1/x^2} = \frac{\ln \sin x - \ln x}{x^2},
\]
so we evaluate
\[
L = \lim_{x \to 0} \frac{\ln \sin x - \ln x}{x^2} = \lim_{x \to 0} \frac{\cos x}{\sin x} - \frac{1}{2x} = \lim_{x \to 0} \frac{x \cos x - \sin x}{2x^2 \sin x}
\]
by l’Hôpital’s rule. Next, observe that
\[
\lim_{x \to 0} \frac{x \cos x - \sin x}{2x^2 \sin x} = \lim_{x \to 0} \frac{\cos x - x \sin x - \cos x}{4x \sin x + 2x^2 \cos x} = \lim_{x \to 0} \frac{-\sin x}{2 \sin x + 2 \cos x} = \frac{1}{6}
\]
using l’Hôpital’s rule and \( \lim \sin x/x = 1 \). Therefore \( \lim_{x \to 0} \left( \frac{\sin x}{x} \right)^{1/x^2} = e^L = e^{-1/6}. \)

4.7.97 a. Approximately 3.43 x 10^{15}.

b. Approximately 3536.

c. We can explicitly solve for \( x \) in this case: \( x^{x/100} = e^x \Rightarrow x^{1/100} = e \Rightarrow x = e^{100}. \)

d. Approximately 163.

4.7.98 Note that \( \ln(1 + ax)^{b/x} = \frac{b \ln(1 + ax)}{x} \); so we evaluate
\[
L = \lim_{x \to 0} \frac{b \ln(1 + ax)}{x} = b \lim_{x \to 0} \frac{\frac{a}{1+ax}}{1} = ab
\]
by l’Hôpital’s rule. Therefore \( \lim_{x \to 0} (1 + ax)^{b/x} = e^L = e^{ab}. \)

4.7.99 Note that \( \ln(a^x - b^x) = x \ln(a^x - b^x) \), so we evaluate
\[
L = \lim_{x \to 0^+} x \ln(a^x - b^x) = \lim_{x \to 0^+} \frac{\ln(a^x - b^x)}{1/x} = \lim_{x \to 0^+} -x^2 \left( \frac{(\ln a)a^x - (\ln b)b^x}{a^x - b^x} \right)
\]
by l’Hôpital’s rule. We have \( \lim_{x \to 0^+} -x^2 \left( \frac{(\ln a)a^x - (\ln b)b^x}{a^x - b^x} \right) = - \lim_{x \to 0^+} x \left( \frac{(\ln a)a^x - (\ln b)b^x}{a^x - b^x} \right) = 1 \) and one more application of l’Hôpital’s rule gives \( \lim_{x \to 0^+} \frac{\ln(a^x - b^x)}{a^x - b^x} = \frac{1}{a^x - b^x} \) and therefore \( \lim_{x \to 0^+} (a^x - b^x)^x = e^L = 1. \)
4.7.100 We have $\lim_{x \to 0} (a^x - b^x)^{1/x} = 0^\infty = 0$.

4.7.101 Apply l’Hôpital’s rule: $\lim_{x \to 0} \frac{a^x - b^x}{x} = \lim_{x \to 0} \frac{(\ln a)a^x - (\ln b)b^x}{1} = \ln a - \ln b$.

4.7.102 Observe that

$$\lim_{x \to 0} \frac{\sin(N\delta/2)}{\sin(\delta/2)} = \left( \lim_{x \to 0} \frac{\sin(N\delta/2)}{\sin(\delta/2)} \right)^2,$$

and

$$\lim_{x \to 0} \frac{\sin(N\delta/2)}{\sin(\delta/2)} = \lim_{x \to 0} \frac{(N/2) \cos(N\delta/2)}{(1/2) \cos(\delta/2)} = \pm N,$$

so $\lim_{x \to 0} \frac{\sin^2(N\delta/2)}{\sin^2(\delta/2)} = N^2$.

4.7.103

a. After each year the balance increases by the factor $1 + r$; therefore the balance after $t$ years is $B(t) = P(1 + r)^t$.

b. Observe that

$$\lim_{m \to \infty} (1 + r/m)^m = \lim_{m \to \infty} \left(1 + \frac{1}{m/r}\right)^{m/r} = e^r,$$

because $\lim_{n \to \infty} \left(1 + \frac{1}{n}\right)^n = e$. So with continuous compounding the balance after $t$ years is $B(t) = Pe^{rt}$.

4.7.104 Note that $\sqrt{n} \log_2 n << n \log_2 n << n(\log_2 n)^2 << n^{3/2}$. For the last relation, we note that $n^{3/2}/n(\log_2 n)^2 = n^{1/2}/(\log_2 n)^2 \to \infty$ as $n \to \infty$. Therefore the ranking in order of least to most efficient is A, C, B, D.

4.7.105 L’Hôpital’s rule gives

$$\lim_{x \to \infty} \frac{\sqrt{ax + b}}{\sqrt{cx + d}} = \lim_{x \to \infty} \frac{a}{c} \frac{\sqrt{ax + b}}{\sqrt{cx + d}} = \frac{a}{c} \lim_{x \to \infty} \frac{\sqrt{ax + b}}{\sqrt{cx + d}},$$

which is the same form as the original limit, so l’Hôpital’s rule fails in this case. We can evaluate this limit as follows:

first observe that $\lim_{x \to \infty} \frac{ax + b}{cx + d} = \frac{a}{c}$ by l’Hôpital’s rule; therefore $\lim_{x \to \infty} \frac{\sqrt{ax + b}}{\sqrt{cx + d}} = \lim_{x \to \infty} \sqrt{\frac{ax + b}{cx + d}} = \sqrt{\frac{a}{c}}$.

4.7.106 Observe that

$$(ax - \sqrt{a^2x^2 - bx}) \cdot \frac{ax + \sqrt{a^2x^2 - bx}}{ax + \sqrt{a^2x^2 - bx}} = \frac{bx}{(ax + \sqrt{a^2x^2 - bx})} = \frac{b}{(a + \sqrt{a^2 - b/x})},$$

so $\lim_{x \to \infty} (ax - \sqrt{a^2x^2 - bx}) = \frac{b}{2a}$.

4.7.107 Let $t = b^x$, as in Example 8; then $x = \ln t/\ln b$ and we have $\lim_{x \to \infty} \frac{x^p}{t^{-1/\ln b}} = \lim_{x \to \infty} \frac{\ln t}{t^{-1/\ln b}} = 0$, by Theorem 4.15.

4.7.108 Observe that $\lim_{x \to \infty} \frac{a^x}{b^x} = \lim_{x \to \infty} \left(\frac{a}{b}\right)^x = \infty$, because $a/b > 1$.

4.7.109 Note that $\log_a t = \ln t/\ln a$, so $\frac{\log_a x}{\log_b x} = \frac{\ln x}{\ln a}$, and therefore $\log_a x$ and $\log_b x$ grow at a comparable rate as $x \to \infty$.

4.7.110 We have $b^n << n! << n^n$ as $n \to \infty$ for any $b > 1$. To see this, observe that $\lim_{n \to \infty} \frac{n!}{b^n} = \lim_{n \to \infty} \sqrt{2\pi n} \frac{n^n}{(be)^n} = \infty$ and $\lim_{n \to \infty} \frac{n!}{n^n} = \lim_{n \to \infty} \frac{\sqrt{2\pi n}}{e^n} = 0$, by Theorem 4.15.
4.7.111 The triangle $ABP$ has base $1 - \cos \theta$ and height $\sin \theta$, so its area is $f(\theta) = \frac{1}{2} \sin \theta (1 - \cos \theta)$. The sector $OBP$ has area $\frac{\theta}{2}$, and the triangle $OBP$ has base 1 and height $\sin \theta$; therefore $g(\theta) = \frac{1}{2} (\theta - \sin \theta)$. We have

$$
\lim_{\theta \to 0} \frac{g(\theta)}{f(\theta)} = \lim_{\theta \to 0} \frac{\theta - \sin \theta}{\sin \theta (1 - \cos \theta)} = \lim_{\theta \to 0} \frac{\theta - \sin \theta}{\sin \theta - (1/2) \sin 2\theta}.
$$

Three applications of l'Hôpital's rule gives

$$
\lim_{\theta \to 0} \frac{g(\theta)}{f(\theta)} = \lim_{\theta \to 0} \frac{1 - \cos \theta}{\cos \theta - \cos 2\theta} = \frac{1}{3}.
$$

4.7.112

a. 

![Graph 1](#)

$a = \frac{1}{2}, b = 2, c = 3$

![Graph 2](#)

$a = \frac{1}{4}, b = 4, c = 12$

![Graph 3](#)

$a = \frac{1}{4}, b = 12, c = 4$

b. Note that $\ln f(x) = \frac{\ln(ab^x + (1-a)c^x)}{x}$; l'Hôpital's rule gives

$$
L = \lim_{x \to 0} \frac{\ln(ab^x + (1-a)c^x)}{x} = \lim_{x \to 0} \frac{a(b-a)c^x + (1-a)(\ln c)c^x}{ab^x + (1-a)c^x} = a \ln b + (1-a) \ln c,
$$

and therefore

$$
\lim_{x \to 0} (ab^x + (1-a)c^x)^{1/x} = e^L = b^a c^{1-a}.
$$

c. Note that $\ln f(x) = \frac{\ln(ab^x + (1-a)c^x)}{x}$; l'Hôpital's rule gives

$$
L = \lim_{x \to \infty} \frac{\ln(ab^x + (1-a)c^x)}{x} = \lim_{x \to \infty} \frac{a(b-a)c^x + (1-a)(\ln c)c^x}{ab^x + (1-a)c^x}.
$$

Assume $c < b$. Then we have

$$
\lim_{x \to \infty} \frac{a(b-a)c^x + (1-a)(\ln c)c^x}{ab^x + (1-a)c^x} = \frac{1}{b^x}, \quad \lim_{x \to \infty} \frac{a(b-a)c^x + (1-a)(\ln c)c^x}{ab^x + (1-a)c^x} = \ln b.
$$

Then $\lim_{x \to \infty} f(x) = b = \max\{c, b\}$. Similarly, if $b < c$, we have

$$
\lim_{x \to \infty} \frac{a(b-a)c^x + (1-a)(\ln c)c^x}{ab^x + (1-a)c^x} = \frac{1}{c^x}, \quad \lim_{x \to \infty} \frac{a(b-a)c^x + (1-a)(\ln c)c^x}{ab^x + (1-a)c^x} = \ln c.
$$

Then $\lim_{x \to \infty} f(x) = c = \max\{c, b\}$.

Now consider the case $c > b$ as $x \to -\infty$.

$$
\lim_{x \to -\infty} \frac{a(b-a)c^x + (1-a)(\ln c)c^x}{ab^x + (1-a)c^x} = \frac{1}{b^x}, \quad \lim_{x \to -\infty} \frac{a(b-a)c^x + (1-a)(\ln c)c^x}{ab^x + (1-a)c^x} = \ln b.
$$

Then $\lim_{x \to -\infty} f(x) = b = \min\{c, b\}$.

Finally if $b > c$, we have

$$
\lim_{x \to -\infty} \frac{a(b-a)c^x + (1-a)(\ln c)c^x}{ab^x + (1-a)c^x} = \frac{1}{c^x}, \quad \lim_{x \to -\infty} \frac{a(b-a)c^x + (1-a)(\ln c)c^x}{ab^x + (1-a)c^x} = \ln c.
$$

Then $\lim_{x \to -\infty} f(x) = c = \min\{c, b\}$. 

Copyright © 2014 Pearson Education, Inc.
d. The inflection point occurs at \( x = 0 \) in all cases.

4.7.113 Note that \( \ln \left(1 + \frac{a}{x}\right)^x = \frac{\ln(1 + a/x)}{1/x} \) so we evaluate \( L = \lim_{x \to \infty} \frac{\ln(1 + a/x)}{1/x} = \lim_{x \to \infty} \frac{1}{1 + a/x} \cdot \frac{a}{x^2} \).

4.7.114 Because \( x \to \infty \), eventually \( x > 2b \). Then \( b^x > \left(\frac{2b}{e}\right)^x = 2^x \to \infty \) as \( x \to \infty \), so \( x^x \) grows faster than \( b^x \) as \( x \to \infty \).

4.7.115

a. Observe that \( \lim_{x \to \infty} \frac{b^x}{e^x} = \lim_{x \to \infty} \left(\frac{b}{e}\right)^x \). This limit is \( \infty \) exactly when \( b > e \).

b. Observe that \( \lim_{x \to \infty} \frac{e^{ax}}{e^x} = \lim_{x \to \infty} e^{(a-1)x} \). If \( 0 < a < 1 \), then \( a - 1 < 0 \), so that this limit is \( 0 \). If \( a = 1 \), then \( a - 1 = 0 \), so that the limit is \( 1 \). Finally, if \( a > 1 \), then \( a - 1 > 0 \) and the limit is infinite.

4.8 Newton’s Method

4.8.1 Newton’s method generates a sequence of \( x \)-intercepts of lines tangent to the graph of \( f \) to approximate the roots of \( f \).

4.8.2 To get the \( x_{n+1} \) iterate from \( x_n \), one puts \( x_n \) into the recursive formula and computes \( x_{n+1} \). Thus, starting with \( x_0 \), a sequence \( x_0, x_1, x_2, x_3, \ldots \) is generated.

4.8.3 Generally, if two successive Newton approximations agree in their first \( p \) digits, then those approximations have \( p \) digits of accuracy. The method is terminated when the desired accuracy is reached.

4.8.4 Because \( f'(x_n) = 2x_n \), we have

\[
x_{n+1} = x_n - \frac{x_n^2 - 5}{2x_n} = \frac{2x_n^2 - x_n^2 + 5}{2x_n} = \frac{x_n^2 + 5}{2x_n}.
\]

4.8.5 Because \( f'(x_n) = 2x_n \), we have

\[
x_{n+1} = x_n - \frac{x_n^2 - 6}{2x_n} = \frac{2x_n^2 - x_n^2 + 6}{2x_n} = \frac{x_n^2 + 6}{2x_n}.
\]

\( x_1 = 2.5 \) and \( x_2 = 2.45 \).

4.8.6 Because \( f'(x_n) = 2x_n - 2 \), we have

\[
x_{n+1} = x_n - \frac{x_n^2 - 2x_n - 3}{2x_n - 2} = \frac{2x_n^2 - 2x_n - (x_n^2 - 2x_n - 3)}{2x_n - 2} = \frac{x_n^2 + 3}{2x_n - 2}.
\]

\( x_1 = 3.5 \) and \( x_2 = 3.05 \).

4.8.7 Because \( f'(x_n) = -e^{-x_n} - 1 \), we have

\[
x_{n+1} = x_n - \frac{e^{-x_n} - x_n}{-e^{-x_n} - 1} = \frac{(-e^{-x_n} - 1)x_n - (e^{-x_n} - x_n)}{-e^{-x_n} - 1} = \frac{-e^{-x_n}x_n - e^{-x_n}}{-e^{-x_n} - 1} = \frac{x_n + 1}{e^{x_n} + 1}.
\]

\( x_1 = 0.564 \) and \( x_2 = 0.567 \).

4.8.8 Because \( f'(x_n) = 3x_n^2 \), we have

\[
x_{n+1} = x_n - \frac{x_n^3 - 2}{3x_n^2} = \frac{3x_n^3 - (x_n^3 - 2)}{3x_n^2} = \frac{2x_n^3 + 2}{3x_n^2}.
\]

\( x_1 = 1.5 \) and \( x_2 = 1.296 \).
4.8.9 Because $f'(x_n) = 2x_n$, we have

$$x_{n+1} = x_n - \frac{x_n^2 - 10}{2x_n} = \frac{2x_n^2 - (x_n^2 - 10)}{2x_n} = \frac{x_n^2 + 10}{2x_n}.$$

4.8.10 Because $f'(x_n) = 3x_n^2 + 2x_n$, we have

$$x_{n+1} = x_n - \frac{x_n^3 + x_n^2 + 1}{3x_n^2 + 2x_n} = \frac{x_n(3x_n^2 + 2x_n) - (x_n^3 + x_n^2 + 1)}{3x_n^2 + 2x_n} = \frac{2x_n^3 + x_n^2 - 1}{3x_n^2 + 2x_n}.$$ 

<table>
<thead>
<tr>

</tbody>
</table>

4.8.11 Because $f'(x_n) = \cos x_n + 1$, we have

$$x_{n+1} = x_n - \frac{\sin x_n + x_n - 1}{\cos x_n + 1}.$$ 

Copyright © 2014 Pearson Education, Inc.
Because \( f'(x_n) = e^{x_n} \), we have

\[
x_{n+1} = x_n - \frac{e^{x_n} - 5}{e^{x_n}} = x_n + 5e^{-x_n} - 1.
\]

Because \( f'(x_n) = \sec^2(x_n) - 2 \), we have

\[
x_{n+1} = x_n - \frac{\tan x_n - 2x_n}{\sec^2(x_n) - 2}.
\]
4.8.14 Because $f'(x_n) = \frac{1}{x_n + 1}$, we have

$$x_{n+1} = x_n - (\ln(x_n + 1) - 1)(x_n + 1) = 1 + 2x_n - (x_n + 1)\ln(x_n + 1).$$

4.8.15 Let $f(x) = \sin x - \frac{x}{2}$; we wish to find the roots of $f(x)$. Note that $f$ is an odd function (and that $x = 0$ is a root). Thus it suffices to find the positive roots. A preliminary sketch of the two curves seems to indicate that they intersect only near $x = 2$ for positive $x$. The Newton’s method formula becomes

$$x_{n+1} = x_n - \frac{\sin x_n - x_n/2}{\cos x_n - 1/2}.$$

If we use an initial estimate of $x_0 = 2$, we obtain $x_1 = 1.901, x_2 = 1.89551, x_3 = 1.89549, and x_4 = 1.89549$, so the point of intersection appears to be at approximately $x = 1.895$. Thus the three points of intersection are $x \approx \pm 1.895$ and $x = 0$.

4.8.16 A preliminary sketch of the two curves seems to indicate that they intersect once near $x = 2$. Let $f(x) = e^x - x^3$. Then $f'(x_n) = e^{x_n} - 3x_n^2$. The Newton’s method formula becomes

$$x_{n+1} = x_n - \frac{e^{x_n} - x_n^3}{e^{x_n} - 3x_n^2}.$$

If we use an initial estimate of $x_0 = 2$, we obtain $x_1 = 1.8675, x_2 = 1.85725, x_3 = 1.85718$, so the point of intersection appears to be at approximately $x = 1.857$. 

Copyright © 2014 Pearson Education, Inc.
4.8.17 A preliminary sketch of the two curves seems to indicate that they intersect three times, once between 
−2.5 and −2, once between 0 and $\frac{1}{2}$, and once between $\frac{3}{2}$ and 2. 
Let $f(x) = 4 - x^2 - \frac{1}{x}$. Then $f'(x_n) = -2x_n + \frac{1}{x_n^2}$. The Newton’s method formula becomes 

$$x_{n+1} = x_n - \frac{4 - x_n^2 - (1/x_n)}{-2x_n + (1/x_n^2)}.$$ 

If we use an initial estimate of $x_0 = -2.25$, we obtain $x_1 = -2.11843$, $x_2 = -2.11491$, $x_3 = -2.11491$, so 
there appears to be a point of intersection near $x = -2.115$. If we use an initial estimate of $x_0 = 0.25$, we 
obtain $x_1 = 0.254032$, $x_2 = 0.254102$, so there appears to be a point of intersection near $x = 0.254$. 
If we use an initial estimate of $x_0 = 1.75$, we obtain $x_1 = 1.86535$, $x_2 = 1.86081$, so there appears to be 
another point of intersection near $x = 1.861$.

4.8.18 A preliminary sketch of the two curves seems to indicate that they intersect once, near $x = 1.5$. 
Let $f(x) = x^3 - (x^2 + 1)$. Then $f'(x_n) = 3x_n^2 - 2x_n$. The Newton’s method formula becomes 

$$x_{n+1} = x_n - \frac{x_n^3 - x_n^2 - 1}{3x_n^2 - 2x_n}.$$ 

If we use an initial estimate of $x_0 = 1.5$, we obtain $x_1 = 1.46667$, $x_2 = 1.46557$, $x_3 = 1.46557$, so 
there appears to be a point of intersection near $x = 1.466$.

4.8.19 A preliminary sketch of the two curves seems to indicate that they intersect twice, once just to the 
right of 0, and once between 2 and 2.5. 
Let $f(x) = 4\sqrt{x} - (x^2 + 1)$. Then $f'(x_n) = \frac{2}{2\sqrt{x_n}} - 2x_n$. The Newton’s method formula becomes 

$$x_{n+1} = x_n - \frac{4\sqrt{x_n} - (x_n^2 + 1)}{2/\sqrt{x_n} - 2x_n}.$$ 

If we use an initial estimate of $x_0 = 0.1$, we obtain $x_1 = 0.0583788$, $x_2 = 0.0629053$, $x_3 = 0.0629971$, so 
there appears to be a point of intersection near $x = 0.0630$. 
If we use an initial estimate of $x_0 = 2.25$, we obtain $x_1 = 2.23026$, $x_2 = 2.23012$, $x_3 = 2.23012$, so there 
appears to be a point of intersection near $x = 2.230$.

4.8.20 A preliminary sketch of the two curves seems to indicate that they intersect twice, once just to the 
right of 0, and once between 1 and 1.5. Let $f(x) = \ln x - (x^3 - 2)$. Then $f'(x_n) = \frac{1}{x_n} - 3x_n^2$. The Newton’s 
method formula becomes 

$$x_{n+1} = x_n - \frac{\ln x_n - (x_n^3 - 2)}{1/x_n - 3x_n^2}.$$ 

If we use an initial estimate of $x_0 = 0.1$, we obtain $x_1 = 0.13045$, $x_2 = 0.13557$, $x_3 = 0.135674$, so there 
appears to be a point of intersection near $x = 0.136$. 
If we use an initial estimate of $x_0 = 1.4$, we obtain $x_1 = 1.32111$, $x_2 = 1.31501$, $x_3 = 1.31498$, and 
x_4 = 1.31498 so there appears to be a point of intersection near $x = 1.315$.

4.8.21 $f'(x) = \frac{-x \sin x - \cos x}{x^2}$, which is zero when $x \sin x + \cos x = 0$. Note that $f'(1) < 0$ and $f'(\pi) > 0$, 
so there must be a local minimum on the interval $(1, \pi)$. Let $g(x) = x \sin x + \cos x$. Then $g'(x_n) = 
\sin x_n + x_n \cos x_n - \sin x_n = x_n \cos x_n$, and the Newton’s method formula becomes 

$$x_{n+1} = x_n - \frac{x_n \sin x_n + \cos x_n}{x_n \cos x_n}.$$ 

If we use an initial estimate of $x_0 = 2.5$, we obtain $x_1 = 2.84702$, $x_2 = 2.79918$, $x_3 = 2.79839$, $x_4 = 2.79839$, 
so the smallest local minimum of $f$ on $(0, \infty)$ occurs at approximately 2.798.

4.8.22 $f'(x) = 12x^3 + 24x^2 + 24x + 48 = 12(x^3 + 2x^2 + 2x + 4)$. We are seeking values of $x$ so that 
x^3 + 2x^2 + 2x + 4 = 0. Using Newton’s method with an initial estimate of $-1.5$, we obtain $x_1 = -2.27273$, 
x_2 = -2.04023, $x_3 = -2.00104$, and $x_4 \approx -2$. We realize that $x = -2$ is a root of $f'(x)$. Using long division 
(by $x + 2$), we see that $f'(x) = 12(x + 2)(x^2 + 2)$, so $f'(x)$ has only the one root of $-2$. 
Note that $f'(-3) < 0$ and $f'(0) > 0$, so there is a local (in fact, absolute) minimum at $x = -2$. 

Copyright © 2014 Pearson Education, Inc.
4.8.25 The recursion for $f(x)$ is $x_{n+1} = x_n - \frac{(x_n^2 - 2x_n - x_n - 2x_n + 1)}{2x_n^2 - 2x_n - 2} = \frac{x_n^2 - 1}{2(x_n - 1)} - \frac{x_n + 1}{2}$. The recursion for $g(x)$ is $y_{n+1} = y_n - \frac{y_n^2 - 1}{2y_n} = \frac{2y_n^2 - (y_n^2 - 1)}{2y_n} = \frac{y_n^2 + 1}{2y_n}$. The comparison below shows that Newton’s method converges much faster for $g(x) = x^2 - 1$. This is because it is steeper near the root $x = 1$ – the value of $g'(1) = 2$, while $f'(1) = 0$. The flatness of $f$ near 1 due to the double root there causes slow convergence.

4.8.26 The Newton’s method recursion is given by

$$x_{n+1} = x_n - \frac{x_n^5 - 4x_n^4 + x_n^3 - 10x_n^2 - 4x_n + 8}{5x_n^4 + 16x_n^3 + 3x_n^2 - 20x_n - 4}.$$
The initial estimate of \(-0.2\) doesn’t work because that number is a root of \(f'(x)\). The others converge, with the initial values near \(x = 1\) converging faster because the function is steeper near \(x = 1\) than it is near \(x = -2\).

4.8.27
a. True.

b. False. The quadratic formula gives exact values.

c. False. It sometime fails depending on factors such as the shape of the curve and the closeness of the initial estimate.

4.8.28 Let \(g(x) = 5 - x^2 - x\). Fixed points of \(f\) are roots of \(g\). Because this is a quadratic, we can find the roots of \(g\) directly with the quadratic formula. The roots are
\[
\frac{1 \pm \sqrt{1 - (4)(-1)(5)}}{-2} = \frac{-1}{2} \pm \frac{\sqrt{21}}{2}.
\]
Thus the fixed points of \(f\) are approximately \(-2.791\) and \(1.791\).

4.8.29 Let \(g(x) = \frac{x^3}{10} + 1 - x\). Fixed points of \(f\) are roots of \(g\). The Newton’s method recursion for \(g\) is given by
\[
x_{n+1} = x_n - \frac{x_n^3/10 + 1 - x_n}{3x_n^2/10 - 1} = x_n - \frac{x_n^3 + 10 - 10x_n}{3x_n^2 - 10} = \frac{2(x_n^3 - 5)}{3x_n^2 - 10}.
\]
A preliminary sketch of \(g\) indicates that there are three roots, near \(-3.5\), \(1\), and \(2.5\).

<table>

</tbody>
</table>

The roots are approximately $-0.335$ and 1.333.

4.8.34 A preliminary sketch of $f$ indicates that there are two roots on $[0, 8]$, near $x = 6.1$ and $x = 6.9$.

The Newton’s method recursion for $f$ is given by

$$x_{n+1} = x_n - \frac{x_n/6 - \sec x_n}{1/6 - \sec x_n \tan x_n}$$

We have:
The roots are approximately 6.101 and 6.763.

**4.8.35** A preliminary sketch of \( f \) indicates that the only root is somewhere just to the right of \( x = 0 \), so we’ll use \( x = 0 \) as our initial guess. The Newton’s method recursion for \( f \) is given by

\[
x_{n+1} = x_n - \frac{e^{-x_n} - (x_n + 4)/5}{-e^{-x_n} - 1/5}.
\]

We have:

\[
\begin{array}{c|c}
 n & x_n \\
 0 & 6.1 \\
 1 & 6.10098 \\
 2 & 6.10099 \\
 3 & 6.10099 \\
 4 & 6.7627 \\
\end{array}
\]

The root is \( x \approx 6.763 \).

**4.8.36** A preliminary sketch of \( f \) indicates that there are three roots, near \( x = -1 \), \( x = -0.7 \) and \( x = 1.2 \). In fact, \( -1 \) is a root because \( f(-1) = (-\frac{1}{5}) - (-\frac{1}{4}) - \frac{1}{20} = 0 \).

The Newton’s method recursion for \( f \) is given by

\[
x_{n+1} = x_n - \frac{x^5_n/5 - x^3_n/4 - 1/20}{x^4_n - 3x^2_n/4}.
\]

We have:

\[
\begin{array}{c|c}
 n & x_n \\
 0 & -0.7 \\
 1 & -0.683234 \\
 2 & -0.683551 \\
 3 & -0.683551 \\
 4 & 1.18355 \\
 5 & 1.18355 \\
\end{array}
\]

The roots are \(-1\) and approximately \(-0.684\) and \(1.184\).

**4.8.37** A preliminary sketch of \( f \) indicates that there are two roots, near \( x = 0.5 \) and near \( x = 3 \).

The Newton’s method recursion for \( f \) is given by

\[
x_{n+1} = x_n - \frac{\ln x_n - x^2_n + 3x_n - 1}{(1/x_n) - 2x_n + 3}.
\]

We have:
4.8. NEWTON’S METHOD

The roots are approximately 0.621 and 3.036.

4.8.38 A preliminary sketch of $f$ indicates that there are three roots, two near $x = 0$ and one near $x = 100$. To avoid division by 0, we use initial estimates of $x_0 = \pm 0.1$ and $x_0 = 100$. The Newton’s method recursion for $f$ is given by

$$x_{n+1} = x_n - \frac{x_n^3 - 100x_n^2 + 1}{3x_n^2 - 200x_n}.$$  

We have:

\[
\begin{array}{c|c}
  n & x_n \\
  \hline
  0 & -0.1 \\
  1 & -0.099501 \\
  2 & -0.0999501 \\
\end{array}
\]

\[
\begin{array}{c|c}
  n & x_n \\
  \hline
  0 & 0.1 \\
  1 & 0.10005 \\
  2 & 0.10005 \\
\end{array}
\]

\[
\begin{array}{c|c}
  n & x_n \\
  \hline
  0 & 100 \\
  1 & 99.9999 \\
  2 & 99.9999 \\
\end{array}
\]

The roots are approximately $\pm 0.100$ and 100.000.

4.8.39

Because the residuals become small quickly, the convergence of $x_n$ is quite slow. This is related to the extreme flatness of the graph of $x^{10}$ between 0 and $\frac{1}{2}$.

\[
\begin{array}{c|c|c|c}
  n & x_n & Error & Residual \\
  \hline
  0 & 0.5 & 0.5 & 9.8 \times 10^{-4} \\
  1 & 0.45 & 0.45 & 3.4 \times 10^{-4} \\
  2 & 0.405 & 0.405 & 1.2 \times 10^{-4} \\
  3 & 0.3645 & 0.3645 & 4.1 \times 10^{-5} \\
  4 & 0.32805 & 0.32805 & 1.4 \times 10^{-4} \\
  5 & 0.295245 & 0.295245 & 5.0 \times 10^{-6} \\
  6 & 0.265721 & 0.265721 & 1.8 \times 10^{-6} \\
  7 & 0.239148 & 0.239148 & 6.1 \times 10^{-7} \\
  8 & 0.215234 & 0.215234 & 2.1 \times 10^{-7} \\
  9 & 0.19371 & 0.19371 & 7.4 \times 10^{-8} \\
  10 & 0.174339 & 0.174339 & 2.6 \times 10^{-8} \\
\end{array}
\]

4.8.40 The graphs of $y = \sin x$ together with $y = \frac{x}{a}$ for $a = 2$, $a = 9$, and $a$ such that there are precisely two points of intersection are shown below:

Copyright © 2014 Pearson Education, Inc.
We want to find a point \((b, \sin b)\) on the graph of \(y = \sin x\) such that the line joining \((0, 0)\) and \((b, \sin b)\) is tangent to \(y = \sin x\) at \((b, \sin b)\). Comparing slopes gives \(\frac{\sin b}{b} = \cos b\), or \(b - \tan b = 0\). This equation has a root \(b \approx 7.725\). Then the slope of the line is \(\frac{1}{a} = \frac{\sin b}{b} = \cos b\), so that \(a = \sec b \approx 7.775\).

4.8.41 The graphs of \(y = x\) together with \(y = e^{x/a}\) for \(a = 1\), \(a = 3\), and \(a\) such that there is precisely one point of intersection are shown below:

We want to find a point \((b, b)\) on the graph of \(y = e^{x/a}\) where the slope is 1. Hence we need \(b = e^{b/a}\) and \(1 = \frac{1}{a} e^{b/a}\). Dividing these equations gives \(b = a\) and thus \(a = e^{a/a} = e\).

4.8.42

a. If \(r\) is a root of \(x^2 - a\), then \(r^2 - a = 0\), so \(r^2 = a\), and \(|r| = \sqrt{a}\), so either \(r = \sqrt{a}\) or \(r = -\sqrt{a}\). If we also insist that \(r > 0\), then \(r = \sqrt{a}\).

b. The Newton’s method recursion is
\[
x_{n+1} = x_n - \frac{x_n^2 - a}{2x_n} = \frac{2x_n^2 - (x_n^2 - a)}{2x_n} = \frac{x_n^2 + a}{2x_n} = \frac{1}{2} \left( x_n + \frac{a}{x_n} \right).
\]

c. Because \(3^2 = 9 < 13\) and \(4^2 = 16 > 13\), a good starting value for \(\sqrt{13}\) would be a number between 3 and 4 (but closer to 4), like 3.6.

Because \(8^2 = 64 < 73\) and \(9^2 = 81 > 73\), a good starting value for \(\sqrt{73}\) would be a number between 8 and 9, like 8.5.

d. The first chart is for \(\sqrt{13}\) and the second is for \(\sqrt{73}\).

<table>
<thead>
<tr>
<th>(n)</th>
<th>(x_n)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>3.6</td>
</tr>
<tr>
<td>1</td>
<td>3.605555555556</td>
</tr>
<tr>
<td>2</td>
<td>3.6055127547</td>

<tr>
<td>9</td>
<td>8.54400374532</td>
</tr>
<tr>
<td>10</td>
<td>8.54400374532</td>
</tr>
</tbody>
</table>

Thus \(\sqrt{13} \approx 3.606\) and \(\sqrt{73} \approx 8.544\).
4.8.43  

a. The Newton’s method formula would be:

\[ x_{n+1} = x_n - \frac{1}{x_n^2} - \frac{a}{1/x_n^2} = x_n + x_n^2 = 2x_n - ax_n^2 = (2 - ax_n)x_n. \]

b. The approximation to \( \frac{1}{7} \) is 0.143.

<table>
<thead>
<tr>
<th>( n )</th>
<th>( x_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.1</td>
</tr>
<tr>
<td>1</td>
<td>0.13</td>
</tr>
<tr>
<td>2</td>
<td>0.1417</td>
</tr>
<tr>
<td>3</td>
<td>0.14284777</td>
</tr>
<tr>
<td>4</td>
<td>0.14285714</td>
</tr>
<tr>
<td>5</td>
<td>0.14285714</td>
</tr>
</tbody>
</table>

4.8.44  

a. Note that \( f(0) = 0 \), and \( f'(x) = 2e^{2\sin x} \cos x - 2 \), so \( f'(0) = 2e^0 - 2 = 0 \). Also, \( f''(x) = 4e^{2\sin(x)} \cos^2(x) - 2e^{2\sin(x)} \sin(x) \), so \( f''(0) = 4 \neq 0 \). Thus, 0 is a root of multiplicity 2 for \( f \).

b. The first chart is for the traditional Newton’s method, and the second is for the modified version. Clearly, \( x_3 \) for the modified method is much closer to the actual root.

<table>
<thead>
<tr>
<th>( n )</th>
<th>( x_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.1</td>
</tr>
<tr>
<td>1</td>
<td>0.0511487</td>
</tr>
<tr>
<td>2</td>
<td>0.0258883</td>
</tr>
<tr>
<td>3</td>
<td>0.0130263</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>( n )</th>
<th>( x_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.1</td>
</tr>
<tr>
<td>1</td>
<td>0.00022974</td>
</tr>
<tr>
<td>2</td>
<td>0.00000131725</td>
</tr>
<tr>
<td>3</td>
<td>(-3.074 \times 10^{-11})</td>
</tr>
</tbody>
</table>

c. In example 4, the value of \( x_3 \) was 0.0171665. For the modified version, we obtain:

<table>
<thead>
<tr>
<th>( n )</th>
<th>( x_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.15</td>
</tr>
<tr>
<td>1</td>
<td>(-0.010125)</td>
</tr>
<tr>
<td>2</td>
<td>0.00000311391</td>
</tr>
<tr>
<td>3</td>
<td>(-9.05817 \times 10^{-17})</td>
</tr>
</tbody>
</table>

Clearly the modified version converges much more quickly to the root of multiplicity two at 0.

4.8.45  

a. We are seeking the time \( t \) when first \( y(t) = 2.5e^{-t} \cos 2t \) is zero. This occurs first for \( t = \frac{\pi}{4} \).

b. We are seeking the minimum value for \( y \). We have \( y'(t) = -2.5e^{-t} \cos 2t + 2.5e^{-t}(-2 \sin 2t) = -2.5e^{-t}(\cos 2t + 2 \sin 2t) \). This is zero when \( \cos 2t = -2 \sin 2t \), or \( \tan 2t = -\frac{1}{2} \). Let \( f(t) = \tan 2t + \frac{1}{2} \). If we apply Newton’s method to \( f(t) \) with a starting point of \( t_0 = 1 \), we obtain a root of \( \approx 1.339 \) after five iterations. An application of the First Derivative Test shows that there is a local minimum for \( y \) at this number. The displacement at this time is \( \approx -0.586 \). This local minimum is in fact an absolute minimum.

c. The second time that \( y(t) = 2.5e^{-t} \cos 2t \) is zero is when \( 2t = \frac{3\pi}{4} \), or \( t = 3\pi/4 \).
d. Following our work in part b, we look for a root of \( f(t) = \tan 2t + \frac{1}{t} \) that is bigger than 1.339. From the graph, we are looking near \( t = 3 \). Applying Newton’s method to \( f(t) \) with an initial value of \( x_0 = 3 \) gives a root 2.910 after three iterations. Applying the First Derivative Test, we see that there is a local maximum of 0.122 at \( x = 2.910 \).

4.8.46

\[ b. \quad f'(x) = \frac{x \cos x - \sin x}{x^2}. \] This is zero when \( x \cos x - \sin x = 0 \), or \( x = \tan x \). Let \( g(x) = x - \tan x \). If we apply Newton’s method to \( g \) with a starting value of \( x_0 = 4.5 \), we obtain a root at 4.493 after 2 iterations. The First Derivative Test confirms that there is a local minimum of about -0.217 at \( x = 4.493 \). Applying Newton’s method to \( g \) with a starting value of 7.8 yields the root 7.725 after 5 iterations. The First Derivative Test confirms that there is a local maximum of about 0.128 at \( x = 7.725 \).

4.8.47 Let \( f(\lambda) = \tan(\pi \lambda) - \lambda \). We are looking for the first three positive roots of \( f \). A preliminary sketch indicates that they are located near 1.4, 2.4, and 3.4. The Newton’s method recursion is given by

\[
x_{n+1} = x_n - \frac{\tan(\pi x_n) - x_n}{\frac{\pi}{\sec^2(\pi x_n)} - 1}.
\]

We obtain the following results:

<table>
<thead>
<tr>
<th>( n )</th>
<th>( x_n )</th>
<th>( n )</th>
<th>( x_n )</th>
<th>( n )</th>
<th>( x_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1.4</td>
<td>0</td>
<td>2.4</td>
<td>0</td>
<td>3.4</td>
</tr>
<tr>
<td>1</td>
<td>1.34741</td>
<td>1</td>
<td>2.37876</td>
<td>1</td>
<td>3.4101</td>
</tr>
<tr>
<td>2</td>
<td>1.30555</td>
<td>2</td>
<td>2.37331</td>
<td>2</td>
<td>3.40919</td>
</tr>
<tr>
<td>3</td>
<td>1.29012</td>
<td>3</td>
<td>2.37305</td>
<td>3</td>
<td>3.40918</td>
</tr>
<tr>
<td>4</td>
<td>1.29011</td>
<td>4</td>
<td>2.37305</td>
<td>4</td>
<td>3.40918</td>
</tr>
<tr>
<td>5</td>
<td>1.29011</td>
<td>6</td>
<td>1.29011</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The first three positive eigenvalues are approximately 1.290, 2.373, and 3.410.

4.8.48

a. We are seeking solutions of \( f(x) = ax(1-x) = x \). This can be written as \( ax^2 + x(1-a) = 0 \), or \( x(ax + (1-a)) = 0 \). The solutions of this equation are \( x = 0 \) and \( x = \frac{a-1}{a} \). If \( 0 < a < 1 \), this does not give a value of \( x \) in the range \((0,1)\). If \( 1 \leq a \leq 4 \), we get a fixed point \( x = \frac{a-1}{a} \).

b. \( g(x) = f(f(x)) = f(ax(1-x)) = a(1-x)(1-ax(1-x)) = (a^2x - a^2x^2)(1-ax + ax^2) = a^2x - a^2x^2 - a^3x^2 + a^3x^3 + a^3x^3 - a^3x^4 = a^2x - a^2x^2 - a^3x^2 + 2a^3x^3 - a^3x^4 \). This is a fourth degree polynomial.

c. From left to right, with \( a = 2 \), then \( a = 3 \), then \( a = 4 \):
d. The graphs of \( y = g(x) \) together with \( y = x \) for \( a = 2 \), then \( a = 3 \), then \( a = 4 \).

When \( a = 2 \), we have \( g(x) = -8x^4 + 16x^3 - 12x^2 + 4x \), so we are looking for a root of \( g(x) - x = -8x^4 + 16x^3 - 12x^2 + 4x - x = -8x^4 + 16x^3 - 12x^2 + 3x = x(-8x^3 + 16x^2 - 12x + 3) \). Clearly \( x = 0 \) is one root, and the diagram indicates that \( g(x) = x \) near \( x = 0.5 \). A quick check shows that \( x = 0.5 \) is a root of \( g(x) - x \), so 0.5 is a fixed point of \( g \).

When \( a = 3 \), we have \( g(x) = -27x^4 + 54x^3 - 36x^2 + 9x \), so we are looking for a root of \( g(x) - x = -27x^4 + 54x^3 - 36x^2 + 9x - x = -27x^4 + 54x^3 - 36x^2 + 8x = x(-27x^3 + 54x^2 - 36x + 8) \). Clearly \( x = 0 \) is one root, and the diagram indicates that \( g(x) = x \) near \( x = 0.6 \). Applying Newton’s method to \( g(x) - x \) with an initial estimate of 0.6 yields a root of approximately \( 0.5 = \frac{3}{2} \). A quick check shows that \( \frac{3}{2} \) is a fixed point of \( g \).

When \( a = 4 \), we have \( g(x) = -64x^4 + 128x^3 - 80x^2 + 16x \), so we are looking for a root of \( g(x) - x = -64x^4 + 128x^3 - 80x^2 + 16x - x = -64x^4 + 128x^3 - 80x^2 + 15x = x(-64x^3 + 128x^2 - 80x + 15) \). Clearly \( x = 0 \) is one root, and the diagram indicates that \( g(x) = x \) near \( x = 0.3 \), \( x = 0.75 \) and \( x = 0.9 \). Checking the value of \( 0.75 = \frac{3}{2} \), we confirm that \( g \left( \frac{3}{2} \right) = \frac{3}{2} \). Applying Newton’s method to \( g(x) - x \) with an initial estimate of 0.3 yields a root of approximately 0.345, and applying it with an initial estimate of 0.9 yields a root of approximately 0.905. Thus the fixed points of \( g \) with \( a = 4 \) are 0, \( \approx 0.345 \), \( \frac{3}{2} \), and \( \approx 0.905 \).

4.8.49 This problem can be solved (approximately) by setting up a computer or calculator program to run Newton’s method, and then experimenting with different starting values. If this is done, it can be seen that any initial estimate between \(-4 \) and the local maximum at approximately \(-1.53 \) converges to the root at \(-2 \). Initial values between approximately \(-1.52 \) and \(-1.486 \) converge to the root at 3, while starting values between \(-1.485 \) and \(-1.475 \) converge to the root at \(-2 \). From \(-1.474 \) to approximately 0.841, starting values lead to convergence to the root at \(-1 \), while from 0.842 to 0.846 they lead to convergence to the root at \(-2 \). From about 0.847 to 0.862 they lead to convergence to the root at 3, while from 0.863 to the local maximum at 1.528 they lead to convergence to the root at 2. From about 1.528 to 4, the convergence is to the root at 3. Thus the approximate basis of convergence for \(-2 \) is \([-4, -1.53] \cup [-1.485, -1.475] \cup [0.842, 0.846] \). For \(-1 \) the approximate basis of convergence is \([-1.474, 0.841] \), and for 3, it is \([-1.52, -1.486] \cup [0.847, 0.862] \cup [1.53, 4] \).

Chapter Review

1. a. False. The point \( x = c \) is a critical point for \( f \), but is not necessarily a local maximum or minimum. Example: \( f(x) = x^3 \) at \( c = 0 \).

b. False. The fact that \( f''(c) = 0 \) does not necessarily imply that \( f \) changes concavity at \( c \). Example: \( f(x) = x^4 \) at \( c = 0 \).

c. True. The function has a maximum on the closed interval determined by the two local minima, and the only way the maximum can occur at the endpoints is if the function is constant, in which case every point is a local max and min.

Copyright © 2014 Pearson Education, Inc.
d. True. The slope of the linearization is given by \( f'(0) = \cos(0) = 1 \), and the line has \( y \)-intercept \( (0, f(0)) = (0, 0) \).

e. False. For example, \( \lim_{x \to -\infty} x^2 = \infty \) and \( \lim_{x \to -\infty} x = -\infty \), but \( \lim_{x \to -\infty} (x^2 - x) = \infty \).

2.

a. There is a local minimum at \((2, -3)\) and a local maximum at \((-1, 3)\).

b. The absolute minimum and maximum on \([-3, 3]\) occur at \((-3, -5)\) and \((-1, 3)\) respectively.

c. The inflection point has coordinates \( \left( \frac{1}{2}, 0 \right) \).

d. The function has zeros at \( x \approx -2.2, 2.8 \).

e. The function is concave up on the interval \( \left( \frac{1}{2}, 3 \right) \).

f. The function is concave down on the interval \( (-3, \frac{1}{2}) \).

3. | 4. | 5. |
--- | --- | --- |
[Graph showing a curve with a local minimum and maximum] | [Graph showing a curve with a local minimum and maximum] | [Graph showing a curve with a local minimum and maximum] |

6. The critical points satisfy \( f'(x) = 2 \cos 2x = 0 \), which has solutions \( x = \pm \frac{\pi}{4} \) and \( x = \pm \frac{3\pi}{4} \) in the interval \((-\pi, \pi)\). We have \( f(-\pi) = 3 \), \( f\left(-\frac{3\pi}{4}\right) = 4 \), \( f\left(-\frac{\pi}{4}\right) = 2 \), \( f\left(\frac{\pi}{4}\right) = 4 \), \( f\left(\frac{3\pi}{4}\right) = 2 \) and \( f(\pi) = 3 \); therefore the absolute minimum and maximum values of \( f \) on \([-\pi, \pi]\) are 2 and 4 respectively.

7. The critical points satisfy \( f'(x) = 6x^2 - 6x - 36 = 6(x-3)(x+2) = 0 \), so the critical points are \( x = 3, -2 \). Because \( \lim_{x \to \infty} f(x) = \infty \) and \( \lim_{x \to -\infty} f(x) = -\infty \), this function has no absolute max or min on \(( -\infty, \infty ) \).

8. Observe that \( f'(x) = 2x^{-1/2} - \frac{5}{2}x^{3/2} \), so the critical points satisfy \( x^2 = \frac{4}{5} \); hence \( x = \frac{2}{\sqrt{5}} \approx 0.894 \) is the only critical point in the interval \((0, 4)\). We have \( f(0) = 0 \), \( f\left(2/\sqrt{5}\right) \approx 3.026 \), \( f(4) = -24 \); hence the absolute minimum and maximum values are \(-24\) and \(\approx 3.026\) respectively.

9. The critical points satisfy \( f'(x) = 2\ln x + 2x - \frac{1}{x} = 2\ln x + 2 = 0 \), which has solution \( x = \frac{1}{e} \). The Second Derivative Test shows that this critical point is a local minimum, so by Theorem 4.5 the absolute minimum value on the interval \((0, \infty)\) is \( f\left(\frac{1}{e}\right) = -\frac{2}{e} + 10 \). Because \( \lim_{x \to \infty} x \ln x = \infty \), this function does not have an absolute maximum on \((0, \infty)\).

10. Express \( g(x) = 9x^{1/3} - x^{7/3} \), so \( g'(x) = 3x^{-2/3} - \frac{7}{3}x^{4/3} \) which is undefined at \( x = 0 \); hence \( x = 0 \) is a critical point. The other critical points satisfy \( x^2 = \frac{9}{7} \), so \( x = \pm \frac{3}{\sqrt{7}} \approx \pm 1.134 \). We have \( g\left(\frac{3}{\sqrt{7}}\right) \approx \pm 8.044 \), \( g(\pm 4) \approx \mp 7 \cdot 4^{1/3} \approx \mp 11.112 \), \( g(0) = 0 \); hence the absolute maximum and minimum values on the interval \([-4, 4]\) are \( \pm 7 \cdot 4^{1/3} \approx \pm 11.112 \).

Copyright © 2014 Pearson Education, Inc.
11. All points in the interval $[-3, 2]$ are critical points. The absolute max occurs at $(4, 9)$; there are no local maxima. All points $(x, 5)$ for $x$ in the interval $[-3, 2]$ are absolute and local minima.

12. Observe that \( f''(x) = 40x^3 - 120x^2 + 120x = 40x(x^2 - 3x + 3) \). The quadratic \( x^2 - 3x + 3 \) has no real roots, so \( x = 0 \) is the only possible inflection point. The sign of \( f''(x) \) changes at \( x = 0 \) so an inflection point occurs at \((0, 1)\).

13. The derivatives of \( f \) are \( f'(x) = 2x^3 - 6x + 4, \quad f''(x) = 6x^2 - 6 \). Observe that \( f'(x) = 2(x - 1)^2(x + 2) \), so we have critical points \( x = 1, -2 \). Solving \( f''(x) = 0 \) gives possible inflection points at \( x = \pm 1 \). Testing the sign of \( f'(x) \) shows that \( f \) is decreasing on the interval \((-\infty, -2)\) and is increasing on \((-2, \infty)\). The First Derivative Test shows that a local minimum occurs at \( x = -2 \), and that the critical point \( x = 1 \) is neither a local max or min. Testing the sign of \( f''(x) \) shows that \( f \) is concave down on the interval \((-1, 1)\) and is concave up on the intervals \((-\infty, -1)\) and \((1, \infty)\). Therefore inflection points occur at \( x = \pm 1 \). The graph has \( x \)-intercepts at \( x \approx -2.917, -0.215 \). We also observe that \( \lim_{x \to \pm \infty} f(x) = \infty \), so \( f \) has no absolute maximum and an absolute minimum at \( x = -2 \).

14. The derivatives of \( f \) are \( f'(x) = 3 \cdot \frac{3-x^2}{(x^2+3)^2}, \quad f''(x) = 6 \cdot \frac{x(x^2-9)}{(x^2+3)^3} \). Solving \( f'(x) = 0 \) gives critical points \( x = \pm \sqrt{3} \), and solving \( f''(x) = 0 \) gives possible inflection points at \( x = 0, \pm 3 \). Testing the sign of \( f'(x) \) shows that \( f \) is decreasing on the intervals \((-\infty, -\sqrt{3})\) and \((\sqrt{3}, \infty)\) and increasing on \((-\sqrt{3}, \sqrt{3})\). The First Derivative Test shows that a local minimum occurs at \( x = -\sqrt{3} \) and a local maximum occurs at \( x = \sqrt{3} \). Testing the sign of \( f''(x) \) shows that \( f \) is concave down on the intervals \((-\infty, -3)\) and \((0, 3)\) and concave up on the intervals \((-3, 0)\) and \((3, \infty)\). Therefore inflection points occur at \( x = 0, \pm 3 \). The graph has
x-intercept at \( x = 0 \). We also observe that \( \lim_{x \to \pm\infty} f(x) = 0 \), so \( f \) has its absolute maximum and minimum at \( x = \sqrt{3}, -\sqrt{3} \) respectively.

15. The derivatives of \( f \) are \( f'(x) = -4\pi \sin[\pi(x - 1)] \), \( f''(x) = -4\pi^2 \cos[\pi(x - 1)] \). Solving \( f'(x) = 0 \) gives the critical point \( x = 1 \), and solving \( f''(x) = 0 \) gives possible inflection points at \( x = 1/2, 3/2 \). Testing the sign of \( f'(x) \) shows that \( f \) is decreasing on the interval \((1, 2)\) and increasing on \((0, 1)\). The First Derivative Test shows that a local maximum occurs at \( x = 1 \). By Theorem 4.5, this solitary local maximum must be the absolute maximum for \( f \) on the interval \([0, 2]\).

Testing the sign of \( f''(x) \) shows that \( f \) is concave down on the interval \((1/2, 3/2)\) and concave up on the intervals \((0, 1/2)\) and \((3/2, 2)\). Therefore inflection points occur at \( x = 1/2, 3/2 \). These points are also the \( x \)-intercepts of the graph. We also observe that \( f(0) = f(2) = -4 \), so \( f \) takes its absolute minimum at these points.

16. The derivatives of \( f \) are \( f'(x) = \frac{x^2 + 8x + 4}{(x^2 - 4)^2} \), \( f''(x) = -2 \cdot \frac{x^3 + 12x^2 + 12x + 16}{(x^2 - 4)^3} \). Solving \( f'(x) = 0 \) gives critical points \( x = -4 \pm 2\sqrt{3} \approx -7.464, -0.536 \), and solving \( f''(x) = 0 \) numerically gives a possible inflection point at \( x \approx -11.045 \). Also note that \( f' \) and \( f'' \) are undefined at \( x = \pm 2 \); \( f \) has vertical asymptotes at these points.

Testing the sign of \( f'(x) \) shows that \( f \) is decreasing on the intervals \((-7.464, -2)\) and \((-2, -0.536)\) and increasing on \((-\infty, -7.464)\), \((-0.536, 2)\) and \((2, \infty)\). The First Derivative Test shows that a local minimum occurs at \( x \approx -0.536 \) and a local maximum occurs at \( x \approx -7.464 \). Testing the sign of \( f''(x) \) shows that \( f \) is concave down on the intervals \((-11.045, -2)\) and \((2, \infty)\) and concave up on the intervals \((-\infty, -11.045)\) and \((-2, 2)\). Therefore an inflection point occurs at \( x \approx -11.045 \). The graph has \( x \)-intercepts at \( x = -1, 0 \). Observe that \( \lim_{x \to -2} \frac{x^2 + x}{4 - x^2} = \infty \), \( \lim_{x \to 2^+} \frac{x^2 + x}{4 - x^2} = -\infty \); therefore \( f \) has no absolute min or max. We also observe that \( \lim_{x \to \pm\infty} f(x) = -1 \).

Copyright © 2014 Pearson Education, Inc.
17. Note that the domain of \( f \) is the interval \((0, \infty)\). The derivatives of \( f \) are \( f'(x) = \frac{1}{3}x^{-2/3} - \frac{1}{2}x^{-1/2} \), \( f''(x) = -\frac{2}{9}x^{-5/3} + \frac{1}{4}x^{-3/2} \). Solving \( f'(x) = 0 \) gives critical point \( x = \left(\frac{4}{3}\right)^6 \), and solving \( f''(x) = 0 \) gives a possible inflection point at \( x = \left(\frac{8}{3}\right)^6 \). Testing the sign of \( f'(x) \) shows that \( f \) is increasing on the interval \( \left(0, \left(\frac{4}{3}\right)^6\right) \) and decreasing on the interval \( \left(\left(\frac{8}{3}\right)^6, \infty\right) \). The First Derivative Test shows that a local maximum occurs at \( x = \left(\frac{4}{3}\right)^6 \) and By Theorem 4.5 this solitary local maximum must be the absolute maximum of \( f \) on the interval \( (0, \infty) \). Testing the sign of \( f''(x) \) shows that \( f \) is concave down on the interval \( \left(0, \left(\frac{4}{3}\right)^6\right) \) and concave up on the interval \( \left(\left(\frac{8}{3}\right)^6, \infty\right) \). Therefore an inflection point occurs at \( x = \left(\frac{8}{3}\right)^6 \). Using a numerical solver, we find that the graph has \( x \)-intercept at \( x \approx 23.767 \). Because \( \lim_{x \to \infty} f(x) = -\infty \), \( f \) has no absolute minimum on the interval \( (0, \infty) \).

18. Observe that \( f \) is an even function, so its graph is symmetric in the \( y \)-axis. The derivatives of \( f \) are \( f'(x) = -\frac{\pi(1+x^2)\sin\pi x + 2x\cos\pi x}{(1+x^2)^2}, f''(x) = \frac{4\pi(x^2 + x)\sin\pi x + (-\pi^2x^4 + (6-2\pi^2)x^2 - \pi^2 - 2)\cos x}{(1+x^2)^3} \). Note that \( x = 0 \) is a critical point; solving \( f'(x) = 0 \) numerically gives additional critical points \( x = \pm 0.902 \) and \( \pm 1.919 \), and solving \( f''(x) = 0 \) gives possible inflection points at \( x \approx \pm 0.382 \) and \( \pm 1.307 \). Testing the sign of \( f' \) between critical points shows that \( f \) is decreasing on the intervals \((-1.919, -0.902), (0, 0.902) \) and \((1.919, 2) \) and increasing on \((-2, -1.919), (-0.902, 0) \) and \((0.902, 1.919) \). The First Derivative Test shows that local minima occur at \( x \approx \pm 0.902 \) and local maxima occur at \( x = 0 \) and \( x \approx \pm 1.919 \). Comparing the values of
$f$ at the critical points and endpoints shows that the absolute maximum occurs at $x = 0$ and the absolute minimum at $x \approx \pm 0.902$.

Testing the sign of $f''(x)$ shows that $f$ is concave down on the intervals $(-2, -1.307)$, $(-0.382, 0.382)$ and $(1.307, 2)$ and concave up on the intervals $(-1.307, -0.382)$ and $(0.382, 1.307)$. Therefore inflection points occur at $x = \pm 0.382, \pm 1.307$. The $x$-intercepts of the graph occur when $\cos \pi x = 0$, which gives $x = \pm \frac{1}{2}, \frac{3}{2}$.

19. The derivatives of $f$ are $f'(x) = \frac{2}{3}x^{-1/3} + \frac{1}{3}(x + 2)^{-2/3}$, $f''(x) = -\frac{2}{9} \left( x^{-4/3} + (x + 2)^{-5/3} \right)$. Solving $f'(x) = 0$ gives critical points $x \approx -2.566, -1.559$; we also have critical points at $x = -2, 0$ because $f'(x)$ is undefined at these points. Solving $f''(x) = 0$ numerically gives a possible inflection point at $x \approx -6.434$. We also have possible inflection points at $x = -2, 0$ because $f''(x)$ is undefined at these points. Testing the sign of $f'(x)$ shows that $f$ is decreasing on the intervals $(-\infty, -2.566)$ and $(-1.559, 0)$ and increasing on $(-2.566, -1.559)$ and $(0, \infty)$. The First Derivative Test shows that local mins occur at $x \approx -2.566$ and $x = 0$ and a local max occurs at $x \approx -1.559$. Testing the sign of $f''(x)$ shows that $f$ is concave down on the intervals $(-\infty, -6.434)$, $(-2, 0)$ and $(0, \infty)$ and concave up on the interval $(-6.434, -2)$. Therefore inflection points occur at $x \approx -6.434$ and $x = -2$. Because $\lim_{x \to \pm \infty} f(x) = \infty$, $f$ has no absolute maximum. The absolute minimum occurs at $x \approx -2.566$.

20. The derivatives of $f$ are $f'(x) = -(x^2 - 3x + 1)e^{-x}$, $f''(x) = (x^2 - 5x + 4)e^{-x}$. Solving $f'(x) = 0$ gives critical points $x \approx 0.382, 2.618$, and solving $f''(x) = 0$ gives possible inflection points at $x = 1, 4$. Testing the sign of $f'(x)$ shows that $f$ is decreasing on the intervals $(-\infty, 0.382)$ and $(2.618, \infty)$ and increasing on $(0.382, 2.618)$. The First Derivative Test shows that a local minimum occurs at $x \approx 0.382$ and a local maximum occurs at $x \approx 2.618$. Testing the sign of $f''(x)$ shows that $f$ is concave up on the intervals $(-\infty, 1)$.
21. The objective function to be maximized is the volume of the cone, given by \( V = \pi r^2 h / 3 \). By the
Pythagorean theorem, \( r \) and \( h \) satisfy the constraint \( h^2 + r^2 = 16 \), which gives \( r^2 = 16 - h^2 \).
Therefore \( V(h) = \frac{2}{3} h(16 - h^2) = \frac{2}{3} (16b - b^3) \). We must maximize this function for \( 0 \leq h \leq 4 \).
The critical points of \( V(h) \) satisfy \( V''(h) = \frac{2}{3}(16 - 3h^2) = 0 \), which has unique solution \( h = \frac{4}{\sqrt{3}} = \frac{4\sqrt[3]{4}}{3} \) in \((0, 4)\). Because
\( V(0) = V(4) = 0 \), \( h = \frac{4\sqrt[3]{4}}{3} \) gives the maximum value of \( V(h) \) on \([0, 4]\). The corresponding value of \( r \) satisfies
\( r^2 = 16 - \frac{16}{3} = \frac{32}{3} \), so \( r = \frac{4\sqrt[3]{4}}{\sqrt{3}} = \frac{4\sqrt[3]{6}}{3} \).

22. The rectangle has dimensions \( x \) and \( \cos x \), so the objective function to be maximized is \( A(x) = x \cos x \),
where \( 0 \leq x \leq \frac{\pi}{2} \). The critical points of this function satisfy \( A'(x) = \cos x - x \sin x = 0 \), which can be solved
numerically to obtain \( x \approx 0.860 \). Note that \( A(0) = A \left( \frac{\pi}{2} \right) = 0 \), so the maximum area occurs at \( x \approx 0.860 \);
the dimensions of the largest rectangle are \( 0.860 \) and \( 0.860 \approx 0.652 \), which gives maximum area \( \approx 0.561 \).

23. We have that \( xy = 98 \), and we want to maximize \( p = (y - 2)(x - 1) = (y - 2) \left( \frac{98}{y} - 1 \right) = 98 - y - \frac{196}{y} + 2 \).
Note that \( p'(y) = -1 + \frac{196}{y^2} \) which is zero when \( y^2 = 196 \), so \( y = \sqrt{196} = 14 \). Also note that \( p'(13) > 0 \) and \( p'(15) < 0 \), so there is a local (in fact, absolute) maximum at \( y = 14 \). The value of \( x \) when \( y = 14 \) is
\( x = \frac{98}{14} = 7 \).

24. A point on the graph of \( y = \frac{5}{2} - x^2 \) has the form \( (x, \frac{5}{2} - x^2) \); the square of its distance to the origin
is given by \( Q(x) = x^2 + \left( \frac{5}{2} - x^2 \right) = x^4 - 4x^2 + \frac{25}{4} \), which we can take as our objective function to be minimized.
The critical points of \( Q(x) \) satisfy \( Q'(x) = 4x^3 - 8x = 4x(x^2 - 2) = 0 \), which has solutions
\( x = 0 \) and \( x = \pm \sqrt{2} \). The First Derivative Test shows that \( x = 0 \) is a local maximum and \( x = \pm \sqrt{2} \) are
local minima. Note that \( Q(x) \) takes the same value at \( x = \pm \sqrt{2} \), so the absolute minimum of \( Q(x) \) occurs
at \( x = \pm \sqrt{2} \) and the points closest to the origin on the graph are \( (\pm \sqrt{2}, \frac{5}{2}) \).

25. The area of the triangle is \( \frac{1}{2} pq \), and the constraint is \( \sqrt{p^2 + q^2} = 10 \), or \( p^2 + q^2 = 100 \). So we can write
the area of the triangle as \( A(p) = \frac{1}{2} p \sqrt{100 - p^2} \). We have \( A'(p) = \frac{1}{2} \sqrt{100 - p^2} + \frac{p}{2 \sqrt{100 - p^2}} \cdot \frac{-p}{\sqrt{100 - p^2}} = \frac{100 - p^2 - p^2}{2 \sqrt{100 - p^2}} = \frac{100 - 2p^2}{2 \sqrt{100 - p^2}} \).
This is zero for \( p = \sqrt{50} = 5\sqrt{2} \). An application of the First Derivative Test shows that there is
a local (in fact, absolute) maximum at this value of \( p \). The value of \( q \) for this value of \( p \) is \( \sqrt{100 - 50} = 5\sqrt{2} \) as well. So the area of the triangle is maximized when \( p = q = 5\sqrt{2} \).

26. The volume of the cistern is \( \pi r^2 h \), so our constraint is \( \pi r^2 h = 50 \), so \( h = \frac{50}{\pi r^2} \). The area of the painted
surface is given by \( A = 2\pi rh + \pi r^2 = 2\pi r \cdot \frac{50}{\pi r^2} + \pi r^2 = \frac{100}{r} + \pi r^2 \). Thus we have \( A'(r) = -\frac{100}{r^2} + 2\pi r \), which

Copyright © 2014 Pearson Education, Inc.
The Newton’s method recursion is given by

\[ x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} \]

27. Let \( f(x) = \frac{1}{\sqrt{1-x^2}} \), so \( f'(x) = \frac{x}{\sqrt{1-x^2}} \). Thus \( L(x) = \frac{\pi}{6} (x - \frac{1}{2}) \), or \( L(x) = \frac{\pi}{6} + \frac{2}{\sqrt{3}} (x - \frac{1}{2}) \).

b. \( f(0.48) \approx L(0.48) = \frac{\pi}{6} + \frac{2}{\sqrt{3}}(-0.02) \approx 0.501 \).

28. Let \( f(x) = \frac{1}{x^2} \) and let \( a = 4 \). Then \( f'(x) = -\frac{2}{x^3} \) so \( f'(4) = -\frac{2}{64} = -\frac{1}{32} \). The linearization is \( L(x) = \frac{1}{16} - \frac{1}{32} (x - 4) \). Then \( f(4.2) = \frac{1}{4.2^2} \approx L(4.2) = \frac{1}{16} - \frac{1}{32} \cdot \frac{2}{10} = 0.05625 \).

30. Let \( f(x) = \tan^{-1}(x) \) and \( a = 1 \). Then \( f'(x) = \frac{1}{x^2+1} \) so \( f'(1) = \frac{1}{2} \). The linearization is \( L(x) = \frac{\pi}{4} + \frac{1}{2} (x - 1) \). Then \( f(1.05) = \tan^{-1}(1.05) \approx L(1.05) = \frac{\pi}{4} + \frac{1}{2} \cdot \frac{1}{20} \approx 0.810 \).

31. \( \Delta h \approx h'(a) \Delta t = -32 \cdot 5 \cdot 0.7 = -112 \) feet.

32. \( \Delta E \approx E'(a) \Delta M = 25000 \cdot 10^{1.57} \cdot 1.5 \ln 10 \cdot 0.5 \approx 1.365 \times 10^{15} \) J.

33. a. The average rate of change of \( P(t) \) on the interval \([0, 8]\) is \( \frac{P(8) - P(0)}{8 - 0} = \frac{800/9 - 0}{8} = \frac{100}{9} \) cells/week.

b. We solve \( P'(t) = \frac{100}{(t+1)^2} \) which gives \((t+1)^2 = 9\), so \( t = 2 \) weeks.

34. a. The average rate of change is \( \frac{\text{change in growth}}{\text{elapsed time}} = \frac{15}{5} = 3 \) cm per hour.

b. 3 cm per hour is equivalent to \( \frac{30}{3600} = \frac{1}{120} \) mm per second. The Mean Value Theorem tells us that sometime between 10:00 a.m. and 3:00 p.m., there will be a time when the instantaneous growth rate is exactly \( \frac{1}{120} \) mm per second.

35. It is possible to note that 1 is a root by inspection. Then by long division by \( x - 1 \), we have \( f(x) = (x - 1)(3x^2 - x - 1) \). We apply Newton’s method to the function \( g(x) = 3x^2 - x - 1 \).

The Newton’s method recursion is given by \( x_{n+1} = x_n - \frac{3x_n^2 - x_n - 1}{6x_n - 1} \). Applying this recursion to the initial estimates of \(-0.5\) and \(0.8\) yields:

\[
\begin{array}{c|c|c|c|c}
 n & x_n & n & x_n \\
 0 & -0.5 & 0 & .8 \\
 1 & -0.4375 & 1 & .768421 \\
 2 & -0.434267 & 2 & .767592 \\
 3 & -0.434259 & 3 & .767592 \\
 4 & -0.434259 & 4 & .767592 \\
\end{array}
\]

The roots are thus 1, and approximately \(-0.434\) and 0.768.

36. The Newton’s method recursion is given by \( x_{n+1} = x_n - \frac{e^{-2x_n} + 2e^{x_n} - 6}{2e^{-2x_n} + 2e^{x_n}} \). Applying this recursion to the initial estimates of \(-1\) and 1 yields:
The roots are thus 1, and approximately $-0.816$ and $1.079$.

37. First note that $f'(x) = 10x^4 - 18x^2 - 4$ and $f''(x) = 40x^3 - 36x = 4x(10x^2 - 9)$. This is clearly 0 when $x = 0$, and when $10x^2 - 9 = 0$. Applying Newton’s method to the function $g(x) = 10x^2 - 9$ with initial estimates of $-1$ and $1$ yields:

```

```

Checking the signs of $f''(x)$ on the appropriate intervals leads to the conclusion that these are all the locations of inflection points of $f$. So the inflection points of $f$ are located at $0$ and approximately $\pm 0.949$.

38. L'Hôpital’s rule gives $\lim_{t \to 2} \frac{t^3 - t^2 - 2t}{t^2 - 4} = \lim_{t \to 2} \frac{3t^2 - 2t - 2}{2t} = \frac{3}{2}$.

39. L'Hôpital’s rule gives $\lim_{t \to 0} \frac{1 - \cos 6t}{2t} = \lim_{t \to 0} \frac{6 \sin 6t}{2} = 0$.

40. If we factor out $x^2$ from the numerator and denominator, we see that $\frac{5x^2 + 2x - 5}{\sqrt{x^2 - 1}} = \frac{5 + 2x - 5x^2}{\sqrt{1 - 1/x^2}} \to 5$ as $x \to \infty$.

41. Observe that $\lim_{\theta \to 0} \frac{3 \sin^2 2\theta}{\theta^2} = 3 \left( \lim_{\theta \to 0} \frac{\sin 2\theta}{\theta} \right)^2$; L’Hôpital’s rule gives $\lim_{\theta \to 0} \frac{\sin 2\theta}{\theta} = \lim_{\theta \to 0} \frac{2 \cos 2\theta}{1} = 2$, so $\lim_{\theta \to 0} \frac{3 \sin^2 2\theta}{\theta^2} = 3 \cdot 2^2 = 12$.

42. First observe that

\[
(\sqrt{x^2 + x + 1} - \sqrt{x^2 - x}) \left( \frac{\sqrt{x^2 + x + 1} + \sqrt{x^2 - x}}{\sqrt{x^2 + x + 1} + \sqrt{x^2 - x}} \right) = \frac{2x + 1}{(\sqrt{x^2 + x + 1} + \sqrt{x^2 - x})}.
\]

Next, factor out $x$ from both numerator and denominator to obtain

\[
\frac{2x + 1}{(\sqrt{x^2 + x + 1} + \sqrt{x^2 - x})} = \frac{2 + 1/x}{(\sqrt{1 + 1/x + 1/x^2 + \sqrt{1 - 1/x})}}.
\]

This expression converges to $\frac{3}{2} = 1$ as $x \to \infty$, so $\lim_{x \to \infty} \left( \sqrt{x^2 + x + 1} - \sqrt{x^2 - x} \right) = 1$. 

Copyright © 2014 Pearson Education, Inc.
43. Observe that
\[ 2\theta \cot 3\theta = 2 \cos 3\theta \cdot \frac{\theta}{\sin 3\theta}; \lim_{\theta \to 0} \frac{\theta}{\sin 3\theta} = \lim_{\theta \to 0} \frac{1}{3 \cos 3\theta} = \frac{1}{3} \]
by l’Hôpital’s rule, so
\[ \lim_{\theta \to 0} 2\theta \cot 3\theta = 2 \cdot 1 \cdot \frac{1}{3} = \frac{2}{3}. \]

44. Apply l’Hôpital's rule twice:
\[ \lim_{x \to 0} \frac{e^{-2x} - 1 + 2x}{x^2} = \lim_{x \to 0} \frac{-2e^{-2x} + 2}{2x} = \lim_{x \to 0} \frac{4e^{-2x}}{2} = 2. \]

45. Make the change of variables \( x = \frac{1}{y} \); then
\[ \ln^{10} y = (\ln y)^{10} = (-\ln x)^{10} = \ln^{10} x, \]
and so
\[ \lim_{y \to 0^+} \ln^{10} y = \lim_{x \to \infty} \sqrt{x} \ln^{10} x = \infty. \]

46. Apply l’Hôpital’s rule:
\[ \lim_{\theta \to 0} \frac{3 \sin 8\theta}{8 \sin 3\theta} = \lim_{\theta \to 0} \frac{24 \cos 8\theta}{24 \cos 3\theta} = 1. \]

47. Apply l’Hôpital’s rule twice:
\[ \lim_{x \to 1} \frac{x^4 - x^3 - 3x^2 + 5x - 2}{x^3 + x^2 - 5x - 3} = \lim_{x \to 1} \frac{4x^3 - 3x^2 - 6x + 5}{3x^2 + 2x - 5} = \lim_{x \to 1} \frac{12x^2 - 6x - 6}{6x + 2} = 0. \]

48. The function \( \ln x^{100} = 100 \ln x \) grows more slowly than \( \sqrt{x} \) as \( x \to \infty \), so
\[ \lim_{x \to \infty} \frac{\ln x^{100}}{\sqrt{x}} = 0. \]

49. \( \lim_{x \to 0} \csc x \sin^{-1} x = \lim_{x \to 0} \frac{\sin^{-1} x}{\sin x} = \lim_{x \to 0} \frac{1/\sqrt{1-x^2}}{\cos x} = 1, \) by l’Hôpital’s rule.

50. The function \( \ln^3 x \) grows more slowly than \( \sqrt{x} \) as \( x \to \infty \), so
\[ \lim_{x \to \infty} \frac{\ln^3 x}{\sqrt{x}} = 0. \]

51. Observe that \( \lim_{x \to \infty} \frac{x + 1}{x} = 1 \), by l’Hôpital’s rule or by Theorem 2.7. Thus
\[ \lim_{x \to \infty} \ln \left( \frac{x + 1}{x - 1} \right) = \ln 1 = 0. \]

52. Note that \( \ln(1 + x) \cot x = \cot x \ln(1 + x) = \frac{\ln(1 + x)}{\tan x} \). We evaluate
\[ L = \lim_{x \to 0^+} \frac{\ln(1 + x)}{\tan x} = \lim_{x \to 0^+} \frac{1/(1+x)}{\sec^2 x} = 1 \]
by l’Hôpital’s rule. Therefore \( \lim_{x \to 0^+} (1 + x)^{\cot x} = e^L = e^1 = e \).

53. Note that \( \ln(\sin x)^{\tan x} = \tan x \ln \sin x \), so we evaluate
\[ L = \lim_{x \to \pi/2^-} \tan x \ln \sin x = \lim_{x \to \pi/2^-} \ln \sin x = \lim_{x \to \pi/2^-} \cot x = \lim_{x \to \pi/2^-} (-\cos x \sin x) = 0 \] by l’Hôpital’s rule. Therefore
\[ \lim_{x \to \pi/2^-} (\sin x)^{\tan x} = e^L = 1. \]

54. Note that \( \ln(\sqrt{x} + 1)^{1/x} = \frac{\ln(\sqrt{x} + 1)}{x} \), so we evaluate
\[ L = \lim_{x \to \infty} \frac{\ln(\sqrt{x} + 1)}{x} = \lim_{x \to \infty} \left[ \frac{1}{\sqrt{x} + 1} \right] \cdot \frac{\sqrt{x}}{1} = 0 \] by l’Hôpital’s rule. Therefore
\[ \lim_{x \to \infty} (\sqrt{x} + 1)^{1/x} = e^L = e^0 = 1. \]

55. We have \( \ln ((1 + x)^p) = x \ln |x| \). Since we are taking the limit as \( x \to 0 \), we can certainly assume \( x < 1 \), so that \( \ln x < 0 \), and then \( x \ln |x| = x \ln(-\ln x) \). Then using L’Hôpital’s rule twice,
\[ \lim_{x \to 0^+} x \ln(-\ln x) = \lim_{x \to 0^+} \frac{\ln(-\ln x)}{1/x} = \lim_{x \to 0^+} \frac{1}{\ln x \cdot \left( -\frac{1}{x} \right)} = \lim_{x \to 0^+} \frac{x}{\ln x} = \lim_{x \to 0^+} \frac{1}{1/x} = \lim_{x \to 0^+} x = 0. \]
Thus \( \lim_{x \to 0} \ln (|\ln x|^2) = e^0 = 1. \)

56. Note that \( \ln (x^{1/x}) = \frac{\ln x}{x} \), so we evaluate \( L = \lim_{x \to \infty} \frac{\ln x}{x} = 0 \) because \( \ln x \) grows more slowly than \( x \) as \( x \to \infty \). Therefore \( \lim_{x \to \infty} x^{1/x} = e^L = 1. \)

57. Note that \( \ln ((1 - \frac{2}{3} x)^x) = x \ln (1 - \frac{2}{3} x) = \frac{\ln(1 - 3/x)}{1/x} \), so we evaluate

\[
L = \lim_{x \to \infty} \frac{\ln(1 - 3/x)}{1/x} = \lim_{x \to \infty} \frac{(1 - 3/x)^{-1}(3/x^2)}{-1/x^2} = -3
\]

by l'Hôpital's rule. Therefore \( \lim_{x \to \infty} (1 - \frac{3}{x})^x = e^L = e^{-3} \).

58. Note that \( \ln \left( \left( \frac{2}{\pi} \tan^{-1} x \right)^x \right) = x \ln \left( \frac{2}{\pi} \tan^{-1} x \right) = \frac{\ln(\frac{2}{\pi} \tan^{-1} x)}{1/x} \). We evaluate

\[
L = \lim_{x \to \infty} \frac{1}{1/x} \cdot \frac{\ln(\frac{2}{\pi} \tan^{-1} x)}{\frac{2}{\pi} \cdot \pi(x^2+1)} = \lim_{x \to \infty} \frac{-x^2}{x^2+1} \cdot \frac{1}{\tan^{-1}(x)} = -\frac{2}{\pi}.
\]

Thus, \( \lim_{x \to \infty} \left( \frac{2}{\pi} \tan^{-1} x \right)^x = e^L = e^{-2/\pi} \).

59. Taking logs gives \( \sin(\pi x) \ln |x-1| \). Then using L'Hôpital's rule twice, first take the right-hand limit:

\[
\lim_{x \to 1^+} \sin(\pi x) \ln |x-1| = \lim_{x \to 1^+} \frac{\ln(x-1)}{\csc \pi x} \cdot \frac{\ln(1/(x-1))}{1/(x-1)} = \lim_{x \to 1^+} \frac{\csc \pi x \cot \pi x}{\csc \pi x \cot \pi x} \cdot \frac{\ln(1/(x-1))}{1/(x-1)} = \lim_{x \to 1^+} \frac{\pi \cos \pi x \tan \pi x + \pi \sin \pi x \sec^2 \pi x}{\pi \cos \pi x \tan \pi x + \pi \sin \pi x \sec^2 \pi x} = 0.
\]

The limit from the left is similar, except that instead of \( x-1 \), we must use \( 1-x \) for \( |x-1| \). The limit remains zero. Since both one-sided limits are zero, the limit exists and is zero, and then \( \lim_{x \to 1} (x-1)^{\sin \pi x} = e^0 = 1. \)

60. By Theorem 4.15, \( 1.1^x \) grows faster than \( x^{100} \) as \( x \to \infty \).

61. Observe that \( \lim_{x \to \infty} x^{1/2} = \lim_{x \to \infty} x^{1/6} = \infty, \) so \( x^{1/2} \) grows faster than \( x^{1/3} \) as \( x \to \infty \).

62. Because \( \log_{10} x = \frac{\ln x}{\ln 10} \), \( \ln x \) and \( \log_{10} x \) have comparable growth rates as \( x \to \infty \).

63. By Theorem 4.15, \( \sqrt{x} \) grows faster than \( \ln^{10} x \) as \( x \to \infty \).

64. Because \( \ln x^2 = 2 \ln x \), Theorem 4.15 shows that \( 10x \) grows faster than \( \ln x^2 \) as \( x \to \infty \).

65. Observe that \( \lim_{x \to \infty} \frac{e^x}{x^3} = \lim_{x \to \infty} \left( \frac{e}{3} \right)^x = 0 \) because \( \frac{e}{3} < 1 \). Therefore \( 3^x \) grows faster than \( e^x \) as \( x \to \infty \).

66. Observe that \( \lim_{x \to \infty} \frac{\sqrt{x^6 + 10}}{x^3} = \lim_{x \to \infty} \sqrt{1 + \frac{10}{x^6}} = 1, \) so \( \sqrt{x^6 + 10} \) and \( x^3 \) have comparable growth rates as \( x \to \infty \).

67. Observe that \( 4^{x/2} = (4^{1/2})^x = 2^x \), so these functions are identical and hence have comparable growth rates as \( x \to \infty \).
68. We have \( \ln(\ln(\ln x)) \ll \ln(\ln x) \ll \ln x \) as \( x \to \infty \). For the first relation, make the change of variables \( y = \ln(\ln(x)) \): then \( \lim_{y \to \infty} \frac{\ln(y)}{\ln(x)} = \lim_{y \to \infty} \frac{\ln y}{y} = 0 \); and for the second, let \( y = \ln x \): \( \lim_{x \to \infty} \frac{\ln(\ln x)}{\ln x} = \lim_{y \to \infty} \frac{\ln y}{y} = 0 \).

69.

For the second limit, let \( y = x^2 \):
\[
\lim_{x \to 0^+} \frac{x^2}{\sqrt{1-e^{-x}}} = \lim_{y \to 0^+} \frac{y}{\sqrt{1 - e^{-y}}} = \lim_{y \to 0^+} \frac{1 - e^{-y}}{y} = 1
\]
by l'Hôpital's rule. For the first, observe that for \( x > 0 \)
\[
\lim_{x \to 0^+} \frac{x}{\sqrt{1-e^{-x}}} = \left( \frac{x^2}{1-e^{-x}} \right)^{1/2},
\]
so
\[
\lim_{x \to 0^+} \frac{x}{\sqrt{1-e^{-x}}} = 1
\]
as well.

70. Observe that
\[
\ln \left( \frac{a^r + b^r + c^r}{3} \right)^{1/r} = \frac{\ln(a^r + b^r + c^r) - \ln 3}{r}
\]
By l'Hôpital's rule, we have
\[
L = \lim_{r \to 0} \frac{\ln(a^r + b^r + c^r) - \ln 3}{r}
= \lim_{r \to 0} \frac{(a^r + b^r + c^r)^{-1} ((\ln a)a^r + (\ln b)b^r + (\ln c)c^r)}{1}
= \frac{1}{3} (\ln a + \ln b + \ln c)
= \ln(abc)^{1/3},
\]
therefore,
\[
\lim_{r \to 0} \left( \frac{a^r + b^r + c^r}{3} \right)^{1/r} = e^L = \sqrt[3]{abc}.
\]

71. Observe that \( \lim_{x \to \infty} \frac{2x^5 - x + 1}{5x^5 + x} = 0 \) by Theorem 2.7. We can also use l'Hôpital's rule:
\[
\lim_{x \to \infty} \frac{2x^5 - x + 1}{5x^5 + x} = \lim_{x \to \infty} \frac{10x^4 - 1}{30x^4 + 1} = \lim_{x \to \infty} \frac{40x^3}{150x^4} = \lim_{x \to \infty} \frac{4}{15x} = 0.
\]

72. Observe that \( \lim_{x \to \infty} \sqrt{x} = 1 \), as shown in Example 6 a. Therefore
\[
\lim_{x \to \infty} \frac{4x^3 - x^2}{2x^4 + x^5} = 4 \cdot 2 = 2.
\]
We can also apply l'Hôpital's rule four times:
\[
\lim_{x \to \infty} \frac{4x^4 - x^{1/2}}{2x^4 + x^{1/2}} = \lim_{x \to \infty} \frac{96 + (15/16)x^{7/2}}{48 + 24x^{-5}} = 2.
\]

73. Note that \( \lim_{x \to 0^+} x^x = 1 \), as shown in Example 6 a. Therefore \( \lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} (x^x)^x = 1^0 = 1 \), and \( \lim_{x \to 0^+} g(x) = \lim_{x \to 0^+} x^{(x^x)} = 0^1 = 0 \).

74.

a. Make the change of variables \( y = x^n \) and apply l'Hôpital's rule twice:
\[
\lim_{x \to 0} \frac{1 - \cos x^n}{x^{2n}} = \lim_{y \to 0} \frac{1 - \cos y}{y^2} = \lim_{y \to 0} \frac{\cos y}{2} = \frac{1}{2}.
\]
b. Apply l’Hôpital’s rule:
\[
\lim_{x \to 0} \frac{1 - \cos^n x}{x^2} = \lim_{x \to 0} \frac{n \cos^{n-1} x \sin x}{2x} = \frac{n}{2} \left( \lim_{x \to 0} \cos^{n-1} x \right) \left( \lim_{x \to 0} \frac{\sin x}{x} \right) = \frac{n}{2} \cdot 1 \cdot 1 = \frac{n}{2}.
\]

75. First, observe that \(\lim_{x \to 0} x^2 = 0\). Clearly, \(\lim_{x \to 0} \frac{\sin x}{x} = 1\) is correct.

\[
\lim_{x \to \infty} \ln g(x) = 1.
\]
It suffices to determine whether \(\ln g(x) - 1\) is positive or negative as \(x \to \infty\). To do this, consider \(\lim_{x \to \infty} x(\ln g(x) - 1) = \lim_{t \to 0} \frac{(1 + at) \ln(1 + t) - t}{t^2}\), where we make the change of variables \(t = \frac{1}{x}\). This limit can be evaluated by using l’Hôpital’s rule twice: \(\lim_{t \to 0} \frac{(1 + at) \ln(1 + t) - t}{t^2} = a - \frac{1}{2}\). Therefore when \(a > \frac{1}{2}\) we have \(g(x) > e\) as \(x \to \infty\), and when \(0 < a < \frac{1}{2}\), \(g(x) < e\) as \(x \to \infty\). In the case \(a = \frac{1}{2}\) we consider the limit \(\lim_{x \to \infty} x^2(\ln g(x) - 1) = \lim_{t \to 0} \frac{(1 + at) \ln(1 + t) - t}{t^3}\), which can be evaluated by using l’Hôpital’s three times: \(\lim_{t \to 0} \frac{(1 + t/2) \ln(1 + t) - t}{t^3} = \frac{1}{12}\). Therefore \(g(x) > e\) as \(x \to \infty\) in this case as well.

76.

a. The domain is the interval \([-a, \infty)\).

b. Observe that \(\lim_{x \to -a^+} (a + x)^x = \lim_{y \to 0^+} y^y\). This limit can be evaluated by using l’Hôpital’s rule twice: \(\lim_{y \to 0^+} y^y = 1 \cdot \infty = \infty\). We also have \(\lim_{x \to -a^+} (a + x)^x = \infty\) because \((a + x)^x > x^x\).

c. Using logarithmic differentiation, we find that \(f'(x) = x(a + x)^{x-1} + \ln(a + x)(a + x)^x\).

d. Multiplying \(f'(x)\) by \((a + x)^{1-x}\) shows that the critical point \(z\) for \(f\) satisfies the equation \(z + (z + a) \ln(z + a) = 0\), which is equivalent to the equation \(\ln(z + a) = -\frac{a}{z + a}\). The left side is an increasing function on \((-a, \infty)\) with range \((-\infty, 0)\), so there exists a unique \(z\) satisfying this equation.

e. Graphical analysis shows that as \(a \to \infty\), \(z \to -\infty\) and \(f(z) \to 0\).

AP Practice Questions

Multiple Choice

1. C is correct. Both \(-1\) and 0.5 are critical points since the slope of the tangent is zero there. A and B are therefore false. D is false since \(f(1) < 0\) but clearly the slope at \(x = 1\), which is \(f'(1)\), is positive. Finally, E is false since between \(x = -1\) and \(x = -0.25\), where \(f''(x) = 0\), the function is concave down.

2. A is correct. Clearly \(x = -2\) is the maximum value of \(f\) on \([-2, 1]\) (\(f\) assumes larger values for \(x > 1.5\), but we are asked only to consider \([-2, 1]\)). B is clearly false since \(f(-2) > f(1)\). C is false since \(f\) is decreasing both to the left and the right of \(x = -1\). D is false since \(x = 0.5\) is the only local minimum — the only two candidates are the critical points, and \(x = -1\) is not a local minimum. Since A is true, E is false as well.

3. C is correct. Inflection points can occur only where \(f''(x) = 0\); the concavity changes at both \(x = -1\) and \(x = -0.25\), so these are both inflection points.

4. C is correct. We have \(f'(x) = e^{-x} - xe^{-x} = (1 - x)e^{-x}\) and \(f''(x) = -e^{-x} - (1 - x)e^{-x} = (x - 2)e^{-x}\). Then for \(x > 2\), we see that \(f'(x) < 0\) and \(f''(x) > 0\), so that \(f\) is decreasing and concave up. (For \(x < 1\), \(f'(x) > 0\) but \(f''(x) < 0\), so that \(f\) is increasing and concave down for \(x < 1\), so that E is false).
5. E is correct. \( f'(x) = 0 \) at \( x = 1, x = 2, \) and \( x = 3. \) Checking points, we find

\[
f'(0) = 12, \quad f'(\frac{3}{2}) = -\frac{3}{16}, \quad f'(\frac{5}{2}) = -\frac{3}{16}, \quad f'(4) = 12.
\]

Thus \( f' \) changes sign from positive to negative at \( x = 1, \) so that is a relative maximum. \( f' \) changes sign from negative to positive at \( x = 3, \) so that is a relative minimum. Since \( f' \) does not change sign at \( x = 2, \) that is not a relative extremum. Thus \( f \) has one relative minimum and one relative maximum.

6. D is correct. Since \( f(x) \) is a polynomial, it is differentiable everywhere, so its critical points are the points where its derivative is zero. We have

\[
f'(x) = 6x^2 + 6x - 12 = 6(x^2 + x - 2) = 6(x + 2)(x - 1),
\]

so \( x = -2 \) and \( x = 1 \) are the critical points.

7. B is correct. We have \( f''(x) = 3(x-1)^2 \) and \( f''(x) = 6(x-1). \) Since \( f''(1) = 0, \) the second derivative test will give us no information about local minima. Since \( f'(x) > 0 \) for \( x \) near 1 on either side of 1, we see that \( f' \) does not change sign at \( x = 1, \) so there is no local extremum there. However, \( f''(1) = 0, \) and \( f'' \) changes sign at \( x = 1, \) so this is an inflection point. Finally, \( f(1) = 0. \) (E is false since \( f \) is defined on \( (-\infty, \infty) \)).

8. A is correct. Since \( y' = \frac{1}{x}, \) we have \( L(x) = y(1) + y'(1)(x-1) = \ln 1 + \frac{1}{1}(x-1) = x - 1. \)

9. E is correct. On \([−1, 2],\) the average rate of change of \( f \) is

\[
\frac{f(2) - f(-1)}{2 - (-1)} = \frac{4 - 1}{3} = 1.
\]

The Mean Value Theorem thus guarantees that there is some \( x \in (-1, 2) \) with \( f'(x) = 1. \) But \( f'(x) = 2x, \) so we must have \( x = \frac{1}{2}. \)

10. A is correct. Since \( y'' = -\sin x, \) and \( \sin x \) changes sign at each of its zeros, we see that \( y'' = 0 \) at each zero of \( y, \) and changes sign there, so that the inflection points are located at the zeros. Thus (I) is true. (II) is false since \( y' = \cos x \) and, for example, \( \sin 0 = 0 \) but \( \cos 0 \neq 0. \) Finally, (III) is false since \( 0 \) is an inflection point but \( 0 \) is not a local extremum, since \( f'(x) = \cos x \) is positive in the vicinity of \( x = 0. \)

11. C is correct. Use L'Hôpital's rule:

\[
\lim_{t \to 0} \frac{1 - \cos 2t}{3t^2} = \lim_{t \to 0} \frac{2 \sin 2t}{6t} = \lim_{t \to 0} \frac{4 \cos 4t}{6} = \frac{2}{3}.
\]

12. B is correct. By Theorem 4.15, \( \ln^3 x \ll x^{1/10} = \sqrt[10]{x} \) as \( x \to \infty, \) so this limit is zero.

13. E is correct. (I) need not hold; for example, let \( f(x) = 2x - 4; \) then \( f(1) = -2 \) and \( f(5) = 6, \) but \( f'(x) = 2, \) which is never zero. (II) is true by the Intermediate Value Theorem: since \( f \) is differentiable and thus continuous on \([1, 5], \) and \( f(1) < 0 < f(5), \) there must be some \( c \in (1, 5) \) with \( f(c) = 0. \) Finally, (III) is true by the Mean Value Theorem: since the average rate of change of \( f \) is \( \frac{f(5) - f(1)}{5 - 1} = 2, \) there must be some \( c \in (1, 5) \) with \( f'(c) = 2. \)

14. B is correct. Since \( f' \) has exactly five zeros, its graph is tangent to the \( x \) axis at the origin, so it does not change sign there. Now, a relative minimum occurs when \( f' \) changes sign from negative to positive. There are exactly two such points in \([-2, 2], \) one around \(-1.5 \) and one around \( 1.8. \) Thus \( f \) has two relative minima.

15. D is correct. (I) must be true by the Mean Value Theorem: since \( \frac{f(5) - f(1)}{4} = 0, \) there is some \( c \in (1, 5) \) such that \( f'(c) = 0. \) (II) is also true by the Mean Value Theorem: since \( \frac{f(2) - f(1)}{1} = \frac{f(3) - f(2)}{1} = 2, \) there must be some \( c_1 \in (1, 2) \) and some \( c_2 \in (2, 3) \) with \( f'(c_1) = f'(c_2) = 2. \) Finally, (III) need not hold. From the information given, for all we know \( f \) could be much greater than 10 — for example, it could have positive slope at \( x = 3 \) and thus increase to the right of \( x = 3. \)
16. B is correct. Call the function (not its derivative) $f(x)$. Now, the critical points of $f$ are the zeros of its derivative, so $x = 3$ and $x = -2$. Thus the only local extrema can occur at those two points. However, since $f'$ changes sign from negative to positive at $x = 3$ but does not change sign at $x = -2$ (due to the even exponent on the factor of $x + 2$), only $x = 3$ is a local extremum; since the sign change is from negative to positive, it is a local minimum. Since $f'(x) < 0$ for all $x < 3$, and $f'(x) > 0$ for all $x > 3$, it follows that $f$ is decreasing to the left of $x = 3$ and increasing to the right, so that in fact $x = 3$ is an absolute minimum. Next,

$$f''(x) = \frac{1}{20} (3(x - 3)^2(x + 2)^2 + (x - 3)^3 \cdot 2(x + 2))$$

$$= \frac{1}{20} (x - 3)^2(x + 2)(3(x + 2) + 2(x - 3))$$

$$= \frac{1}{4} x(x - 3)^2(x + 2).$$

Possible inflection points are at the zeros of $f''(x)$, which are $x = 3, x = -2, and x = 0$. However, $f''$ changes sign only at the latter two of these, so there are two inflection points: $x = -2$ and $x = 0$.

17. D is correct. We want to maximize $P = xy$ given that $y = 4 - x^3$. Substitute to get $P(x) = x(4 - x^3) = 4x - x^4$. Then $P'(x) = 4 - 4x^3$, so that $P'(x) = 0$ when $x = 1$. Since $P''(x) = -12x^2$, we have $P''(1) < 0$ so that in fact $x = 1$ is a local maximum; since it is the only local maximum, it is an absolute maximum. So the point is $(1,4 - 1^3) = (1,3)$, and the maximum product is $1 \cdot 3 = 3$.

18. B is correct. Since $f'(x) = \frac{1}{\sqrt{1 - x^2}}$, we have $f'(\frac{1}{2}) = \frac{1}{\sqrt{1 - \frac{1}{4}}} = \frac{2}{\sqrt{3}}$. So the linear approximation is

$$L(x) = f\left(\frac{1}{2}\right) + f'\left(\frac{1}{2}\right) \left( x - \frac{1}{2}\right) = \frac{\pi}{6} + \frac{2}{\sqrt{3}} \left( x - \frac{1}{2}\right) = \frac{\pi}{6}x + \frac{\pi}{6} - \frac{1}{\sqrt{3}}.$$

Thus

$$\sin^{-1}(0.55) \approx L(0.55) = \frac{2}{\sqrt{3}} \cdot 0.55 + \frac{\pi}{6} - \frac{1}{\sqrt{3}} \approx 0.581.$$

19. D is correct. The slope of the tangent line is the value of the derivative $f'(x) = \sin x + x \cos x$, so we want $f'(x) = 4$. Solving $\sin x + x \cos x = 4$ numerically gives $x \approx 5.657$.

**Free Response**

1. a. Differentiating implicitly we get $2yy' = 3x^2 - 6$, so that

$$y' = \frac{3x^2 - 6}{2y}.$$ 

So at $(1,1)$, we have $y' = \frac{3-6}{2} = -\frac{3}{2}$, so that the equation of the tangent line is

$$y = 1 - \frac{3}{2}(x - 1) = -\frac{3}{2}x + \frac{5}{2}.$$ 

b. There is a possible horizontal tangent where the numerator of $f'$ vanishes but the denominator does not. The numerator vanishes at $x = \pm \sqrt{2}$; at those points, we get

$$y^2 = \left(\sqrt{2}\right)^3 - 6\sqrt{2} + 6 = 6 - 4\sqrt{2} \approx 0.343, \quad y^2 = (-\sqrt{2})^3 - 6(-\sqrt{2}) + 6 = 6 + 4\sqrt{2} \approx 11.657.$$ 

Since $\sqrt{2} \approx 1.414$, $\sqrt{0.343} \approx 0.586$, and $\sqrt{11.657} \approx 3.344$, we get four points where the tangent is horizontal:

$$(1.414, 0.586), \quad (1.414, -0.586), \quad (-1.414, 3.414), \quad (-1.414, -3.414).$$

There is a possible vertical tangent line where the denominator of $f'$ vanishes but the numerator does not. The denominator vanishes at $y = 0$; the points on $C$ at $y = 0$ are the roots of $x^3 - 6x + 6$. The only real root of this cubic is $x \approx -2.847$; since the numerator of $f'(x)$ is nonzero at this value of $x$, we get the point $\approx (-2.847, 0)$ as the only point with a vertical tangent line.
c. The line \( y = \frac{2}{5}x \) intersects \( C \) at the points where
\[
\left( \frac{2}{5}x \right)^2 = y^2 = x^3 - 6x + 6, \quad \text{or} \quad x^3 - \frac{4}{25}x^2 - 6x + 6 = 0, \quad \text{or} \quad 25x^3 - 4x^2 - 150x + 150 = 0.
\]
Again solving numerically, the only real root is at \( x \approx -2.778 \); the coordinates of this point are
\[
\left( -2.778, \frac{2}{5}(-2.778) \right) \approx \left( -2.778, -1.111 \right),
\]
which is the only point of intersection.

2.
   a. We have
   \[
f'(x) = \frac{x^2}{2} - \sin x,
   \]
   so that the relative extrema of \( f \) can occur where \( f'(x) = 0 \). A graph of \( f'(x) \) is
   
   ![Graph of f'(x)](image)

   and we see that there are two roots. \( x = 0 \) is one of the roots, by inspection; for the other, solve numerically to get \( x \approx 1.404 \). Since \( f' \) changes sign from positive to negative at \( x = 0 \) and from negative to positive at \( x \approx 1.404 \), we must have a local maximum at \( x = 0 \) and a local minimum at \( x \approx 1.404 \). The corresponding values are \( f(0) = 2 \) and \( f(1.404) \approx 1.627 \).

   b. At \( x = \pi \), the slope of the tangent is \( f'(\pi) = \frac{\pi^2}{2} - \sin \pi = \frac{\pi^2}{2} \), so that the linear approximation is
   \[
   L(x) = f(\pi) + f'(\pi)(x - \pi) = \frac{\pi^3}{6} + \cos \pi + 1 + \frac{\pi^2}{2}(x - \pi) = \frac{\pi^2}{2}x - \frac{\pi^3}{3}.
   \]

   c. Using the approximation from part (b), we get
   \[
f(3) \approx L(3) = \frac{\pi^2}{2} \cdot 3 - \frac{\pi^3}{3} \approx 4.469.
   \]

   d. Since \( f''(x) = x - \cos x \), we have \( f''(3) = 3 - \cos 3 > 0 \), so that the estimate in part (c) is an underestimate.

3.
   a. Since the numerator and denominator are defined everywhere, and the denominator is zero only at \( x = 0 \), the domain is \( \{ x : x \neq 0 \} \).

   b. We have
   \[
   \lim_{x \to 0} \frac{e^{4x} - e^{3x}}{2x} = \lim_{x \to 0} \frac{4e^{4x} - 3e^{3x}}{2} = \frac{4 - 3}{2} = \frac{1}{2}.
   \]

   c. For \( f \) to be continuous, we must have \( f(0) = \lim_{x \to 0} f(x) \), so we have to define \( f(0) = \frac{1}{2} \).

Copyright © 2014 Pearson Education, Inc.
4.

a. Since the numerator and denominator are defined everywhere, and the denominator is zero only at \( x = 0 \), the domain is \( \{ x : x \neq 0 \} \).

b. We have
\[
g'(x) = \frac{x(2x - 3) - (x^2 - 3x + 4) \cdot 1}{x^2} = \frac{x^2 - 4}{x^2}, \quad g''(x) = \frac{x^2 \cdot 2x - (x^2 - 4) \cdot 2x}{x^4} = \frac{8}{x^3}.
\]
Then \( g'(x) = 0 \) for \( x = \pm 2 \). Since \( g''(2) = 1 \) but \( g''(-2) = -1 \), we see that \( x = 2 \) is a local minimum while \( x = -2 \) is a local maximum.

c. \( g \) is concave up when \( g''(x) > 0 \), which is on \( (0, \infty) \). It is concave down when \( g''(x) < 0 \), which is in \( (-\infty, 0) \).

d. \( g \) has a vertical asymptote where the denominator vanishes but the numerator does not; this is at \( x = 0 \).

e. We have
\[
\lim_{x \to \infty} \frac{x^2 - 3x + 4}{x} = \lim_{x \to \infty} \frac{x - 3 + \frac{4}{x}}{1} = \lim_{x \to \infty} \left( x - 3 + \frac{4}{x} \right) = \infty.
\]
\[
\lim_{x \to -\infty} \frac{x^2 - 3x + 4}{x} = \lim_{x \to -\infty} \frac{x - 3 + \frac{4}{x}}{1} = \lim_{x \to -\infty} \left( x - 3 + \frac{4}{x} \right) = -\infty.
\]

5.

a. Differentiating with \( f(x) = x\sqrt{k - x} = x(k - x)^{1/2} \) gives
\[
f'(x) = \frac{(k - x)^{1/2} + x \cdot \frac{1}{2}(k - x)^{-1/2}(-1)}{\sqrt{k - x}} = \frac{k - x - \frac{1}{2}x}{\sqrt{k - x}} = \frac{2k - 3x}{2\sqrt{k - x}},
\]
\[
f''(x) = \frac{2\sqrt{k - x}(-3) - (2k - 3x) \left(2 \cdot \frac{1}{2}(k - x)^{-1/2}(-1)\right)}{4(k - x)} = \frac{-6(k - x) + (2k - 3x)}{4(k - x)^{3/2}} = \frac{3x - 4k}{4(k - x)^{3/2}}.
\]

b. \( x = 2 \) is an absolute maximum if \( f'(2) = 0 \) and \( f''(2) < 0 \). Now,
\[
f'(2) = \frac{2k - 6}{2\sqrt{k - 2}},
\]
so that \( f'(2) = 0 \) if and only if \( k = 3 \). At \( x = 2 \) with \( k = 3 \), we have
\[
f''(2) = \frac{3 \cdot 2 - 4 \cdot 3}{4(3 - 2)^{3/2}} = \frac{3}{2} < 0.
\]
Thus \( k = 3 \) is the only such value of \( k \).

c. As \( x \to -\infty \), we have \( 5 - x > 0 \), so that \( \sqrt{5 - x} \to \infty \). Thus \( x\sqrt{5 - x} \to -\infty \cdot \infty = -\infty \) as \( x \to -\infty \).

d. By part (c), \( \lim_{x \to -\infty} f(x) = -\infty \), so that \( f \) does not have an absolute minimum value for \( k = 5 \).

6.

a. We have
\[
f'(x) = e^{1-x} + xe^{1-x}(-1) = (1 - x)e^{1-x}, \quad f''(x) = -e^{1-x} + (1 - x)e^{1-x}(-1) = (x - 2)e^{1-x}.
\]
The local extreme values of \( f \) occur where \( f'(x) = 0 \), which is only at \( x = 1 \). At \( x = 1 \), \( f''(x) = -1 < 0 \), so that \( x = 1 \) is a local maximum, and \( f(1) = 1e^{1-1} = 1 \) is the corresponding value.
b. The graph of $f$ is concave up and decreasing where $f'(x)$ is negative and $f''(x)$ is positive. Since the exponential factors are always positive, we need both $1 - x < 0$ and $x - 2 > 0$, so that $x > 1$ and $x > 2$. So the interval is $(2, \infty)$.

c. The graph of $f$ is concave down and increasing where $f'(x)$ is positive and $f''(x)$ is negative. Since the exponential factors are always positive, we need both $1 - x > 0$ and $x - 2 < 0$, so that $x < 1$ and $x < 2$. So the interval is $(-\infty, 1)$.

d. We have, using L'Hôpital’s rule,

$$
\lim_{x \to \infty} xe^{1-x} = \lim_{x \to \infty} \frac{x}{e^{x-1}} = \lim_{x \to \infty} \frac{1}{e^{x-1}} = 0.
$$

As $x \to -\infty$, we see that $1 - x \to \infty$, so that $e^{1-x} \to \infty$ and thus $xe^{1-x} \to -\infty$.

e. A graph of the function is

![Graph of the function](image)
5.1 Antiderivatives

5.1.1 If $F'(x) = f(x)$, then $f$ is the derivative of $F$ and $F$ is an antiderivative of $f$.

5.1.2 $C$, where $C$ is any constant.

5.1.3 $x + C$, where $C$ is any constant.

5.1.4 By Theorem 4.11, if two functions have the same derivative then they differ by a constant.

5.1.5 $\frac{x^{p+1}}{p+1} + C$, where $C$ is any real number and $p \neq -1$.

5.1.6 $-e^{-x} + C$, where $C$ is any constant.

5.1.7 $\ln |x| + C$, where $C$ is any constant.

5.1.8 From Table 5.1, $\int \cos ax \, dx = \frac{1}{a} \sin ax + C$, $\int \sin ax \, dx = -\frac{1}{a} \cos ax + C$.

5.1.9 Observe that $F(-1) = 4 + C = 4$, so $C = 0$.

5.1.10 First, find the general solution $F(t)$, which is the family of all antiderivatives of $f(t)$. Then use the initial condition to find the specific value of the constant in the formula for $F(t)$.

5.1.11 The antiderivatives of $5x^4$ are $x^5 + C$.
Check: $\frac{d}{dx}(x^5 + C) = 5x^4$.

5.1.12 The antiderivatives of $11x^{10}$ are $x^{11} + C$.
Check: $\frac{d}{dx}(x^{11} + C) = 11x^{10}$.

5.1.13 The antiderivatives of $\sin 2x$ are $-\frac{1}{2} \cos 2x + C$.
Check: $\frac{d}{dx}(-\frac{1}{2} \cos 2x + C) = \sin 2x$.

5.1.14 The antiderivatives of $-4 \cos 4x$ are $-\sin 4x + C$.
Check: $\frac{d}{dx}(-\sin 4x + C) = -\cos 4x$.

5.1.15 The antiderivatives of $3 \sec^2 x$ are $3 \tan x + C$.
Check: $\frac{d}{dx}(3 \tan x + C) = 3 \sec^2 x$.

5.1.16 The antiderivatives of $\csc^2 s$ are $-\cot s + C$.
Check: $\frac{d}{ds}(-\cot s + C) = \csc^2 s$. 

Copyright © 2014 Pearson Education, Inc.
5.1.17 The antiderivatives of \(-\frac{2}{y^2}\) are \(-2y^{-3} + C\).
Check: \(\frac{d}{dy}(y^{-2} + C) = -2y^{-3}\).

5.1.18 The antiderivatives of \(-6z^{-7}\) are \(-6z^{-7} + C\).
Check: \(\frac{d}{dz}(z^{-6} + C) = -6z^{-7}\).

5.1.19 The antiderivatives of \(e^x\) are \(e^x + C\).
Check: \(\frac{d}{dx}(e^x + C) = e^x\).

5.1.20 The antiderivatives of \(y^{-1}\) are \(\ln |y| + C\).
Check: \(\frac{d}{dy}(\ln |y| + C) = \frac{1}{y}\).

5.1.21 The antiderivatives of \(\frac{1}{\sqrt{4 + t^2}}\) are \(\tan^{-1} s + C\).
Check: \(\frac{d}{dt}(\tan^{-1}(s) + C) = \frac{1}{\sqrt{4 + t^2}}\).

5.1.22 The antiderivatives of \(\pi\) are \(\pi t + C\).
Check: \(\frac{d}{dt}(\pi t + C) = \pi\).

5.1.23 \(\int (3x^5 - 5x^9)\, dx = 3 \cdot \frac{x^6}{6} - 5 \cdot \frac{x^{10}}{10} + C = \frac{1}{2}x^6 - \frac{1}{2}x^{10} + C\).
Check: \(\frac{d}{dx}\left(\frac{1}{2}x^6 - \frac{1}{2}x^{10} + C\right) = 3x^5 - 5x^9\).

5.1.24 \(\int (3u^{-2} - 4u^2 + 1)\, du = 3 \cdot \frac{u^{-1}}{-1} - 4 \cdot \frac{u^3}{3} + u + C = -\frac{4}{3}u^3 + u - \frac{3}{u} + C\).
Check: \(\frac{d}{du}\left(-\frac{4}{3}u^3 + u - \frac{3}{u} + C\right) = -4u^2 + 1 + 3u^{-2}\).

5.1.25 \(\int \left(\frac{4\sqrt{x} - \frac{4}{x^2}}{3}\right)\, dx = \int \left(\frac{4x^{1/2} - 4x^{-1/2}}{2}\right)\, dx = 4 \cdot \frac{x^{3/2}}{3/2} - 4 \cdot \frac{x^{1/2}}{1/2} + C = \frac{8}{3}x^{3/2} - 8x^{1/2} + C\).
Check: \(\frac{d}{dx}\left(\frac{8}{3}x^{3/2} - 8x^{1/2} + C\right) = 4\sqrt{x} - \frac{4}{\sqrt{x}}\).

5.1.26 \(\int \left(\frac{3}{x} + 4t^2\right)\, dt = 5 \cdot \frac{1}{t} + 4 \cdot \frac{t^3}{3} + C = \frac{5}{t} + \frac{4}{3}t^3 + C\).
Check: \(\frac{d}{dt}\left(\frac{5}{t} + \frac{4}{3}t^3 + C\right) = 4t^2 + \frac{5}{t}\).

5.1.27 \(\int (5s + 3)^2\, ds = \int (25s^2 + 30s + 9)\, ds = \frac{25}{3}s^3 + 15s^2 + 9s + C\).
Check: \(\frac{d}{ds}\left(\frac{25}{3}s^3 + 15s^2 + 9s + C\right) = 25s^2 + 30s + 9 = (5s + 3)^2\).

5.1.28 \(\int 5m(12m^4 - 10m)\, dm = \int (60m^4 - 50m^2)\, dm = 60 \cdot \frac{m^5}{5} - 50 \cdot \frac{m^3}{3} + C = 12m^5 - \frac{50}{3}m^3 + C\).
Check: \(\frac{d}{dm}\left(12m^5 - \frac{50}{3}m^3 + C\right) = 5m(12m^4 - 10m)\).

5.1.29 \(\int (3x^{1/3} + 4x^{-1/3} + 6)\, dx = 3 \cdot \frac{3}{2}x^{4/3} + 4 \cdot \frac{3}{2}x^{2/3} + 6x + C = \frac{9}{2}x^{4/3} + 6x^{2/3} + 6x + C\).
Check: \(\frac{d}{dx}\left(\frac{9}{2}x^{4/3} + 6x^{2/3} + 6x + C\right) = 3x^{1/3} + 4x^{-1/3} + 6\).

5.1.30 \(\int 6\sqrt{x}\, dx = \int 6x^{1/2}\, dx = 6 \cdot \frac{2}{3}x^{3/2} + C = \frac{4}{3}x^{3/2} + C\).
Check: \(\frac{d}{dx}\left(\frac{4}{3}x^{3/2} + C\right) = 6\sqrt{x}\).

5.1.31 \(\int (3x + 1)(4 - x)\, dx = \int (12x - 3x^2 + 4 - x)\, dx = \int (-3x^2 + 11x + 4)\, dx = -x^3 + \frac{11}{2}x^2 + 4x + C\).
Check: \(\frac{d}{dx}\left(-x^3 + \frac{11}{2}x^2 + 4x + C\right) = -3x^2 + 11x + 4\).

5.1.32 \(\int (4z^{1/3} - z^{-1/3})\, dz = 3z^{4/3} - 3z^{-2/3} + C\).
Check: \(\frac{d}{dz}\left(3z^{4/3} - 3z^{-2/3} + C\right) = 4z^{1/3} - z^{-1/3}\).

5.1.33 \(\int (3x^4 - 2 + 3x^{-2})\, dx = -x^{-3} + 2x + 3x^{-1} + C\).
Check: \(\frac{d}{dx}\left(-x^{-3} + 2x + 3x^{-1} + C\right) = 3x^{-4} + 2 - 3x^{-2}\).

5.1.34 \(\int r^{2/5}\, dr = \frac{5}{7}r^{7/5} + C\).
Check: \(\frac{d}{dr}\left(\frac{5}{7}r^{7/5} + C\right) = r^{2/5}\).
5.1.35 \[ \int \frac{4x^4-6x^2}{x^2} \, dx = \int \left( \frac{4x^4}{x^2} - \frac{6x^2}{x^2} \right) \, dx = \int (4x^3 - 6x) \, dx = x^4 - 3x^2 + C. \]
Check: \( \frac{d}{dx} (x^4 - 3x^2 + C) = 4x^3 - 6x. \)

5.1.36 \[ \int \frac{12t^5-1}{t^2} \, dt = \int \left( \frac{12t^5}{t^2} - \frac{1}{t^2} \right) \, dt = \int (12t^3 - t^{-2}) \, dt = 2t^6 + t^{-1} + C. \]
Check: \( \frac{d}{dt} (2t^6 + t^{-1} + C) = 12t^3 - t^{-2}. \)

5.1.37 Using Table 5.1 (formulas 1 and 2), \[ \int (\sin 2y + \cos 3y) \, dy = -\frac{1}{2} \cos 2y + \frac{1}{3} \sin 3y + C. \]
Check: \( \frac{d}{dy} \left( -\frac{1}{2} \cos 2y + \frac{1}{3} \sin 3y + C \right) = \sin 2y + \cos 3y. \)

5.1.38 Using Table 5.1 (formula 2), \[ \int \left[ \sin 4t - \sin \left( \frac{1}{4}t \right) \right] \, dt = -\frac{1}{4} \cos 4t + 4 \cos \left( \frac{1}{4}t \right) + C. \]
Check: \( \frac{d}{dt} \left( -\frac{1}{4} \cos 4t + 4 \cos \left( \frac{1}{4}t \right) + C \right) = \sin 4t - \sin \left( \frac{1}{4}t \right). \)

5.1.39 Using Table 5.1 (formula 3), \[ \int (\sec^2 x - 1) \, dx = \tan x - x + C. \]
Check: \( \frac{d}{dx} (\tan x - x + C) = \sec^2 x - 1. \)

5.1.40 Using Table 5.1 (formula 3), \[ \int 2 \sec^2 2v \, dv = 2 \cdot \frac{1}{2} \tan 2v + C = \tan 2v + C. \]
Check: \( \frac{d}{dv} (\tan 2v + C) = 2 \sec^2 2v. \)

5.1.41 Using Table 5.1 (formulas 3 and 5), \[ \int (\sec^2 \theta + \sec \theta \tan \theta) \, d\theta = \tan \theta + \sec \theta + C. \]
Check: \( \frac{d}{d\theta} (\tan \theta + \sec \theta + C) = \sec^2 \theta + \sec \theta \tan \theta. \)

5.1.42 Using Table 5.1 (formulas 3 and 5), \[ \int \frac{\sin \theta - 1}{\cos \theta} \, d\theta = \int (\sec \theta \tan \theta - \sec^2 \theta) \, d\theta = \sec \theta - \tan \theta + C. \]
Check: \( \frac{d}{d\theta} (\sec \theta - \tan \theta + C) = \sec \theta \tan \theta - \sec^2 \theta = \frac{\sin \theta - 1}{\cos \theta}. \)

5.1.43 \[ \int (3t^2 + \sec^2 2t) \, dt = t^3 + \frac{1}{2} \tan 2t + C. \]
Check: \( \frac{d}{dt} \left( t^3 + \frac{1}{2} \tan 2t + C \right) = 3t^2 + \frac{1}{2} \cdot 2 \sec^2 2t \cdot 2t = 3t^2 + \sec^2 2t. \)

5.1.44 \[ \int \csc 3\phi \cot 3\phi \, d\phi = -\frac{1}{3} \csc 3\phi + C. \]
Check: \( \frac{d}{d\phi} \left( -\frac{1}{3} \csc 3\phi + C \right) = -\frac{1}{3} (-3 \csc 3\phi \cot 3\phi) = \csc 3\phi \cot 3\phi. \)

5.1.45 \[ \int \sec 4\theta \tan 4\theta \, d\theta = \frac{1}{4} \sec 4\theta + C. \]
Check: \( \frac{d}{d\theta} \left( \frac{1}{4} \sec 4\theta + C \right) = \frac{1}{4} (4 \sec 4\theta \tan 4\theta) = \sec 4\theta \tan 4\theta. \)

5.1.46 \[ \int \csc^2 6x \, dx = -\frac{1}{6} \cot 6x + C. \]
Check: \( \frac{d}{dx} \left( -\frac{1}{6} \cot 6x + C \right) = -\frac{1}{6} (-6 \csc^2 6x) = \csc^2 6x. \)

5.1.47 \[ \int \frac{1}{y} \, dy = \int y^{-1} \, dy = \frac{1}{2} \ln |y| + C. \]
Check: \( \frac{d}{dy} \left( \frac{1}{2} \ln |y| + C \right) = \frac{1}{2y}. \)

5.1.48 \[ \int (e^{2t} + 2\sqrt{I}) \, dt = \frac{1}{2} e^{2t} + 2 \cdot \frac{2}{3} t^{3/2} + C = \frac{1}{2} e^{2t} + \frac{4}{3} t^{3/2} + C. \]
Check: \( \frac{d}{dt} \left( \frac{1}{2} e^{2t} + \frac{4}{3} t^{3/2} + C \right) = e^{2t} + 2\sqrt{I}. \)

5.1.49 Using Table 5.2 (formula 10, a = 5), \[ \int \frac{6}{\sqrt{25-x^2}} \, dx = 6 \sin^{-1} \left( \frac{x}{5} \right) + C. \]
Check: \( \frac{d}{dx} \left( 6 \sin^{-1} \left( \frac{x}{5} \right) + C \right) = \frac{6}{\sqrt{1-(x/5)^2}} \cdot \frac{1}{5} = \frac{6}{\sqrt{25-x^2}}. \)

5.1.50 Using Table 5.2 (formula 11, a = 2), \[ \int \frac{3}{4+x^2} \, dx = \frac{3}{2} \tan^{-1} \left( \frac{x}{2} \right) + C. \]
Check: \( \frac{d}{dx} \left( \frac{3}{2} \tan^{-1} \left( \frac{x}{2} \right) + C \right) = \frac{1}{2} \cdot \frac{1}{\left( \frac{x}{2} \right)^2+1} \cdot \frac{1}{2} = \frac{3}{4+x^2}. \)

5.1.51 Using Table 5.2 (formula 12, a = 10), \[ \int \frac{1}{x\sqrt{x^2-100}} \, dx = \frac{1}{10} \sec^{-1} \left( \frac{x}{10} \right) + C. \]
Check: \( \frac{d}{dx} \left( \frac{1}{10} \sec^{-1} \left( \frac{x}{10} \right) + C \right) = \frac{1}{10} \cdot \frac{1}{\left( \frac{x}{10} \right)^2+1} \cdot \frac{1}{2} = \frac{1}{x\sqrt{x^2-100}}. \)
5.1.52 Using Table 5.2 (formula 11, \( a = \frac{5}{4} \)),
\[
\int \frac{2}{16z^2 + 25} \, dz = \frac{1}{8} \int \frac{1}{z^2 + 25/16} \, dz = \frac{1}{8} \cdot \frac{4}{5} \tan^{-1} \left( \frac{4}{5} z \right) + C = \frac{1}{10} \tan^{-1} \left( \frac{4}{5} z \right) + C.
\]
Check: \( \frac{d}{dz} \left( \frac{1}{10} \tan^{-1} \left( \frac{4}{5} z \right) + C \right) = \frac{1}{10} \cdot \frac{1}{(16z^2/25) + 1} \cdot \frac{4}{5} = \frac{2}{16z^2 + 25}. \)

5.1.53 Using Table 5.2 (formula 12, \( a = 5 \)), \( \int \frac{1}{x \sqrt{x^2 - 25}} \, dx = \frac{1}{2} \sec^{-1} \left( \frac{x}{5} \right) + C. \)
Check: \( \frac{d}{dx} \left( \frac{1}{2} \sec^{-1} \left( \frac{x}{5} \right) + C \right) = \frac{1}{2} \cdot \frac{5}{x \sqrt{x^2 - 25}} = \frac{1}{x \sqrt{x^2 - 25}}. \)

5.1.54 \( \int (49 - x^2)^{-1/2} \, dx = \sin^{-1} \left( \frac{x}{7} \right) + C. \)
Check: \( \frac{d}{dx} \left( \sin^{-1} \left( \frac{x}{7} \right) + C \right) = \frac{1}{\sqrt{1 - (x^2/49)}} \cdot \frac{1}{7} = \frac{1}{\sqrt{49 - x^2}}. \)

5.1.55 \( \int \frac{44}{t^2 + 1} \, dt = \int (\frac{4}{t} + \frac{1}{t^2}) \, dt = \int (1 + \frac{1}{t}) \, dt = t + \ln |t| + C. \)
Check: \( \frac{d}{dt} (t + \ln |t| + C) = 1 + \frac{1}{t} = \frac{t+1}{t}. \)

5.1.56 \( \int (22x^{10} - 24e^{12x}) \, dx = 2x^{11} - 2e^{12x} + C. \)
Check: \( \frac{d}{dx} (2x^{11} - 2e^{12x} + C) = 22x^{10} - 24e^{12x}. \)

5.1.57 \( \int e^{x+2} \, dx = \int e^x e^2 \, dx = e^x \int e^2 \, dx = e^x e^2 + C = e^{x+2} + C. \)
Check: \( \frac{d}{dx} (e^{x+2} + C) = e^{x+2}. \)

5.1.58 \( \int \frac{10t^4 - 3}{t^3} \, dt = \int \left( \frac{10t^4}{t^3} - \frac{3}{t^3} \right) \, dt = \int (10t - \frac{3}{t^3}) \, dt = 2t^5 - 3 \ln |t| + C. \)
Check: \( \frac{d}{dt} (2t^5 - 3 \ln |t| + C) = 10t^4 - \frac{3}{t^3} = \frac{10t^4 - 3}{t^3}. \)

5.1.59 We have \( F(x) = \int (x^5 - 2x^{-2} + 1) \, dx = \frac{x^6}{6} + 2x^{-1} + x + C; \) substituting \( F(1) = 0 \) gives \( \frac{1}{6} + 2 + 1 + C = 0, \) so \( C = -\frac{16}{6} \), and thus \( F(x) = \frac{x^6}{6} + \frac{2}{x} + x - \frac{16}{6}. \)

5.1.60 We have \( F(t) = \int \sec^2 t \, dt = \tan t + C; \) substituting \( F \left( \frac{\pi}{4} \right) = 1 \) gives \( \tan \frac{\pi}{4} + C = 1 + C = 1, \) so \( C = 0, \) and thus \( F(t) = \tan t. \)

5.1.61 We have \( F(v) = \int \sec v \tan v \, dv = \sec v + C; \) substituting \( F(0) = 2 \) gives \( 0 + C = 1 + C = 2, \) so \( C = 1, \) and thus \( F(v) = \sec v + 1. \)

5.1.62 We have \( F(x) = \int \left( \frac{4\sqrt{x+6}/\sqrt{x}}{x^2} \right) \, dx = \int \left( 4x^{-3/2} + 6x^{-5/2} \right) \, dx = 4 \cdot (-2)x^{-1/2} + 6 \cdot \left( -2 \right) x^{-3/2} + C = -8x^{-1/2} - 4x^{-3/2} + C; \) substituting \( F(1) = 4 \) gives \(-8 - 4 + C = 4, \) so \( C = 16, \) and thus \( F(x) = -8x^{-1/2} - 4x^{-3/2} + 16. \)

5.1.63 We have \( F(x) = \int (8x^3 - 2x^{-2}) \, dx = 2x^4 + 2x^{-1} + C; \) substituting \( F(1) = 5 \) gives \( 2 + 1 + C = 5, \) so \( C = 1, \) and thus \( F(x) = 2x^4 + 2x^{-1} + 1. \)

5.1.64 We have \( F(u) = \int (2u^3 + 3) \, du = 2u^4 + 3u + C; \) substituting \( F(0) = 8 \) gives \( 2 + 0 + C = 8, \) so \( C = 6, \) and thus \( F(u) = 2u^4 + 3u + 6. \)

5.1.65 We have \( F(y) = \int \frac{3y^2 + 5}{y} \, dy = \int \left( \frac{3y^2}{y} + \frac{5}{y} \right) \, dy = \left( 3y^2 + \frac{5}{y} \right) \, dy = y^3 + 5 \ln |y| + C; \) substituting \( F(1) = 3 \) gives \( 1 + 0 + C = 3, \) so \( C = 2, \) and thus \( F(y) = y^3 + 5 \ln |y| + 2. \)

5.1.66 \( F(\theta) = \int (2 \sin 2\theta - 4 \cos 4\theta) \, d\theta = -\cos 2\theta - \sin 4\theta + C; \) substituting \( F \left( \frac{\pi}{4} \right) = 2 \) gives \( 0 + 0 + C = 2, \) so \( C = 2, \) and thus \( F(\theta) = -\cos 2\theta - \sin 4\theta + 2. \)

5.1.67 We have \( f(x) = \int (2x - 3) \, dx = x^2 - 3x + C; \) substituting \( f(0) = 4 \) gives \( C = 4, \) so \( f(x) = x^2 - 3x + 4. \)

5.1.68 We have \( g(x) = \int \left( 7x^6 - 4x^3 + 12 \right) \, dx = x^7 - x^4 + 12x + C; \) substituting \( g(1) = 24 \) gives \( 1 - 1 + 12 + C = 24, \) so \( C = 12, \) and thus \( g(x) = x^7 - x^4 + 12x + 12. \)
5.1.69 We have \( g(x) = \int 7x \left( x^6 - \frac{1}{2} \right) \, dx = \int (7x^7 - x) \, dx = \frac{7}{8} x^8 - \frac{x^2}{2} + C; \) substituting \( g(1) = 2 \) gives \( \frac{7}{8} - \frac{1}{2} + C = 2, \) so \( C = \frac{13}{8}, \) and thus \( g(x) = \frac{7}{8} x^8 - \frac{x^2}{2} + \frac{13}{8}. \)

5.1.70 We have \( h(t) = \int 6 \sin 3t \, dt = 6 \cdot (-\frac{1}{3} \cos 3t) + C = -2 \cos 3t + C; \) substituting \( h \left( \frac{\pi}{6} \right) = 6 \) gives \(-2 \cos 3 \cdot \frac{\pi}{2} + C = 6, \) so \( C = 6, \) and thus \( h(t) = -2 \cos 3t + 6. \)

5.1.71 We have \( f(u) = \int 4 (\cos u - \sin 2u) \, du = 4 (\sin u + \frac{1}{2} \cos 2u) + C = 4 \sin u + 2 \cos 2u + C; \) substituting \( f \left( \frac{\pi}{6} \right) = 0 \) gives \( 4 \sin \frac{\pi}{6} + 2 \cos \frac{2\pi}{6} + C = 2 + 1 + C = 0, \) so \( C = -3, \) and thus \( f(u) = 4 \sin u + 2 \cos 2u - 3. \)

5.1.72 We have \( p(t) = \int 10 e^{-t} \, dt = -10 e^{-t} + C; \) substituting \( p(0) = 100 \) gives \(-10 + C = 100, \) so \( C = 110, \) and thus \( p(t) = -10 e^{-t} + 110. \)

5.1.73 We have \( y(t) = \int \left( \frac{3}{t} + 6 \right) \, dt = 3 \ln |t| + 6t + C; \) substituting \( y(1) = 8 \) gives \( 0 + 6 + C = 8, \) so \( C = 2, \) and thus \( y(t) = 3 \ln |t| + 6t + 2. \)

5.1.74 We have \( u(x) = \int \frac{x^2 + 4e^{-x}}{e^x} \, dx = \int \left( \frac{e^{2x} + 4e^{-x}}{e^x} \right) \, dx = \int (e^x + 4e^{-2x}) \, dx = e^x - 2e^{-2x} + C; \) substituting \( u(\ln 2) = 2 \) gives \( 2 - 2 \cdot \frac{1}{4} + C = 2, \) so \( C = \frac{1}{2}, \) and thus \( u(x) = e^x - 2e^{-2x} + \frac{1}{2}. \)

5.1.75 We have \( y(\theta) = \int \frac{\sqrt{2} \cos^3 \theta + 1}{\cos^2 \theta} \, d\theta = \int \left( \frac{\sqrt{2} \cos^3 \theta}{\cos^2 \theta} + \frac{1}{\cos^2 \theta} \right) \, d\theta = \int \left( \sqrt{2} \cos \theta + \sec^2 \theta \right) \, d\theta = \sqrt{2} \sin \theta + \tan \theta + C; \) substituting \( y \left( \frac{\pi}{4} \right) = 3 \) gives \( 1 + 1 + C = 3, \) so \( C = 1, \) and thus \( y(\theta) = \sqrt{2} \sin \theta + \tan \theta + 1. \)

5.1.76 We have \( v(x) = \int \left( 4x^{\frac{1}{3}} + 2x^{-\frac{1}{3}} \right) \, dx = 3x^{\frac{4}{3}} + 3x^{\frac{2}{3}} + C; \) substituting \( v(8) = 40 \) gives \( 3 \cdot 8^{\frac{4}{3}} + 3 \cdot 8^{\frac{2}{3}} + C = 60 + C = 40 \) so that \( C = -20. \) So \( v(x) = 3x^{\frac{4}{3}} + 3x^{\frac{2}{3}} - 20. \)

5.1.77

We have \( f(x) = \int (2x - 5) \, dx = x^2 - 5x + C; \) substituting \( f(0) = 4 \) gives \( C = 4, \) so \( f(x) = x^2 - 5x + 4. \)

5.1.78

We have \( f(x) = \int (3x^2 - 1) \, dx = x^3 - x + C; \) substituting \( f(1) = 2 \) gives \( C = 2, \) so \( f(x) = x^3 - x + 2. \)
5.1.79

We have \( f(x) = \int (3x + \sin \pi x) \, dx = \frac{3x^2}{2} - \frac{\cos \pi x}{\pi} + C; \) substituting \( f(2) = 3 \) gives \( 6 - \frac{\cos 2\pi}{\pi} + C = 6 - \frac{1}{\pi} + C = 3, \) so \( C = \frac{1}{\pi} - 3, \) and thus \( f(x) = \frac{3x^2}{2} - \frac{\cos \pi x}{\pi} + \frac{1 - 3\pi}{\pi}. \)

5.1.80

We have \( f(s) = \int 4 \sec s \tan s \, ds = 4 \sec s + C; \) substituting \( f \left( \frac{\pi}{4} \right) = 1 \) gives \( 4 \sec \frac{\pi}{4} + C = 4\sqrt{2} + C = 1, \) so \( C = 1 - 4\sqrt{2}, \) and thus \( f(s) = 4 \sec s + 1 - 4\sqrt{2}. \)

5.1.81

We have \( f(t) = \int \frac{1}{t} \, dt = \ln t + C; \) substituting \( f(1) = 4 \) gives \( C = 4, \) so \( f(t) = \ln t + 4. \)

5.1.82

We have \( f(x) = \int 2 \cos 2x \, dx = 2 \cdot \frac{\sin 2x}{2} + C = \sin 2x + C; \) substituting \( f(0) = 1 \) gives \( C = 1, \) so \( f(x) = \sin 2x + 1. \)
5.1.83

We have \( s(t) = \int (2t + 4) \, dt = t^2 + 4t + C \); substituting \( s(0) = 0 \) gives \( C = 0 \), so \( s(t) = t^2 + 4t \).

5.1.84

We have \( s(t) = \int (e^{-2t} + 4) \, dt = -\frac{1}{2} e^{-2t} + 4t + C \); substituting \( s(0) = 2 \) gives \(-\frac{1}{2} + C = 2\), so \( C = \frac{5}{2} \), and thus \( s(t) = -\frac{1}{2} e^{-2t} + 4t + \frac{5}{2} \).

5.1.85

We have \( s(t) = \int 2 \sqrt{t} \, dt = 2 \cdot \frac{2}{3} t^{3/2} + C = \frac{4}{3} t^{3/2} + C \); substituting \( s(0) = 1 \) gives \( C = 1 \), so \( s(t) = \frac{4}{3} t^{3/2} + 1 \).

5.1.86

We have \( s(t) = \int 2 \cos t \, dt = 2 \sin t + C \); substituting \( s(0) = 0 \) gives \( C = 0 \), so \( s(t) = 2 \sin t \).
5.1.87

We have \( s(t) = \int (6t^2 + 4t - 10) \, dt = 2t^3 + 2t^2 - 10t + C \); substituting \( s(0) = 0 \) gives \( C = 0 \), so \( s(t) = 2t^3 + 2t^2 - 10t \).

5.1.88

We have \( s(t) = \int 2 \sin 2t \, dt = -\cos 2t + C \); substituting \( s(0) = 0 \) gives \(-1 + C = 0\), so \( C = 1 \) and \( s(t) = 1 - \cos 2t \).

5.1.89 \( v(t) = \int a(t) \, dt = \int -32 \, dt = -32t + C_1 \). Because \( v(0) = 20 \), we have \( 0 + C_1 = 20 \), so \( v(t) = -32t + 20 \).

\( s(t) = \int v(t) \, dt = \int (-32t + 20) \, dt = -16t^2 + 20t + C_2 \). Because \( s(0) = 0 \), we have \( C_2 = 0 \), and thus \( s(t) = -16t^2 + 20t \).

5.1.90 \( v(t) = \int a(t) \, dt = \int 4 \, dt = 4t + C_1 \). Because \( v(0) = -3 \), we have \( C_1 = -3 \).

\( s(t) = \int v(t) \, dt = \int (4t - 3) \, dt = 2t^2 - 3t + C_2 \). Because \( s(0) = 2 \), we have \( C_2 = 2 \), and thus \( s(t) = 2t^2 - 3t + 2 \).

5.1.91 \( v(t) = \int a(t) \, dt = \int 0.2t \, dt = 0.1t^2 + C_1 \). Because \( v(0) = 0 \), we have \( C_1 = 0 \).

\( s(t) = \int v(t) \, dt = \int 0.1t^2 \, dt = \frac{1}{3}t^3 + C_2 \). Because \( s(0) = 1 \), we have \( C_2 = 1 \), and thus \( s(t) = \frac{1}{3}t^3 + 1 \).

5.1.92 \( v(t) = \int a(t) \, dt = \int 2 \cos t \, dt = 2 \sin t + C_1 \). Because \( v(0) = 1 \), we have \( C_1 = 1 \).

\( s(t) = \int v(t) \, dt = \int (2 \sin t + 1) \, dt = -2 \cos t + t + C_2 \). Because \( s(0) = 0 \), we have \(-2 + 0 + C_2 = 0 \), so \( C_2 = 2 \). Thus, \( s(t) = -2 \cos t + t + 2 \).

5.1.93 \( v(t) = \int a(t) \, dt = \int 3 \sin 2t \, dt = -\frac{3}{2} \cos 2t + C_1 \). Because \( v(0) = 1 \), we have \(-\frac{3}{2} + C_1 = 1 \), so \( C_1 = \frac{5}{2} \).

\( s(t) = \int v(t) \, dt = \int \left( -\frac{3}{2} \cos 2t + \frac{5}{2} \right) \, dt = -\frac{3}{4} \sin 2t + \frac{5}{2}t + C_2 \). Because \( s(0) = 10 \), we have \( C_2 = 10 \), so \( s(t) = -\frac{3}{4} \sin 2t + \frac{5}{2}t + 10 \).

5.1.94 \( v(t) = \int a(t) \, dt = \int 2e^{-t/6} \, dt = -12e^{-t/6} + C_1 \). Because \( v(0) = 1 \), we have \(-12 + C_1 = 1 \), so \( C_1 = 13 \).

\( s(t) = \int v(t) \, dt = \int (-12e^{-t/6} + 13) \, dt = 72e^{-t/6} + 13t + C_2 \). Because \( s(0) = 0 \), we have \( 72 + C_2 = 0 \), so \( C_2 = -72 \). Thus, \( s(t) = 72e^{-t/6} + 13t - 72 \).

Copyright © 2014 Pearson Education, Inc.
5.1.95

Runner A has position function \( s(y) = \int \sin t \, dt = -\cos t + C \); the initial condition \( s(0) = 0 \) gives \( C = 1 \), so \( s(t) = 1 - \cos t \). Runner B has position function \( S(t) = \int \cos t \, dt = \sin t + C \); the initial condition \( S(0) = 0 \) gives \( C = 0 \), so \( S(t) = \sin t \). Thus runner A overtakes runner B at \( t = \frac{\pi}{2} \).

5.1.96

Runner A has position function \( s(y) = \int 2e^{-t} \, dt = -2e^{-t} + C \); the initial condition \( s(0) = 0 \) gives \(-2 + C = 0 \), so \( C = 2 \) and \( s(t) = 2 - 2e^{-t} \). Runner B has position function \( S(t) = \int 4e^{-4t} \, dt = -e^{-4t} + C \); the initial condition \( S(0) = 10 \) gives \(-1 + C = 10 \), so \( C = 11 \) and \( S(t) = 11 - e^{-4t} \). Observe that \( s(t) < 2 \) and \( S(t) > 10 \) for all \( t > 0 \), so runner A never catches runner B.

5.1.97

a. We have \( v(t) = -9.8t + v_0 \) and \( v_0 = 30 \), so \( v(t) = -9.8t + 30 \).

b. The height of the softball above ground is given by \( s(t) = \int (-9.8t + 30) \, dt = -4.9t^2 + 30t + s_0 = -4.9t^2 + 30t \).

c. The ball reaches its maximum height when \( v(t) = -9.8t + 30 = 0 \), which gives \( t = \frac{30}{9.8} \approx 3.061 \) s; the maximum height is \( s\left(\frac{30}{9.8}\right) \approx 45.918 \) m.

d. The ball strikes the ground when \( s(t) = 0 \) (and \( t > 0 \)), which gives \( t(30 - 4.9t) = 0 \), so \( t = \frac{30}{4.9} \approx 6.122 \) s.

5.1.98

a. We have \( v(t) = -9.8t + v_0 \) and \( v_0 = 30 \), so \( v(t) = -9.8t + 30 \).

b. The height of the stone above ground is given by \( s(t) = \int (-9.8t + 30) \, dt = -4.9t^2 + 30t + s_0 = -4.9t^2 + 30t + 200 \).

c. The stone reaches its maximum height when \( v(t) = -9.8t + 30 = 0 \), which gives \( t = \frac{30}{9.8} \approx 3.061 \) s; the maximum height is \( s\left(\frac{30}{9.8}\right) \approx 245.918 \) m.

d. The stone strikes the ground when \( s(t) = 0 \) (and \( t > 0 \)), which gives \(-4.9t^2 + 30t + 200 = 0 \), so \( t \approx 10.146 \) s.

5.1.99

a. We have \( v(t) = -9.8t + v_0 \) and \( v_0 = 10 \), so \( v(t) = -9.8t + 10 \).

b. The height of the payload above ground is given by \( s(t) = \int (-9.8t + 10) \, dt = -4.9t^2 + 10t + s_0 = -4.9t^2 + 10t + 400 \).

c. The payload reaches its maximum height when \( v(t) = -9.8t + 10 = 0 \), which gives \( t = \frac{10}{9.8} \approx 1.020 \) s; the maximum height is \( s\left(\frac{10}{9.8}\right) \approx 405.102 \) m.

Copyright © 2014 Pearson Education, Inc.
d. The payload strikes the ground when \( s(t) = 0 \) (and \( t > 0 \)), which gives \(-4.9t^2 + 10t + 400 = 0\), so \( t \approx 10.113 \) s.

5.1.100  

a. We have \( v(t) = -9.8t + v_0 \) and \( v_0 = -10 \), so \( v(t) = -9.8t - 10 \).

b. The height of the payload above ground is given by \( s(t) = \int (-9.8t - 10) \, dt = -4.9t^2 - 10t + s_0 = -4.9t^2 - 10t + 400 \).

c. Because \( v(t) < 0 \) for \( t > 0 \), the maximum height occurs at \( t = 0 \) and is the initial height 400 m.

d. The payload strikes the ground when \( s(t) = 0 \) (and \( t > 0 \)), which gives \(-4.9t^2 - 10t + 400 = 0\), so \( t \approx 8.072 \) s.

5.1.101  

a. True, because \( F'(x) = G'(x) \).

b. False; \( f \) is the derivative of \( F \).

c. True; \( \int f(x) \, dx \) is the most general antiderivative of \( f(x) \), which is \( F(x) + C \).

d. False; a function cannot have more than one derivative.

e. False; one can only conclude that \( F(x) \) and \( G(x) \) differ by a constant.

5.1.102 \[ \int (\sqrt{x^2} + \sqrt{x^3}) \, dx = \int (x^{3/2} + x^{3/2}) \, dx = \frac{3}{8}x^{5/3} + \frac{3}{6}x^{5/2} + C. \]

Check: \[ \frac{d}{dx} \left( \frac{3}{8}x^{5/3} + \frac{3}{6}x^{5/2} + C \right) = \sqrt{x^2} + \sqrt{x^3}. \]

5.1.103 \[ \int \frac{2x - e^{-2x}}{2} \, dx = \frac{1}{2} \left( \frac{2x}{2} - e^{-2x} \right) + C = \frac{e^{2x} + e^{-2x}}{4} + C. \]

Check: \[ \frac{d}{dx} \left( \frac{e^{2x} + e^{-2x}}{4} + C \right) = \frac{e^{2x} - e^{-2x}}{2}. \]

5.1.104 \[ \int (4 \cos 4w - 3 \sin 3w) \, dw = 4 \cdot \frac{\sin 4w}{4} - 3 \cdot \left( \frac{\cos 3w}{3} \right) + C = \sin 4w + \cos 3w + C. \]

Check: \[ \frac{d}{dw}(\sin 4w + \cos 3w + C) = 4 \cos 4w - 3 \sin 3w. \]

5.1.105 \[ \int (\csc^2 \theta + 2 \theta^2 - 3 \theta) \, d\theta = -\cot \theta + \frac{2}{3} \theta^3 - \frac{3}{2} \theta^2 + C. \]

Check: \[ \frac{d}{d\theta} \left( -\cot \theta + \frac{2}{3} \theta^3 - \frac{3}{2} \theta^2 + C \right) = \csc^2 \theta + 2 \theta^2 - 3 \theta. \]

5.1.106 \[ \int (\csc^2 \theta + 1) \, d\theta = -\cot \theta + \theta + C. \]

Check: \[ \frac{d}{d\theta} \left( -\cot \theta + \theta + C \right) = \csc^2 \theta + 1. \]

5.1.107 \[ \int \frac{1 + \sqrt{x}}{x} \, dx = \int (x^{-1} + x^{-1/2}) \, dx = \ln |x| + 2x^{1/2} + C = \ln |x| + 2\sqrt{x} + C. \]

Check: \[ \frac{d}{dx}(\ln |x| + 2\sqrt{x} + C) = \frac{1}{x} + \frac{1}{\sqrt{x}} = \frac{1 + \sqrt{x}}{x}. \]

5.1.108 \[ \int \frac{2 + x^2}{1 + x^2} \, dx = \int \frac{(1 + x^2) + 1}{1 + x^2} \, dx = \int \left( 1 + \frac{1}{1 + x^2} \right) \, dx = x + \tan^{-1} x + C. \]

Check: \[ \frac{d}{dx} \left( x + \tan^{-1} x + C \right) = 1 + \frac{1}{x^2 + 1} = \frac{2 + x^2}{1 + x^2}. \]

5.1.109 \[ \int \sqrt{x}(2x^6 - 4 \sqrt{x}) \, dx = \int (2x^{13/2} - 4x^{5/2}) \, dx = 2 \cdot \frac{2}{15}x^{15/2} - 4 \cdot \frac{6}{11}x^{11/2} + C = \frac{4}{15}x^{15/2} - \frac{24}{11}x^{11/2} + C. \]

Check: \[ \frac{d}{dx} \left( \frac{4}{15}x^{15/2} - \frac{24}{11}x^{11/2} + C \right) = 2x^{13/2} - 4x^{5/2} = \sqrt{x}(2x^6 - 4 \sqrt{x}). \]

5.1.110 We have \( F'(x) = \int 1 \, dx = x + C; \) \( F'(0) = 3 \) so \( C = 3. \) Then \( F(x) = \int (x + 3) \, dx = \frac{x^2}{2} + 3x + C; \) \( F(0) = 4 \) so \( C = 4 \) and \( F(x) = \frac{1}{2}x^2 + 3x + 4. \)

5.1.111 We have \( F'(x) = \int \cos x \, dx = \sin x + C; \) \( F'(0) = 3 \) so \( C = 3. \) Then \( F(x) = \int (\sin x + 3) \, dx = -\cos x + 3x + C; \) \( F(\pi) = 4 \) gives \( 1 + 3 \pi + C = 4 \) so \( C = 3 - 3 \pi \) and \( F(x) = -\cos x + 3x + 3 - 3 \pi. \)
5.1.112 We have \( F''(x) = \int 4x \, dx = 2x^2 + C; \) \( F''(0) = 0 \) so \( C = 0. \) Next \( F'(x) = \int 2x^2 \, dx = 2 \cdot \frac{x^3}{3} + C; \) \( F'(0) = 1 \) so \( C = 1. \) Finally \( F(x) = \int \left( \frac{2}{3}x^3 + 1 \right) \, dx = \frac{2}{3} \cdot \frac{x^4}{4} + x + C; \) \( F(0) = 3 \) so \( C = 3 \) and \( F(x) = \frac{x^4}{6} + x + 3. \)

5.1.113 We have \( F''(x) = \int (672x^5 + 24x) \, dx = 672 \cdot \frac{x^6}{6} + 24 \cdot \frac{x^2}{2} + C; \) \( F''(0) = 0 \) so \( C = 0. \) Next \( F'(x) = \int (112x^6 + 12x^2) \, dx = 112 \cdot \frac{x^7}{7} + 12 \cdot \frac{x^3}{3} + C; \) \( F'(0) = 2 \) so \( C = 2. \) Finally \( F(x) = \int (16x^7 + 4x^3 + 2) \, dx = 16 \cdot \frac{x^8}{8} + 4 \cdot \frac{x^4}{4} + 2x + C; \) \( F(0) = 1 \) so \( C = 1 \) and \( F(x) = 2x^8 + x^4 + 2x + 1. \)

5.1.114 The velocity is given by \( v(t) = \int \sin(\pi t) \, dt = -\frac{\cos(\pi t)}{\pi} + C; \) \( v(0) = 3 \) implies \( -\frac{1}{\pi} + C = 3, \) so \( C = 3 + \frac{1}{\pi}. \) The position \( s \) is given by \( s(t) = \int \left( -\frac{\cos(\pi t)}{\pi} + 3 + \frac{1}{\pi} \right) \, dt = -\frac{\sin(\pi t)}{\pi^2} + (3 + \frac{1}{\pi}) t + C; \) \( s(0) = 0 \) implies that \( C = 0, \) so \( s(t) = -\frac{\sin(\pi t)}{\pi^2} + (3 + \frac{1}{\pi}) t. \)

5.1.115

a. We have \( Q(t) = \int 0.1(100 - t^2) \, dt = 0.1 \left( 100t - \frac{t^3}{3} \right) + C; \) \( Q(0) = 0, \) so \( C = 0 \) and \( Q(t) = 10t - \frac{t^3}{30} \) gal.

b. \( y = Q(t) \)

c. \( Q(10) = \frac{200}{3} \approx 67 \) gal.

5.1.116 Object A has position function \( s(t) \) given by \( s(t) = \int 2at \, dt = at^2 + s_0, \) and we are given \( s_0 = 0, \) so \( s(t) = at^2. \) Object B has position function \( S(t) \) given by \( S(t) = \int b dt = bt + S_0, \) and we are given \( S_0 = c > 0, \) so \( S(t) = bt + c. \) Therefore A will overtake B when \( s(t) = S(t), \) which gives the quadratic equation \( at^2 - bt - c = 0; \) this equation has a unique positive root given by \( t = \frac{b + \sqrt{b^2 + 4ac}}{2a}. \)

5.1.117 \( \int \sin^2 x \, dx = \frac{1}{2} \int (1 - \cos 2x) \, dx = \frac{1}{2} \left( x - \frac{\sin 2x}{2} \right) + C = \frac{x}{2} - \frac{\sin 2x}{4} + C; \) \( \int \cos^2 x \, dx = \frac{1}{2} \int (1 + \cos 2x) \, dx = \frac{1}{2} \left( x + \frac{\sin 2x}{2} \right) + C = \frac{x}{2} + \frac{\sin 2x}{4} + C. \)

5.1.118 Check that \( \frac{d}{dx}(2 \sin \sqrt{x}) = 2 \cos \sqrt{x} \left( \frac{1}{2\sqrt{x}} \right) = \frac{\cos \sqrt{x}}{\sqrt{x}}. \)

5.1.119 Check that \( \frac{d}{dx}(\sqrt{x^2 + 1}) = \frac{2x}{2\sqrt{x^2 + 1}} = \frac{x}{\sqrt{x^2 + 1}}. \)

5.1.120 Check that \( \frac{d}{dx} \left( \frac{1}{3} \sin x^3 \right) = \frac{1}{3} \cos x^3(3x^2) = x^2 \cos x^3. \)

5.1.121 Check that \( \frac{d}{dx} \left( -\frac{1}{2(x^2 - 1)} \right) = -\frac{1}{2} \frac{d}{dx} (x^2 - 1)^{-1} = -\frac{1}{2} (-1)(x^2 - 1)^{-2}(2x) = \frac{x}{(x^2 - 1)^2}. \)
5.2 Approximating Areas under Curves

5.2.1

In the first 2 seconds, the object moves 15 \cdot 2 = 30 meters. In the next three seconds, the object moves 25 \cdot 3 = 75 meters, so the total displacement is 75 + 30 = 105 meters.

5.2.2 The area under the curve and above the t-axis, between t = \(a\) and t = \(b\) numerically represents the displacement.

5.2.3 Subdivide the interval from 0 to \(\frac{\pi}{2}\) into subintervals. On each subinterval, pick a sample point (like the left endpoint, or the right endpoint, or the midpoint, for example) and call the first sample point \(x_1\) and the second sample point \(x_2\) and so on. For each sample point \(x_i\), calculate the area of the rectangle which lies over the subinterval and has height \(f(x_i) = \cos(x_i)\). Do this for each subinterval, and add the areas of the corresponding rectangles together. This will give an approximation to the area under the curve, with generally a better approximation occurring as \(n\) increases – where \(n\) is the number of subintervals used.

5.2.4 As the number of subintervals increases, the approximation to the area under the curve improves.

5.2.5 Because the interval \([1, 3]\) has length 2, if we subdivide it into 4 subintervals, each will have length \(\Delta x = \frac{2}{4} = \frac{1}{2}\). The grid points will be \(x_0 = 1\), \(x_1 = 1 + \Delta x = 1.5\), \(x_2 = 1 + 2\Delta x = 2\), \(x_3 = 1 + 3\Delta x = 2.5\), and \(x_4 = 1 + 4\Delta x = 3\).

If we use the left-hand side of each subinterval, we will use 1, 1.5, 2, and 2.5.

If we use the right-hand side of each subinterval, we will use 1.5, 2, 2.5, and 3.

If we use the midpoint of each subinterval, we will use 1.25, 1.75, 2.25, and 2.75.

5.2.6

The left Riemann sum will be \(\sum_{k=1}^{4} f(x_{k-1}) \cdot 1 = \sum_{k=1}^{4} x_{k-1}^2\).

The right Riemann sum will be \(\sum_{k=1}^{4} f(x_k) \cdot 1 = \sum_{k=1}^{4} x_k^2\).

The midpoint Riemann sum will be \(\sum_{k=1}^{4} f\left(\frac{x_{k-1} + x_k}{2}\right) \cdot 1 = \sum_{k=1}^{4} \left(\frac{x_{k-1} + x_k}{2}\right)^2\).

5.2.7 It is an underestimate. If we use the right-hand side of each subinterval to determine the height of the rectangles, the height of each rectangle will be the minimum of \(f\) over the subinterval, so the sum of the areas of the rectangles will be less than the corresponding area under the curve.

5.2.8 It is an underestimate. If we use the left-hand side of each subinterval to determine the height of the rectangles, the height of each rectangle will be the minimum of \(f\) over the subinterval, so the sum of the areas of the rectangles will be less than the corresponding area under the curve.
5.2.9
a. On the first subinterval, the midpoint is 0.5, and \( v(0.5) = 1.75 \). On the 2nd subinterval, the midpoint is 1 and \( v(1) = 7.75 \). Continuing in this manner, we obtain the estimate to the displacement of
\[
v(0.5) \cdot 1 + v(1) \cdot 1 + v(2.5) \cdot 1 + v(3.5) \cdot 1 = 1.75 + 7.75 + 19.75 + 37.75 = 67.
\]
b. This time the midpoints are at 0.25, 0.75, 1.25 . . . . Each subinterval has length \( \frac{1}{2} \). Thus, the estimate is given by
\[
v(0.25) \cdot 0.5 + v(0.75) \cdot 0.5 + v(1.25) \cdot 0.5 + v(1.75) \cdot 0.5 + v(2.25) \cdot 0.5
\]
\[
+ v(2.75) \cdot 0.5 + v(3.25) \cdot 0.5 + v(3.75) \cdot 0.5
\]
\[
= 0.5(1.1875 + 2.6875 + 5.6875 + 10.1875 + 16.1875 + 23.6875 + 32.6875 + 43.1875)
\]
\[
= 0.5(135.5) = 67.75.
\]

5.2.10
a. The midpoints are 2, 4, and 6. So the estimate is
\[
v(2) \cdot 2 + v(4) \cdot 2 + v(6) \cdot 2 \approx 37.085.
\]
b. The midpoints are \( \frac{3}{2}, \frac{5}{2}, \frac{7}{2}, \frac{9}{2}, \frac{11}{2}, \) and \( \frac{13}{2} \). So the estimate is
\[
v \left( \frac{3}{2} \right) + v \left( \frac{5}{2} \right) + v \left( \frac{7}{2} \right) + v \left( \frac{9}{2} \right) + v \left( \frac{11}{2} \right) + v \left( \frac{13}{2} \right) = \sqrt{15} + 5 + \sqrt{35} + 3\sqrt{5} + \sqrt{55} + \sqrt{65} \approx 36.976.
\]

5.2.11
The left-hand grid points are 0 and 4. The length of each subinterval is \( \frac{5}{2} = 4 \). So the left Riemann sum is given by \( v(0) \cdot 4 + v(4) \cdot 4 = 4 \cdot (1 + 9) = 40 \).

5.2.12
The left-hand grid points are 0, 1 and 2. The length of each subinterval is \( \frac{3}{2} = 1 \). So the left Riemann sum is given by \( v(0) \cdot 1 + v(1) \cdot 1 + v(2) \cdot 1 = 1 + e + e^2 \approx 11.107 \) m.

5.2.13
The left-hand grid points are 0, 2, 4, and 6. The length of each subinterval is 2. So the left Riemann sum is given by \( v(0) \cdot 2 + v(2) \cdot 2 + v(4) \cdot 2 + v(6) \cdot 2 = 2 \cdot (\frac{1}{2} + \frac{1}{4} + \frac{1}{9} + \frac{1}{16}) \approx 2.776. \)
5.2.14

The left-hand grid points are 0, 2, 4, and 6, 8, and 10. The length of each subinterval is 2. So the left Riemann sum is given by

\[
\sum_{k=1}^{6} v(2(k - 1)) \cdot 2 = 8 + 12 + 24 + 44 + 72 + 108 = 268.
\]

5.2.15

The left-hand grid points are 0, 3, 6, 9, and 12. The length of each subinterval is 3. So the left Riemann sum is given by

\[
\sum_{k=1}^{5} v(3(k - 1)) \cdot 3 = 12 + 24 + 12\sqrt{7} + 12\sqrt{10} + 12\sqrt{13} \approx 148.963.
\]

5.2.16

The left-hand grid points are 0, 1, 2, and 3. The length of each subinterval is 1. So the left Riemann sum is given by

\[
v(0) + v(1) + v(2) + v(3) = \frac{1}{2} + \frac{2}{3} + \frac{5}{6} + 1 = 3.
\]

5.2.17 The left Riemann sum is given by \( f(1) + f(2) + f(3) + f(4) + f(5) = 2 + 3 + 4 + 5 + 6 = 20 \).
The right Riemann sum is given by \( f(2) + f(3) + f(4) + f(5) + f(6) = 3 + 4 + 5 + 6 + 7 = 25 \).

5.2.18 The left Riemann sum is given by \( f(1) + f(2) + f(3) + f(4) = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} = \frac{25}{12} \).
The right Riemann sum is given by \( f(2) + f(3) + f(4) + f(5) = \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} = \frac{77}{60} \).
5.2. APPROXIMATING AREAS UNDER CURVES

5.2.19

a.

b. We have $\Delta x = \frac{4-0}{4} = 1$. The grid points are $x_0 = 0$, $x_1 = 1$, $x_2 = 2$, $x_3 = 3$, and $x_4 = 4$.

c.

d. The left Riemann sum is $1 \cdot 1 + 2 \cdot 1 + 3 \cdot 1 + 4 \cdot 1 = 10$, which is an underestimate of the area under the curve. The right Riemann sum is $2 \cdot 1 + 3 \cdot 1 + 4 \cdot 1 + 5 \cdot 1 = 14$ which is an overestimate of the area under the curve.

5.2.20

a.

b. We have $\Delta x = \frac{8-3}{5} = 1$. The grid points are $x_0 = 3$, $x_1 = 4$, $x_2 = 5$, $x_3 = 6$, $x_4 = 7$, and $x_5 = 8$.

c.

d. The left Riemann sum is $6 \cdot 1 + 5 \cdot 1 + 4 \cdot 1 + 3 \cdot 1 + 2 \cdot 1 = 20$, which is an overestimate of the area under the curve. The right Riemann sum is $5 \cdot 1 + 4 \cdot 1 + 3 \cdot 1 + 2 \cdot 1 + 1 \cdot 1 = 15$ which is an underestimate of the area under the curve.

Copyright © 2014 Pearson Education, Inc.
5.2.21

a. 

b. We have \( \Delta x = \frac{\pi/2 - 0}{4} = \frac{\pi}{8} \). The grid points are \( x_0 = 0, x_1 = \frac{\pi}{8}, x_2 = \frac{\pi}{4}, x_3 = \frac{3\pi}{8}, \) and \( x_4 = \frac{\pi}{2} \).

c. 

d. The left Riemann sum is \( 1 \cdot \frac{\pi}{8} \cdot \cos \frac{\pi}{8} + \cos \frac{\pi}{4} \cdot \frac{\pi}{8} \approx 1.185 \), which is an overestimate of the area under the curve. The right Riemann sum is \( \cos \frac{\pi}{8} \cdot \frac{\pi}{8} + \cos \frac{\pi}{4} \cdot \frac{\pi}{8} + 0 \cdot \frac{\pi}{8} \approx 0.791 \), which is an underestimate of the area under the curve.

5.2.22

a. 

b. We have \( \Delta x = \frac{3 - 0}{6} = \frac{1}{2} \). The grid points are \( x_0 = 0, x_1 = \frac{1}{2}, x_2 = 1, x_3 = \frac{3}{2}, x_4 = 2, x_5 = \frac{5}{2}, \) and \( x_6 = 3 \).

c. 

d. The left Riemann sum is 
\[
\frac{1}{2} \left( 0 + \sin^{-1} \frac{1}{6} + \sin^{-1} \frac{1}{3} + \sin^{-1} \frac{1}{2} + \sin^{-1} \frac{2}{3} + \sin^{-1} \frac{5}{6} \right) \approx 1.373,
\]
which is an underestimate of the area under the curve. The right Riemann sum is 
\[
\frac{1}{2} \left( \sin^{-1} \frac{1}{6} + \sin^{-1} \frac{1}{3} + \sin^{-1} \frac{1}{2} + \sin^{-1} \frac{2}{3} + \sin^{-1} \frac{5}{6} + \sin^{-1} 1 \right) \approx 2.158,
\]
which is an overestimate of the area under the curve.

5.2.23

a.

b. We have $\Delta x = \frac{4 - 2}{4} = \frac{1}{2}$. The grid points are $x_0 = 2$, $x_1 = 2.5$, $x_2 = 3$, $x_3 = 3.5$, and $x_4 = 4$.

c.

d. The left Riemann sum is $(3 + 5.25 + 8 + 11.25) \cdot 0.5 = 13.75$, which is an underestimate of the area under the curve. The right Riemann sum is $(5.25 + 8 + 11.25 + 15) \cdot 0.5 = 19.75$ which is an overestimate of the area under the curve.

5.2.24

a.

b. We have $\Delta x = \frac{6 - 1}{5} = 1$. The grid points are $x_0 = 1$, $x_1 = 2$, $x_2 = 3$, $x_3 = 4$, $x_4 = 5$, and $x_5 = 6$.

c.

d. The left Riemann sum is $2 + 8 + 18 + 32 + 50 = 110$, which is an underestimate of the area under the curve. The right Riemann sum is $8 + 18 + 32 + 50 + 72 = 180$ which is an overestimate of the area under the curve.
5.2.25

a. We have \( \Delta x = \frac{4-1}{6} = \frac{1}{2} \). The grid points are \( x_0 = 1, x_1 = 1.5, x_2 = 2, x_3 = 2.5, x_4 = 3, x_5 = 3.5, \) and \( x_6 = 4 \).

c. The left Riemann sum is \[ \frac{1}{2} \left( e^{1/2} + e^{3/4} + e + e^{5/4} + e^{3/2} + e^{7/4} \right) \approx 10.105, \] which is an underestimate of the area under the curve. The right Riemann sum is \[ \frac{1}{2} \left( e^{3/4} + e + e^{5/4} + e^{3/2} + e^{7/4} + e^2 \right) \approx 12.975 \] which is an overestimate of the area under the curve.

5.2.26

a. We have \( \Delta x = \frac{3-1}{5} = \frac{2}{5} = 0.4 \). The grid points are \( x_0 = 1, x_1 = 1.4, x_2 = 1.8, x_3 = 2.2, x_4 = 2.6, \) and \( x_5 = 3 \).

c. The left Riemann sum is \[ 0.4 \left( \ln 4 + \ln 5.6 + \ln 7.2 + \ln 8.8 + \ln 10.4 \right) \approx 3.840, \] which is an underestimate of the area under the curve. The right Riemann sum is \[ 0.4 \left( \ln 5.6 + \ln 7.2 + \ln 8.8 + \ln 10.4 + \ln 12 \right) \approx 4.279, \] which is an overestimate of the area under the curve.
5.2.27 We have $\Delta x = 2$, so the midpoints are 1, 3, 5, 7, and 9. So the midpoint Riemann sum is $2(f(1) + f(3) + f(5) + f(7) + f(9)) = 670$.

5.2.28 We have $\Delta x = \frac{\pi}{4}$, so the midpoints are $\frac{\pi}{8}$, $\frac{3\pi}{8}$, $\frac{5\pi}{8}$, and $\frac{7\pi}{8}$. So the midpoint Riemann sum is $\frac{\pi}{4} \cdot (f\left(\frac{\pi}{8}\right) + f\left(\frac{3\pi}{8}\right) + f\left(\frac{5\pi}{8}\right) + f\left(\frac{7\pi}{8}\right)) \approx 2.013$.

5.2.29

a. 

b. We have $\Delta x = \frac{4-0}{4} = 1$. The grid points are $x_0 = 0$, $x_1 = 1$, $x_2 = 2$, $x_3 = 3$, and $x_4 = 4$, so the midpoints are 0.5, 1.5, 2.5, and 3.5.

c. 

d. The midpoint Riemann sum is $1(2+4+6+8) = 20$.

5.2.30

a. 

b. We have $\Delta x = \frac{1-0}{5} = 0.2$. The grid points are $x_0 = 0$, $x_1 = 0.2$, $x_2 = 0.4$, $x_3 = 0.6$, $x_4 = 0.8$, and $x_5 = 1$, so the midpoints are 0.1, 0.3, 0.5, 0.7, and 0.9.

c. 

d. The midpoint Riemann sum is $0.4(\cos^{-1}0.1 + \cos^{-1}0.3 + \cos^{-1}0.5 + \cos^{-1}0.7 + \cos^{-1}0.9) \approx 2.012$. 

Copyright © 2014 Pearson Education, Inc.
5.2.31

a. 

b. We have $\Delta x = \frac{3-1}{4} = \frac{1}{2}$. The grid points are $x_0 = 1$, $x_1 = 1.5$, $x_2 = 2$, $x_3 = 2.5$, and $x_4 = 3$, so the midpoints are 1.25, 1.75, 2.25, and 2.75.

c. 

d. The midpoint Riemann sum is $0.5(\sqrt{1} + \sqrt{1.75} + \sqrt{2.25} + \sqrt{2.75}) \approx 2.800$.

5.2.32

a. 

b. We have $\Delta x = \frac{4-0}{4} = 1$. The grid points are $x_0 = 0$, $x_1 = 1$, $x_2 = 2$, $x_3 = 3$, and $x_4 = 4$, so the midpoints are 0.5, 1.5, 2.5, and 3.5.

c. 

d. The midpoint Riemann sum is $0.5^2 + 1.5^2 + 2.5^2 + 3.5^2 = 21.$

Copyright © 2014 Pearson Education, Inc.
5.2. APPROXIMATING AREAS UNDER CURVES

5.2.33

a. 

b. We have $\Delta x = \frac{6 - 1}{5} = 1$. The grid points are $x_0 = 1$, $x_1 = 2$, $x_2 = 3$, $x_3 = 4$, $x_4 = 5$, and $x_5 = 6$, so the midpoints are 1.5, 2.5, 3.5, 4.5, and 5.5.

d. The midpoint Riemann sum is
\[
\frac{2}{3} + \frac{2}{5} + \frac{2}{11} + \frac{2}{11} \approx 1.756.
\]

5.2.34

a. 

b. We have $\Delta x = \frac{4 - (-1)}{5} = 1$. The grid points are $x_0 = -1$, $x_1 = 0$, $x_2 = 1$, $x_3 = 2$, $x_4 = 3$, and $x_5 = 4$, so the midpoints are $-0.5$, 0.5, 1.5, 2.5, and 3.5.

d. The midpoint Riemann sum is
\[
(4 - (-0.5)) + (4 - 0.5) + (4 - 1.5) \\
+ (4 - 2.5) + (4 - 3.5) \\
= 20 - 7.5 = 12.5.
\]

5.2.35 Note that $\Delta x = \frac{2 - 0}{3} = .5$. So the left Riemann sum is given by $0.5(5 + 3 + 2 + 1) = 5.5$ and the right Riemann sum is given by $0.5(3 + 2 + 1 + 1) = 3.5$.

5.2.36 Note that $\Delta x = \frac{5 - 1}{5} = 0.5$. So the left Riemann sum is given by $0.5(0 + 2 + 3 + 2 + 2 + 1 + 0 + 2) = 6$ and the right Riemann sum is given by $0.5(2 + 3 + 2 + 1 + 0 + 2 + 3) = 7.5$. 

Copyright © 2014 Pearson Education, Inc.
5.2.37

a. 

b. With \( n = 2 \), we have \( \Delta x = \frac{2 - 0}{2} = 1 \), so the midpoints are 0.5 and 1.5. So the midpoint Riemann sum is 60 + 50 = 110. For \( n = 4 \), we have \( \Delta x = \frac{2 - 0}{4} = \frac{1}{2} \), so the midpoints are 0.25, 0.75, 1.25, and 1.75. The midpoint Riemann sum in this case is \( 0.5 \cdot (50 + 60 + 65 + 60) = \frac{235}{2} = 117.5 \).

5.2.38

a. 

b. With \( n = 2 \), we have \( \Delta x = \frac{4 - 0}{2} = 2 \), so the midpoints are 1 and 3. So the midpoint Riemann sum is \( 2(30 + 35) = 130 \). For \( n = 4 \), we have \( \Delta x = \frac{4 - 0}{4} = 1 \), so the midpoints are 0.5, 1.5, 2.5, and 3.5. The midpoint Riemann sum in this case is \( 25 + 35 + 30 + 40 = 130 \).

5.2.39

a. \( \sum_{k=1}^{5} k \)

b. \( \sum_{k=1}^{6} (k + 3) \)

c. \( \sum_{k=1}^{4} k^2 \)

d. \( \sum_{k=1}^{4} \frac{1}{k} \)

5.2.40

a. \( \sum_{k=1}^{50} (2k - 1) \)

b. \( \sum_{k=1}^{9} (5k - 1) \)

c. \( \sum_{k=1}^{13} (5k - 2) \)

d. \( \sum_{k=1}^{49} \frac{1}{k(k + 1)} \)

5.2.41

a. \( \sum_{k=1}^{10} k = 1 + 2 + 3 + \ldots + 10 = 55 \).

b. \( \sum_{k=1}^{6} (2k + 1) = 3 + 5 + 7 + 9 + 11 + 13 = 48 \).

c. \( \sum_{k=1}^{4} k^2 = 1 + 4 + 9 + 16 = 30 \).

d. \( \sum_{n=1}^{5} (1 + n^2) = 2 + 5 + 10 + 17 + 26 = 60 \).

e. \( \sum_{m=1}^{3} \frac{2m + 2}{3} = \frac{4}{3} + \frac{6}{3} + \frac{8}{3} = 6 \).

f. \( \sum_{j=1}^{3} (3j - 4) = -1 + 2 + 5 = 6 \).

g. \( \sum_{p=1}^{5} (2p + p^2) = 3 + 8 + 15 + 24 + 35 = 85 \).

h. \( \sum_{n=0}^{4} \sin \frac{n\pi}{2} = 0 + 1 + 0 + (-1) + 0 = 0 \).

Copyright © 2014 Pearson Education, Inc.
5.2. APPROXIMATING AREAS UNDER CURVES

5.2.42

a. \[
\sum_{k=1}^{45} k = \frac{45 \cdot 46}{2} = 45 \cdot 23 = 1035.
\]

b. \[
\sum_{k=1}^{45} (5k - 1) = 5 \sum_{k=1}^{45} k - \sum_{k=1}^{45} 1 = 5 \cdot 1035 - 45 = 5130.
\]

c. \[
\sum_{k=1}^{75} 2k^2 = 2 \sum_{k=1}^{75} k^2 = 2 \cdot \frac{75 \cdot 76 \cdot 151}{6} = 286,900.
\]

d. \[
\sum_{n=1}^{50} (1 + n^2) = \sum_{n=1}^{50} 1 + \sum_{n=1}^{50} n^2 = 50 + \frac{50 \cdot 51 \cdot 101}{6} = 50 + 42925 = 42975.
\]

e. \[
\sum_{m=1}^{75} 2m + 2 = \frac{2}{3} \sum_{m=1}^{75} m + \frac{2}{3} \sum_{m=1}^{75} 1 = \frac{2}{3} \cdot \frac{75 \cdot 76}{2} + \frac{2}{3} \cdot 75 = 1900 + 50 = 1950.
\]

f. \[
\sum_{j=1}^{20} (3j - 4) = 3 \sum_{j=1}^{20} j - 4 = 3 \cdot \frac{20 \cdot 21}{2} - 20 \cdot 4 = 550.
\]

g. \[
\sum_{p=1}^{35} (2p + p^2) = 2 \sum_{p=1}^{35} p + \sum_{p=1}^{35} p^2 = 2 \cdot \frac{35 \cdot 36}{2} + \frac{35 \cdot 36 \cdot 71}{6} = 16170.
\]

h. \[
\sum_{n=0}^{40} (n^2 + 3n - 1) = \sum_{n=0}^{40} n^2 + \sum_{n=0}^{40} 3n - \sum_{n=0}^{40} 1 = \frac{40 \cdot 41 \cdot 81}{6} + 3 \cdot \frac{40 \cdot 41}{2} - 41 = 24559.
\]

5.2.43 Note that \( \Delta x = \frac{1}{10} \), and \( x_k = a + k \Delta x = \frac{k}{10} \).

a. The left Riemann sum is given by \[
\sum_{k=1}^{40} \sqrt{\frac{k - \frac{1}{10}}{10}} \cdot \frac{1}{10} \approx 5.227.
\]

The right Riemann sum is given by \[
\sum_{k=1}^{40} \sqrt{\frac{k}{10}} \cdot \frac{1}{10} \approx 5.427.
\]

The midpoint Riemann sum is given by \[
\sum_{k=1}^{40} \sqrt{\frac{1}{20} + \frac{k - \frac{1}{10}}{10}} \cdot \frac{1}{10} \approx 5.335.
\]

b. It appears that the actual area is about \( 5 + \frac{1}{4} = \frac{16}{4} \).

5.2.44 Note that \( \Delta x = \frac{1}{25} \), and \( x_k = -1 + k \Delta x = -1 + \frac{k}{25} \). So \( f(x_k) = (-1 + \frac{k}{25})^2 + 1 \).

a. The left Riemann sum is given by \[
\sum_{k=1}^{50} \left[ \left(-1 + \frac{k - \frac{1}{25}}{25} \right)^2 + 1 \right] \cdot \frac{1}{25} \approx 2.667.
\]

The right Riemann sum is given by \[
\sum_{k=1}^{50} \left[ \left(-1 + \frac{k}{25} \right)^2 + 1 \right] \cdot \frac{1}{25} \approx 2.667.
\]

The midpoint Riemann sum is given by \[
\sum_{k=1}^{50} \left[ \left(-1 + \frac{k - \frac{1}{25}}{25} \right)^2 + 1 \right] \cdot \frac{1}{25} \approx 2.666.
\]

b. It appears that the actual area is about \( 2 + \frac{2}{3} = \frac{8}{3} \).
5.2.45 Note that $\Delta x = \frac{1}{15}$, and $x_k = 2 + k\Delta x = 2 + \frac{k}{15}$. So $f(x_k) = \left(2 + \frac{k}{15}\right)^2 - 1$.

a. The left Riemann sum is given by $\sum_{k=1}^{75} \left[ \left(2 + \frac{k-1}{15}\right)^2 - 1 \right] \cdot \frac{1}{15} \approx 105.170$.

The right Riemann sum is given by $\sum_{k=1}^{75} \left[ \left(2 + \frac{k}{15}\right)^2 - 1 \right] \cdot \frac{1}{15} \approx 108.170$.

The midpoint Riemann sum is given by $\sum_{k=1}^{75} \left[ \left(\frac{61 + k-1}{30}\right)^2 - 1 \right] \cdot \frac{1}{15} \approx 106.665$.

b. It appears that the actual area is about $106 + \frac{2}{3} = \frac{320}{3}$.

5.2.46 Note that $\Delta x = \frac{\pi}{240}$, and $x_k = k\Delta x = \frac{k\pi}{240}$. So $f(x_k) = \cos \frac{k\pi}{120}$.

a. The left Riemann sum is given by $\sum_{k=1}^{60} \frac{\pi}{240} \cdot \cos \frac{(k-1)\pi}{120} \approx 0.507$.

The right Riemann sum is given by $\sum_{k=1}^{60} \frac{\pi}{240} \cdot \cos \frac{k\pi}{120} \approx 0.493$.

The midpoint Riemann sum is given by $\sum_{k=1}^{60} \frac{\pi}{240} \cdot \cos \frac{(k-\frac{1}{2})\pi}{120} \approx 0.500$.

b. It appears that the actual area is about $\frac{1}{2}$.

c. True. The value of $f$ at the midpoint will always be between the value of $f$ at the endpoints, if $f$ is monotonic increasing or monotonic decreasing.

5.2.47 True. Because the curve is a straight line, the region under the curve and over each subinterval is a trapezoid. The formula for the area of such a trapezoid over $[x_i, x_{i+1}]$ is $f(x_i) + f(x_{i+1}) \cdot \Delta x = \frac{f(x_i) + f(x_{i+1})}{2} \cdot \Delta x = (x_i + x_{i+1} + 5)\Delta x$ and the area given by using the midpoint formula is $f \left( \frac{x_i + x_{i+1}}{2} \right) \Delta x = (x_i + x_{i+1} + 5)\Delta x$. So the area under the curve is exactly given by the midpoint Riemann sum. Note that this holds for any straight line.

b. False. The left Riemann sum will underestimate the area under an increasing function.

c. True. The value of $f$ at the endpoints will always be between the value of $f$ at the endpoints, if $f$ is monotonic increasing or monotonic decreasing.

5.2.48 

a. Note that if $y = \sqrt{1 - x^2}$, then $y^2 = 1 - x^2$, so $x^2 + y^2 = 1$, which represents a circle of radius one. Note that for the original function $y > 0$ for all $x$, so this represents the top semicircle.

b. We have $\sum_{k=1}^{25} f(x^*_k) \cdot \frac{2}{25}$ where $x^*_k$ represents the midpoint of the $k$th subinterval. Since there are 25 subdivisions, each subinterval is 0.08 wide, so the midpoint of the first subinterval is at $-0.96$, and the sum is $\sum_{k=0}^{24} \sqrt{1 - \left(\frac{-0.96 + \frac{2k}{25}}{2}\right)^2} \cdot \frac{2}{25} \approx 1.575$.

c. We have $\sum_{k=1}^{75} f(x^*_k) \cdot \frac{2}{75}$ where $x^*_k$ represents the midpoint of the $k$th subinterval. Since there are 75 subdivisions, each subinterval is 0.025 wide, so the midpoint of the first subinterval is at $-0.985$, and the sum is $\sum_{k=0}^{74} \sqrt{1 - \left(\frac{-0.985 + \frac{2k}{75}}{2}\right)^2} \cdot \frac{2}{75} \approx 1.572$. 

Copyright © 2014 Pearson Education, Inc.
d. It appears as though the area approaches $\frac{\pi}{2}$ as $n \to \infty$.

5.2.49 This is the right Riemann sum for $f$ on the interval [1, 5] for $n = 4$.

5.2.50 This is the right Riemann sum for $f$ on the interval [2, 6] for $n = 4$.

5.2.51 This is the midpoint Riemann sum for $f$ on the interval [2, 6] with $n = 4$.

5.2.52 This is the right Riemann sum for $f$ on [1.5, 5.5] with $n = 8$, or the midpoint Riemann sum for $f$ on [1.75, 5.75] with $n = 8$.

5.2.53 For all of the calculations below, we have $\Delta x = \frac{1}{2}$, and grid points $x_0 = 0$, $x_1 = 0.5$, $x_2 = 1$, $x_3 = 2.5$, and $x_4 = 2$.

a. The left Riemann sum is given by $\frac{1}{2} (f(0) + f(0.5) + f(1) + f(1.5))$ which is equal to $\frac{1}{2} (2 + 2.25 + 3 + 4.25) = 5.75$.

b. The midpoint Riemann sum is given by $\frac{1}{2} (f(0.25) + f(0.75) + f(1.25) + f(1.75))$ which is equal to $\frac{1}{2} (2.0625 + 2.5625 + 3.5625 + 5.0625) = 6.625$. 

Copyright © 2014 Pearson Education, Inc.
c. The right Riemann sum is given by
\[\frac{1}{2} (f(0.5) + f(1) + f(1.5) + f(2))\]
which is equal to \[\frac{1}{2} (2.25 + 3 + 4.25 + 6) = 7.75.\]

5.2.54 Using 3 subintervals, we have \(\Delta x = \frac{6}{3} = 2\). The left Riemann sum is \(2(f(0) + f(2) + f(4)) = 2(1 + 6 + 9) = 32\). The right Riemann sum is given by \(2(f(2) + f(4) + f(6)) = 2(6 + 9 + 11) = 52\).

5.2.55 We have \(\Delta x = \frac{7-1}{6} = 1\). The left Riemann sum is given by \(1(10 + 9 + 7 + 5 + 2 + 1) = 34\) and the right Riemann sum is given by \(1(9 + 7 + 5 + 2 + 1 + 0) = 24\).

5.2.56
a. The object’s velocity decreases during the first second, then remains constant between time \(t = 1\) and \(t = 3\), and then steadily increases until \(t = 5\), and then stays constant after that.
b. The displacement is given by the area under the curve, which between \(t = 0\) and \(t = 3\) is 35, so the displacement is 35 meters.
c. Between \(t = 3\) and \(t = 5\) the area under the curve is 50, so the displacement is 50 meters.
d. Between \(t = 0\) and \(t = 4\) the displacement is 55, and between 4 and \(t\) for \(t \geq 4\), the displacement is \(30(t - 4)\). So the displacement between 0 and \(t\) for \(t \geq 4\) is \(55 + 30(t - 4) = 30t - 65\).

5.2.57
a. During the first second, the velocity steadily increases from 0 to 20, then it remains constant until \(t = 3\). From \(t = 3\) until \(t = 5\) it steadily decreases, and then remains constant until \(t = 6\).
b. Between \(t = 0\) and \(t = 2\) the area under the curve is \(\frac{1}{2} \cdot 1 \cdot 20 + 1 \cdot 20 = 30\).
c. Between \(t = 2\) and \(t = 5\) the displacement is the sum of the area of a rectangle with area 20 and a trapezoid with area 30, so the displacement is 50 meters.
d. Between \(t = 0\) and \(t = 5\) the displacement is 80. Between \(t = 5\) and any time \(t \geq 5\) the displacement is \(10(t - 5)\) so the displacement between \(t = 0\) and \(t \geq 5\) is \(80 + 10(t - 5) = 10t + 30\).

5.2.58
a. Between 0 and 4, the area under the curve is given by \(\frac{1}{2} \cdot 4000 \cdot 4 = 8000\) cubic feet.
b. Between 8 and 10, the area under the curve is given by \(2 \cdot 5000 = 10,000\) cubic feet.
c. Between 4 and 6 the amount is 9500 cubic feet, which is more than between 0 and 4.
d. When we multiply ft\(^3\)/hr \cdot hr the result is ft\(^3\).

5.2.59
a. Between 0 and 5, the area under the curve is given by the area of a square of area 4 and the area of a trapezoid of area 10.5, so the total area is 14.5.
b. Between 5 and 10, the area under the curve is given by the area of a trapezoid of area 5.5 and the area of a rectangle of area 4 \cdot 6 = 24, so the total area is 29.5.

c. The mass of the entire rod would be the total area under the curve from 0 to 10, which would be 14.5 + 29.5 = 44 grams.

d. At \( x = \frac{19}{3} \) there is a mass of 22 on each side. Note that from 0 to 6 the mass is 20 grams, so the center of mass is a little greater than 6.

5.2.60 If 0 \( \leq t \leq 1.5 \), the displacement is 40\( t \). If 1.5 \( \leq t \leq 3 \), the displacement is 60 + 50\( t - 1.5 \).

Thus, \( d(t) = \begin{cases} 40t & \text{if } 0 \leq t \leq 1.5, \\ 50t - 15 & \text{if } 1.5 \leq t \leq 3. \end{cases} \)

5.2.61 If 0 \( \leq t \leq 2 \), the displacement is 30\( t \). If 2 \( \leq t \leq 2.5 \), the displacement is 60 + 50\( t - 2 \). If 2.5 \( \leq t \leq 3 \), the displacement is 85 + 44\( t - 2.5 \).

Thus, \( d(t) = \begin{cases} 30t & \text{if } 0 \leq t \leq 2, \\ 50t - 40 & \text{if } 2 < t \leq 2.5, \\ 44t - 25 & \text{if } 2.5 < t \leq 3. \end{cases} \)

5.2.62 Using the left Riemann sum

\[
\sum_{k=0}^{n-1} \left| 25 - \left( \frac{10k}{n} \right)^2 \right| \cdot \frac{10}{n},
\]

we have

<table>
<thead>
<tr>
<th>( n )</th>
<th>16</th>
<th>32</th>
<th>64</th>
</tr>
</thead>
<tbody>
<tr>
<td>( A_n )</td>
<td>234.375</td>
<td>242.188</td>
<td>246.094</td>
</tr>
</tbody>
</table>

It is not clear from the data given what the limit might be (the areas in fact approach 300).

5.2.63 Using the left Riemann sum

\[
\sum_{k=0}^{n-1} \left| -1 + \frac{2k}{n} \right| \left( -1 + \frac{2k}{n} \right)^2 - 1 \right| \cdot \frac{2}{n},
\]

we have

<table>
<thead>
<tr>
<th>( n )</th>
<th>16</th>
<th>32</th>
<th>64</th>
</tr>
</thead>
<tbody>
<tr>
<td>( A_n )</td>
<td>0.492188</td>
<td>0.498047</td>
<td>0.499512</td>
</tr>
</tbody>
</table>

It appears that the areas are approaching 0.5.

5.2.64 Using the left Riemann sum

\[
\sum_{k=0}^{n-1} \left| \cos \left( 2 \cdot \frac{\pi k}{n} \right) \right| \cdot \frac{\pi}{n},
\]

we have

<table>
<thead>
<tr>
<th>( n )</th>
<th>16</th>
<th>32</th>
<th>64</th>
</tr>
</thead>
<tbody>
<tr>
<td>( A_n )</td>
<td>1.97423</td>
<td>1.99357</td>
<td>1.99839</td>
</tr>
</tbody>
</table>

It appears that the areas are approaching 2.
Using the left Riemann sum
\[
\sum_{k=1}^{n} 1 - \left( -1 + \frac{3(k-1)}{16} \right) + \left( -1 + \frac{3k}{16} \right) \cdot \frac{3}{n},
\]
we have

\[
\begin{array}{|c|c|c|c|}
\hline
n & 16 & 32 & 64 \\
A_n & 4.72573 & 4.7437 & 4.74845 \\
\hline
\end{array}
\]

It appears that the areas are approaching 4.75.

Because the function \( f \) is constant, its value is \( c \) at each grid point. Thus the left Riemann sum is
\[
\sum_{k=0}^{n-1} f(x_k) \cdot \frac{b-a}{n} = \sum_{k=0}^{n-1} c \cdot \frac{b-a}{n} = \frac{c(b-a)}{n} \cdot n = c(b-a).
\]

For the right Riemann sum we have
\[
\sum_{k=1}^{n} f(x_k) \cdot \frac{b-a}{n} = \sum_{k=1}^{n} c \cdot \frac{b-a}{n} = \frac{c(b-a)}{n} \cdot n = c(b-a).
\]

For the midpoint Riemann sum we have
\[
\sum_{k=0}^{n-1} f \left( a + \frac{b-a}{2n} + \frac{k(b-a)}{n} \right) \cdot \frac{b-a}{n} = \sum_{k=0}^{n-1} c \cdot \frac{b-a}{n} = \frac{c(b-a)}{n} \cdot n = c(b-a).
\]

So all three rules give the exact area of \( (b-a) \cdot c \).

The midpoint Riemann sum gives
\[
\sum_{k=0}^{n-1} f \left( a + \frac{b-a}{2n} + \frac{k(b-a)}{n} \right) \cdot \frac{b-a}{n} = \sum_{k=0}^{n-1} \left( m \left( a + \frac{b-a}{2n} + \frac{k(b-a)}{n} \right) + c \right) \cdot \frac{b-a}{n} \\
= m \cdot a \cdot \frac{b-a}{n} + \frac{m(b-a)^2}{2n^2} + \frac{(n-1) \cdot n \cdot m(b-a)^2}{2} + \frac{cn(b-a)}{n} \\
= m \cdot a \cdot (b-a) + \frac{m(b-a)^2}{2n} + \frac{m(b-a)^2}{2} - \frac{m(b-a)^2}{2n} + c(b-a) \\
= m \cdot a \cdot (b-a) + \frac{m(b-a)^2}{2} + c(b-a) \\
= (b-a) \left( \frac{m(a+b)}{2} + c \right).
\]

This proves that the midpoint Riemann sum is independent of \( n \). Because the region in question is a trapezoid, we know that the exact area is given by the width of the subinterval times the average value at the endpoints, which is \( (b-a) \left( \frac{f(a)+f(b)}{2} \right) = (b-a) \left( \frac{ma+mb+c}{2} \right) = (b-a) \left( \frac{m(a+b)}{2} + c \right) \).

For a function that is concave up and increasing, each rectangle of the left Riemann sum will lie wholly below the curve, since the value of the function at the left edge of the rectangle will be smaller than at any other point in the rectangle. Thus this will be an underestimate. For a function that is concave up and decreasing, however, each rectangle will have its top edge above the curve, since the value of the function at the left edge will be larger than at any other point in the rectangle. Thus this will be an overestimate. For a function that is concave down and increasing, each rectangle of the left Riemann sum will lie wholly below the curve, since the value of the function at the left edge of the rectangle will be smaller than at any other point in the rectangle. Thus this will be an underestimate. Finally, for a function that is concave down and decreasing, each rectangle will have its top edge above the curve, since the value of the function at the left edge will be larger than at any other point in the rectangle. Thus this will be an overestimate. Graphs of each of the four situations are below:
So the answer is

<table>
<thead>
<tr>
<th>Concave up on $[a, b]$</th>
<th>Increasing on $[a, b]$</th>
<th>Concave down on $[a, b]$</th>
<th>Decreasing on $[a, b]$</th>
</tr>
</thead>
</table>

5.2.69 For a function that is concave up and increasing, each rectangle of the right Riemann sum will have its top edge above the curve, since the value of the function at the right edge of the rectangle will be larger than at any other point in the rectangle. Thus this will be an overestimate. For a function that is concave up and decreasing, however, each rectangle will lie wholly below the curve, since the value of the function at the right edge will be smaller than at any other point in the rectangle. Thus this will be an underestimate. For a function that is concave down and increasing, each rectangle of the right Riemann sum will have its top edge above the curve, since the value of the function at the right edge of the rectangle will be larger than at any other point in the rectangle. Thus this will be an overestimate. Finally, for a function that is concave down and decreasing, however, each rectangle will lie wholly below the curve, since the value of the function at the right edge will be smaller than at any other point in the rectangle. Thus this will be an underestimate. Graphs of each of the four situations are below:

Concave up and increasing

Concave up and decreasing

Concave down and increasing

Concave down and decreasing

So the answer is

<table>
<thead>
<tr>
<th>Increasing on $[a, b]$</th>
<th>Decreasing on $[a, b]$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Concave up on $[a, b]$</td>
<td>Overestimate</td>
</tr>
<tr>
<td>Concave down on $[a, b]$</td>
<td>Underestimate</td>
</tr>
</tbody>
</table>

5.2.70 The right Riemann sum is given by

$$A_n = \sum_{k=1}^{n} f(x_k) \Delta x = \sum_{k=1}^{n} \left( \left( \frac{2k}{n} \right)^2 + 1 \right) \cdot \frac{2}{n}.$$

<table>
<thead>
<tr>
<th>$n$</th>
<th>$A_n$</th>
</tr>

<tbody>
<tr>
<td>10</td>
<td>5.08</td>
</tr>
<tr>
<td>30</td>
<td>4.801</td>
</tr>
<tr>
<td>60</td>
<td>4.734</td>
</tr>
<tr>
<td>80</td>
<td>4.717</td>
</tr>
</tbody>
</table>

A reasonable guess for the limit is 4.70 (in fact, the limit is $\frac{14}{3} \approx 14.667$).

5.2.71 The right Riemann sum is given by

$$A_n = \sum_{k=1}^{n} f(x_k) \Delta x = \sum_{k=1}^{n} \left( 4 - \left( -2 + \frac{4k}{n} \right)^2 \right) \cdot \frac{4}{n}.$$

<table>
<thead>
<tr>
<th>$n$</th>
<th>$A_n$</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>30</td>
<td>10.6548</td>
</tr>
<tr>
<td>60</td>
<td>10.6637</td>
</tr>
<tr>
<td>80</td>
<td>10.665</td>
</tr>
</tbody>
</table>

$A_n$ is approaching $10\frac{2}{3} = \frac{32}{3}$. 
5.2.72 The right Riemann sum is given by

\[ A_n = \sum_{k=1}^{n} f(x_k) \Delta x = \sum_{k=1}^{n} 2^{1 + \frac{k}{n}} \cdot \frac{1}{n}. \]

<table>
<thead>
<tr>
<th>( n )</th>
<th>( A_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>2.98655</td>
</tr>
<tr>
<td>30</td>
<td>2.91885</td>
</tr>
<tr>
<td>60</td>
<td>2.90209</td>
</tr>
<tr>
<td>80</td>
<td>2.897908</td>
</tr>
</tbody>
</table>

\( A_n \) is approaching \( \frac{2}{\ln 2} \approx 2.885 \).

5.2.73 The right Riemann sum is given by

\[ A_n = \sum_{k=1}^{n} f(x_k) \Delta x = \sum_{k=1}^{n} \left( 2 - 2 \sin \left( -\frac{\pi}{2} + \frac{\pi k}{n} \right) \right) \cdot \frac{\pi}{n}. \]

<table>
<thead>
<tr>
<th>( n )</th>
<th>( A_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>5.6549</td>
</tr>
<tr>
<td>30</td>
<td>6.0737</td>
</tr>
<tr>
<td>60</td>
<td>6.1785</td>
</tr>
<tr>
<td>80</td>
<td>6.2046</td>
</tr>
</tbody>
</table>

\( A_n \) is approaching \( 2\pi \).

5.2.74 The right Riemann sum is given by

\[ A_n = \sum_{k=1}^{n} f(x_k) \Delta x = \sum_{k=1}^{n} \sqrt{\frac{3k}{n} + 1} \cdot \frac{3}{n}. \]

<table>
<thead>
<tr>
<th>( n )</th>
<th>( A_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>4.8148</td>
</tr>
<tr>
<td>30</td>
<td>4.71646</td>
</tr>
<tr>
<td>60</td>
<td>4.69161</td>
</tr>
<tr>
<td>80</td>
<td>4.68539</td>
</tr>
</tbody>
</table>

\( A_n \) is approaching \( 4 \frac{2}{3} = \frac{14}{3} \).

5.2.75 The right Riemann sum is given by

\[ A_n = \sum_{k=1}^{n} f(x_k) \Delta x = \sum_{k=1}^{n} \ln \left( 1 + \frac{k(e - 1)}{n} \right) \cdot \frac{e - 1}{n}. \]

<table>
<thead>
<tr>
<th>( n )</th>
<th>( A_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>1.08436</td>
</tr>
<tr>
<td>30</td>
<td>1.02847</td>
</tr>
<tr>
<td>60</td>
<td>1.01428</td>
</tr>
<tr>
<td>80</td>
<td>1.01071</td>
</tr>
</tbody>
</table>

\( A_n \) is approaching 1.
5.2.76 \[ \sum_{k=0}^{39} e^{k\ln 2}/40 \cdot \frac{\ln 2}{40} \approx 0.991. \]

5.2.77 \[ \sum_{k=1}^{50} \left( \frac{2k}{25} + 1 \right) \cdot \frac{2}{25} = 12.16. \]

5.2.78 \[ \sum_{k=0}^{49} \left[ 1 + \cos \left( \frac{\pi}{50} + \frac{k}{25} \right) \right] \cdot \frac{1}{25} = 2. \]

5.2.79 \[ \sum_{k=0}^{31} \left( 3 + \frac{1}{8} + \frac{k}{4} \right)^3 \cdot \frac{1}{4} \approx 3639.125. \]

5.3 Definite Integrals

5.3.1 The net area is the difference between the area above the \( x \)-axis and below the curve, and below the \( x \)-axis and above the curve.

5.3.2 The definite integral \( \int_{a}^{b} f(x) \, dx \) gives the net area of the function between \( x = a \) and \( x = b \).

5.3.3 When the function is strictly above the \( x \)-axis, the net area is equal to the area. The net area differs from the area when the function dips below the \( x \)-axis so that the area below the \( x \)-axis and above the curve is nonzero.

5.3.4 In the Riemann sum formulas like \( \sum_{k=1}^{n} f(x_k) \Delta x \), the quantity \( \Delta x \) is positive, so if the quantity \( f(x_i) \) is negative, we have the sum of \( n \) negative numbers, which is a negative number.

5.3.5 Because each of the functions \( \sin x \) and \( \cos x \) have the same amount of area above the \( x \)-axis as below between 0 and \( 2\pi \), these both have value 0.

5.3.6 The greek letter \( \sum \) and the integral sign \( \int \) both remind us of the letter S, which stands for sum. The differential \( dx \) is analogous to \( \Delta x \), helping us think of a small width. In both cases, the product of some form of \( f(x) \) with either \( dx \) or \( \Delta x \) should make us think of an area — a height times a width. So both symbols are evocative of a sum of areas of rectangles, or a limit of such things.

5.3.7 Because a region “from \( x = a \) to \( x = a \)” has no width, its area is zero. This is akin to asking for the area of a one-dimensional object.

5.3.8 \[ \int_{1}^{6} (2x^3 - 4x) \, dx = 2 \int_{1}^{6} x^3 \, dx - 4 \int_{1}^{6} x \, dx. \]

5.3.9 This integral represents the area under \( y = x \) between \( x = 0 \) and \( x = a \), which is a right triangle. The length of the base of the triangle is \( a \) and the height is \( a \), so the area is \( \frac{1}{2} \cdot a^2 \), so \( \int_{0}^{a} x \, dx = \frac{a^2}{2} \).

5.3.10 Because the function \( |f| \) never goes below the \( x \) axis, the definite integral of \( |f| \) does represent the area between \( |f| \) and the \( x \)-axis. If this area is zero, then \( f \) must strictly lie on the \( x \) axis, so \( f \) must be the constant function with value 0.
5.3.11

b. We have $\Delta x = \frac{4}{4} = 1$. The left Riemann sum is
\[
f(0) \cdot 1 + f(1) \cdot 1 + f(2) \cdot 1 + f(3) \cdot 1 = -1 - 3 - 5 - 7 = -16.
\]
The right Riemann sum is
\[
f(1) \cdot 1 + f(2) \cdot 1 + f(3) \cdot 1 + f(4) \cdot 1 = -3 - 5 - 7 - 9 = -24.
\]
The midpoint Riemann sum is
\[
f(1.5) \cdot 1 + f(2.5) \cdot 1 + f(3.5) \cdot 1 = -2 - 4 - 6 - 8 = -20.
\]

5.3.12

b. We have $\Delta x = \frac{7 - 3}{4} = 1$. The left Riemann sum is
\[
f(3) \cdot 1 + f(4) \cdot 1 + f(5) \cdot 1 + f(6) \cdot 1 = -31 - 68 - 129 - 220 = -448.
\]
The right Riemann sum is
\[
f(4) \cdot 1 + f(5) \cdot 1 + f(6) \cdot 1 + f(7) \cdot 1 = -68 - 129 - 220 - 347 = -764.
\]
The midpoint Riemann sum is
\[
f(4.5) \cdot 1 + f(5.5) \cdot 1 + f(6.5) \cdot 1 = -46.875 - 95.125 - 170.375 - 278.625 = -591.
\]

5.3.13

Copyright © 2014 Pearson Education, Inc.
b. We have $\Delta x = \frac{\pi/2}{4} = \frac{\pi}{8}$. The left Riemann sum is

$$f\left(\frac{\pi}{2}\right) \cdot \frac{\pi}{8} + f\left(\frac{5\pi}{8}\right) \cdot \frac{\pi}{8} + f\left(\frac{7\pi}{8}\right) \cdot \frac{\pi}{8} = \left(0 - \frac{\sqrt{2}}{2} - 1 - \frac{\sqrt{2}}{2}\right) \cdot \frac{\pi}{8} = \frac{\pi}{8} \cdot (-1 - \sqrt{2}) \approx -0.948.$$

The right Riemann sum is

$$f\left(\frac{5\pi}{8}\right) \cdot \frac{\pi}{8} + f\left(\frac{7\pi}{8}\right) \cdot \frac{\pi}{8} = \left(-\frac{\sqrt{2}}{2} - 1 - \frac{\sqrt{2}}{2} - 0\right) \cdot \frac{\pi}{8} = \frac{\pi}{8} \cdot (-1 - \sqrt{2}) \approx -0.948.$$

The midpoint Riemann sum is

$$f\left(\frac{9\pi}{16}\right) \cdot \frac{\pi}{8} + f\left(\frac{11\pi}{16}\right) \cdot \frac{\pi}{8} = \left(0.382683 - 0.92388 - 0.92388 - 0.382683\right) \approx -1.026.$$

5.3.14

a.

b. We have $\Delta x = \frac{2}{4} = \frac{1}{2}$. The left Riemann sum is

$$f\left(-\frac{1}{2}\right) + f\left(-1.5\right) \cdot \frac{1}{2} + f\left(-1\right) \cdot \frac{1}{2} + f\left(-0.5\right) \cdot \frac{1}{2} = 0.5(-9 - 4.375 - 2 - 1.125) = -8.25.$$

The right Riemann sum is

$$f\left(-1.5\right) \cdot \frac{1}{2} + f\left(-1\right) \cdot \frac{1}{2} + f\left(-0.5\right) \cdot \frac{1}{2} + f\left(0\right) \cdot \frac{1}{2} = 0.5(-4.375 - 2 - 1.125 - 1) = -4.25.$$

The midpoint Riemann sum is

$$f\left(-1.75\right) \cdot \frac{1}{2} + f\left(-1.25\right) \cdot \frac{1}{2} + f\left(-0.75\right) \cdot \frac{1}{2} + f\left(-0.25\right) \cdot \frac{1}{2} = 0.5(-6.35938 - 2.95313 - 1.42188 - 1.10563) \approx -5.875.$$

5.3.15

The right Riemann sum is \( \sum_{k=1}^{4} f(x_k) \cdot \frac{3}{4} \approx 7.547 \).

The midpoint Riemann sum is \( \sum_{k=1}^{4} f(x_k^*) \cdot \frac{3}{4} \approx 3.539 \).

c. The rectangles whose height is \( f(x_k) \) contribute positively when \( x_k > 0 \) and negatively when \( x_k < 0 \).

**5.3.19**

![Graph showing Riemann sums](image)

b. The left Riemann sum is \( \sum_{k=0}^{3} f(x_k) \cdot \frac{1}{4} \approx 0.082 \).

The right Riemann sum is \( \sum_{k=1}^{4} f(x_k) \cdot \frac{1}{4} \approx 0.555 \).

The midpoint Riemann sum is \( \sum_{k=1}^{4} f(x_k^*) \cdot \frac{1}{4} \approx 0.326 \).

c. The rectangles whose height is \( f(x_k) \) contribute positively when \( x_k > \frac{1}{3} \) and negatively when \( x_k < \frac{1}{3} \).
5.3.20

b. The left Riemann sum is \( \sum_{k=0}^{3} f(x_k) \cdot \frac{1}{2} \approx -1.620. \)

The right Riemann sum is \( \sum_{k=1}^{4} f(x_k) \cdot \frac{1}{2} \approx -0.0766. \)

The midpoint Riemann sum is \( \sum_{k=1}^{4} f(x^*_k) \cdot \frac{1}{2} \approx -0.680. \)

c. The rectangles whose height is \( f(x_k) \) contribute positively when \( x_k > 0 \) and negatively when \( x_k < 0. \)

5.3.21 This is \( \int_{0}^{2} (x^2 + 1) \, dx. \)  

5.3.22 This is \( \int_{-2}^{2} (4 - x^2) \, dx. \)  

5.3.23 This is \( \int_{1}^{2} x \ln x \, dx. \)  

5.3.24 This is \( \int_{-2}^{2} |x^2 - 1| \, dx. \)

5.3.25

The region in question is a triangle with base 4 and height 8, so the area is \( \frac{1}{2} \cdot 8 \cdot 4 = 16, \) and this is therefore the value of the definite integral as well.

5.3.26

The region in question is a triangle with base 4 and height 8, above the axis, and a triangle with base 2 and height 4 below the axis, so the net area is \( \frac{1}{2} \cdot 4 \cdot 8 - \frac{1}{2} \cdot 2 \cdot 4 = 16 - 4 = 12. \)
5.3.27

The region consists of two triangles, both below the axis. One has base 1 and height 1, the other has base 2 and height 2, so the net area is 

\[ -\frac{1}{2} \cdot 1 \cdot 1 - \frac{1}{2} \cdot 2 \cdot 2 = -2.5. \]

5.3.28

The region consists of two triangles of equal area, one of which is above the axis and one below, so the net area is 0.

5.3.29

The region consists of a quarter circle of radius 4, situated above the axis. So the net area is

\[ \pi \cdot 4^2 / 4 = 4\pi. \]

5.3.30

The region consists of a semicircle situated above the axis, of radius 2. The area is thus \( \frac{4\pi}{2} = 2\pi. \)
5.3.31

The region consists of a rectangle of area 10 above the axis, and a trapezoid of area 16 above the axis, so the net area is $10 + 16 = 26$.

5.3.32

The region consists of a trapezoid of area 6 above the axis, a triangle of area 4 below the axis, and a rectangle of area 56 below the axis. So the net area is $6 - 4 - 56 = -54$.

5.3.33 $\int_0^a f(x) \, dx = 16$.

5.3.34 $\int_0^b f(x) \, dx = 16 - 5 = 11$.

5.3.35 $\int_a^c f(x) \, dx = 11 - 5 = 6$.

5.3.36 $\int_0^c f(x) \, dx = 16 - 5 + 11 = 22$.

5.3.37 $\int_0^\pi x \sin x \, dx = A(R_1) + A(R_2) = 1 + \pi - 1 = \pi$.

5.3.38 $\int_0^{3\pi/2} x \sin x \, dx = A(R_1) + A(R_2) - A(R_3) = 1 + \pi - 1 - \pi - 1 = -1$.

5.3.39 $\int_0^{2\pi} x \sin x \, dx = A(R_1) + A(R_2) - A(R_3) - A(R_4) = 1 + \pi - 1 - \pi - 1 - 2\pi + 1 = -2\pi$.

5.3.40 $\int_{\pi/2}^{2\pi} x \sin x \, dx = A(R_2) - A(R_3) - A(R_4) = \pi - 1 - \pi - 1 - 2\pi + 1 = -2\pi - 1$.

5.3.41

a. $\int_4^0 3x(4 - x) \, dx = -\int_0^4 3x(4 - x) \, dx = -32$.

b. $\int_4^0 x(4 - x) \, dx = -\frac{1}{3} \int_0^4 3x(4 - x) \, dx = -\frac{1}{3} \cdot 32 = -\frac{32}{3}$.

c. $\int_4^0 6x(4 - x) \, dx = -2 \cdot \int_0^4 3x(4 - x) \, dx = -2 \cdot 32 = -64$.

d. $\int_0^8 3x(4 - x) \, dx = \int_0^4 3x(4 - x) \, dx + \int_4^8 3x(4 - x) \, dx = 32 + \int_4^8 3x(4 - x) \, dx$. It is not possible to evaluate the given integral from the information given.

5.3.42

a. $\int_1^4 (-3f(x)) \, dx = -3 \int_1^4 f(x) \, dx = -3 \cdot 8 = -24$. 

Copyright © 2014 Pearson Education, Inc.
5.3.43

b. \( \int_{1}^{4} 3f(x) \, dx = 3 \int_{1}^{4} f(x) \, dx = 3 \cdot 8 = 24. \)

c. \( \int_{6}^{4} 12f(x) \, dx = -12 \int_{6}^{4} f(x) \, dx = -12 \left( \int_{1}^{6} f(x) \, dx - \int_{4}^{1} f(x) \, dx \right) = -12(5 - 8) = 36. \)

d. \( \int_{4}^{6} 3f(x) \, dx = 3 \left( \int_{1}^{6} f(x) \, dx - \int_{1}^{4} f(x) \, dx \right) = 3(5 - 8) = -9. \)

5.3.44

a. \( \int_{0}^{5} 5f(x) \, dx = 5 \int_{0}^{5} f(x) \, dx = 5 \cdot 2 = 10. \)

b. \( \int_{3}^{6} (-3g(x)) \, dx = -3 \int_{3}^{6} g(x) \, dx = -3 \cdot 1 = -3. \)

c. \( \int_{3}^{6} (3f(x) - g(x)) \, dx = 3 \int_{3}^{6} f(x) \, dx - \int_{3}^{6} g(x) \, dx = 3(-5) - 1 = -16. \)

d. \( \int_{6}^{3} [f(x) + 2g(x)] \, dx = - \left[ \int_{3}^{6} f(x) \, dx + 2 \int_{3}^{6} g(x) \, dx \right] = -[-5 + 2 \cdot 1] = 3. \)

5.3.45

a. \( \int_{0}^{1} (4x - 2x^3) \, dx = -2 \int_{0}^{1} x^3 - 2x \, dx = -2 \cdot \left( -\frac{3}{4} \right) = \frac{3}{2}. \)

b. \( \int_{1}^{0} (2x - x^3) \, dx = \int_{0}^{1} (x^3 - 2x) \, dx = -\frac{3}{4}. \)

5.3.46

a. \( \int_{0}^{\pi/2} (2 \sin \theta - \cos \theta) \, d\theta = - \int_{0}^{\pi/2} (\cos \theta - 2 \sin \theta) \, d\theta = -(-1) = 1. \)

b. \( \int_{\pi/2}^{0} (4 \cos \theta - 8 \sin \theta) \, d\theta = -4 \int_{\pi/2}^{0} (\cos \theta - 2 \sin \theta) \, d\theta = -4(-1) = 4. \)

5.3.47

\[
\int_{0}^{2} (2x + 1) \, dx = \lim_{n \to \infty} \sum_{k=1}^{n} f(x_k) \Delta x = \lim_{n \to \infty} \sum_{k=1}^{n} \left[ 2 \left( \frac{2k}{n} \right) + 1 \right] \frac{2}{n}
\]
\[
= \lim_{n \to \infty} \left[ \frac{8}{n^2} \sum_{k=1}^{n} k + \frac{2}{n} \sum_{k=1}^{n} 1 \right]
\]
\[
= \lim_{n \to \infty} \left[ \frac{8}{n^2} \cdot \frac{n(n+1)}{2} + \frac{2}{n} \cdot n \right]
\]
\[
= \lim_{n \to \infty} \left[ \frac{4(n+1)}{n} + 2 \right] = 4 + 2 = 6.
\]
5.3.48

\[
\int_1^5 (1 - x) \, dx = \lim_{n \to \infty} \sum_{k=1}^{n} f(x_k) \Delta x = \lim_{n \to \infty} \sum_{k=1}^{n} \left[ 1 - \left( 1 + \frac{4k}{n} \right) \right] \frac{4}{n} \\
= \lim_{n \to \infty} \left[ -\frac{16}{n^2} \sum_{k=1}^{n} k \right] \\
= \lim_{n \to \infty} \left[ -\frac{16}{n^2} \cdot \frac{n(n+1)}{2} \right] \\
= \lim_{n \to \infty} \left[ -\frac{8(n+1)}{n} \right] = -8.
\]

5.3.49

\[
\int_3^7 (4x + 6) \, dx = \lim_{n \to \infty} \sum_{k=1}^{n} f(x_k) \Delta x = \lim_{n \to \infty} \sum_{k=1}^{n} \left[ 4 \left( 3 + \frac{4k}{n} \right) + 6 \right] \frac{4}{n} \\
= \lim_{n \to \infty} \left[ \frac{64}{n^2} \sum_{k=1}^{n} k + \frac{72}{n} \sum_{k=1}^{n} 1 \right] \\
= \lim_{n \to \infty} \left[ \frac{64}{n^2} \cdot \frac{n(n+1)}{2} + \frac{72}{n} \cdot n \right] \\
= \lim_{n \to \infty} \left[ \frac{32(n+1)}{n} + 72 \right] = 104.
\]

5.3.50

\[
\int_0^2 (x^2 - 1) \, dx = \lim_{n \to \infty} \sum_{k=1}^{n} f(x_k) \Delta x = \lim_{n \to \infty} \sum_{k=1}^{n} \left[ \left( \frac{2k}{n} \right)^2 - 1 \right] \frac{2}{n} \\
= \lim_{n \to \infty} \left[ \frac{2}{n} \left( \sum_{k=1}^{n} (-1) \right) + \frac{8}{n^3} \sum_{k=1}^{n} k^2 \right] \\
= \lim_{n \to \infty} \left[ \frac{2}{n} (-n) + \frac{8}{n^3} \frac{n(n+1)(2n+1)}{6} \right] \\
= \lim_{n \to \infty} \left[ -2 + \frac{8n^2 + 12n + 4}{3n^2} \right] = -2 + \frac{8}{3} = \frac{2}{3}.
\]

5.3.51

\[
\int_1^4 (x^2 - 1) \, dx = \lim_{n \to \infty} \sum_{k=1}^{n} f(x_k) \Delta x = \lim_{n \to \infty} \sum_{k=1}^{n} \left[ \left( \frac{3k}{n} \right)^2 - 1 \right] \frac{3}{n} \\
= \lim_{n \to \infty} \left[ \frac{18}{n^2} \sum_{k=1}^{n} k + \frac{27}{n^3} \sum_{k=1}^{n} k^2 \right] \\
= \lim_{n \to \infty} \left[ \frac{18}{n^2} \cdot \frac{n(n+1)}{2} + \frac{27}{n^3} \cdot \frac{n(n+1)(2n+1)}{6} \right] \\
= \lim_{n \to \infty} \left[ \frac{9(n+1)}{n} + \frac{18n^2 + 27n + 9}{2n^2} \right] = 9 + 9 = 18.
\]
5.3.52

\[ \int_{0}^{2} 4x^3 \, dx = \lim_{n \to \infty} \sum_{k=1}^{n} f(x_k) \Delta x = \lim_{n \to \infty} \sum_{k=1}^{n} \left[ 4 \left( \frac{2k}{n} \right)^3 \right] \frac{2}{n} \]

\[ = \lim_{n \to \infty} \frac{64}{n^4} \sum_{k=1}^{n} k^3 \]

\[ = \lim_{n \to \infty} \frac{64}{n^4} \left[ \frac{n(n+1)}{2} \right]^2 \]

\[ = \lim_{n \to \infty} \frac{16(n^2 + 2n + 1)}{n^2} = 16. \]

5.3.53

a. True. See Exercise 66 in the previous section for a proof.

b. True. See Exercise 67 in the previous section for a proof.

c. True. Because both of those function are periodic with period \( \frac{2\pi}{a} \), and both have the same amount of area above the axis as below for one period, the net area of each between 0 and \( \frac{2\pi}{a} \) is zero.

d. False. For example \( \int_{0}^{2\pi} \sin x \, dx = 0 = \int_{2\pi}^{0} \sin x \, dx \), but \( \sin x \) is not a constant function.

e. False. Because \( x \) is not a constant, it can not be factored outside of the integral. For example \( \int_{0}^{1} x \cdot 1 \, dx \neq x \int_{0}^{1} 1 \, dx \).

5.3.54

a. \begin{align*}
&\Delta x = \frac{1}{2}, \text{ so the grid points are at 0, 0.5, 1, 1.5, and 2.} \\
&c. \text{ The left Riemann sum is } 0.5(-2-1.75-1+0.25) = -2.25. \text{ The right Riemann sum is } 0.5(-1.75-1+0.25+2) = -0.25. \\
&d. \text{ The left Riemann sum underestimates the true value, while the right Riemann sum overestimates it.}
\end{align*}

5.3.55

a. \begin{align*}
&\Delta x = \frac{1}{2}, \text{ so the grid points are at 3, 3.5, 4, 4.5, 5, 5.5, and 6.} \\
&c. \text{ The left Riemann sum is } 0.5(-5-6-7-8-9-10) = -22.5. \text{ The right Riemann sum is } 0.5(-6-7-8-9-10-11) = -25.5. \\
&d. \text{ The left Riemann sum overestimates the true value, while the right Riemann sum underestimates it.}
\end{align*}
5.3.56

b. \( \Delta x = \frac{\pi}{8} \), so the grid points are at \( 0, \frac{\pi}{8}, \frac{\pi}{4}, \frac{3\pi}{8}, \) and \( \frac{\pi}{2} \).

c. The left Riemann sum is approximately
\[
\frac{\pi}{8} \left( 1 + .92388 + .707107 + .382683 \right) \approx 1.183.
\]
The right Riemann sum is about
\[
\frac{\pi}{8} \left( .92388 + .707107 + .382683 + 0 \right) \approx 0.791.
\]
d. The left Riemann sum overestimates the true value, while the right Riemann sum underestimates it.

5.3.57

b. \( \Delta x = 1 \), so the grid points are at 1, 2, 3, 4, 5, 6, and 7.

c. The left Riemann sum is approximately
\[
1 + 0.5 + 0.333333 + 0.25 + 0.2 + 0.166666 = 2.45.
\]
The right Riemann sum is approximately
\[
0.5 + 0.333333 + 0.25 + 0.2 + 0.166666 + 0.142857 \\
\approx 1.593.
\]
d. The left Riemann sum overestimates the true value, while the right Riemann sum underestimates it.

5.3.58

a. \[
\int_1^4 3f(x) \, dx = 3 \int_1^4 f(x) \, dx = 3 \cdot \left( \int_1^6 f(x) \, dx - \int_4^6 f(x) \, dx \right) = 3 \cdot (10 - 5) = 15.
\]
b. \[
\int_1^6 (f(x) - g(x)) \, dx = \int_1^6 f(x) \, dx - \int_1^6 g(x) \, dx = 10 - 5 = 5.
\]
c. \[
\int_1^4 (f(x) - g(x)) \, dx = \int_1^4 f(x) \, dx - \int_1^4 g(x) \, dx = \left( \int_1^6 f(x) \, dx - \int_4^6 f(x) \, dx \right) - 2 = (10 - 5) - 2 = 3.
\]

5.3.59

a. \[
\int_4^6 (g(x) - f(x)) \, dx = \int_4^6 g(x) \, dx - \int_4^6 f(x) \, dx = \left( \int_1^6 g(x) \, dx - \int_4^6 f(x) \, dx \right) - 5 = (5 - 2) - 5 = -2.
\]
b. \[
\int_4^6 8g(x) \, dx = 8 \left( \int_1^6 g(x) \, dx - \int_1^4 g(x) \, dx \right) = 8(5 - 2) = 24.
\]
c. \[
\int_1^4 2f(x) \, dx = -2 \int_1^4 f(x) \, dx = -2 \cdot \left( \int_1^6 f(x) \, dx - \int_4^6 f(x) \, dx \right) = -2(10 - 5) = -10.
\]
5.3.60

The region above the axis is a triangle with base $8 - 2 = 6$ and height $f(8) = 24$, while the region below the axis is a triangle with base $2 - (-4) = 6$ and height $-f(-4) = 24$, so the net area is 0, and the area is 144.

5.3.61

The region above the axis is a triangle with base 2 and height $f(-2) = 6$, and the region below the axis is a triangle with base 2 and height $-f(2) = 6$, so the net area is 0, and the area is 12.

5.3.62

The region above the axis is a triangle with base $6 - 2 = 4$ and height $f(6) = 12$, while the region below the axis is a triangle with base 2 and height $-f(-0) = 6$, so the net area is $\frac{1}{2} \cdot 4 \cdot 12 - \frac{1}{2} \cdot 2 \cdot 6 = 24 - 6 = 18$, while the area is 30.

5.3.63

The region above the axis is a triangle with base 2 and height $f(0) = 1$, while the region below the axis consists of two triangles each with base 1 and height 1, so the net area is 0, and the area is 2.

5.3.64

The region in question consists of two triangles above the axis, one with base 1 and height 1, and one with base 4 and height 4, so the net area is $\frac{1}{2} \cdot 1 \cdot 1 + \frac{1}{2} \cdot 4 \cdot 4 = 8.5$. 

Copyright © 2014 Pearson Education, Inc.
5.3.65

The region in question consists of two triangles above the axis, one with base 1 and height 2, and one with base 4 and height 8, so the net area is \( \frac{1}{2} \cdot 1 \cdot 2 + \frac{1}{2} \cdot 4 \cdot 8 = 17 \).

5.3.66

The region above the axis is a triangle with base 4 and height \( f(6) = 12 \), while the region below the axis consists of a triangle with base 1 and height \( -f(1) = 3 \), so the net area is \( \frac{1}{2} \cdot 4 \cdot 12 - \frac{1}{2} \cdot 1 \cdot 3 = 24 - 1.5 = 22.5 \).

5.3.67

The region in question is a semicircle above the axis with radius 5, so the area is \( \frac{1}{2} \pi \cdot 5^2 = \frac{25\pi}{2} \).

5.3.68

Let the grid points for the interval \([a, c]\) be \( x_i = a + i \cdot \frac{c-a}{n} \), where \( 1 \leq i \leq n \). Let the grid points for the interval \([c, b]\) be \( x^*_j = c + j \cdot \frac{b-c}{m} \) where \( 1 \leq j \leq m \). Note that if we take the union of both of these sets of grid points, we get a set of grid points for \([a, b]\).

One Riemann sum for \( f \) on \([a, b]\) is \( \sum_{k=1}^{n} f(x_k) \cdot \frac{c-a}{n} + \sum_{j=1}^{m} f(x^*_j) \cdot \frac{b-c}{m} \), which naturally splits into a right Riemann sum for \( f \) on \([a, c]\) plus a right Riemann sum for \( f \) on \([c, b]\).

By the definition of definite integral, taking limits as \( m, n \to \infty \) shows that \( \int_{a}^{b} f(x) \, dx = \int_{a}^{c} f(x) \, dx + \int_{c}^{b} f(x) \, dx \).

5.3.69

\( \int_{0}^{10} f(x) \, dx = \int_{0}^{5} 2 \, dx + \int_{5}^{10} 3 \, dx = 10 + 15 = 25 \).

5.3.70

\( \int_{1}^{6} f(x) \, dx = \int_{1}^{4} 2x \, dx + \int_{4}^{6} (10 - 2x) \, dx = 15 + 0 = 15 \).
5.3.71

\[ \int_a^b cf(x) \, dx = \lim_{\Delta \to 0} \sum_{k=1}^{n} cf(x_k^*) \Delta x_k \]
\[ = \lim_{\Delta \to 0} c \sum_{k=1}^{n} f(x_k^*) \Delta x_k \]
\[ = c \lim_{\Delta \to 0} \sum_{k=1}^{n} f(x_k^*) \Delta x_k = c \int_a^b f(x) \, dx. \]

5.3.72 Note that \( \int_c^d x \, dx = \frac{d^2 - c^2}{2} \), because it represents the area of a trapezoid with base of length \( d - c \) and heights \( c \) and \( d \). Also note that \( \int_c^d b \, dx = b(d - c) \) because it represents the area of a rectangle with base \( d - c \) and height \( b \).

Therefore, \( \int_c^d (x + b) \, dx = \int_c^d x \, dx + \int_c^d b \, dx = \frac{d^2 - c^2}{2} + b(d - c) = (d - c) \cdot \left( \frac{d + c}{2} + b \right) \). Because \( c \neq d \), this is zero exactly when \( b = -\frac{c+d}{2} \).

5.3.73 Let \( n \) be a positive integer. Let \( \Delta x = \frac{1}{n} \). Note that each grid point \( \frac{k}{n} \) for \( 0 \leq k \leq n \) where \( i \) is an integer is a rational number. So \( f(x_k) = 1 \) for each grid point. So the right Riemann sum is \( \sum_{k=1}^{n} f(x_k) \frac{1}{n} = \frac{1}{n} \sum_{k=1}^{n} 1 = \frac{1}{n} \cdot n = 1 \). The left Riemann sum calculation is similar, as is the midpoint Riemann sum calculation (because the grid midpoints are also rational numbers – they are the average of two rational numbers and hence are rational as well).

5.3.74

a. The left Riemann sum for \( I(p) \) is \( \sum_{k=0}^{n-1} \left( \frac{k}{n} \right)^p \cdot \frac{1}{n} \).

b. We have \( I(p) = \int_0^1 x^p \, dx = \lim_{n \to \infty} \sum_{k=0}^{n-1} \left( \frac{k}{n} \right)^p \cdot \frac{1}{n} = \frac{1}{p+1} \).

5.3.75

</table>

It appears that the integral's value is \( \frac{32}{3} \).

5.3.84 A Riemann sum with non-uniform grid points has a nonconstant width for the various rectangles. Thus what is \( \Delta x \) in the usual Riemann sum becomes a varying width in this case.

a. The left Riemann sum is

\[
\begin{align*}
&f(1)(2.5 - 1) + f(2.5)(3 - 2.5) + f(3)(4 - 3) + f(4)(5.5 - 4) + f(5.5)(6 - 5.5) + f(6)(7 - 6) \\
&= (19 - 1) \cdot 1.5 + (19 - 6.25) \cdot 0.5 + (19 - 9) \cdot 1 + (19 - 16) \cdot 1.5 + (19 - 30.25) \cdot 0.5 + (19 - 36) \cdot 1 \\
&= 27 + 6.375 + 10 + 4.5 - 5.625 - 17 = 25.25.
\end{align*}
\]

b. The midpoint Riemann sum is

\[
\begin{align*}
f \left( \frac{2.5 + 1}{2} \right) (2.5 - 1) + f \left( \frac{2.5 + 3}{2} \right) (3 - 2.5) + f \left( \frac{3 + 4}{2} \right) (4 - 3) + f \left( \frac{4 + 5.5}{2} \right) (5.5 - 4) \\
+ f \left( \frac{5.5 + 6}{2} \right) (6 - 5.5) + f \left( \frac{6 + 7}{2} \right) (7 - 6) \\
= f(1.75) \cdot 1.5 + f(2.75) \cdot 0.5 + f(3.5) \cdot 1 + f(4.75) \cdot 1.5 + f(5.75) \cdot 0.5 + f(6.5) \cdot 1 \\
&\approx 23.9063 + 5.7188 + 6.75 - 5.3438 - 7.0312 - 23.25 = 0.75.
\end{align*}
\]

Copyright © 2014 Pearson Education, Inc.
c. The right Riemann sum is
\[
\begin{align*}
&f(2.5)(2.5 - 1) + f(3)(3 - 2.5) + f(4)(4 - 3) + f(5.5)(5.5 - 4) + f(6)(6 - 5.5) + f(7)(7 - 6) \\
&= (19 - 6.25) \cdot 1.5 + (19 - 9) \cdot 0.5 + (19 - 16) \cdot 1 + (19 - 30.25) \cdot 1.5 + (19 - 36) \cdot 0.5 + (19 - 49) \cdot 1 \\
\end{align*}
\]

d. Since the true value of the integral is zero, the error in the left sum approximation is \(|25.25 - 0| = 25.25\); the error in the midpoint sum approximation is \(|0.75 - 0| = 0.75\); and the error in the right sum approximation is \(|-28.25 - 0| = 28.25\).

e. The midpoint sum approximation is much closer to the true value. This makes sense, since the curve is decreasing everywhere on \([1, 7]\), so that the left sum will be an overapproximation and the right sum will be an underapproximation.

5.3.85 A Riemann sum with non-uniform grid points has a nonconstant width for the various rectangles. Thus what is \(\Delta x\) in the usual Riemann sum becomes a varying width in this case.

a. The left Riemann sum is
\[
\begin{align*}
&f(1)(1.5 - 1) + f(1.5)(2.5 - 1.5) + f(2.5)(3 - 2.5) + f(3)(3.25 - 3) + f(3.25)(3.75 - 3.25) \\
&+ f(3.75)(4.5 - 3.75) + f(4.5)(5 - 4.5) \\
&\approx -6 - 16.125 - 8.4375 - 3 - 3.961 + 2.9883 + 16.3125 \approx -18.223.
\end{align*}
\]

b. The midpoint Riemann sum is
\[
\begin{align*}
&f \left( \frac{1 + 1.5}{2} \right)(1.5 - 1) + f \left( \frac{1.5 + 2.5}{2} \right)(2.5 - 1.5) + f \left( \frac{2.5 + 3}{2} \right)(3 - 2.5) + f \left( \frac{3 + 3.25}{2} \right)(3.25 - 3) \\
&+ f \left( \frac{3.25 + 3.75}{2} \right)(3.75 - 3.25) + f \left( \frac{3.75 + 4.5}{2} \right)(4.5 - 3.75) + f \left( \frac{4.5 + 5}{2} \right)(5 - 4.5) \\
\end{align*}
\]

c. The right Riemann sum is
\[
\begin{align*}
&f(1.5)(1.5 - 1) + f(2.5)(2.5 - 1.5) + f(3)(3 - 2.5) + f(3.25)(3.25 - 3) \\
&+ f(3.75)(3.75 - 3.25) + f(4.5)(4.5 - 3.75) + f(5)(5 - 4.5) \\
&\approx -8.0625 - 16.875 - 6 - 1.9805 + 1.9922 + 24.4688 + 30 \approx 23.543.
\end{align*}
\]

d. Since the true value of the integral is zero, the error in the left sum approximation is \(|-18.223 - 0| = 18.223\); the error in the midpoint sum approximation is \(|-1.330 - 0| = 1.330\); and the error in the right sum approximation is \(|23.543 - 0| = 23.543\).

e. The midpoint sum approximation is much closer to the true value. This makes sense, since the curve is mostly increasing on \([1, 5]\) \((f'(x) = 0 \text{ at } x \approx 2.082)\, and the curve increases sharply to the right of that point), so that the left sum will be an underapproximation and the right sum will be an overapproximation.

5.4 Fundamental Theorem of Calculus

5.4.1 \(A\) is also an antiderivative of \(f\).

5.4.2 Because \(F\) and \(A\) are both antiderivatives of \(f\), we have \(A(x) = F(x) + C\), where \(C\) is a constant.
5.4.3 The fundamental theorem says that \( \int_a^b f(x) \, dx = F(b) - F(a) \) where \( F \) is any antiderivative of \( f \). So to evaluate \( \int_a^b f(x) \, dx \), one could find an antiderivative \( F(x) \), and then evaluate this at \( a \) and \( b \) and then subtract, obtaining \( F(b) - F(a) \).

5.4.4 An area function has the form \( \int_a^x c \, dt \), and gives the area between \( a \) and \( x \) and under \( c \), which is the area of a rectangle with base \( x - a \) and height \( c \). As \( x \) increases, the base \( x - a \) increases while the height \( c \) remains constant, so the area increases.

5.4.5

\[
A(x) = \int_0^x (3 - t) \, dt \quad \text{represents the area between 0 and } x \text{ and below this curve. As } x \text{ increases (but remains less than 3), the trapezoidal region’s area increases, so the area function increases until } x = 3.
\]

5.4.6 \( \int_0^2 3x^2 = x^3 \bigg|_0^2 = 8 - 0 = 8 \) and \( \int_{-2}^2 3x^2 = x^3 \bigg|_{-2}^2 = 8 - (-8) = 16 \).

5.4.7 \( \frac{d}{dx} \int_a^x f(t) \, dt = f(x) \) and \( \int f'(x) \, dx = f(x) + C \).

5.4.8 It can be omitted because it doesn’t change the value of \( F(b) - F(a) \). For example, suppose \( F(x) \) is an antiderivative of \( f \) and so is \( G(x) = F(x) + C \). Then \( G(b) - G(a) = F(b) + C - (F(a) + C) = F(b) - F(a) \).

5.4.9 \( \frac{d}{dx} \int_a^x f(t) \, dt = f(x) \), and \( \frac{d}{dx} \int_a^b f(t) \, dt = 0 \). The latter is the derivative of a constant, the former follows from the Fundamental Theorem.

5.4.10 Because \( f \) is an antiderivative of \( f' \), the Fundamental Theorem assures us that

\[
\int_a^b f'(x) \, dx = f(b) - f(a).
\]

5.4.11

a. \( A(-2) = \int_{-2}^2 f(t) \, dt = 0 \).

b. \( F(8) = \int_4^8 f(t) \, dt = -9 \).

c. \( A(4) = \int_{-2}^4 f(t) \, dt = 8 + 17 = 25 \).

d. \( F(4) = \int_4^8 f(t) \, dt = 0 \).

e. \( A(8) = \int_{-2}^8 f(t) \, dt = 25 - 9 = 16 \).

5.4.12

a. \( A(2) = \int_2^4 f(t) \, dt = 8 \).

b. \( F(5) = \int_2^5 f(t) \, dt = -5 \).

c. \( A(0) = \int_0^2 f(t) \, dt = 0 \).

d. \( F(8) = \int_2^8 f(t) \, dt = -16 \).

e. \( A(8) = \int_0^8 f(t) \, dt = 8 - 16 = -8 \).

f. \( A(5) = \int_0^5 f(t) \, dt = 8 - 5 = 3 \).

g. \( F(2) = \int_2^4 f(t) \, dt = 0 \).

Copyright © 2014 Pearson Education, Inc.
5.4.13

a. $A(x) = \int_0^x f(t) \, dt = \int_0^x 5 \, dt = 5x$.
b. $A'(x) = 5 = f(x)$.

5.4.14

a. $A(x) = \int_4^x f(t) \, dt = \int_4^x 10 \, dt = 10(x - 4)$.
b. $A'(x) = 10 = f(x)$.

5.4.15

a. $A(x) = \int_{-5}^x f(t) \, dt = \int_{-5}^x 5 \, dt = 5(x + 5)$.
b. $A'(x) = 5 = f(x)$.

5.4.16

a. $A(x) = \int_{-3}^x f(t) \, dt = \int_{-3}^x 2 \, dt = 2(x + 3)$.
b. $A'(x) = 2 = f(x)$.

5.4.17

a. $A(2) = \int_0^2 t \, dt = 2$. $A(4) = \int_0^4 t \, dt = 8$. Because the region whose area is $A(x) = \int_0^x t \, dt$ is a triangle with base $x$ and height $x$, its value is $\frac{1}{2}x^2$.
b. $F(4) = \int_2^4 t \, dt = 6$. $F(6) = \int_2^6 t \, dt = 16$. Because the region whose area is $A(x) = \int_2^x t \, dt$ is a trapezoid with base $x - 2$ and $h_1 = 2$ and $h_2 = x$, its value is $(x - 2)\frac{2+x}{2} = \frac{x^2-4}{2} = \frac{x^2}{2} - 2$.
c. We have $A(x) - F(x) = \frac{x^2}{2} - (\frac{x^2}{2} - 2) = 2$, a constant.

Copyright © 2014 Pearson Education, Inc.
5.4.18

a. \( A(2) = \int_{1}^{2} (2t - 2) \, dt = 1 \). \( A(3) = \int_{1}^{3} (2t - 2) \, dt = 4 \). Because the region whose area is \( A(x) = \int_{1}^{x} (2t - 2) \, dt \) is a triangle with base \( x - 1 \) and height \( 2x - 2 \), its value is \( \frac{1}{2} \cdot (x - 1)(2(x - 1)) = (x - 1)^2 \).

b. \( F(5) = \int_{4}^{5} (2t - 2) \, dt = 7 \). \( F(6) = \int_{4}^{6} (2t - 2) \, dt = 16 \). Because the region whose area is \( A(x) = \int_{x}^{2} t \, dt \) is a trapezoid with base \( x - 4 \) and \( h_1 = 6 \) and \( h_2 = 2x - 2 \), its value is \( (x - 4) \left( \frac{6+2x-2}{2} \right) = (x - 4)(x + 2) = x^2 - 2x - 8 \).

c. We have \( A(x) - F(x) = x^2 - 2x + 1 - (x^2 - 2x - 8) = 9 \), a constant.

5.4.19

a.

The region is a triangle with base \( x + 5 \) and height \( x + 5 \), so its area is \( A(x) = \frac{1}{2}(x + 5)^2 \).

b. \( A'(x) = x + 5 = f(x) \).

5.4.20

a.

The region is a trapezoid with base \( x \) and heights \( h_1 = f(0) = 5 \) and \( h_2 = f(x) = 2x + 5 \), so its area is \( A(x) = x \cdot \frac{5+2x+5}{2} = x \cdot (x + 5) = x^2 + 5x \).

b. \( A'(x) = 2x + 5 = f(x) \).

5.4.21

a.

The region is a trapezoid with base \( x - 2 \) and heights \( h_1 = f(2) = 7 \) and \( h_2 = f(x) = 3x + 1 \), so its area is \( A(x) = (x - 2) \cdot \frac{7+3x+1}{2} = (x - 2) \cdot (\frac{3}{2}x + 4) = \frac{3}{2}x^2 + x - 8 \).

b. \( A'(x) = 3x + 1 = f(x) \).
5.4.22

a. The region is a trapezoid with base $x$ and heights $h_1 = f(0) = 2$ and $h_2 = f(x) = 4x + 2$, so its area is $A(x) = (x) \cdot \frac{2+4x+2}{2} = (x) \cdot (2x + 2) = 2x^2 + 2x$.

b. $A'(x) = 4x + 2 = f(x)$.

5.4.23 $\int_0^1 (x^2 - 2x + 3) \, dx = \left( \frac{x^3}{3} - x^2 + 3x \right) \bigg|_0^1 = \frac{1}{3} - 1 + 3 - (0 - 0 + 0) = \frac{7}{3}$. It does appear that the area is between 2 and 3.

5.4.24 $\int_{-\pi/4}^{7\pi/4} (\sin x + \cos x) \, dx = (\cos x + \sin x) \bigg|_{-\pi/4}^{7\pi/4} = -\frac{\sqrt{2}}{2} + \left( -\frac{\sqrt{2}}{2} \right) - \left( -\frac{\sqrt{2}}{2} + \left( -\frac{\sqrt{2}}{2} \right) \right) = 0$. It does appear that the area above the axis is equal to the area below, so the net area is 0.

5.4.25

$$\int_{-2}^{3} (x^2 - x - 6) \, dx = \left( \frac{x^3}{3} - \frac{x^2}{2} - 6x \right) \bigg|_{-2}^{3} = -\frac{125}{6}$$.

5.4.26

$$\int_{0}^{1} (x - \sqrt{x}) \, dx = \left( \frac{x^2}{2} - \frac{2}{3}x^{3/2} \right) \bigg|_{0}^{1} = \frac{1}{2} - \frac{2}{3} - (0 - 0) = -\frac{1}{6}$$.

5.4.27

$$\int_{0}^{5} (x^2 - 9) \, dx = \left( \frac{x^3}{3} - 9x \right) \bigg|_{0}^{5} = \frac{125}{3} - 45 - (0 - 0) = -\frac{10}{3}$$.
5.4.28
\[ \int_{1/2}^{2} \left( 1 - \frac{1}{x^2} \right) dx = \left( x + \frac{1}{x} \right)^2 \bigg|_{1/2} = 2 + \frac{1}{2} - \left( \frac{1}{2} + 2 \right) = 0. \]

5.4.29 \[ \int_{0}^{2} 4x^3 \, dx = x^4 \bigg|_{0}^{2} = 16 - 0 = 16. \]

5.4.30 \[ \int_{0}^{2} (3x^2 + 2x) \, dx = (x^3 + x^2) \bigg|_{0}^{2} = (8 + 4) - (0 + 0) = 12. \]

5.4.31 \[ \int_{0}^{1} (x + \sqrt{x}) \, dx = \left( \frac{x^2}{2} + \frac{2x^{3/2}}{3} \right) \bigg|_{0}^{1} = \frac{1}{2} + \frac{2}{3} - (0 + 0) = \frac{7}{6}. \]

5.4.32 \[ \int_{0}^{\pi/4} 2 \cos x \, dx = (2 \sin x) \bigg|_{0}^{\pi/4} = \frac{2 \sqrt{2}}{2} - 0 = \sqrt{2}. \]

5.4.33 \[ \int_{1}^{9} \frac{2}{\sqrt{x}} \, dx = \int_{1}^{9} 2x^{-1/2} \, dx = 4x^{1/2} \bigg|_{1}^{9} = 12 - 4 = 8. \]

5.4.34 \[ \int_{4}^{9} \frac{2 + \sqrt{t}}{t} \, dt = \int_{4}^{9} (2t^{-1} + t^{-1/2}) \, dt = \left( 2 \ln |t| + 2 \sqrt{t} \right) \bigg|_{4}^{9} = (2 \ln 9 + 6) - (2 \ln 4 + 4) = 2 + \ln \frac{81}{16}. \]

5.4.35 \[ \int_{-2}^{2} (x^2 - 4) \, dx = \left( \frac{x^3}{3} - 4x \right) \bigg|_{-2}^{2} = \frac{8}{3} - 8 - \left( \frac{8}{3} + 8 \right) = \frac{16}{3} - 16 = -\frac{32}{3}. \]

5.4.36 \[ \int_{0}^{\ln 8} e^x \, dx = e^{\ln 8} - e^0 = 8 - 1 = 7. \]

5.4.37 \[ \int_{1/2}^{1} (x^{-3} - 8) \, dx = \left( \frac{x^{-2}}{-2} - 8x \right) \bigg|_{1/2}^{1} = -\frac{1}{2} - 8 - (-2 - 4) = -\frac{5}{2}. \]

5.4.38 \[ \int_{0}^{4} x(x - 2)(x - 4) \, dx = \int_{0}^{4} (x^3 - 6x^2 + 8x) \, dx = \left( \frac{x^4}{4} - 2x^3 + 4x^2 \right) \bigg|_{0}^{4} = 64 - 128 + 64 - 0 = 0. \]

5.4.39 \[ \int_{0}^{\pi/4} \sec^2 \theta \, d\theta = \tan \theta \bigg|_{0}^{\pi/4} = 1 - 0 = 1. \]

5.4.40 \[ \int_{0}^{1/2} \frac{dx}{\sqrt{1 - x^2}} = \sin^{-1} x \bigg|_{0}^{1/2} = \sin^{-1} \frac{1}{2} - \sin^{-1} 0 = \frac{\pi}{6} - 0 = \frac{\pi}{6}. \]

5.4.41 \[ \int_{-2}^{-1} x^{-3} \, dx = \frac{x^{-2}}{-2} \bigg|_{-2}^{-1} = \frac{1}{2x^2} \bigg|_{-2}^{-1} = \frac{1}{2} - \left( \frac{1}{8} \right) = -\frac{3}{8}. \]

5.4.42 \[ \int_{0}^{\pi} (1 - \sin x) \, dx = (x + \cos x) \bigg|_{0}^{\pi} = \pi - 1 - (0 + 1) = \pi - 2. \]
5.4.43 \( \int_1^4 (1 - x)(x - 4) \, dx = \int_1^4 (-x^2 + 5x - 4) \, dx = \left( \frac{-x^3}{3} + \frac{5x^2}{2} - 4x \right)|_1^4 = \frac{9}{2} \). 

5.4.44 \( \int_{-\pi/2}^{\pi/2} (\cos x - 1) \, dx = (\sin x - x)|_{-\pi/2}^{\pi/2} = 1 - \frac{\pi}{2} - \left( -1 - \left( -\frac{\pi}{2} \right) \right) = 2 - \pi \).

5.4.45 \( \int_1^2 \frac{3}{t} \, dt = 3 \ln |t||_1^2 = 3 \ln 2 - 3 \ln 1 = 3 \ln 2 \).

5.4.46 \[
\int_4^9 \frac{x - \sqrt{x}}{x^3} \, dx = \int_4^9 \left( \frac{x}{x^3} - \frac{x^{1/2}}{x^3} \right) \, dx \\
= \int_4^9 \left( x^{-2} - x^{-5/2} \right) \, dx \\
= \left( \frac{x^{-1}}{-1} - \frac{x^{-3/2}}{-3/2} \right)|_4^9 \\
= \left( \frac{1}{x} + \frac{2}{3 \cdot 3x^{3/2}} \right)|_4^9 \\
= \frac{1}{9} + \frac{2}{81} - \left( \frac{1}{4} + \frac{2}{24} \right) \\
= \frac{7}{81} - \left( \frac{1}{6} \right) = \frac{13}{162}.
\]

5.4.47 \( \int_0^{\pi/8} \cos 2x \, dx = \left( \frac{\sin 2x}{2} \right)|_0^{\pi/8} = \frac{\sqrt{2}/2 - 0}{2} = \frac{\sqrt{2}}{4} \).

5.4.48 \( \int_0^1 10e^{2x} \, dx = (5e^{2x})|_0^1 = 5(e^2 - 1) \).

5.4.49 \( \int_1^{\sqrt{3}} \frac{1}{1 + x^2} \, dx = \tan^{-1} x|_1^{\sqrt{3}} = \tan^{-1} \sqrt{3} - \tan^{-1} 1 = \frac{\pi}{3} - \frac{\pi}{4} = \frac{\pi}{12} \).

5.4.50 \( \int_{\pi/16}^{\pi/8} 8 \csc^2 4x \, dx = (-2 \cot 4x)|_{\pi/16}^{\pi/8} = -2 \cdot 0 - (-2) \cdot 1 = 2 \).

5.4.51

The area (and net area) of this region is given by \( \int_1^4 \sqrt{x} \, dx = \frac{2}{3} x^{3/2}|_1^4 = \frac{16}{3} - \frac{2}{3} = \frac{14}{3} \).
5.4.52

The area (and net area) of this region is given by

\[
\int_{-2}^{2} (4 - x^2) \, dx = \left[ \frac{4x - \frac{x^3}{3} \right]_{-2}^{2} = 8 - \frac{8}{3} - \left(-8 + \frac{8}{3}\right) = 16 - \frac{16}{3} = \frac{32}{3}.
\]

5.4.53

The net area of this region is given by

\[
\int_{-2}^{2} (x^4 - 16) \, dx = \left[ \frac{x^5}{5} - 16x \right]_{-2}^{2} = \frac{32}{5} - 32 - \left(-\frac{32}{5} + 32\right) = 64 - 64 = -\frac{256}{5}.
\]

Thus the area is \( \frac{256}{5} \).

5.4.54

The net area of this region is given by

\[
\int_{-\pi/2}^{\pi/2} 6 \cos x \, dx = 6 \sin x \bigg|_{-\pi/2}^{\pi/2} = 0 - (-6) = 6.
\]

The area is given by

\[
\int_{-\pi/2}^{\pi/2} 6 \cos x \, dx - \int_{-\pi/2}^{\pi/2} 6 \cos x \, dx = 6 \sin x \bigg|_{-\pi/2}^{\pi/2} - 6 \sin x \bigg|_{\pi/2}^{\pi/2} = 6 - (-6) - (0 - 6) = 18.
\]

5.4.55 Because this region is below the axis, its area is given by

\[
-\int_{2}^{4} (x^2 - 25) \, dx = -\left( \frac{x^3}{3} - 25x \right) \bigg|_{2}^{4} = -\left( \frac{64}{3} - 100 - \left( \frac{8}{3} - 50 \right) \right) = 50 - \frac{56}{3} = \frac{94}{3}.
\]

Copyright © 2014 Pearson Education, Inc.
5.4.56 Because the function is below the axis between $-1$ and $1$, and is above the axis between $1$ and $2$, the area of the bounded region is given by

\[
- \int_{-1}^{1} (x^3 - 1) \, dx + \int_{1}^{2} (x^3 - 1) \, dx = - \left( \frac{x^4}{4} - x \right) \bigg|_{-1}^{1} + \left( \frac{x^4}{4} - x \right) \bigg|_{1}^{2} \\
= - \left( \frac{1}{4} - 1 - \left( \frac{1}{4} + 1 \right) \right) + \left( 4 - 2 - \left( \frac{1}{4} - 1 \right) \right) \\
= 2 + \frac{11}{4} = \frac{19}{4}.
\]

5.4.57 Because this region is below the axis, its area is given by

\[
- \int_{-2}^{-1} \frac{1}{x} \, dx = - \left( \ln |x| \right|_{-2}^{-1} = \ln 2 - \ln 1 = \ln 2.
\]

5.4.58 Because the function is above the axis between $-1$ and $0$ and is below the axis between $0$ and $2$, the area is given by

\[
\int_{-1}^{0} (x^3 - x^2 - 2x) \, dx - \int_{0}^{2} (x^3 - x^2 - 2x) \, dx = \left( \frac{x^4}{4} - \frac{x^3}{3} - 2x \right) \bigg|_{-1}^{0} - \left( \frac{x^4}{4} - \frac{x^3}{3} - 2x \right) \bigg|_{0}^{2} \\
= \left( 0 - \left( \frac{1}{4} + \frac{1}{3} - 1 \right) \right) - \left( 4 - \frac{8}{3} - 4 - 0 \right) \\
= \frac{5}{12} + \frac{8}{3} = \frac{37}{12}.
\]

5.4.59 The area is given by

\[
- \int_{-\pi/4}^{0} \sin x \, dx + \int_{0}^{3\pi/4} \sin x \, dx = \left( \cos x \right|_{-\pi/4}^{0} + \left( - \cos x \right|_{0}^{3\pi/4} \right) = \left( 1 - \frac{\sqrt{2}}{2} \right) + \left( 1 + \frac{\sqrt{2}}{2} \right) = 2.
\]

5.4.60 Because this region is below the axis, the area is given by

\[- \int_{\pi/2}^{\pi} \cos x \, dx = - \left( \sin x \right|_{\pi/2}^{\pi} = \sin \frac{\pi}{2} - \sin \pi = 1.\]

5.4.61 By a direct application of the Fundamental Theorem, this is $x^2 + x + 1$.

5.4.62 By a direct application of the Fundamental Theorem, this is $e^x$.

5.4.63 By the Fundamental Theorem and the chain rule, this is $\frac{1}{x} \cdot 3x^2 = \frac{3}{x}$.

5.4.64 This is equal to $- \frac{d}{dx} \int_{10}^{x^2} \frac{dz}{z^2 + 1} = - \frac{-1}{x^4 + 1} \cdot 2x = - \frac{2x}{x^4 + 1}$.

5.4.65 This is $- \frac{d}{dx} \int_{1}^{x} \sqrt{t^4 + 1} \, dt = - \sqrt{x^4 + 1}$.

5.4.66 This is $- \frac{d}{dx} \int_{0}^{x} \frac{dp}{p^2 + 1} = - \frac{1}{x^2 + 1}$.

5.4.67 This can be written as

\[
\frac{d}{dx} \left( \int_{-x}^{0} \sqrt{1 + t^2} \, dt + \int_{0}^{x} \sqrt{1 + t^2} \, dt \right) = \frac{d}{dx} \left( - \int_{0}^{-x} \sqrt{1 + t^2} \, dt + \int_{0}^{x} \sqrt{1 + t^2} \, dt \right) \\
= - \sqrt{1 + (-x)^2} + \sqrt{1 + x^2} \\
= 2 \sqrt{1 + x^2}.
\]
5.4.68 This can be written as
\[
\frac{d}{dx} \left( \int_0^e \ln(t^2) \, dt + \int_0^{e^2} \ln(t^2) \, dt \right) = \frac{d}{dx} \left( -\int_0^e \ln(t^2) \, dt + \int_0^{e^2} \ln(t^2) \, dt \right)
\]
\[
= -\ln((e^x)^2) \cdot e^x + \ln((e^{2x})^2) \cdot 2e^{2x}
\]
\[
= -2xe^x + 8xe^{2x} = 2xe^x(4e^x - 1).
\]

5.4.69
(a) matches with (C) – its area function is increasing linearly.
(b) matches with (B) – its area function increases then decreases.
(c) matches with (D) – its area function is always increasing on \([0, b]\), although not linearly.
(d) matches with (A) – its area function decreases at first and then eventually increases.

5.4.70
a. It appears that \(A(x) = 0\) for \(x = 0\) and \(x = 10\).

5.4.71
a. It appears that \(A(x) = 0\) for \(x = 0\) and at about \(x = 3.5\).

5.4.72
a. It appears that \(A(x) = 0\) for \(x = 0, x = 2, x = 4, x = 6, x = 8,\) and \(x = 10\).

Copyright © 2014 Pearson Education, Inc.
5.4.73

a. It appears that $A(x) = 0$ for $x = 0$ and $x = 10$.
b. $A$ has a local maximum at $x = 5$ where the area function changes from increasing to decreasing.

c.

\[ A(1) = \frac{1}{2} \cdot 1 \cdot 1 = \frac{1}{2}. \quad A(2) = \frac{1}{2} \cdot 2 \cdot 2 = 2. \quad A(4) = 2 + 2^2 = 6. \quad A(6) = 6 + \frac{3}{4} \pi \cdot 2^2 = 6 + \pi. \]

5.4.74

\[ A(1) = 1 \quad 2 \quad 1 \cdot 1 = 1 \]
\[ A(2) = 1 \quad 2 \quad 2 \cdot 2 = 2. \]
\[ A(4) = 2 + 2^2 = 6. \]
\[ A(6) = 6 + \frac{3}{4} \pi \cdot 2^2 = 6 + \pi. \]

5.4.75

\[ A(2) = -\frac{1}{4} \pi \cdot 2^2 = -\pi, \quad A(5) = -\pi + \frac{1}{2} \cdot 3 \cdot 3 = \frac{9}{2} - \pi, \]
\[ A(8) = \frac{9}{2} - \pi + \frac{1}{2} \cdot 3 \cdot 3 = 9 - \pi, \quad A(12) = 9 - \pi - \frac{1}{2} \cdot 4 \cdot 2 = 5 - \pi. \]

5.4.76

a. $A(x) = \int_0^x \sin t \, dt = -\cos t \bigg|_0^x = -\cos x - (-1) = 1 - \cos x$.
b. $A \left( \frac{\pi}{2} \right) = 1 - \cos \frac{\pi}{2} = (1 - 0) = 1$ and $A(\pi) = 1 - \cos \pi = 1 - (-1) = 2$. The area under the curve between 0 and $\frac{\pi}{2}$ is the same as the area under the curve between $\frac{\pi}{2}$ and $\pi$.

c. $A(\ln 2) = e^{\ln 2} - 1 = 2 - 1 = 1$. $A(\ln 4) = e^{\ln 4} - 1 = 4 - 1 = 3$. There is twice as much area under the curve between $\ln 2$ and $\ln 4$ as there is between 0 and $\ln 2$.

5.4.77

a. $A(x) = \int_0^x e^t \, dt = e^t \bigg|_0^x = e^x - 1$.
b. $A(\ln 2) = e^{\ln 2} - 1 = 2 - 1 = 1$. $A(\ln 4) = e^{\ln 4} - 1 = 4 - 1 = 3$. There is twice as much area under the curve between $\ln 2$ and $\ln 4$ as there is between 0 and $\ln 2$.

c. $A(1) = \frac{3}{2} + 12 - 12 = -3. \quad A(2) = -48 + 96 - 48 = 0$. The area bounded between the $x$-axis and the curve on $[0, 1]$ is equal to the area bounded between the $x$-axis and the curve on $[1, 2]$.

Copyright © 2014 Pearson Education, Inc.
5.4.79

a. \( A(x) = \int_0^x \cos \pi t \, dt = \frac{1}{\pi} \sin \pi t \bigg|_0^x = \frac{\sin \pi x}{\pi} \).

c. \( A \left( \frac{1}{2} \right) = \frac{1}{\pi} \). \( A(1) = \frac{\sin \frac{\pi}{2}}{\pi} = 0 \). The area bounded between the \( x \)-axis and the curve on \([0, \frac{1}{2}]\) is equal to the area bounded between the \( x \)-axis and the curve on \([\frac{1}{2}, 1]\).

5.4.80

a. \( A(x) = \int_1^x \frac{1}{t} \, dt = \ln t \bigg|_1^x = \ln x \).

c. \( A(4) = \ln 4 \) and \( A(6) = \ln 6 \).

5.4.81

a. \( g'(x) = \sin^2 x \).

b. \( g'(x) = \sin^2 x \).

c. Note that \( g' \) is always positive, so \( g \) is always increasing. There are inflection points where \( g' \) changes from increasing to decreasing, and vice versa.
5.4.82

a.

b. $g'(x) = x^2 + 1$.

Note that $g'$ is always positive, so $g$ is always increasing. Also $g'$ is always increasing, so $g$ is always concave up.

5.4.83

a.

b. $g'(x) = \sin(\pi x^2)$.

c. 

Note that $g$ is increasing where $g' > 0$ and $g$ is decreasing when $g' < 0$. Also, where $g'$ is increasing, $g$ is concave up and where $g'$ is decreasing, $g$ is concave down.
5.4.84

a.

b. \( g'(x) = \cos(\pi \sqrt{x}) \).

c.

Note that \( g \) is increasing where \( g' > 0 \) and \( g \) is decreasing when \( g' < 0 \). Also, where \( g' \) is increasing, \( g \) is concave up and where \( g' \) is decreasing, \( g \) is concave down.

5.4.85

a. True. The net area under the curve increases as \( x \) increases, as long as \( f \) is above the axis.

b. True. The net area decreases as \( x \) increases, as long as \( f \) is below the axis.

c. False. These do not have the same derivative, so they are not antiderivatives of the same function.

d. True, because the two functions differ by a constant, and thus have the same derivative.

e. True, because the derivative of a constant is zero.

5.4.86

\[
\int_{0}^{\ln 2} e^x \, dx = \frac{1}{2} \left( e^{\ln 2} \right) = \frac{1}{2} (2 - 1) = \frac{1}{2}.
\]

5.4.87

\[
\int_{1}^{4} \frac{x - 2}{\sqrt{x}} \, dx = \int_{1}^{4} \left( \frac{x}{\sqrt{x}} - \frac{2}{\sqrt{x}} \right) \, dx
= \int_{1}^{4} \left( x^{1/2} - 2x^{-1/2} \right) \, dx
= \left[ \frac{2}{3} x^{3/2} - 4x^{1/2} \right]_{1}^{4}
= \frac{14}{3} - 8 - \left( \frac{2}{3} - 4 \right)
= \frac{16}{3} - 8 - \left( \frac{2}{3} - 4 \right)
= \frac{14}{3} - \frac{12}{3} = \frac{2}{3}.
\]

5.4.88

\[
\int_{1}^{2} \left( \frac{2}{s} - \frac{4}{s^3} \right) \, ds = \left( 2 \ln |s| + \frac{2}{s^2} \right) \bigg|_{1}^{2} = 2 \ln 2 + \frac{1}{2} - (0 + 2) = \ln 4 - \frac{3}{2}.
\]

5.4.89

\[
\int_{0}^{\pi/3} \sec x \tan x \, dx = \sec x \bigg|_{0}^{\pi/3} = 2 - 1 = 1.
\]

5.4.90

\[
\int_{\pi/4}^{\pi/2} \csc^2 \theta \, d\theta = -\cot \theta \bigg|_{\pi/4}^{\pi/2} = 0 + 1 = 1.
\]
5.4.91 \[ \int_1^8 \sqrt[3]{y} \, dy = \left. \frac{3}{4} y^{4/3} \right|_1^8 = 12 - \frac{3}{4} = \frac{45}{4}. \]

5.4.92 \[ \int_2^8 \frac{dx}{\sqrt{x \sqrt{x^2 - 1}}} = \sec^{-1} x \bigg|_{\sqrt{2}}^2 = \frac{\pi}{3} - \frac{\pi}{4} = \frac{\pi}{12}. \]

5.4.93 \[ \int_1^2 \frac{z^2 + 4}{z} \, dz = \int_1^2 \left( z + \frac{4}{z} \right) \, dz = \left( \frac{z^3}{3} + 4 \ln z \right) \bigg|_1^2 = 2 + 4 \ln 2 - \left( \frac{1}{2} + 0 \right) = \ln 16 + \frac{3}{2}. \]

5.4.94 \[ \int_0^\sqrt{3} \frac{3dx}{9 + x^2} = \tan^{-1} \frac{x}{3} \bigg|_0^\sqrt{3} = \tan^{-1} \frac{\sqrt{3}}{3} = \frac{\pi}{6}. \]

5.4.95

We can use geometry – there is a triangle with base 4 and height 2 and a triangle with base 2 and height 2, so the total area is \( \frac{1}{2} \cdot 4 \cdot 2 + \frac{1}{2} \cdot 2 \cdot 2 = 6. \)

5.4.96

Because the region is above the axis, we can simply compute

\[ \int_{-\sqrt{2}}^\sqrt{2} \frac{dx}{\sqrt{1 - x^2}} = \sin^{-1}(x) \bigg|_{-\sqrt{2}}^\sqrt{2} = \frac{\pi}{3} - \left( -\frac{\pi}{6} \right) = \frac{\pi}{2}. \]

5.4.97

Because the region is below the axis on \([1, \sqrt{2}]\) and above on \([\sqrt{2}, 4]\) we need to compute

\[ \int_1^4 (x^4 - 4) \, dx - \int_1^{\sqrt{2}} (x^4 - 4) \, dx = \left( \frac{x^5}{5} - 4x \right) \bigg|_1^4 - \left( \frac{x^5}{5} - 4x \right) \bigg|_1^{\sqrt{2}} = \frac{1024}{5} - 16 - \left( \frac{4\sqrt{2}}{5} - 4\sqrt{2} \right) - \left( \frac{4\sqrt{2}}{5} - 4\sqrt{2} \right) + \frac{1}{5} - 4 \]

\[ = 185 + \frac{32\sqrt{2}}{5}. \]
5.4.98

Because the function is below (or touching) the axis on \([-1, 2]\) and above on \([2, 3]\), the area is given by

\[
\int_{-1}^{3} (x^3 - 2x^2) \, dx - \int_{-1}^{2} (x^3 - 2x^2) \, dx = \left. \left( \frac{x^4}{4} - \frac{2x^3}{3} \right) \right|_{-1}^{3} - \left. \left( \frac{x^4}{4} - \frac{2x^3}{3} \right) \right|_{-1}^{2} \\
= \left( \frac{81}{4} - 18 \right) - \left( \frac{4 - 16}{3} \right) - \left( 4 - \frac{16}{3} \right) + \left( \frac{1}{4} + \frac{2}{3} \right) \\
= \frac{41}{2} - 26 + \frac{34}{3} = \frac{35}{6}.
\]

5.4.99 \( \int_{3}^{8} f'(t) \, dt = f(8) - f(3) \).

5.4.100 \( \frac{d}{dx} \int_{0}^{x^2} \frac{1}{t^2 + 4} \, dt = \frac{2x}{x^4 + 4} \).

5.4.101 \( \frac{d}{dx} \int_{0}^{\cos x} (t^4 + 6) \, dt = (\cos^4 x + 6) \cdot (-\sin x) = - (\cos^4 x + 6) \sin x \).

5.4.102 \( \frac{d}{dx} \int_{x}^{1} e^t \, dt = - \frac{d}{dx} \int_{1}^{x} e^t \, dt = -e^x \).

5.4.103 \( \frac{d}{dt} \left( \int_{1}^{t} \frac{3}{x} \, dx - \int_{1/2}^{1/2} \frac{3}{x} \, dx \right) = \frac{d}{dt} \int_{1}^{t} \frac{3}{x} \, dx + \frac{d}{dx} \int_{1/2}^{t} \frac{3}{x} \, dx = \frac{3}{t} + \frac{6t}{t^2} = \frac{9}{t} \).

5.4.104 \( \frac{d}{dt} \left( \int_{0}^{t} \frac{dx}{1 + x^2} + \int_{0}^{1/t} \frac{dx}{1 + x^2} \right) = \frac{1}{1 + t^2} + \frac{1}{1 + (1/t)^2} \cdot \left( -\frac{1}{t^2} \right) = \frac{1}{1 + t^2} - \frac{1}{t^2 + 1} = 0 \).

5.4.105

b. We seek \( b \) so that \( \int_{0}^{b} (x^2 - 4x) = 0 \) for \( b > 0 \). We have \( \left. \left( \frac{x^3}{3} - 2x^2 \right) \right|_{0}^{b} = \frac{b^3}{3} - 2b^2 = 0 \), which occurs for \( \frac{b}{3} = 2 \), or \( b = 6 \).

c. We seek \( b \) so that \( \int_{0}^{b} (x^2 - ax) = 0 \) for \( b > 0 \). We have \( \left. \left( \frac{x^3}{3} - \frac{ax^2}{2} \right) \right|_{0}^{b} = \frac{b^3}{3} - \frac{ab^2}{2} = 0 \), which occurs for \( \frac{b}{3} = \frac{a}{2} \), or \( b = \frac{3a}{2} \).

5.4.106 If \( 0 < x < a \), then \( x > 0, x - a < 0, \) and \( x - b < 0 \), so the product of these three quantities is positive. If \( a < x < b \), then \( x > 0, x - a > 0, \) and \( x - b < 0 \), so the product of these three quantities is negative. The region between \( x = 0 \) and \( x = a \), which is above the \( x \) axis, has area

\[
\int_{0}^{a} x(x - a)(x - b) \, dx = \int_{0}^{a} \left( x^3 - (a + b)x^2 + abx \right) \, dx = \left. \left( \frac{x^4}{4} - \frac{a + b}{3} x^3 + \frac{ab}{2} x \right) \right|_{0}^{a} = \frac{a^3(2b - a)}{12}.
\]
while the region between \( x = a \) and \( x = b \), which is below the \( x \)-axis, has area

\[
- \int_a^b x(x-a)(x-b) \, dx = - \int_a^b (x^3 - (a + b)x^2 + abx) \, dx = - \left( \frac{x^4}{4} - \frac{a + b}{3} x^3 + \frac{ab}{2} x \right) \bigg|_a^b = \frac{(b-a)^3(a+b)}{12}.
\]

These are equal when \( a^3(2b-a) = (b-a)^3(a+b) \). Divide through by \( a^4 \) to get

\[
2 \cdot \frac{b}{a} - 1 = \left( \frac{b}{a} - 1 \right)^3 \left( 1 + \frac{b}{a} \right).
\]

Let \( c = \frac{b}{a} \); then \( 2c - 1 = (c-1)(c+1) = c^4 - 2c^3 + 2c - 1 \), so that \( c^4 - 2c^3 = 0 \). Since \( b > 0 \) we must have \( c > 0 \), and the only nonzero root is \( c = 2 \). Thus \( c = \frac{b}{a} = 2 \), so that \( b = 2a \).

**5.4.107** Because \( \frac{d}{db} \int_1^b x^2(3-x) \, dx = b^2(3-b) \) we see that this function of \( b \) has critical points at \( b = 0 \) and \( b = 3 \). Note also that the integrand is positive on \([0,3]\), but is negative on \([3,\infty)\). So the maximum for this area function is at \( b = 3 \).

**5.4.108** The function \( f(x) = 8 + 2x - x^2 = (4-x)(2+x) \) is 0 for \( x = 4 \) and \( x = -2 \), and is positive on \((-2,4)\) and negative on \((-\infty,-2)\) and on \((4,\infty)\). Thus, the largest possible value for the area \( \int_a^b f(x) \, dx \) is when \( a = -2 \) and \( b = 4 \).

**5.4.109** Differentiating both sides of the given equation yields \( f(x) = -2 \sin x + 3 \).

**5.4.110** Suppose that a maximum of \( A \) occurs at \( x = c \), and that \( A \) is not a constant function near \( c \). Then \( A \) changes from increasing to decreasing at \( c \). But because \( A \) is the net area from 0 to \( x \), the only way for \( A \) to change from increasing to decreasing is for \( f \) to change from above the axis to below, so it must be the case that \( f > 0 \) to the left of \( c \) and \( f < 0 \) to the right of \( c \), but because \( f \) is continuous, this implies that \( f(c) = 0 \). An analogous argument holds for the case when \( A \) has a minimum at \( c \).

For \( f(x) = x^2 - 10x \), note that \( A(x) = \int_0^x (t^2 - 10t) \, dt = \frac{x^3}{3} - 5x^2 \), and that this function has a minimum at \( x = 10 \), because \( A'(x) = x^2 - 10x = f(x) \) changes from negative to positive at \( x = 10 \), so that \( A \) changes from decreasing to increasing there.

**5.4.111** Using a computer or calculator, we obtain:

\[
\begin{array}{|c|c|c|c|c|}
\hline
x & 500 & 1000 & 1500 & 2000 \\
\hline
S(x) & 1.5726 & 1.57023 & 1.57087 & 1.57098 \\
\hline
\end{array}
\]

This appears to be approaching \( \frac{\pi}{2} \).

Note that between 0 and \( \pi \), the area is approximately half the area of a rectangle with height 1 and base \( \pi \), and then from \( \pi \) on there is approximately as much area above the axis as below.

**5.4.112** By the Fundamental Theorem, \( S'(x) = \frac{\sin x}{x} \), so

\[
S''(x) = \frac{x \cos x - \sin x}{x^2} = \frac{\cos x}{x} - \frac{\sin x}{x^2},
\]

\[
S'''(x) = \frac{-x \sin x - \cos x}{x^2} - \frac{x^2 \cos x - 2x \sin x}{x^4} = - \frac{\sin x}{x} - \frac{2 \cos x}{x^2} + \frac{2 \sin x}{x^3}.
\]

Then

\[
x S'(x) + 2 S''(x) + x S'''(x) = \sin x + \frac{2 \cos x}{x} - \frac{2 \sin x}{x^2} + \left( - \frac{\sin x}{x} - \frac{2 \cos x}{x^2} + \frac{2 \sin x}{x^2} \right) = 0.
\]

Copyright © 2014 Pearson Education, Inc.
5.4.113 By the Fundamental Theorem, \( S'(x) = \sin x^2 \), so \( S''(x) = 2x \cos x^2 \), and then

\[
S'(x)^2 + \left( \frac{S''(x)}{2x} \right)^2 = \sin^2 x^2 + \cos^2 x^2 = 1.
\]

5.4.114 Note that \( \int_{-x}^{x} (t^2 + t) \, dt = \int_{0}^{x} (t^2 + t) \, dt - \int_{0}^{-x} (t^2 + t) \, dt \). Thus, the derivative with respect to \( x \) of this expression is

\[
(x^2 + x) - ((-x)^2 + (-x)) \cdot (-1) = (x^2 + x) + (x^2 - x) = 2x^2.
\]

5.4.115

a. By definition of Riemann sums, \( \int_{a}^{b} f'(x) \, dx \) is approximated by \( \frac{\sum_{k=1}^{n} f'(x_{k-1}) \Delta x}{n} \). If \( h = \Delta x \), then we have

\[
\int_{a}^{b} f'(x) \, dx \approx \sum_{k=1}^{n} \frac{f(x_k) - f(x_{k-1})}{\Delta x} \cdot \Delta x.
\]

b. Canceling the \( \Delta x \) factors we get

\[
\int_{a}^{b} f'(x) \, dx \approx \sum_{k=1}^{n} \frac{f(x_k) - f(x_{k-1})}{\Delta x} \cdot \Delta x
\]

\[
= \sum_{k=1}^{n} (f(x_k) - f(x_{k-1}))
\]

\[
= (f(x_1) - f(x_0)) + (f(x_2) - f(x_1)) + \cdots + (f(x_n) - f(x_{n-1})) + (f(x_n) - f(x_{n-1}))
\]

\[
= f(x_n) - f(x_0) = f(b) - f(a).
\]

c. The analogy between the two situations is that both (a) the sum of difference quotients and (b) integral of a derivative are equal to the difference in function values at the endpoints.

5.5 Working with Integrals

5.5.1 If \( f \) is odd, it is symmetric about the origin, which guarantees that between \(-a\) and \( a \), there is as much area above the axis and under \( f \) as there is below the axis and above \( f \), so the net area must be 0.

5.5.2 If \( f \) is even, it is symmetric about the \( y \)-axis, which guarantees that the region between \(-a\) and 0 has the same net area as the region between 0 and \( a \), so \( \int_{-a}^{0} f(x) \, dx + \int_{0}^{a} f(x) \, dx = 2 \int_{0}^{a} f(x) \, dx \).

5.5.3 \( f(x) = x^{12} \) is an even function, because \( f(-x) = (-x)^{12} = x^{12} = f(x) \). \( g(x) = \sin x^2 \) is also even, because \( g(-x) = \sin((-x)^2) = \sin x^2 = g(x) \).

5.5.4 The average value of a function \( f \) on \([a, b]\) is \( \frac{1}{b-a} \int_{a}^{b} f(x) \, dx \). This is analogous to “adding up all the value of \( f \) and dividing by how many there are” – in the sense that computing the interval is like adding up all the values of the function, and dividing by \( b - a \) is like dividing by how many \( x \) values there are.

5.5.5 The average value of a continuous function on a closed interval \([a, b]\) will always be between the maximum and the minimum value of \( f \) on that interval. Because the function is continuous, the Intermediate Value Theorem assures us that the function will take on each value between the maximum and the minimum somewhere on the interval.
5.5.6

Note that the area of the triangle is \( \frac{1}{2} \cdot 2 \cdot 2 = 2 \), so the rectangle needs to have a height of 1 and a base of 2 so that its area is 2.

5.5.7 Because \( x^9 \) is an odd function, \( \int_{-2}^{2} x^9 \, dx = 0 \).

5.5.8 Because \( 2x^5 \) is an odd function, \( \int_{-200}^{200} 2x^5 \, dx = 0 \).

5.5.9 \( \int_{-2}^{2} (3x^8 - 2) \, dx = 2 \int_{0}^{2} (3x^8 - 2) \, dx = 2 \left( \frac{x^9}{3} - 2x \right) \Big|_{0}^{2} = \left( \frac{1024}{3} \right) - 8 = \frac{1000}{3} \).

5.5.10 \( \int_{-\pi/4}^{\pi/4} \cos x \, dx = 2 \int_{0}^{\pi/4} \cos x \, dx = 2 \sin x \Big|_{0}^{\pi/4} = 2 \left( \frac{\sqrt{2}}{2} \right) = \sqrt{2} \).

5.5.11 Note that the first two terms of the integrand form an odd function, and the last two terms form an even function. \( \int_{-2}^{2} (x^9 - 3x^5 + 2x^2 - 10) \, dx = 2 \int_{0}^{2} (2x^2 - 10) \, dx = 2 \left( \frac{2x^3}{3} - 10x \right) \Big|_{0}^{2} = \frac{32}{3} - 40 = \frac{-88}{3} \).

5.5.12 \( \int_{-\pi/2}^{\pi/2} 5 \sin x \, dx = 0 \) because the integrand is an odd function.

5.5.13 \( \int_{-10}^{10} \frac{x}{\sqrt{200 - x^2}} \, dx = 0 \) because the integrand is an odd function.

5.5.14 Note that the first term of the integrand is an even function, and the other two terms are odd functions. Thus, \( \int_{-\pi/2}^{\pi/2} (\cos 2x + \cos x \sin x - 3 \sin x^5) \, dx = 2 \int_{0}^{\pi/2} \cos 2x \, dx = 2 \left( \frac{\sin 2x}{2} \right) \Big|_{0}^{\pi/2} = 0. \)

5.5.15 Because the integrand is an odd function and the interval is symmetric about 0, this integral’s value is 0.

5.5.16 \( \int_{-1}^{1} (1 - |x|) \, dx = 2 \int_{0}^{1} (1 - x) \, dx = 2 \left( x - \frac{x^2}{2} \right) \Big|_{0}^{1} = 2 \left( 1 - \frac{1}{2} \right) = 1 \).

5.5.17

Because the integrand is an odd function and the interval is symmetric about 0, this integral’s value is 0.
5.5.18

Because of the symmetry of the cosine function, the net area is zero between 0 and $2\pi$.

5.5.19

Because of the symmetry of the cosine function, the net area is zero between 0 and $\pi$.

5.5.20

Because of the symmetry of the sine function, the net area is zero between 0 and $2\pi$.

5.5.21

The average value is

$$
\frac{1}{1 - (-1)} \int_{-1}^{1} x^3 \, dx = \frac{1}{2} \left( \frac{x^4}{4} \right) \bigg|_{-1}^{1} = 0.
$$
5.5. WORKING WITH INTEGRALS

5.5.22

The average value is
\[
\frac{1}{2 - (-2)} \int_{-2}^{2} (x^2 + 1) \, dx = \frac{1}{4} \left( \frac{x^3}{3} + x \right) \bigg|_{-2}^{2} = \frac{8/3 + 2 - (-8/3 - 2)}{4} = \frac{7}{3}.
\]

5.5.23

The average value is
\[
\frac{1}{1 - (-1)} \int_{-1}^{1} \frac{1}{x^2 + 1} \, dx = \frac{1}{2} \tan^{-1} x \bigg|_{-1}^{1} = \frac{\pi}{4} - (-\pi/4) = \frac{\pi}{4}.
\]

5.5.24

The average value is
\[
\frac{1}{\pi/2} \int_{-\pi/4}^{\pi/4} \cos 2x \, dx = \frac{1}{\pi} \left( \sin 2x \right) \bigg|_{-\pi/4}^{\pi/4} = \frac{1}{\pi} [1 - (-1)] = \frac{2}{\pi}.
\]

5.5.25

The average value is
\[
\frac{1}{e - 1} \int_{1}^{e} \frac{1}{x} \, dx = \frac{1}{e - 1} (\ln |x|) \bigg|_{1}^{e} = \frac{1}{e - 1} \approx 0.582.
\]
5.5.26

The average value is
\[
\frac{1}{\ln 2} \int_0^{\ln 2} e^{2x} \, dx = \frac{1}{\ln 2} \left( \frac{e^{2x}}{2} \right)_0^{\ln 2} \\
= \frac{1}{\ln 2} \cdot \left( 2 - \frac{1}{2} \right) = \frac{3}{2\ln 2} \approx 2.164.
\]

5.5.27

The average value is
\[
\frac{1}{\pi} \int_{-\pi/2}^{\pi/2} \cos x \, dx = \frac{1}{\pi} \left( \sin x \right)_{-\pi/2}^{\pi/2} \\
= \frac{1}{\pi} \cdot (1 - (-1)) = \frac{2}{\pi} \approx 0.637.
\]

5.5.28

The average value is
\[
\frac{1}{1} \int_0^1 (x - x^2) \, dx = \left( \frac{x^2}{2} - \frac{x^3}{3} \right)_0^1 \\
= \frac{1}{2} - \frac{1}{3} = \frac{1}{6} \approx 0.167.
\]

5.5.29

The average value is
\[
\frac{1}{1} \int_0^1 x^n \, dx = \left( \frac{x^{n+1}}{n+1} \right)_0^1 = \frac{1}{n+1}.
\]
The picture shown is for the case \( n = 3 \).

5.5.30

The average value is
\[
\frac{1}{1} \int_0^1 x^{1/n} \, dx = \left( \frac{x^{(n+1)/n}}{n+1/n} \right)_0^1 = \frac{n}{n+1}.
\]
The picture shown is for the case \( n = 3 \).
5.5.31 The average distance to the axis is given by \( \frac{1}{20} \int_0^{20} 30x(20-x) \, dx \). This is equal to
\[
\frac{1}{20} \int_0^{20} (600x - 30x^2) \, dx = \frac{1}{20} \left( 300x^2 - 10x^3 \right)_0^{20} = 2000.
\]

5.5.32
The average value is
\[
\frac{1}{4} \int_0^4 (x^3 - 5x^2 + 30) \, dx = \frac{1}{4} \left( \frac{x^4}{4} - \frac{5x^3}{3} + 30x \right)_0^4 = 58.
\]

5.5.33 The average height is \( \frac{1}{\pi} \int_0^\pi 10 \sin x \, dx = \frac{1}{\pi} (-10 \cos x)\bigg|_0^\pi = \frac{1}{\pi} (10 - (-10)) = \frac{20}{\pi} \).

5.5.34 The average height is \( \frac{1}{2\pi} \int_{-\pi}^\pi (5 + 5 \cos x) \, dx = \frac{1}{2\pi} (5x + 5 \sin x)\bigg|_{-\pi}^\pi = \frac{1}{2\pi} (5\pi - (-5\pi)) = 5 \).

5.5.35 The average value is \( \frac{1}{4} \int_0^4 (8 - 2x) \, dx = \frac{1}{4} (8x - x^2)\bigg|_0^4 = 4 \). The function has a value of 4 when \( 8 - 2x = 4 \), which occurs when \( x = 2 \).

5.5.36 The average value is \( \frac{1}{2} \int_0^2 e^x \, dx = \frac{1}{2} (e^x)\bigg|_0^2 = e^2 - 1 = \frac{2}{e} \). The function attains this value when \( e^{\frac{2}{e}} = e^x \), which is when \( x = \ln \left( \frac{e^2 - 1}{2} \right) \approx 1.161 \).

5.5.37 The average value is \( \frac{1}{3} \int_0^a \left( 1 - \frac{x^2}{a^2} \right) \, dx = \frac{1}{3} \left( x - \frac{x^3}{3a^2} \right)\bigg|_0^a = \frac{2}{3} \). The function attains this value when \( \frac{2}{3} = 1 - \frac{x^2}{a^2} \), which is when \( x^2 = \frac{a^2}{3} \), which on the given interval occurs for \( x = \frac{\sqrt{3}a}{3} \).

5.5.38 The average value is \( \frac{1}{\pi} \int_0^\pi \frac{\pi}{4} \sin x \, dx = \frac{1}{\pi} (-\cos x)\bigg|_0^\pi = \frac{1}{\pi} (1 - (-1)) = \frac{1}{2} \). The function attains this value when \( \frac{1}{2} \cdot \frac{\pi}{4} = \sin x \), which is when \( x = \sin^{-1} \frac{\pi}{8} \approx 0.690 \) and for \( x \approx 2.451 \).

5.5.39 The average value is
\[
\frac{1}{2} \int_{-1}^1 (1 - |x|) \, dx = \frac{1}{2} \int_{-1}^0 (1 + x) \, dx + \frac{1}{2} \int_0^1 (1 - x) \, dx
= \frac{1}{2} \left( x + \frac{x^2}{2} \right)\bigg|_0^1 + \frac{1}{2} \left( x - \frac{x^2}{2} \right)\bigg|_0^1
= \frac{1}{4} + \frac{1}{4} = \frac{1}{2}.
\]

The function attains this value twice, once on \([-1, 0]\) when \( 1 + x = \frac{1}{2} \) which occurs when \( x = -\frac{1}{2} \), and once on \([0, 1]\) when \( 1 - x = \frac{1}{2} \) which occurs when \( x = \frac{1}{2} \).

5.5.40 The average value is given by \( \frac{1}{3} \int_1^4 \frac{1}{x} \, dx = \frac{1}{3} (\ln x)|_1^4 = \frac{1}{3} (\ln 4) \). The function attains this value when \( x = \frac{3}{\ln 4} \approx 2.164 \).
5.5.41
a. True. Because of the symmetry, the net area between 0 and 4 will be twice the net area between 0 and 2.

b. True. This follows because the symmetry implies that the net area from \(a\) to \(a + 2\) is the opposite of the net area from \(a - 2\) to \(a\).

c. True. If \(f(x) = cx + d\) on \([a, b]\) the value at the midpoint is \(c \cdot \frac{a + b}{2} + d\), and the average value is
\[
\frac{1}{b - a} \int_a^b (cx + d) \, dx = \frac{1}{b - a} \left( \frac{cx^2}{2} + dx \right) \bigg|_a^b = \frac{1}{b - a} \left( \frac{cb^2}{2} + db - \left( \frac{ca^2}{2} + da \right) \right) = c \cdot \frac{(a + b)}{2} + d.
\]

d. False, for example, when \(a = 1\), we have that the maximum value of \(x - x^2\) on \([0, 1]\) occurs at \(\frac{1}{2}\) and is equal to \(\frac{1}{4}\), but the average value is
\[
\frac{1}{1} \int_0^1 (x - x^2) \, dx = \left( \frac{x^2}{2} - \frac{x^3}{3} \right) \bigg|_0^1 = \frac{1}{2} - \frac{1}{3} = \frac{1}{6}.
\]

5.5.42 Recall that the tangent function is an odd function, so the value of this integral is 0.

5.5.43 \(\sec^2 x\) is even, so the value of this integral is
\[
2 \int_0^{\pi/4} \sec^2 x \, dx = 2(\tan x) \bigg|_0^{\pi/4} = 2 \cdot (1 - 0) = 2.
\]

5.5.44 The function \(1 - |x|^3\) is even, so the value of this integral is
\[
2 \int_0^2 (1 - x^3) \, dx = 2 \left( x - \frac{x^4}{4} \right) \bigg|_0^2 = 2(2 - 4) = -4.
\]

5.5.45 The integrand is an odd function, so the value of this integral is zero.

5.5.46 Let \(T = \frac{2\pi k}{\omega}\) where \(k\) is an integer. The RMS is given by
\[
\sqrt{\frac{\omega}{2\pi k}} \int_0^{2\pi k/\omega} A^2 \sin^2(\omega t) \, dt = A \sqrt{\frac{\omega}{2\pi k}} \int_0^{2\pi k/\omega} \frac{1 - \cos(2\omega t)}{2} \, dt = A \sqrt{\frac{\omega}{2\pi k}} \left[ \frac{t - \sin(2\omega t)}{4\omega} \right]_0^{2\pi k/\omega} = A \sqrt{\frac{\omega}{2}}.
\]

5.5.47 The average height of the arch is given by
\[
\frac{1}{630} \int_{-315}^{315} \left( 630 - \frac{630}{315^2} x^2 \right) \, dx = 630 \left( 315 - \frac{x^3}{3 \cdot 315^2} \right) \bigg|_{-315}^{315} = (315 - 105 - (-315 + 105)) = 420 \text{ ft}.
\]

5.5.48 The average height of the arch is given by
\[
\frac{1}{630} \int_{-315}^{315} \left( 1260 - 315 \left( e^{0.00418x} + e^{-0.00418x} \right) \right) \, dx
= \frac{1}{630} \left( 1260x - 315 \left( e^{0.00418x} - e^{-0.00418x} \right) \right) \bigg|_{-315}^{315} \approx 431.514 \text{ ft}.
\]

5.5.49
a. \(d^2 = x^2 + y^2 = x^2 + b^2(1 - (x^2/a^2))\). The average value of \(d^2\) is
\[
\frac{1}{2a} \int_{-a}^a \left( b^2 + \left( 1 - \frac{b^2}{a^2} \right) x^2 \right) \, dx = \frac{1}{2a} \left( b^2x + \frac{x^3}{3} \left( 1 - \frac{b^2}{a^2} \right) \right) \bigg|_{-a}^a
= \frac{1}{2a} \left( b^2a + \frac{a^3}{3} - \frac{b^2a}{3} - \left( -b^2a - \frac{a^3}{3} + \frac{b^2a}{3} \right) \right)
= \frac{2b^2}{3} + \frac{a^2}{3}.
\]

b. If \(a = b = R\), the above becomes \(\frac{2R^2}{3} + \frac{R^2}{3} = R^2\).
5.5. WORKING WITH INTEGRALS 515

c. \( D^2 = (x - \sqrt{a^2 - b^2})^2 + y^2 = x^2 - 2x\sqrt{a^2 - b^2} + y^2 + a^2 - b^2 = \left(1 - \frac{b^2}{a^2}\right)x^2 - 2x\sqrt{a^2 - b^2} + a^2 \). So the average value of \( D^2 \) is

\[
\frac{1}{2a} \int_{-a}^{a} D^2 \, dx = \frac{1}{2a} \int_{-a}^{a} \left[ \left(1 - \frac{b^2}{a^2}\right)x^2 + a^2 \right] \, dx - \frac{1}{a} \int_{-a}^{a} x\sqrt{a^2 - b^2} \, dx \\
= \frac{1}{a} \int_{0}^{a} \left[ \left(1 - \frac{b^2}{a^2}\right)x^2 + a^2 \right] \, dx + 0 \\
= \frac{1}{3}(a^2 - b^2) + a^2 = \frac{4a^2 - b^2}{3}.
\]

5.5.50

a. 

Note that \( \frac{d}{dx} \sin x = \cos x \), which is zero when \( x = \pi/2 \), and because the derivative is positive on \( (0, \pi/2) \) and negative on \( (\pi/2, 0) \), there is a maximum at \( x = \pi/2 \). Similarly, \( \frac{d}{dx} \frac{4\pi x - x^2}{\pi^2} = 4\pi - 8x/\pi \), which is zero when \( x = \pi/2 \), and this function increasing on \( (0, \pi/2) \) and decreasing on \( (\pi/2, \pi) \), so it also has a maximum at \( \pi/2 \). Also, both functions have the value 0 at \( x = \pi/2 \).

b. On \( (0, \pi) \), the sine function is always less than or equal to the other function.

c. The average values are

\[
\frac{1}{\pi} \int_{0}^{\pi} \sin x \, dx = \frac{1}{\pi}(-\cos x)\bigg|_{0}^{\pi} = \frac{2}{\pi} \\
\frac{1}{\pi} \cdot \frac{4}{\pi^2} \int_{0}^{\pi} (\pi x - x^2) \, dx = \frac{4}{\pi^3} \left( \frac{\pi^2 x^2}{2} - \frac{x^3}{3} \right)\bigg|_{0}^{\pi} = \frac{4}{\pi^3} \left( \frac{\pi^3}{2} - \frac{\pi^3}{3} \right) = \frac{2}{3}.
\]

5.5.51

a. Because \( \int_{-8}^{8} f(x) \, dx = 18 = 2 \int_{0}^{8} f(x) \, dx \), we have \( \int_{0}^{8} f(x) \, dx = \frac{18}{2} = 9 \).

b. Because \( xf(x) \) is an odd function when \( f(x) \) is even, we have \( \int_{-8}^{8} xf(x) \, dx = 0 \).

5.5.52

a. Because \( f \) is an odd function,

\[
\int_{-4}^{8} f(x) \, dx = \int_{-4}^{0} f(x) \, dx + \int_{0}^{8} f(x) \, dx = -\int_{0}^{4} f(x) \, dx + \int_{0}^{8} f(x) \, dx = -9 + 9 = 6.
\]

b. Because \( f \) is an odd function,

\[
\int_{-8}^{4} f(x) \, dx = \int_{-8}^{0} f(x) \, dx + \int_{0}^{4} f(x) \, dx = -\int_{0}^{8} f(x) \, dx + \int_{0}^{4} f(x) \, dx = -9 + 3 = -6.
\]

5.5.53 \( f(g(-x)) = f(g(x)) \), so \( f(g(x)) \) is an even function, and \( \int_{-8}^{8} f(g(x)) \, dx = 2 \int_{0}^{8} f(g(x)) \, dx \).
5.5.54 \( f(p(-x)) = f(-p(x)) = f(p(x)) \), and thus \( f(p(x)) \) is an even function, so
\[
\int_{-a}^{a} f(p(x)) \, dx = 2 \int_{0}^{a} f(p(x)) \, dx.
\]

5.5.55 \( p(g(-x)) = p(g(x)) \), so \( p(g(x)) \) is an even function, and
\[
\int_{-a}^{a} p(g(x)) \, dx = 2 \int_{0}^{a} p(g(x)) \, dx.
\]

5.5.56 \( p(q(-x)) = -p(q(x)) \), so \( p(q(x)) \) is an odd function, and
\[
\int_{-a}^{a} p(q(x)) \, dx = 0.
\]

5.5.57
a. The average value is
\[
\int_{0}^{1} (ax - ax^2) \, dx = \left( \frac{ax^2}{2} - \frac{ax^3}{3} \right) \bigg|_{0}^{1} = \frac{a}{2} - \frac{a}{3} = \frac{a}{6}.
\]

b. The function is equal to its average value when \( \frac{a}{6} = ax - ax^2 \) which occurs when \( 6x - 6x^2 = 1 \), so when \( 6x^2 - 6x + 1 = 0 \). On the given interval, this occurs for \( x = \frac{6 \pm \sqrt{36}}{12} = \frac{3 \pm \sqrt{3}}{6} \).

5.5.58 The statement is true for constant functions \( f(x) = c \). For these functions, the average value over \([a, b]\) is
\[
\frac{1}{b-a} \int_{a}^{b} c \, dx = \frac{c(b-a)}{b-a} = c,
\]
so the square of the average value is \( c^2 \), while the average value of the square of the function is
\[
\frac{1}{b-a} \int_{a}^{b} c^2 \, dx = \frac{c^2(b-a)}{b-a} = c^2.
\]

If \( f(x) \) is not constant, then the statement does not hold. To see this, suppose \( f(x) \) is a polynomial satisfying the given condition. Let
\[
P(t) = \frac{1}{t} \int_{0}^{t} f(x)^2 \, dx, \quad Q(t) = \left( \frac{1}{t} \int_{0}^{t} f(x) \, dx \right)^2 = \frac{1}{t^2} \left( \int_{0}^{t} f(x) \, dx \right)^2.
\]

Then \( P(t) \) is the average value of the square of \( f(x) \) on \([0, t]\), while \( Q(t) \) is the square of the average value of \( f(x) \) on \([0, t]\). So \( P(t) = Q(t) \) for all values of \( t \). Since \( f \) is a polynomial, so is its integral, and so is its square and the integral of its square. Thus \( P(t) \) and \( Q(t) \) are polynomials that are equal for all values of \( t \), so that \( P(t) = Q(t) \) is the zero polynomial and thus \( P(t) = Q(t) \) as polynomials. Thus each term of \( P(t) \) must be the same as the corresponding term of \( Q(t) \). Now, suppose \( f \) has degree \( d \), so that its highest-degree term is \( cx^d \) for some nonzero constant. Then
\[
P(t) = \frac{1}{t} \int_{0}^{t} f(x)^2 \, dx = \frac{1}{t} \int_{0}^{t} (cx^d + \ldots)^2 \, dx = \frac{1}{t} \int_{0}^{t} (c^2 x^{2d} + \ldots) \, dx
\]
\[
= \frac{1}{t} \left( \frac{c^2}{2d+1} x^{2d+1} + \ldots \right) \bigg|_{0}^{t} = \frac{c^2}{2d+1} t^{2d} + \ldots
\]

and
\[
Q(t) = \frac{1}{t^2} \left( \int_{0}^{t} f(x) \, dx \right)^2 = \frac{1}{t^2} \left( \int_{0}^{t} (cx^d + \ldots) \, dx \right)^2 = \frac{1}{t^2} \left( \frac{c}{d+1} t^{d+1} + \ldots \right)^2
\]
\[
= \frac{1}{t^2} \left( \frac{c^2}{(d+1)^2} t^{2d+2} + \ldots \right) = \frac{c^2}{(d+1)^2} t^{2d} + \ldots
\]

So both \( P(t) \) and \( Q(t) \) have degree \( 2d \) and thus their leading coefficients must be equal, so that \((d+1)^2 = 2d+1\), or \(d^2 + 2d + 1 = 2d + 1\). Hence \( d^2 = 0 \) so that \( d = 0 \) and \( f \) has degree zero, so it is constant.
5.5.59

a. The area of the triangle is \( \frac{1}{2} \cdot 2a \cdot a^2 = a^3 \). The area under the parabola is \( \int_{-a}^{a} (a^2 - x^2) \, dx = \left( \frac{a^2x - x^3}{3} \right) \bigg|_{-a}^{a} = a^3 - \frac{a^3}{3} - (-a^3 + \frac{a^3}{3}) = 2a^3 - \frac{2a^3}{3} = \frac{4a^3}{3} \), as desired. The diagram shown is for \( a = 2 \).

b. The area of the rectangle described is \( 2a \cdot a^2 = 2a^3 \), and \( \frac{2}{3} \) of this is \( \frac{4a^3}{3} \), which is the area under the parabola derived above.

5.5.60 The area bounded by \( c \sin x \) over the stated interval is \( \int_{0}^{\pi} c \sin x \, dx = -c \cos x \bigg|_{0}^{\pi} = (c - (-c)) = 2c \). So this is 1 when \( c = \frac{1}{2} \).

5.5.61 \( \int_{0}^{c} x(x - c)^2 \, dx = \int_{0}^{c} (x^3 - 2cx^2 + c^2x) \, dx = \left( \frac{x^4}{4} - 2\frac{x^3}{3} + \frac{c^2x^2}{2} \right) \bigg|_{0}^{c} = \frac{c^4}{4} - \frac{2c^4}{3} + \frac{c^4}{2} = \frac{c^4}{12} \). This is 1 when \( c = \sqrt{12} \).

5.5.62

a. \( \int_{1}^{b} \frac{1}{x} \, dx = \ln x \bigg|_{1}^{b} = \ln b - 0 = \ln b \). This is equal to 1 when \( b = e \).

b. Since \( p \neq 1 \), we have \( \int_{1}^{b} x^{-p} \, dx = \left( \frac{x^{1-p}}{1-p} \right) \bigg|_{1}^{b} = \frac{b^{1-p} - 1}{1-p} \). This is equal to 1 when \( b^{1-p} = 2 - p \), which occurs for \( b = (2 - p)^{1/(1-p)} \). Such a \( b \) exists and is bigger than 1 when \( p < 2 \) and \( p \neq -1 \).

c. \( b(p) \) is increasing, because as \( p \) gets bigger, the area under \( \frac{1}{x^p} \) from 1 to \( b \) gets smaller, so \( b \) would have to increase in order for the area to remain equal to 1.

5.5.63

a. The left Riemann sum is given by \( \frac{\pi}{2n} \sum_{k=0}^{n-1} \sin((k\pi)/(2n)) \).

b. \( \lim_{\theta \to 0} \theta \left( \frac{\cos \theta + \sin \theta - 1}{2(1 - \cos \theta)} \right) \left( \frac{1 + \cos \theta}{1 + \cos \theta} \right) = \lim_{\theta \to 0} \theta \left( \frac{1 + \cos \theta}{\sin^2 \theta} \right) \left( \frac{1 + \cos \theta}{1} \right) \left( \frac{\cos \theta - 1}{\sin \theta} + \lim_{\theta \to 0} \frac{\sin \theta}{\sin \theta} \right) = \frac{1}{2} \cdot 1 \cdot 2 \left( \lim_{\theta \to 0} \frac{\cos \theta - 1}{\sin \theta} + 1 \right) = 1(0 + 1) = 1 \).

c. Using the previous result, the left Riemann sum is given by \( \frac{\pi}{2n} \left( \frac{\cos(\pi/(2n)) + \sin(\pi/(2n)) - 1}{2(1 - \cos((\pi/(2n))))} \right) \). Let \( \theta = \frac{\pi}{2n} \).

Then as \( n \to \infty, \theta \to 0 \), and the limit of the left Riemann sum as \( n \to \infty \) is 1.

5.5.64

a. \( f(0) = \frac{\int_{a}^{b} x \, dx}{\int_{a}^{b} 1 \, dx} = \frac{\frac{b^2-a^2}{2}}{b-a} = \frac{a+b}{2} \).
b. \( f \left( \frac{-3}{2} \right) = \frac{b^2}{a} \int_{a}^{b} x^{-1/2} \frac{dx}{dx} = \frac{2}{3} \left( b^{1/2} - a^{1/2} \right) \cdot \frac{\sqrt{ab}}{\sqrt{ab}} = \frac{b^{1/2} - a^{1/2}}{b^{1/2} - a^{1/2}} = \sqrt{ab} \).

c. \( f(-3) = \frac{b^2}{a} \int_{a}^{b} x^{-2} \frac{dx}{dx} = -\left( b^{-1} - a^{-1} \right) \cdot \frac{a^2 b^2}{a^2 b^2} = \frac{2(a^2 b - b^2 a)}{a^2 b^2} = \frac{2ab(a - b)}{(a-b)(a+b)} = \frac{2ab}{a+b} \).

d. \( f(-1) = \int_{a}^{b} \frac{1}{x} \frac{dx}{dx} = \frac{b - a}{\ln b - \ln a} \).

5.5.65 Suppose \( f \) is even, so that \( f(-x) = f(x) \). Then \( f^n(x) = f^n(-x) \), so that \( f^n \) is an even function, no matter what the parity of \( n \) is.

Suppose \( g \) is an odd function, so that \( g(-x) = -g(x) \). Then \( g^n(-x) = (-1)^n g^n(x) \), so \( g^n \) is even when \( n \) is even, and is odd when \( n \) is odd.

5.5.66 The average value of \( f' \) is given by \( \frac{1}{b-a} \int_{a}^{b} f'(x) \frac{dx}{dx} = \frac{f(b) - f(a)}{b-a} \). This result tells us that for a function with a continuous derivative, the average slope of the tangent line over an interval is the slope of the secant line through the endpoints of the interval.

5.5.67

a. Because of the symmetry, \( \int_{c-a}^{c-a} (f(x) - d) \frac{dx}{dx} = \int_{c-a}^{c-a} (d - f(x)) \frac{dx}{dx} \). Thus,

\[
\int_{c-a}^{c+a} f(x) \frac{dx}{dx} = \int_{c-a}^{c} (f(x) - d) \frac{dx}{dx} + \int_{c}^{c+a} f(x) \frac{dx}{dx} \\
= \int_{c-a}^{c} d \frac{dx}{dx} + \int_{c-a}^{c} (f(x) - d) \frac{dx}{dx} + \int_{c}^{c+a} f(x) \frac{dx}{dx} \\
= ad + \int_{c-a}^{c} (d - f(x)) \frac{dx}{dx} + \int_{c}^{c+a} f(x) \frac{dx}{dx} \\
= ad + ad + 0 = 2ad.
\]

b. The curve is symmetric about \( \left( \frac{a}{2}, \frac{1}{2} \right) \). To see this, we will show that if \( \sin^2 \left( \frac{a}{4} - x \right) = \frac{1}{2} - r \), then \( \sin^2 \left( \frac{a}{4} + x \right) = \frac{1}{2} + r \). Using a double angle identity, we have \( \sin^2 \left( \frac{a}{4} - x \right) = \frac{1}{2} - \frac{1}{2} \cos \left( \frac{a}{2} - 2x \right) = \frac{1}{2} - \frac{1}{2} \sin 2x \).

On the other hand, \( \sin^2 \left( \frac{a}{4} + x \right) = \frac{1}{2} - \frac{1}{2} \cos \left( \frac{a}{2} + 2x \right) = \frac{1}{2} + \frac{1}{2} \sin 2x \).
c. Using the idea from part a), the area under $f$ over this interval must be equal to the area of the rectangle over the interval $[0, \frac{\pi}{2}]$ with height $\frac{1}{2}$. Thus the area is $\frac{\pi}{2} \cdot \frac{1}{2} = \frac{\pi}{4}$.

5.5.68

a. The smallest expression is the area of a rectangle on the $x$-axis over $[a,b]$ and height given by the value of $f$ at the midpoint of the interval. The biggest expression is the area of a rectangle with that same base, but height equal to the average of the value of the function at the endpoints. The middle quantity represents the area under the curve.

b. After dividing, we have that

$$f\left(\frac{a+b}{2}\right) \leq \frac{1}{b-a} \int_a^b f(x) \, dx \leq \frac{f(a) + f(b)}{2}.$$ 

This says that the average value of $f$ over the interval is greater than or equal to the value of $f$ at the midpoint of $[a,b]$, and is less than or equal to the average of the values of $f$ at $a$ and $b$.

5.6 Substitution Rule

5.6.1 It is based on the Chain Rule for differentiation.

5.6.2 After making a substitution, one obtains an integral in terms of a different variable, so the variable has “changed.”

5.6.3 Typically $u$ is substituted for the inner function, so $u = g(x)$.

5.6.4 One can either let $u = \tan x$, which is a good choice because the derivative is then $\sec^2 x$ which is a factor of the integrand, or one can let $u = \sec x$, because then the derivative is $\tan x \sec x$ which is also a factor of the integrand.

5.6.5 The new integral is $\int_{g(a)}^{g(b)} f(u) \, du$.

5.6.6 The new limits of integration are 0 and 12.

5.6.7 Using the identity $\sin^2 x = \frac{1}{2} + \frac{\sin 2x}{2}$, we have $\int \sin^2 x \, dx = \int \left(\frac{1}{2} - \frac{\cos 2x}{2}\right) \, dx = \frac{x}{2} - \frac{\sin 2x}{4} + C$.

5.6.8 The identity $\tan x = \frac{\sin x}{\cos x}$ is used, followed by the substitution $u = \cos x$ so that $du = -\sin x \, dx$.

5.6.9 $\int (x+1)^{12} \, dx = \frac{(x+1)^{13}}{13} + C$, because $\frac{d}{dx} \left(\frac{(x+1)^{13}}{13} + C\right) = (x+1)^{12}$.

5.6.10 $\int e^{3x+1} \, dx = \frac{e^{3x+1}}{3} + C$, because $\frac{d}{dx} \left(\frac{e^{3x+1}}{3} + C\right) = e^{3x+1}$.

5.6.11 $\int \sqrt{2x+1} \, dx = \frac{(2x+1)^{3/2}}{3} + C$, because $\frac{d}{dx} \left(\frac{(2x+1)^{3/2}}{3} + C\right) = \frac{3}{2} \cdot \frac{1}{3} \cdot (2x+1)^{1/2} \cdot 2 = \sqrt{2x+1}$.

Copyright © 2014 Pearson Education, Inc.
5.6.12 \( \int \cos(2x + 5)\,dx = \frac{\sin(2x + 5)}{2} + C \), because \( \frac{d}{dx} \left( \frac{\sin(2x + 5)}{2} + C \right) = \cos(2x + 5) \).

5.6.13 Because \( u = x^2 + 1 \), \( du = 2x\,dx \). Substituting yields \( \int u^4\,du = \frac{u^5}{5} + C = \frac{(x^2 + 1)^5}{5} + C \).

5.6.14 Because \( u = 4x^2 + 3 \), \( du = 8x\,dx \). Substituting yields \( \int \cos u\,du = \sin u + C = \sin(4x^2 + 3) + C \).

5.6.15 Because \( u = \sin x \), \( du = \cos x\,dx \). Substituting yields \( \int u^3\,du = \frac{u^4}{4} + C = \frac{\sin^4 x}{4} + C \).

5.6.16 Because \( u = 3x^2 + x \), \( du = 6x + 1\,dx \). Substituting yields \( \int \sqrt{u}\,du = \frac{2}{3}u^{3/2} + C = \frac{2}{3}(3x^2 + x)^{3/2} + C \).

5.6.17 Let \( u = x^2 - 1 \). Then \( du = 2x\,dx \). Substituting yields \( \int u^{99}\,du = \frac{u^{100}}{100} + C = \frac{(x^2 - 1)^{100}}{100} + C \).

5.6.18 Let \( u = x^2 \). Then \( du = 2x\,dx \), so \( \frac{1}{2}du = x\,dx \). Substituting yields \( \frac{1}{2} \int e^u\,du = \frac{1}{2} \cdot e^u + C = \frac{1}{2} e^{x^2} + C \).

5.6.19 Let \( u = 1 - 4x^3 \). Then \( du = -12x^2\,dx \), so \( -\frac{1}{6}du = 2x^2\,dx \). Substituting yields

\[
-\frac{1}{6} \int \frac{1}{\sqrt{u}}\,du = -\frac{1}{3} \cdot \sqrt{u} + C = -\frac{1}{3} \sqrt{1 - 4x^3} + C.
\]

5.6.20 Let \( u = \sqrt{x} + 1 \). Then \( du = \frac{1}{2\sqrt{x}}\,dx \). Substituting yields \( \int u^4\,du = \frac{u^5}{5} + C = \frac{(\sqrt{x} + 1)^5}{5} + C \).

5.6.21 Let \( u = x^2 + x \). Then \( du = 2x + 1\,dx \). Substituting yields \( \int u^{10}\,du = \frac{u^{11}}{11} + C = \frac{(x^2 + x)^{11}}{11} + C \).

5.6.22 Let \( u = 10x - 3 \). Then \( du = 10\,dx \), so \( \frac{1}{10}du = dx \). Substituting yields

\[
\frac{1}{10} \int \frac{1}{u}\,du = \frac{1}{10} \cdot \ln |u| + C = \frac{1}{10} \ln |10x - 3| + C.
\]

5.6.23 Let \( u = x^4 + 16 \). Then \( du = 4x^3\,dx \), so \( \frac{1}{4}du = x^3\,dx \). Substituting yields

\[
\frac{1}{4} \int u^6\,du = \frac{1}{4} \cdot \frac{u^7}{7} + C = \frac{(x^4 + 16)^7}{28} + C.
\]

5.6.24 Let \( u = \sin \theta \). Then \( du = \cos \theta d\theta \). Substituting yields \( \int u^{10}\,du = \frac{u^{11}}{11} + C = \frac{\sin^{11} \theta}{11} + C \).

5.6.25 Let \( u = 3x \). Then \( du = 3\,dx \), so \( \frac{1}{3}du = dx \). Substituting yields

\[
\frac{1}{3} \int \frac{1}{\sqrt{1 - u^2}}\,du = \frac{1}{3} \cdot \sin^{-1} u + C = \frac{1}{3} \sin^{-1} 3x + C.
\]

5.6.26 Let \( u = x^{10} \). Then \( du = 10x^9\,dx \), so \( \frac{1}{10}du = x^9\,dx \). Substituting yields

\[
\frac{1}{10} \int \sin u\,du = -\frac{1}{10} \cos u + C = -\frac{1}{10} \cos x^{10} + C.
\]

5.6.27 Let \( u = x^6 - 3x^2 \). Then \( du = (6x^5 - 6x)\,dx \), so \( \frac{1}{6}du = (x^5 - x)\,dx \). Substituting yields

\[
\frac{1}{6} \int u^4\,du = \frac{1}{6} \cdot \frac{u^5}{5} + C = \frac{(x^6 - 3x^2)^5}{30} + C.
\]
5.6.28 Let \( u = x - 2 \), so that \( u + 2 = x \). Then \( du = dx \). Substituting yields

\[
\int \frac{u + 2}{u} \, du = \int \left(1 + \frac{2}{u}\right) \, du = u + 2 \ln |u| + C = x - 2 + 2 \ln |x - 2| + C = x + 2 \ln |x - 2| + C.
\]

The final equality is justified by subsuming the 2 into the constant.

5.6.29 Let \( u = 2x \), so that \( du = 2 \, dx \). Substituting yields

\[
\frac{1}{2} \int \frac{1}{1 + u^2} \, du = \frac{1}{2} \tan^{-1} u + C = \frac{1}{2} \tan^{-1} 2x + C.
\]

5.6.30 Let \( u = 5x \), so that \( du = 5 \, dx \). Substituting yields

\[
\frac{3}{5} \int \frac{1}{1 + u^2} \, du = \frac{3}{5} \tan^{-1} u + C = \frac{3}{5} \tan^{-1} 5x + C.
\]

5.6.31 Let \( u = 2x \), so that \( du = 2 \, dx \). Substituting yields

\[
2 \int \frac{1}{u \sqrt{u^2 - 1}} \, du = 2 \sec^{-1} u + C = 2 \sec^{-1} 2x + C.
\]

5.6.32 Let \( u = 2x^2 + 3x \), so that \( du = (4x + 3) \, dx = \frac{1}{2} (8x + 6) \, dx \). Substituting yields

\[
2 \int \frac{1}{u} \, du = 2 \ln |u| + C = 2 \ln |2x^2 + 3x| + C.
\]

5.6.33 Let \( u = x - 4 \), so that \( u + 4 = x \). Then \( du = dx \). Substituting yields

\[
\int \frac{u + 4}{\sqrt{u}} \, du = \int \left(\frac{u}{\sqrt{u}} + \frac{4}{\sqrt{u}}\right) \, du
= \int u^{1/2} + 4u^{-1/2} \, du
= \frac{2}{3} u^{3/2} + 8u^{1/2} + C
= \frac{2}{3} \cdot (x - 4)^{3/2} + 8\sqrt{x - 4} + C
= \frac{2}{3} (x - 4)^{1/2} (x + 8) + C.
\]

5.6.34 Let \( u = y + 1 \), so that \( u - 1 = y \). Then \( du = dy \). Substituting yields

\[
\int \frac{(u - 1)^2}{u^4} \, du = \int \frac{u^2 - 2u + 1}{u^4} \, du
= \int \left(u^{-2} - 2u^{-3} + u^{-4}\right) \, du
= -\frac{1}{u} + \frac{1}{u^2} - \frac{1}{3u^3} + C
= -\frac{1}{y + 1} + \frac{1}{(y + 1)^2} - \frac{1}{3(y + 1)^3} + C.
\]

5.6.35 Let \( u = x + 4 \), so that \( u - 4 = x \). Then \( du = dx \). Substituting yields

\[
\int \frac{u - 4}{\sqrt{u}} \, du = \int \left(u^{2/3} - 4u^{-1/3}\right) \, du
= \frac{3}{5} u^{5/3} - 6u^{2/3} + C
= \frac{3}{5} (x + 4)^{5/3} - 6(x + 4)^{2/3} + C
= \frac{3}{5} (x + 4)^{2/3} (x - 6) + C.
\]

5.6.36 Let \( u = e^x + e^{-x} \). Then \( du = (e^x - e^{-x}) \, dx \). Substituting yields

\[
\int \frac{1}{u} \, du = \ln |u| + C = \ln(e^x + e^{-x}) + C.
\]
5.6.37 Let \( u = 2x + 1 \). Then \( du = 2dx \) and \( x = \frac{u - 1}{2} \). Substituting yields
\[
\frac{1}{2} \int \frac{u - 1}{2} \cdot \sqrt{u} \, du = \frac{1}{4} \int (u^{4/3} - u^{1/3}) \, du
\]
\[
= \frac{1}{4} \left( \frac{3}{7} u^{7/3} - \frac{3}{4} u^{4/3} \right) + C
\]
\[
= \frac{3}{112} (2x + 1)^{7/3} - \frac{3}{16} (2x + 1)^{4/3} + C
\]

5.6.38 Let \( u = 3x + 2 \). Then \( du = 3dx \) and \( x = \frac{u - 2}{3} \). Substituting yields
\[
\frac{1}{3} \int \frac{u + 1}{3} \cdot \sqrt{u} \, du = \frac{1}{9} \int (u^{3/2} + u^{1/2}) \, du = \frac{1}{9} \left( \frac{2}{5} u^{5/2} + \frac{2}{3} u^{3/2} \right) + C
\]
\[
= \frac{2(3x + 2)^{5/2}}{45} + \frac{2(3x + 2)^{3/2}}{27} + C.
\]

5.6.39 Let \( u = 6x \), so that \( du = 6dx \). Substituting yields
\[
\int \tan 6x \, dx = \frac{1}{6} \int \tan u \, du = -\frac{1}{6} \ln |\cos u| + C = -\frac{1}{6} \ln |\cos 6x| + C.
\]

5.6.40 Let \( u = 2x \), so that \( du = 2dx \). Substituting yields
\[
\int \sec 2x \, dx = \frac{1}{2} \int \sec u \, du = \frac{1}{2} \ln |\sec u + \tan u| + C = \frac{1}{2} \ln |\sec 2x + \tan 2x| + C.
\]

5.6.41 Let \( u = 4x \), so that \( du = 4dx \). Substituting yields
\[
\int (1 + \cot 4x) \, dx = \frac{1}{4} \int (1 + \cot u) \, du = \frac{1}{4} (u + \ln |\sin u|) + C = x + \frac{1}{4} \ln |\sin 4x| + C.
\]

5.6.42 Use the substitution \( u = 3x \) for the second term, so that \( du = 3dx \). We get
\[
\int (x + \csc 3x) \, dx = \int x \, dx + \int \csc 3x \, dx
\]
\[
= \frac{1}{2} x^2 - \frac{1}{3} \ln |\csc u + \cot u| + C
\]
\[
= \frac{1}{2} x^2 - \frac{1}{3} \ln |\csc 3x + \cot 3x| + C.
\]

5.6.43 Let \( u = x^2 \), so that \( du = 2dx \). Substituting yields
\[
\int x \tan x^2 \, dx = \frac{1}{2} \int \tan u \, du = -\frac{1}{2} \ln |\cos u| + C = -\frac{1}{2} \ln |\cos x^2| + C.
\]

5.6.44 Let \( u = e^x \), so that \( du = e^x \, dx \). Substituting yields
\[
\int e^x \sec e^x \, dx = \int \sec u \, du = \ln |\sec u + \tan u| + C = \ln |\sec e^x + \tan e^x| + C.
\]

5.6.45 Let \( u = 1 + t \), so that \( du = dt \). Substituting yields
\[
\int \cot(1 + t) \, dt = \int \cot u \, du = \ln |\sin u| + C = \ln |\sin(1 + t)| + C.
\]

5.6.46 Let \( u = \ln x \), so that \( du = \frac{1}{x} \, dx \). Substituting yields
\[
\int \frac{\tan \ln x}{x} \, dx = \int \tan u \, du = -\ln |\cos u| + C = -\ln |\cos \ln x| + C = \ln |\sec \ln x| + C.
\]
5.6.47 Let \( u = 4 - x^2 \). Then \( du = -2x \, dx \). Also, when \( x = 0 \) we have \( u = 4 \) and when \( x = 1 \) we have \( u = 3 \). Substituting yields \( \int_0^1 u \, du = \int_0^1 u \, du = \left( \frac{u^3}{3} \right) \bigg|_1^4 = 8 - 4.5 = 3.5 \).

5.6.48 Let \( u = x^2 + 1 \). Then \( du = 2x \, dx \). Also, when \( x = 0 \) we have \( u = 1 \) and when \( x = 2 \) we have \( u = 5 \). Substituting yields \( \int_1^5 u^{-2} \, du = \left( -\frac{1}{u} \right) \bigg|_1^5 = 1 - \frac{1}{5} = \frac{4}{5} \).

5.6.49 Let \( u = \sin \theta \). Then \( du = \cos \theta \, d\theta \). Also, when \( \theta = 0 \) we have \( u = 0 \) and when \( \theta = \frac{\pi}{2} \) we have \( u = 1 \). Substituting yields \( \int_0^1 u^2 \, du = \left( \frac{u^3}{3} \right) \bigg|_0^1 = \frac{1}{3} \).

5.6.50 Let \( u = \cos x \). Then \( du = -\sin x \, dx \). Also, when \( x = 0 \) we have \( u = 1 \) and when \( x = \frac{\pi}{4} \) we have \( u = \frac{\sqrt{2}}{2} \). Substituting yields \( \int_1^{\sqrt{2}/2} \frac{1}{u^2} \, du = \int_1^{\sqrt{2}/2} u^{-2} \, du = \left( -\frac{1}{u} \right) \bigg|_{\sqrt{2}/2}^1 = \frac{2}{\sqrt{2}} - 1 = \sqrt{2} - 1 \).

5.6.51 Let \( u = x^4 + 1 \). Then \( du = 3x^2 \, dx \). Also, when \( x = -1 \) we have \( u = 0 \) and when \( x = 2 \) we have \( u = 9 \). Substituting yields \( \frac{1}{3} \int_0^9 e^u \, du = \frac{2}{3} \left( \frac{e^9 - 1}{3} \right) \).

5.6.52 Let \( u = 9 + p^2 \). Then \( du = 2p \, dp \). Also, when \( p = 0 \) we have \( u = 9 \) and when \( p = 4 \) we have \( u = 25 \). Substituting yields \( \frac{1}{2} \int_9^{25} u^{-1/2} \, du = \sqrt{u} \bigg|_9^{25} = 5 - 3 = 2 \).

5.6.53 Let \( u = \sin x \). Then \( du = \cos x \, dx \). Also, when \( x = \frac{\pi}{4} \) we have \( u = \frac{\sqrt{2}}{2} \) and when \( x = \frac{\pi}{2} \) we have \( u = 1 \). Substituting yields \( \int_{\sqrt{2}/2}^{\sqrt{2}} \frac{1}{u} \, du = \left( -\frac{1}{u} \right) \bigg|_{\sqrt{2}/2}^{\sqrt{2}} = -\left( -\frac{2}{\sqrt{2}} \right) = \sqrt{2} - 1 \).

5.6.54 Let \( u = \cos x \). Then \( du = -\sin x \, dx \). Also, when \( x = 0 \) we have \( u = 1 \) and when \( x = \frac{\pi}{4} \) we have \( u = \frac{\sqrt{2}}{2} \). Substituting yields \( \int_{\sqrt{2}/2}^{\sqrt{2}} \frac{1}{u} \, du = \left( -\frac{1}{2u^2} \right) \bigg|_{\sqrt{2}/2}^1 = -\frac{1}{2} + 1 = \frac{1}{2} \).

5.6.55 Let \( u = 5x \), so that \( du = 5 \, dx \). Also, when \( x = 2/5 \sqrt{3} \) we have \( u = \frac{2}{\sqrt{3}} \) and when \( x = 2 \) we have \( u = 2 \). Substituting yields \( \int_{2/\sqrt{3}}^2 \frac{du}{u \sqrt{u^2 - 1}} = \sec^{-1} u \bigg|_{2/\sqrt{3}}^1 = \frac{\pi}{3} - \frac{\pi}{6} = \frac{\pi}{6} \).

5.6.56 Let \( u = v^3 + 3v + 4 \), so that \( du = (3v^2 + 3) \, dv \), so that \( \frac{1}{3} \cdot du = (v^2 + 1) \, dv \). Also, when \( v = 0 \) we have \( u = 4 \) and when \( v = 3 \) we have \( u = 40 \). Substituting yields \( \frac{1}{3} \int_4^{40} u^{-1/2} \, du = \frac{1}{3} \left( \frac{2\sqrt{u}}{4} \right) \bigg|_4^{40} = \frac{4\sqrt{10} - 4}{3} \).

5.6.57 Let \( u = x^2 + 1 \), so that \( du = 2x \, dx \). Substituting yields \( \frac{1}{2} \int_1^{17} \frac{1}{u} \, du = \frac{1}{2} \ln |u| \bigg|_1^{17} = \frac{\ln 17}{2} \).

5.6.58 Let \( u = 1 - 16x^2 \), so that \( du = -32x \, dx \). Then \( x = 0 \) corresponds to \( u = 1 \) while \( x = \frac{1}{4} \) corresponds to \( u = \frac{3}{4} \). Substituting yields \( -\frac{1}{32} \int_1^{3/4} \frac{1}{\sqrt{u}} \, du = \frac{1}{16} \sqrt{u} \bigg|_1^{3/4} = \frac{1}{16} \left( \frac{\sqrt{3}}{2} \right) = 2 - \frac{\sqrt{3}}{32} \).

5.6.59 Let \( u = 3x \), so that \( du = 3 \, dx \). Substituting yields \( \frac{4}{3} \int_1^{3/\sqrt{3}} \frac{1}{u^2 + 1} \, du = \frac{4}{3} \tan^{-1} u \bigg|_1^{3/\sqrt{3}} = \frac{4}{3} \left( \frac{\pi}{3} - \frac{\pi}{4} \right) = \frac{4}{3} \cdot \frac{\pi}{12} = \frac{\pi}{9} \).

Copyright © 2014 Pearson Education, Inc.
5.6.60 Let \( u = 3 + 2e^x \), so that \( du = 2e^x \, dx \). Substituting yields \( \frac{1}{2} \int_5^{11} \frac{1}{u} \, du = \frac{1}{2} \ln|u| \bigg|_5^{11} = \frac{1}{2} \ln \frac{11}{5} \).

5.6.61 Let \( u = \frac{x}{2} \), so that \( du = \frac{1}{2} \, dx \). When \( x = 0 \), then \( u = 0 \); when \( x = \frac{\pi}{2} \), then \( u = \frac{\pi}{4} \). So substituting yields
\[
\int_0^{\pi/2} \tan \frac{x}{2} \, dx = 2 \int_0^{\pi/4} \tan u \, du
\]
\[
= -2 \left( \ln |\cos u| \bigg|_{u=0}^{u=\pi/4} \right)
\]
\[
= -2 \left( \ln \frac{\sqrt{2}}{2} - \ln 1 \right)
\]
\[
= -2 \ln \left( 2^{1/2} \right) = -2 \cdot \left( -\frac{1}{2} \right) \ln 2 = \ln 2.
\]

5.6.62 Let \( u = \frac{x}{4} \), so that \( du = \frac{1}{4} \, dx \). When \( x = -\pi \), then \( u = -\frac{\pi}{4} \); when \( x = \pi \), then \( u = \frac{\pi}{4} \). So substituting yields
\[
\int_{-\pi}^{\pi} \sec \frac{x}{4} \, dx = 8 \int_{-\pi/4}^{\pi/4} \sec u \, du
\]
\[
= 8 \left( \ln |\sec u + \tan u| \bigg|_{u=-\pi/4}^{u=\pi/4} \right)
\]
\[
= 8 \left( \ln(\sqrt{2} + 1) - \ln(\sqrt{2} - 1) \right) = 8 \ln \frac{\sqrt{2} + 1}{\sqrt{2} - 1}.
\]

5.6.63 We recognize the integrand as the derivative of \( \tan x \), so we get
\[
\int_0^{\pi/3} \sec^2 x \, dx = \tan x \bigg|_0^{\pi/3} = \tan \frac{\pi}{3} = \sqrt{3}.
\]

5.6.64 Let \( u = 2\theta \), so that \( du = 2 \, d\theta \). When \( \theta = \frac{\pi}{12} \), then \( u = \frac{\pi}{6} \); when \( \theta = \frac{\pi}{6} \), then \( u = \frac{\pi}{3} \). So substituting yields
\[
\int_{\pi/12}^{\pi/6} 3 \cot 2\theta \, d\theta = \frac{3}{2} \int_{\pi/6}^{\pi/3} \cot u \, du
\]
\[
= \frac{3}{2} \left( \ln |\sin u| \bigg|_{\pi/6}^{\pi/3} \right)
\]
\[
= \frac{3}{2} \left( \ln \frac{\sqrt{3}}{2} - \ln \frac{1}{2} \right)
\]
\[
= \frac{3}{2} \left( \ln \sqrt{3} - \ln 2 - (\ln 1 - \ln 2) \right) = \frac{3}{2} \ln \sqrt{3} = \frac{3}{4} \ln 3.
\]

5.6.65 Let \( u = y^2 \), so that \( du = 2y \, dy \). When \( y = \sqrt{\frac{\pi}{2}} \), then \( u = \frac{\pi}{4} \); when \( y = \sqrt{\frac{\pi}{4}} \), then \( u = \frac{\pi}{2} \). So substituting yields
\[
\int_{\sqrt{\pi/2}}^{\sqrt{\pi/4}} y \csc y^2 \, dy = \frac{1}{2} \int_{\pi/2}^{\pi/4} \csc u \, du
\]
\[
= -\frac{1}{2} \left( \ln |\csc u + \cot u| \bigg|_{\pi/2}^{\pi/4} \right)
\]
\[
= -\frac{1}{2} \left( \ln \left| \sqrt{2} + 1 \right| - \ln |1| \right)
\]
\[
= -\frac{1}{2} \ln(\sqrt{2} + 1).
\]
5.6.66 Let $u = \tan x$, so that $du = \sec^2 x \, dx$. When $x = 0$, then $u = 0$; when $x = \frac{\pi}{4}$, then $u = 1$. So substituting gives
\[
\int_0^{\pi/4} \sec^2 x \tan^2 x \, dx = \int_0^1 u^2 \, du = \left( \frac{1}{3} u^3 \right) \bigg|_0^1 = \frac{1}{3}.
\]

5.6.67 $\int_{-\pi}^{\pi} \cos^2 x \, dx = 2 \int_0^{\pi} \frac{1 + \cos 2x}{2} \, dx = \left( x + \frac{\sin 2x}{2} \right) \bigg|_0^\pi = \pi.$

5.6.68 $\int \sin^2 x \, dx = \int \frac{1 - \cos 2x}{2} \, dx = \frac{1}{2} \left( x - \frac{\sin 2x}{2} \right) + C = \frac{x}{2} - \frac{\sin 2x}{4} + C.$

5.6.69 $\int \sin^2 \left( \theta + \frac{\pi}{6} \right) \, d\theta = \frac{1}{2} \int \left( 1 - \cos \left( 2\theta + \frac{\pi}{3} \right) \right) \, d\theta = \frac{\theta}{2} - \frac{\sin \left( \theta + \frac{\pi}{3} \right)}{4} + C.$

5.6.70 $\int_0^{\pi/4} \cos^2 (8\theta) \, d\theta = \int_0^{\pi/4} \frac{1 + \cos 16\theta}{2} \, d\theta = \left( \frac{\theta}{2} + \frac{\sin 16\theta}{32} \right) \bigg|_0^{\pi/4} = \frac{\pi}{8}.$

5.6.71 $\int_{-\pi/4}^{\pi/4} \sin^2 (2\theta) \, d\theta = \int_{-\pi/4}^{\pi/4} \frac{1 - \cos 4\theta}{2} \, d\theta = \left( \frac{\theta}{4} - \frac{\sin 4\theta}{4} \right) \bigg|_0^{\pi/4} = \frac{\pi}{4}.$

5.6.72 Let $u = x^2$, so that $du = 2x \, dx$. Substituting yields
\[
\frac{1}{2} \int \cos^2 u \, du = \frac{1}{2} \int \frac{1 + \cos 2u}{2} \, du = \frac{1}{4} \left( u + \frac{\sin 2u}{2} \right) + C = \frac{x^2}{4} + \frac{\sin 2x^2}{8} + C.
\]

5.6.73 Let $u = \sin^2 y + 2$ so that $du = 2 \sin y \cos y \, dy = (2y) \, dy$. Substituting yields
\[
\int_2^{9/4} \frac{1}{u} \, du = \ln |u| \bigg|_2^{9/4} = \ln \frac{9}{4} - \ln 2 = \ln \frac{9}{8}.
\]

5.6.74 Because $\sin^4 \theta = (\sin^2 \theta)^2 = \left( \frac{1 - \cos 2\theta}{2} \right)^2 = \frac{1 - 2 \cos 2\theta + \cos^2 2\theta}{4},$ we have
\[
\int \sin^4 \theta \, d\theta = \int \left( 1 - \frac{2 \cos 2\theta + \cos^2 2\theta}{4} \right) \, d\theta = \frac{1}{4} \theta - \frac{\sin 2\theta}{4} + \frac{1}{4} \int \cos^2 2\theta \, d\theta.
\]
Because $\frac{1}{4} \cos^2 2\theta = \frac{1 + \cos 4\theta}{8},$ we have
\[
\int \sin^4 \theta \, d\theta = \frac{1}{4} \theta - \frac{\sin 2\theta}{4} + \frac{1}{8} \theta + \frac{\sin 4\theta}{32} = \frac{3}{8} \theta - \frac{\sin 2\theta}{4} + \frac{\sin 4\theta}{32}.
\]
Thus, $\int_0^{\pi/2} \sin^4 \theta \, d\theta = \left( \frac{3}{8} \theta - \frac{\sin 2\theta}{4} + \frac{\sin 4\theta}{32} \right) \bigg|_0^{\pi/2} = \frac{3\pi}{16}.$

5.6.75
a. True. This follows by substituting $u = f(x)$ to obtain the integral $\int u \, du = \frac{u^2}{2} + C = \frac{f(x)^2}{2} + C.$

b. True. Again, this follows from substituting $u = f(x)$ to obtain the integral $\int u^n \, du = \frac{u^{n+1}}{n+1} + C = \frac{f(x)^{n+1}}{n+1} + C$ where $n \neq -1.$
c. False. If this were true, then \( \sin 2x \) and \( 2 \sin x \) would have to differ by a constant, which they do not. In fact, \( \sin 2x = 2 \sin x \cos x \).

d. False. The derivative of the right hand side is \((x^2 + 1)^9 \cdot 2x\) which is not the integrand on the left hand side.

e. False. If we let \( u = f'(x) \), then \( du = f''(x) \, dx \). Substituting yields \( \int f''(a) \, du = \left( \frac{u^2}{2} \right)^{f''(a)} = (f'(b))^2 - (f'(a))^2 \).

5.6.76 Let \( u = 4w \). Then \( du = 4 \, dw \). Substituting yields \( \frac{1}{4} \int \sec u \tan u \, du = \frac{1}{4} \sec u + C = \frac{1}{4} \sec 4w + C \).

5.6.77 Let \( u = 10x \). Then \( du = 10 \, dx \). Substituting yields \( \frac{1}{10} \int \sec^2 u \, du = \frac{1}{10} \tan u + C = \frac{1}{10} \tan 10x + C \).

5.6.78 Let \( u = \sin x \). Then \( du = \cos x \, dx \). Substituting yields \( \int u^5 + 3u^3 - u \, du = \frac{u^6}{6} + \frac{3u^4}{4} - \frac{u^2}{2} + C = \frac{\sin^6 x}{6} + \frac{3 \sin^4 x}{4} - \frac{\sin^2 x}{2} + C \).

5.6.79 Let \( u = \cot x \). Then \( du = -\csc^2 x \, dx \). Substituting yields \(- \int u^{-3} \, du = \frac{1}{2u^2} + C = -\frac{1}{2 \cot^2 x} + C = \frac{1}{2} \tan^2 x + C \).

5.6.80 Let \( u = x^{3/2} + 8 \). Then \( du = \frac{3}{2} \cdot \sqrt{x} \, dx \). Substituting gives \( \frac{2}{3} \int u^5 \, du = \frac{2}{3} \frac{u^6}{6} + C = \frac{(x^{3/2} + 8)^6}{9} + C \).

5.6.81 Note that \( \sin x \sec^8 x = \frac{\sin x}{\cos^7 x} \). Let \( u = \cos x \), so that \( du = -\sin x \, dx \). Substituting yields \(- \int u^{-8} \, du = \frac{1}{7u^7} + C = \frac{1}{7 \cos^7 x} + C = \frac{\sec^7 x}{7} + C \).

5.6.82 Let \( u = e^{2x} + 1 \). Then \( du = 2e^{2x} \, dx \). Substituting yields \( \frac{1}{2} \int \frac{1}{u} \, du = \frac{\ln |u|}{2} + C = \frac{\ln (e^{2x} + 1)}{2} + C \).

5.6.83 Let \( u = 1 - x^2 \). Then \( du = -2x \, dx \). Also note that when \( x = 0 \) we have \( u = 1 \), and when \( x = 1 \) we have \( u = 0 \). Substituting yields \( -\frac{1}{2} \int_1^0 \sqrt{u} \, du = \frac{1}{2} \int_0^1 \sqrt{u} \, du = \left( \frac{u^{3/2}}{3} \right) \bigg|_0^1 = \frac{1}{3} \).

5.6.84 Let \( u = \ln x \). Then \( du = \frac{1}{x} \, dx \). Also note that when \( x = 1 \) we have \( u = 0 \), and when \( x = e^2 \) we have \( u = 2 \). Substituting yields \( \int_1^2 u \, du = \left( \frac{u^2}{2} \right) \bigg|_0^1 = 2 \).

5.6.85 Let \( u = x^2 - 1 \), so that \( du = 2x \, dx \). Also note that when \( x = 2 \) we have \( u = 3 \), and when \( x = 3 \) we have \( u = 8 \). Substituting yields \( \frac{1}{2} \int_3^8 u^{-1/3} \, du = \frac{1}{2} \left( \frac{3u^{2/3}}{2} \right) \bigg|_3^8 = \frac{3}{4} (4 - \sqrt[3]{9}) \).

5.6.86 Let \( u = \frac{5x}{6} \), so that \( du = \frac{5}{6} \, dx \). Also note that when \( x = 0 \) we have \( u = 0 \) and when \( x = \frac{6}{5} \) we have \( u = 1 \). Substituting yields \( \frac{6}{5 \cdot 36} \int_0^1 \frac{1}{u^3 + 1} \, du = \frac{1}{30} (\tan^{-1} u) \bigg|_0^1 = \frac{\pi}{120} \).

Copyright © 2014 Pearson Education, Inc.
5.6.87 Let \( u = 16 - x^4 \). Then \( du = -4x^3 \, dx \). Also note that when \( x = 0 \) we have \( u = 16 \), and when \( x = 2 \) we have \( u = 0 \). Substituting yields \[
\frac{1}{4} \int_0^{16} \sqrt{u} \, du = \frac{1}{4} \left( \frac{2u^{3/2}}{3} \right)|_0^{16} = \frac{32}{3}.
\]

5.6.88 Let \( u = x^2 - 2x \). Then \( du = 2(x - 1) \, dx \). Also note that when \( x = -1 \) we have \( u = 3 \) and when \( x = 1 \) we have \( u = -1 \). Substituting yields
\[
\frac{1}{2} \int_3^{-1} u^7 \, du = \frac{1}{2} \left[ \frac{1}{8} u^8 \right]_3^{-1} = \frac{1}{16} \cdot (1 - 6561) = -410.
\]

5.6.89 Let \( u = 2 + \cos x \) so that \( du = - \sin x \, dx \). Note that when \( x = -\pi \), \( u = 1 \) and when \( x = 0 \), \( u = 3 \). Substituting yields \[
\int_1^3 \left( -\frac{1}{u} \right) \, du = -\ln |u| |_1^3 = -(\ln 3 - \ln 1) = -\ln 3.
\]

5.6.90 Let \( u = 2x^3 + 9x^2 + 12x + 36 \), so that \( du = (6x^2 + 18x + 12) \, dx = 6(x + 1)(x + 2) \, dx \). Note that \( u = 36 \) when \( x = 0 \) and \( u = 59 \) when \( x = 1 \). Substituting yields
\[
\frac{1}{6} \int_{36}^{59} \frac{1}{u} \, du = \frac{1}{6} \ln |u| |_{36}^{59} = \frac{1}{6} (\ln 59 - \ln 36) = \frac{1}{6} \ln \frac{59}{36}.
\]

5.6.91 Let \( u = 3x + 1 \) so that \( du = 3 \, dx \). Note that \( 9x^2 + 6x + 1 = (3x + 1)^2 = u^2 \), and also that when \( x = 1 \), \( u = 4 \) and when \( x = 2 \), \( u = 7 \). Substituting yields
\[
4 \int_4^7 \frac{1}{u^2} \, du = \frac{4}{3} \left( -\frac{1}{u} \right)|_4^7 = \frac{4}{3} \left( -\frac{1}{7} - \left( -\frac{1}{4} \right) \right) = \frac{4}{3} \left( \frac{3}{28} \right) = \frac{1}{7}.
\]

5.6.92 Let \( u = \sin^2 x \), so that \( du = 2\sin x \cos x \, dx = \sin 2x \, dx \). Note that when \( x = 0 \), \( u = 0 \), and when \( x = \frac{\pi}{4} \), \( u = \frac{1}{2} \). Substituting yields \[
\int_0^{1/2} e^u \, du = e^u |_{0}^{1/2} = \sqrt{e} - 1.
\]

5.6.93 \( A(x) = \int_0^\pi x \sin(x^2) \, dx \). Let \( u = x^2 \), so that \( du = 2x \, dx \). Also, when \( x = 0 \) we have \( u = 0 \) and when \( x = \sqrt{\pi} \) we have \( u = \pi \). Substituting yields \[
\frac{1}{2} \int_0^\pi \sin u \, du = \frac{1}{2} \left( -\cos u \right)|_0^\pi = 1.
\]

5.6.94 \( A(x) = \int_0^{\pi/2} \sin x \cos x \, dx \). Let \( u = \sin x \), so that \( du = \cos x \, dx \). Also, when \( x = 0 \) we have \( u = 0 \) and when \( x = \frac{\pi}{2} \) we have \( u = 1 \). Substituting yields \[
\int_0^{\pi/2} u \, du = \frac{u^2}{2}|_0^{1} = \frac{1}{2}.
\]

5.6.95 \( A(x) = \int_2^6 (x - 4)^4 \, dx = \left( \frac{(x - 4)^5}{5} \right)|_2^6 = \frac{25}{5} - \frac{(-2)^5}{5} = \frac{64}{5} \).

5.6.96 \( A(x) = \int_4^5 \frac{x}{\sqrt{x^2 - 9}} \, dx \). Let \( u = x^2 - 9 \), so that \( du = 2x \, dx \). Also, when \( x = 4 \) we have \( u = 7 \) and when \( x = 5 \) we have \( u = 16 \). Substituting yields \[
\int_7^{16} u^{-1/2} \, du = (\sqrt{u})|_7^{16} = 4 - \sqrt{7}.
\]

5.6.97 \( A(a) = \int_0^a \left( \frac{1}{a} - \frac{x^2}{a^3} \right) \, dx = \left( \frac{x}{a} - \frac{x^3}{3a^3} \right)|_0^a = \frac{a}{3} - \frac{a^2}{3} = \frac{2}{3} \). This is a constant function.

5.6.98 a. Let \( u = x^2 \), so that \( du = 2x \, dx \). Note that when \( x = 1 \) or \( x = -1 \), we have \( u = 1 \). Substituting gives \[
\frac{1}{2} \int_{-1}^1 f(u) \, du = 0. \quad \text{Alternatively, we could note that when } f \text{ is even, } xf(x^2) \text{ is odd, and so we have}
\int_{-1}^{-1} xf(x^2) \, dx = 0.
\]
b. Let \( u = x^3 \) so that \( du = 3x^2 \, dx \). Note that when \( x = -2, u = -8 \), and when \( x = 2, u = 8 \). Substituting yields \( \frac{1}{3} \int_{-8}^{8} f(u) \, du = \frac{2}{3} \int_{0}^{8} f(u) \, du = \frac{2}{3} \cdot 9 = 6 \).

5.6.99

a. Let \( u = \sin px \), so that \( du = p \cos px \, dx \). Note that when \( x = 0, u = 0 \), and when \( x = \frac{\pi}{2p}, u = 1 \). Substituting yields \( \frac{1}{p} \int_{0}^{1} f(u) \, du = \frac{\pi}{p} \).

b. Let \( u = \sin x \) so that \( du = \cos x \, dx \). Note that when \( x = -\frac{\pi}{2}, u = -1 \) and when \( x = \frac{\pi}{2}, u = 1 \). Substituting yields \( \int_{-1}^{1} f(u) \, du = 0 \), because \( f \) is an odd function. Alternatively, we could note that when \( f \) is odd, \( \cos x \cdot f(\sin x) \) is also odd, because \( \sin x \) is odd and \( \cos x \) is even. Thus the given integral must be zero because it is the definite integral of an odd function over a symmetric interval about 0.

5.6.100

a. Let \( u = t \) so that \( du = dt \). Then \( a = \frac{5}{2} \) and \( b = 10 \).

b. \( \int_{0}^{t} 8 \cos \frac{\pi y}{6} \, dy = \left( \frac{48}{\pi} \sin \frac{\pi y}{6} \right)_{0}^{t} = \frac{48}{\pi} \sin \frac{\pi t}{6} \).

c. The period is \( \frac{2\pi}{\pi/6} = 12 \).

5.6.101

a. \( \int_{0}^{4} \frac{200}{(t+1)^2} \, dt = \left( -\frac{200}{t+1} \right)_{0}^{4} = -40 + 200 = 160 \).

b. \( \int_{0}^{6} \frac{200}{(t+1)^3} \, dt = \left( -\frac{200}{2(t+1)^2} \right)_{0}^{6} = -100 + 100 = \frac{4800}{49} \).

c. \( \Delta P = \int_{0}^{T} \frac{200}{(t+1)^r} \, dt \). This decreases as \( r \) increases, because \( \frac{200}{(t+1)^{1-r}} > \frac{200}{(t+1)^{2-r}} \).

d. Suppose \( \int_{0}^{10} \frac{200}{(t+1)^{1-r}} \, dt = 350 \). Then \( \left( \frac{200(t+1)^{-r+1}}{1-r} \right)_{0}^{10} = 350 \), so \( 11^{1-r} - 1 = \frac{350(1-r)}{200} \), and thus \( \frac{11}{11^{1-r}} = \frac{7-7r}{4} = \frac{11-7r}{4} \), and \( 11^r = \frac{44}{11^{1-r}} \). Using trial and error to find \( r \), we arrive at \( r \approx 1.278 \).

e. \( \int_{0}^{T} \frac{200}{(t+1)^{3}} \, dt = \left( -\frac{200}{2(t+1)^2} \right)_{0}^{T} = -\frac{100}{(T+1)^2} + 100 \). As \( T \to \infty \), this expression \( \to 100 \), so in the long run, the bacteria population approaches a finite limit.

5.6.102 The average vertical distance is given by

\[
\frac{1}{a} \int_{0}^{a} \left( b - \frac{b}{a} x \right) \, dx = \frac{1}{a} \left( bx - \frac{b}{2a} x^2 \right)_{0}^{a} = \frac{1}{a} \left( ba - \frac{ba^2}{2a} \right) = b - \frac{b}{2} = \frac{b}{2}.
\]

5.6.103 \( \frac{1}{\pi/k} \int_{0}^{\pi/k} \sin(kx) \, dx = \frac{k}{\pi} \cdot \left( -\frac{\cos kx}{k} \right)_{0}^{\pi/k} = \frac{1}{\pi} (1 - (-1)) = \frac{2}{\pi} \).
5.6.104
a. Note that \( \cot x = \frac{\cos x}{\sin x} \). Now let \( u = \sin x \) so that \( du = \cos x \, dx \). Substituting yields
\[
\int \frac{1}{u} \, du = \ln |u| + C = \ln |\sin x| + C.
\]

b. We have
\[
\int \csc x \, dx = \int \csc x \cdot \frac{\csc x + \cot x}{\csc x + \cot x} \, dx = \int \frac{\csc^2 x + \csc x \cot x}{\csc x + \cot x} \, dx.
\]
Let \( u = \csc x + \cot x \) and note that \( du = -(\csc^2 x + \csc x \cot x) \, dx \). Substituting yields
\[
-\int \frac{1}{u} \, du = -\ln |u| + C = -\ln |\csc x + \cot x| + C.
\]

5.6.105
a. Use the substitution \( u = ax \), so that \( du = a \, dx \) and (since \( a \neq 0 \)) \( dx = \frac{1}{a} \, du \). Then
\[
\int \tan ax \, dx = \frac{1}{a} \int \tan u \, du = \frac{1}{a} \ln |\sec u| + C = \frac{1}{a} \ln |\sec ax| + C.
\]

b. Use the substitution \( u = ax \), so that \( du = a \, dx \) and (since \( a \neq 0 \)) \( dx = \frac{1}{a} \, du \). Then
\[
\int \sec ax \, dx = \frac{1}{a} \int \sec u \, du = \frac{1}{a} \ln |\sec u + \tan u| + C = \frac{1}{a} \ln |\sec ax + \tan ax| + C.
\]

5.6.106 The area on the left is given by \( \int_{0}^{\pi/2} 2 \sin 2x \, dx \). If we let \( u = 2x \) so that \( du = 2 \, dx \), we obtain the equivalent integral \( \int_{0}^{\pi} \sin u \, du \) which represents the area on the right.

5.6.107 The area on the left is given by \( \int_{4}^{9} \frac{(\sqrt{x} - 1)^2}{2\sqrt{x}} \, dx \). If we let \( u = \sqrt{x} - 1 \) so that \( du = \frac{1}{2\sqrt{x}} \, dx \), we obtain the equivalent integral \( \int_{1}^{2} u^2 \, du \) which represents the area on the right.

5.6.108 Let \( u = f(x) \), so that \( du = f'(x) \, dx \). Substituting yields
\[
\int (5u^3 + 7u^2 + u) \, du = \frac{5u^4}{4} + \frac{7u^3}{3} + \frac{u^2}{2} + C = \frac{5f^4(x)}{4} + \frac{7f^3(x)}{3} + \frac{f^2(x)}{2} + C.
\]

5.6.109 Let \( u = f(x) \), so that \( du = f'(x) \, dx \). Substituting yields
\[
\int_{4}^{5} (5u^3 + 7u^2 + u) \, du = \left( \frac{5u^4}{4} + \frac{7u^3}{3} + \frac{u^2}{2} \right)_{4}^{5} = \frac{7297}{12}.
\]

5.6.110 Let \( u = f'(x) \) so that \( du = f''(x) \, dx \). Substituting yields
\[
\int_{3}^{2} u \, du = \left( \frac{u^2}{2} \right)_{3}^{2} = 2 - \frac{9}{2} = -2.5.
\]

5.6.111 Let \( u = f^{(p)}(x) \) so that \( du = f^{(p+1)}(x) \, dx \). Substituting yields
\[
\int u^n \, du = \frac{u^{n+1}}{n+1} + C = \frac{1}{n+1} \left( f^{(p)}(x) \right)^{n+1} + C.
\]

5.6.112 Let \( u = f(x) \) so that \( du = f'(x) \, dx \). Substituting yields
\[
2 \int (u^3 + 2u^2) \, du = 2 \left( \frac{u^4}{4} + \frac{2u^3}{3} \right) + C = \frac{f^4(x)}{2} + \frac{4f^3(x)}{3} + C.
\]
If we let \( u = \sqrt{x + a} \), then \( u^2 = x + a \) and \( 2u\,du = dx \). Substituting yields
\[
\int_{\sqrt{a}}^{\sqrt{x+a}} (u^2 - a) \cdot u \cdot 2u\,du = \int_{\sqrt{a}}^{\sqrt{x+a}} (2u^4 - 2au^2) \,du
\]
\[
= \left( \frac{2u^5}{5} - \frac{2au^3}{3} \right) \bigg|_{\sqrt{a}}^{\sqrt{x+a}}
\]
\[
= \frac{2(\sqrt{1+a})^5}{5} - \frac{2a(\sqrt{1+a})^3}{3} - \frac{2a^5/2}{5} + \frac{2a^{5/2}}{3}
\]
\[
= \frac{2}{15} (1+a)^{3/2} (3-2a) + \frac{4}{15} a^{5/2}.
\]

If we let \( u = x + a \), then \( u - a = x \) and \( du = dx \). Substituting yields
\[
\int_{a}^{a+1} (u-a)\sqrt{u} \,du = \left( \frac{2u^{5/2}}{5} - \frac{2au^{3/2}}{3} \right) \bigg|_{a}^{a+1} = \frac{2(a+1)^{5/2}}{5} - \frac{2a(a+1)^{3/2}}{3} - \frac{2a^{5/2}}{5} + \frac{2a^{5/2}}{3}.
\]

Note that the two results are the same.

If we let \( u = \sqrt{x + a} \), then \( u^p = x + a \) and \( pu^{p-1}\,du = dx \). Substituting yields
\[
p \int_{\sqrt{a}}^{\sqrt{x+a}} (u^{2p} - au^p)\,du = \left( \frac{pu^{2p+1}}{2p+1} - \frac{pa^p+1}{p+1} \right) \bigg|_{\sqrt{a}}^{\sqrt{x+a}}
\]
\[
= p(a+1)^2 \sqrt{1+a} - \frac{ap(1+a)^{3/2}}{p+1} - \frac{pa^2 \sqrt{1+a}}{p+1} + \frac{a^2 p \sqrt{a}}{p+1}.
\]

If we let \( u = x + a \), then \( u - a = x \) and \( du = dx \). Substituting yields
\[
\int_{a}^{a+1} (u-a)\sqrt{u} \,du = \int_{a}^{a+1} (u^{(p+1)/p} - au^{1/p}) \,du
\]
\[
= \left( \frac{u^{(2p+1)/p}}{2p+1} - \frac{au^{(p+1)/p}}{p+1} \right) \bigg|_{a}^{a+1} - \frac{pa^2 \sqrt{a}}{p+1} + \frac{a^2 p \sqrt{a}}{p+1}.
\]

Note that the two results are the same.

If we let \( u = \cos \theta \), then \( du = -\sin \theta \,d\theta \). Substituting yields
\[
\int -u^{-4} \,du = \frac{1}{3u^3} + C = \frac{1}{3 \cos^3 \theta} + C = \frac{\sec^3 \theta}{3} + C.
\]

If we let \( u = \sec \theta \), then \( du = \sec \theta \tan \theta \,d\theta \). Substituting yields \( \int u^2 \,du = \frac{u^3}{3} + C = \frac{\sec^3 \theta}{3} + C \). Note that the two results are the same.

Let \( u = ax \), so that \( \frac{1}{a} \,du = dx \). Substituting yields
\[
\frac{1}{a} \int \sin^2 u \,du = \frac{1}{a} \int \frac{1 - \cos 2u}{2} \,du = \frac{1}{2a} \int (1 - \cos 2u) \,du
\]
\[
= \frac{1}{2a} \left( u - \frac{\sin 2u}{2} \right) + C = \frac{x}{2} - \frac{\sin(2ax)}{4a} + C.
\]
For the second integral, we use the same substitution to obtain
\[
\frac{1}{a} \int \cos^2 u \, du = \frac{1}{a} \int \frac{1 + \cos 2u}{2} \, du = \frac{1}{2a} \int (1 + \cos 2u) \, du
\]
\[
= \frac{1}{2a} \left( u + \frac{\sin 2u}{2} \right) + C = \frac{x}{2} + \frac{\sin(2ax)}{4a} + C.
\]

5.6.117
a. Because \(\sin 2x = 2 \sin x \cos x\), we can write \((\sin x \cos x)^2 = \left(\frac{\sin 2x}{2}\right)^2 = \frac{\sin^2 2x}{4}\). Then we have
\[
I = \frac{1}{4} \int \sin^2 2x \, dx = \frac{1}{4} \left( \frac{x}{2} - \frac{\sin(4x)}{8} \right) + C = \frac{x}{8} - \frac{\sin(4x)}{32} + C.
\]
Note that we used the result of the previous problem during this derivation.

b. 
\[
I = \frac{1}{4} \int (1 - \cos 2x)(1 + \cos 2x) \, dx
\]
\[
= \frac{1}{4} \int (1 - \cos^2 2x) \, dx
\]
\[
= \frac{1}{4} \int \sin^2 2x \, dx
\]
\[
= \frac{1}{4} \left( \frac{x}{2} - \frac{\sin 4x}{8} \right) + C
\]
\[
= \frac{x}{8} - \frac{\sin 4x}{32} + C.
\]

c. The results are consistent. The work involved is similar in each method.

5.6.118

a. Let \(u = x + c\). Note that \(du = dx\). Substitution yields \(\int_a^b f(x + c) \, dx = \int_{a+c}^{b+c} f(u) \, du\).

5.6.119

a. Let \(u = cx\). Note that \(du = c \cdot dx\). Substitution yields \(\int_a^b f(cx) \, dx = \frac{1}{c} \int_{ac}^{bc} f(u) \, du\).

5.6.120 First let \(u = x^2\), so that \(du = 2x \, dx\). Substituting yields \(\frac{1}{2} \int \sin^4 u \cos u \, du\). Now let \(v = \sin u\), so \(dv = \cos u \, du\). This substitution yields \(\frac{1}{2} \int v^4 \, dv = \frac{1}{2} \frac{v^5}{5} + C = \frac{\sin^5 u}{10} + C = \frac{\sin^5 x^2}{10} + C\).
5.7.121 Let \( u = \sqrt{x + 1} \) so that \( u^2 = x + 1 \). Then \( 2u \, du = dx \). Substituting yields \( \int 2 \cdot \frac{u \, du}{\sqrt{1 + u}} \). Now let \( v = \sqrt{1 + u} \) so that \( v^2 = 1 + u \) and \( 2v \, dv = du \). Now a substitution yields
\[
4 \int \frac{(v^2 - 1)v}{v} \, dv = 4 \int (v^2 - 1) \, dv
\]
\[
= \frac{4v^3}{3} - 4v + C
\]
\[
= \frac{4}{3} (1 + u)^{3/2} - 4\sqrt{1 + u} + C
\]
\[
= \frac{4}{3} (1 + \sqrt{x + 1})^{3/2} - 4\sqrt{1 + \sqrt{x + 1}} + C
\]
\[
= \frac{4}{3} (-2 + \sqrt{x + 1}) \sqrt{1 + \sqrt{x + 1}}.
\]

5.7.122 Let \( u = 4x \), so that \( du = 4 \, dx \). Substituting yields \( \frac{1}{4} \int \tan^{10} u \sec^2 u \, du \). Now let \( v = \tan u \), so that \( dv = \sec^2 u \, du \). This leads to \( \frac{1}{4} \int v^{10} \, dv = \frac{v^{11}}{44} + C = \frac{\tan^{11} 4x}{44} + C \).

5.7.123 Let \( u = \cos \theta \), so that \( du = -\sin \theta \, d\theta \). This substitution yields \( \int_0^1 \frac{u}{\sqrt{u^2 + 16}} \, du \). Now let \( v = u^2 + 16 \), so that \( dv = 2u \, du \). Now a substitution yields \( \frac{1}{2} \int_{16}^{17} v^{-1/2} \, dv = \sqrt{v}|_{16}^{17} = \sqrt{17} - 4 \).

5.7 Numerical Integration

5.7.1 \( \Delta x = \frac{18.4}{28} = \frac{1}{2} \).

5.7.2 The Midpoint Rule uses the value of the function evaluated at the midpoint of each subinterval to determine the height of the approximating rectangle over each subinterval. The areas of these rectangles are added up to yield an approximation to the definite integral.

5.7.3 The Trapezoidal Rule approximates the definite integral by using a trapezoid over each subinterval rather than a rectangle.

5.7.4 It is evaluated at 1, 5, and 9, which are the midpoints of the 3 subinterval of length 4.

5.7.5 The endpoints of the subintervals are -1, 1, 3, 5, 7, and 9. The trapezoidal rule uses the value of \( f \) at each of these endpoints.

5.7.6 As in Example 4, each time \( \Delta x \) is halved, the error decreases by a factor of about 4.

5.7.7 The absolute error is |\( \pi - 3.14 \)| ≈ 0.00159. The relative error is \( \frac{|\pi - 3.14|}{\pi} \approx 5.1 \times 10^{-4} \).

5.7.8 The absolute error is |\( \sqrt{2} - 1.414 \)| ≈ 2.1 \times 10^{-4}. The relative error is \( \frac{|\sqrt{2} - 1.414|}{\sqrt{2}} \approx 1.5 \times 10^{-4} \).

5.7.9 The absolute error is |\( e - 2.72 \)| ≈ 0.00172. The relative error is \( \frac{|e - 2.72|}{e} \approx 6.3 \times 10^{-4} \).

5.7.10 The absolute error is |\( e - 2.718 \)| ≈ 2.8 \times 10^{-4} and the relative error is \( \frac{|e - 2.718|}{e} \approx 1.0 \times 10^{-4} \).

5.7.11
For \( n = 1 \), we have \( f(6) \cdot 8 = 72 \cdot 8 = 576 \).
For \( n = 2 \) we have \( f(4) \cdot 4 + f(8) \cdot 4 = 32 \cdot 4 + 128 \cdot 4 = 640 \).
For \( n = 4 \), we have \( f(3) \cdot 2 + f(5) \cdot 2 + f(7) \cdot 2 + f(9) \cdot 2 = 18 \cdot 2 + 50 \cdot 2 + 98 \cdot 2 + 162 \cdot 2 = 656 \).

Copyright © 2014 Pearson Education, Inc.
5.7.12
For \( n = 1 \), we have \( f(5) \cdot 8 = 125 \cdot 8 = 1000 \).
For \( n = 2 \) we have \( f(3) \cdot 4 + f(7) \cdot 4 = 27 \cdot 4 + 343 \cdot 4 = 1480 \).
For \( n = 4 \), we have \( f(2) \cdot 2 + f(4) \cdot 2 + f(6) \cdot 2 + f(8) \cdot 2 = 8 \cdot 2 + 64 \cdot 2 + 216 \cdot 2 + 512 \cdot 2 = 1600 \).

5.7.13 We have
\[
\frac{1}{6} \left( \sin \frac{\pi}{12} + \sin \frac{\pi}{4} + \sin \frac{5\pi}{12} + \sin \frac{7\pi}{12} + \sin \frac{3\pi}{4} + \sin \frac{11\pi}{12} \right) \approx 0.644.
\]

5.7.14 We have
\[
\frac{1}{8} \left( e^{-1/16} + e^{-3/16} + e^{-5/16} + e^{-7/16} + e^{-9/16} + e^{-11/16} + e^{-13/16} + e^{-15/16} \right) \approx 0.632.
\]

5.7.15
For \( n = 2 \) we have \( T(2) = \frac{4}{2} (f(2) + 2f(6) + f(10)) = 2(8 + 2 \cdot 72 + 200) = 704 \).
Using the results of Exercise 11, for \( n = 4 \), we have \( T(4) = \frac{T(2) + M(2)}{2} = \frac{704 + 1480}{2} = 672 \).
Using the results of Exercise 11, for \( n = 8 \) we have \( T(8) = \frac{T(4) + M(4)}{2} = \frac{672 + 658}{2} = 664 \).

5.7.16
Note that we can find \( T(2) = \frac{T(1) + M(1)}{2} \) using problem 12 if we compute \( T(1) \). We have \( T(1) = (\frac{1}{2} + \frac{729}{2}) \cdot 8 = 2920 \).
Thus, \( T(2) = \frac{2920 + 1000}{2} = 1600 \).
For \( n = 4 \), we have \( T(4) = \frac{T(2) + M(2)}{2} = \frac{1600 + 1480}{2} = 1720 \).
For \( n = 8 \) we have \( T(8) = \frac{T(4) + M(4)}{2} = \frac{1720 + 1600}{2} = 1660 \).

5.7.17 We have
\[
T(6) = \frac{1}{12} \left( \sin 0 + 2 \sin \frac{\pi}{6} + 2 \sin \frac{\pi}{3} + 2 \sin \frac{\pi}{2} + 2 \sin \frac{2\pi}{3} + 2 \sin \frac{5\pi}{6} + \sin \pi \right)
= \frac{1}{6} \left( \frac{1}{2} + \frac{3}{2} + 1 + \frac{3}{2} + \frac{1}{2} \right)
= \frac{1}{6} (2 + \sqrt{3}) \approx 0.622.
\]

5.7.18 \( T(8) = \frac{1}{8} (e^0 + 2e^{-1/8} + 2e^{-1/4} + 2e^{-3/8} + 2e^{-1/2} + 2e^{-5/8} + 2e^{-3/4} + 2e^{-7/8} + e^{-1}) \approx 0.633 \).

5.7.19 The width of each subinterval is \( \frac{1}{25} \), so
\[
M(25) = \frac{1}{25} \left( \sin \frac{\pi}{50} + \sin \frac{3\pi}{50} + \sin \frac{5\pi}{50} + \ldots + \sin \frac{49\pi}{50} \right) \approx 0.637.
\]
Since \( \int_0^1 \sin \pi x \, dx = \frac{2}{\pi} \), the absolute error is \( |\frac{2}{\pi} - M(25)| \approx 4.19 \times 10^{-4} \) and the relative error is this number divided by \( \frac{2}{\pi} \) which is approximately \( 6.6 \times 10^{-4} \). The Trapezoidal Rule yields approximately 0.636, with a relative error of \( \approx 1.3 \times 10^{-4} \).

5.7.20 The width of each subinterval is \( \frac{1}{50} \), so
\[
M(50) = \frac{1}{50} \left( e^{-1/100} + (e^{-1/100})^3 + (e^{-1/100})^5 + \ldots + (e^{-1/100})^{99} \right) \approx 0.632
\]
\[
T(50) = \frac{1}{100} \left( e^0 + 2e^{-1/50} + 2e^{-2/50} + \ldots + 2e^{-49/50} + e^{-1} \right) \approx 0.632.
\]
The actual value of the integral is \( 1 - \frac{1}{e} \). The absolute error for \( M(50) \) is \( |1 - \frac{1}{e} - 0.632| \approx 1 \times 10^{-5} \), and the relative error is that number divided by \( 1 - \frac{1}{e} \) which is about \( 1.7 \times 10^{-5} \). The absolute error for \( T(50) \) is \( |1 - \frac{1}{e} - 0.632| \approx 2.1 \times 10^{-5} \) and the relative error is that number divided by \( 1 - \frac{1}{e} \) which is about \( 3.3 \times 10^{-5} \). (The errors for \( M(50) \) and \( T(50) \) are different even though \( M(50) = T(50) \) to three decimal places, because they differ starting in the fifth decimal place).

\[
T = \frac{1}{12} \int_{0}^{12} T(t) \, dt \approx \frac{1}{12} \text{Trapezoid}(12)
\]

\[
= \frac{1}{24} (47 + 2(50 + 46 + 45 + 48 + 52 + 54 + 61 + 62 + 63 + 63 + 59) + 55) = 54.5.
\]
5.7.28 Answers may vary.

\[ T = \frac{1}{12} \int_0^{12} T(t) \, dt \approx \frac{1}{12} \text{Trapezoid}(12) \]

\[ \approx \frac{1}{24} (41 + 2(44 + 46 + 48 + 52 + 53 + 53 + 51 + 51 + 49 + 47) + 47) = 49.25. \]

5.7.29

a. Using a left Riemann sum gives

\[ \frac{1}{120} \int_0^{120} T(t) \, dt \approx \frac{1}{120} (T(0)(20 - 0) + T(20)(45 - 20) + T(45)(60 - 45) + T(60)(90 - 60) + T(90)(110 - 90) + T(110)(120 - 110)) \]

\[ = \frac{1}{120} (70 \cdot 20 + 130 \cdot 25 + 200 \cdot 15 + 239 \cdot 30 + 311 \cdot 20 + 355 \cdot 10) \]

\[ = \frac{2459}{12} \approx 204.917. \]

The right Riemann sum gives

\[ \frac{1}{120} \int_0^{120} T(t) \, dt \approx \frac{1}{120} (T(20)(20 - 0) + T(45)(45 - 20) + T(60)(60 - 45) + T(90)(90 - 60) + T(110)(110 - 90) + T(120)(120 - 110)) \]

\[ = \frac{1}{120} (130 \cdot 20 + 200 \cdot 25 + 239 \cdot 15 + 311 \cdot 30 + 355 \cdot 20 + 375 \cdot 10) \]

\[ = \frac{2091}{8} \approx 261.375. \]

From the discussion in the text, the Trapezoid sum is

\[ \frac{1}{120} \int_0^{120} T(t) \, dt \approx \frac{1}{120} \cdot \frac{1}{2} ((T(0) + T(20))(20 - 0) + (T(20) + T(45))(45 - 20) + (T(45) + T(60))(60 - 45) + (T(60) + T(90))(90 - 60) + (T(90) + T(110))(110 - 90) + (T(110) + T(120))(120 - 110)) \]

\[ = \frac{11191}{48} \approx 233.146. \]

According to these three estimates, the average temperature of the curling iron over the two minutes measured is somewhere between \( \approx 205^\circ \) and \( 261^\circ \) F, probably close to \( 233^\circ \) F.

b. Since the curve is increasing, we expect the left sum to be an underapproximation and the right sum to be an overapproximation. The trapezoid sum will likely be close to correct, since the values of \( T(t) \) seem to increase roughly linearly. Plots of all three approximations, together with the point themselves and a curve fitted through the points (a cubic curve, actually) are:

This confirms the analysis above. In fact, in the viewing window shown, it is hard to tell whether the trapezoid approximation is exact or not.
c. Since \( \int_0^{120} T'(t) = T(120) - T(0) = 305 \), the total change in temperature of the curling iron over the two-minute interval is 305°F.

5.7.30

a. Using a left Riemann sum gives
\[
\begin{align*}
\int_0^{20} f(x) \, dx & \approx f(0)(4 - 0) + f(4)(7 - 4) + f(7)(12 - 7) \\
& \quad + f(12)(14 - 12) + f(14)(18 - 14) + f(18)(20 - 18) \\
& = 3 \cdot 4 + 0 \cdot 3 - 2 \cdot 5 - 1 \cdot 2 + 2 \cdot 4 + 4 \cdot 2 \\
& = 16.
\end{align*}
\]

The right Riemann sum gives
\[
\begin{align*}
\int_0^{20} f(x) \, dx & \approx f(4)(4 - 0) + f(7)(7 - 4) + f(12)(12 - 7) \\
& \quad + f(14)(14 - 12) + f(18)(18 - 14) + f(20)(20 - 18) \\
& = 0 \cdot 4 - 2 \cdot 3 - 1 \cdot 5 + 2 \cdot 2 + 4 \cdot 4 + 7 \cdot 2 \\
& = 23.
\end{align*}
\]

From the discussion in the text, the Trapezoid sum is
\[
\begin{align*}
\int_0^{20} f(t) \, dt & \approx \frac{1}{2} ((f(0) + f(4))(4 - 0) + (f(4) + f(7))(7 - 4) \\
& \quad + (f(7) + f(12))(12 - 7) + (f(12) + f(14))(14 - 12) \\
& \quad + (f(14) + f(18))(18 - 14) + (f(18) + f(20))(20 - 18)) \\
& = \frac{1}{2} (3 \cdot 4 - 2 \cdot 3 - 3 \cdot 5 + 1 \cdot 2 + 6 \cdot 4 + 11 \cdot 2) \\
& = \frac{39}{2} = 19.5.
\end{align*}
\]

b. Plots of all three approximations, together with the point themselves and a curve fitted through the points (a degree 4 curve, actually) are:

\begin{itemize}
  \item Left
  \item Right
  \item Trapezoid
\end{itemize}

c. We have
\[
\begin{align*}
\int_4^{12} (3f'(x) + 2) \, dx &= 3 \int_4^{12} f'(x) \, dx + \int_4^{12} 2 \, dx \\
&= 3(f(12) - f(4)) + 2 \cdot (12 - 4) = 13.
\end{align*}
\]

5.7.31

a. True. In the case of a linear function, the region under the curve and over each subinterval is a trapezoid, so the trapezoidal rule gives the exact area.

b. False. Since \( E_M(n) \leq \frac{k(b-a)^3}{24n^2} \), we have \( E_M(3n) \leq \frac{k(b-a)^3}{24(9n^2)} \), so the error decreases by a factor of about 9.
5.7.32 \( \int_{0}^{\pi/2} \sin^6 x \, dx = \frac{5\pi}{32} \approx 0.4908738521. \)

</table>

5.7.36 With \( \omega^2 = \frac{g}{L}, k^2 = \sin^2 \frac{\theta_0}{2}, \) \( g = 9.8, L = 1, \) and \( \theta_0 = \frac{\pi}{4}, \) we get

\[
T = \frac{4}{\omega} \int_{0}^{\pi/2} \frac{d\varphi}{\sqrt{1 - k^2 \sin^2 \varphi}} \approx \frac{4}{\sqrt{g/L}} \int_{0}^{\pi/2} \frac{d\varphi}{\sqrt{1 - \sin^2 \frac{\theta_0}{2} \sin^2 \varphi}} \approx 4 \int_{0}^{\pi/2} \frac{d\varphi}{\sqrt{1 - 0.146447 \sin^2 \varphi}} \approx 1.27775 \int_{0}^{\pi/2} \frac{d\varphi}{\sqrt{1 - 0.146447 \sin^2 \varphi}}.
\]
So with \( f(\varphi) = \frac{1.27775}{\sqrt{1 - 0.14647 \sin^2 \varphi}} \), the trapezoidal sums with \( n = 2 \) and \( n = 4 \) are

\[
\left( \frac{1}{2} f(0) + f \left( \frac{\pi}{4} \right) + \frac{1}{2} f \left( \frac{\pi}{2} \right) \right) \cdot \frac{\pi}{4} \approx 2.08732
\]

\[
\left( \frac{1}{2} f(0) + f \left( \frac{\pi}{8} \right) + f \left( \frac{3\pi}{8} \right) + \frac{1}{2} f \left( \frac{\pi}{2} \right) \right) \cdot \frac{\pi}{8} \approx 2.08732.
\]

So the integral is, to three decimal places, 2.087.

5.7.37 With \( a = 4 \) and \( b = 8 \), we wish to approximate

\[
\int_0^{2\pi} \sqrt{a^2 \cos^2 t + b^2 \sin^2 t} \, dt = \int_0^{2\pi} 4 \sqrt{\cos^2 t + 4 \sin^2 t} \, dt.
\]

So let \( f(t) = 4 \sqrt{\cos^2 t + 4 \sin^2 t} \). Then the trapezoid sums for \( n \) from 2 to 13 are

<table>
<thead>
<tr>
<th>( n )</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>( T(n) )</td>
<td>25.1327</td>
<td>38.5384</td>
<td>37.6991</td>
<td>38.7457</td>
<td>38.5834</td>
<td>37.7533</td>
</tr>
<tr>
<td>( n )</td>
<td>8</td>
<td>9</td>
<td>10</td>
<td>11</td>
<td>12</td>
<td>13</td>
</tr>
<tr>
<td>( T(n) )</td>
<td>37.7187</td>
<td>38.7538</td>
<td>38.7457</td>
<td>38.7538</td>
<td>38.7518</td>
<td>38.7538</td>
</tr>
</tbody>
</table>

The values appear to be converging; the final value may be 38.754 to three decimal places. All the odd-numbered approximations from 9 on are 38.7538, while the even-numbered approximations converge more slowly, also to 38.7538.

5.7.38 \( \text{Si}(1) = \int_0^1 \frac{\sin t}{t} \, dt \). We have

\[
\begin{array}{|c|c|}
\hline
n & M(n) \\
\hline
4 & 0.9468682055 \\
8 & 0.9462791963 \\
16 & 0.9461320920 \\
\hline
\end{array}
\]

For \( \text{Si}(10) = \int_0^{10} \frac{\sin t}{t} \, dt \), we have

\[
\begin{array}{|c|c|}
\hline
n & M(n) \\
\hline
4 & 1.682149231 \\
8 & 1.663648208 \\
16 & 1.659636470 \\
\hline
\end{array}
\]

5.7.39 To approximate

\[
\frac{1}{3\sqrt{2\pi}} \int_{66}^{72} e^{-(x-69)^2/2} \, dx
\]

let \( f(x) = \frac{1}{3\sqrt{2\pi}} e^{-(x-69)^2/18} \) and integrate using the trapezoid approximation. The table for various values of \( n \) is

<table>
<thead>
<tr>
<th>( n )</th>
<th>2</th>
<th>5</th>
<th>10</th>
<th>15</th>
<th>20</th>
<th>25</th>
</tr>
</thead>
<tbody>
<tr>
<td>( T(n) )</td>
<td>0.64091</td>
<td>0.67620</td>
<td>0.68107</td>
<td>0.68197</td>
<td>0.68229</td>
<td>0.68243</td>
</tr>
</tbody>
</table>

The values are converging quite slowly to the correct value, which is \( \approx 0.682689 \), so as a percentage we get \( \approx 68.269\% \).
5.7.40 To approximate

\[
\frac{1}{22\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-(x-110)^2/22} \, dx = \frac{1}{22\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-(x-110)^2/968} \, dx,
\]

let \( f(x) = \frac{1}{22\sqrt{2\pi}} e^{-(x-110)^2/968} \) and integrate using the midpoint approximation, just for variety. The table for various values of \( n \) is

<table>
<thead>
<tr>
<th>( n )</th>
<th>2</th>
<th>5</th>
<th>10</th>
<th>15</th>
<th>20</th>
<th>25</th>
</tr>
</thead>
<tbody>
<tr>
<td>( M(n) )</td>
<td>0.1663</td>
<td>0.16959</td>
<td>0.17000</td>
<td>0.17007</td>
<td>0.17010</td>
<td>0.17011</td>
</tr>
</tbody>
</table>

The values are converging quite slowly to the correct value, which is \( \approx 0.170 \), so as a percentage we get \( \approx 17.0\% \).

5.7.41

a. With the trapezoidal approximation we have

\[
T(n) = \frac{n}{2} \left( \frac{1}{2} P(1940) + P(x_1) + P(x_2) + \cdots + P(x_{n-1}) + \frac{1}{2} P(2000) \right).
\]

Choose \( n = 6 \), since there are six decades between 1940 and 2000. Then using the estimates

\[
P(1940) \approx 3.5, \quad P(1950) \approx 5.2, \quad P(1960) \approx 7.0, \quad P(1970) \approx 9.4,
\]

\[
P(1980) \approx 8.6, \quad P(1990) \approx 7.5, \quad P(2000) \approx 5.8
\]

for the amount produced per day in each year, we get

\[
T(6) = \frac{60}{6} \left( \frac{1}{2} P(1940) + P(1950) + P(1960) + \cdots + P(1990) + \frac{1}{2} P(2000) \right)
\]

\[
\approx 10 (1.75 + 5.2 + 7.0 + 9.4 + 8.6 + 7.5 + 2.9)
\]

\[
\approx 423.5 \text{ million barrels/day}.
\]

Multiplying by 365 days per year gives \( 365 \cdot 423.5 \approx 1.546 \times 10^{11} \) barrels of oil produced.

b. As in part (a), with the trapezoidal approximation we have

\[
T(n) = \frac{n}{2} \left( \frac{1}{2} I(1940) + I(x_1) + I(x_2) + \cdots + I(x_{n-1}) + \frac{1}{2} I(2000) \right).
\]

Choose \( n = 6 \), since there are six decades between 1940 and 2000. Then using the estimates

\[
I(1940) \approx 0.1, \quad I(1950) \approx 0.4, \quad I(1960) \approx 1.0, \quad I(1970) \approx 1.4,
\]

\[
I(1980) \approx 6.5, \quad I(1990) \approx 6.0, \quad I(2000) \approx 9.0
\]

for the amount imported per day in each year, we get

\[
T(6) = \frac{60}{6} \left( \frac{1}{2} I(1940) + I(1950) + I(1960) + \cdots + I(1990) + \frac{1}{2} I(2000) \right)
\]

\[
\approx 10 (0.05 + 0.4 + 1.0 + 1.4 + 6.5 + 6.0 + 4.5)
\]

\[
\approx 198.5 \text{ million barrels}.
\]

Multiplying by 365 days per year gives \( 365 \cdot 198.5 \approx 7.25 \times 10^{10} \) barrels of oil imported.

5.7.42

a. Using the trapezoid rule, we have to choose \( n = 7 \), since those are the points we are given; then the approximate area is

\[
A \approx \frac{0 + 2.5}{2} \cdot 1 + \frac{2.5 + 3.2}{2} \cdot 1 + \frac{3.2 + 4}{2} \cdot 1 + \frac{4 + 6}{2} \cdot 1 + \frac{6 + 7}{2} \cdot 2 + \frac{7 + 3}{2} \cdot 1.5 + \frac{3 + 0}{2} \cdot 0.5
\]

\[
\approx 1.25 + 2.85 + 3.6 + 5.0 + 13.0 + 7.5 + 0.75
\]

\[
\approx 33.95 \text{ square inches}.
\]
b. Using a left Riemann sum, again with \( n = 7 \), we get

\[
A \approx 0.1 + 1 + 2.5 \cdot 1 + 3.2 \cdot 1 + 4 \cdot 1 + 6 \cdot 2 + 7 \cdot 1.5 + 3 \cdot 0.5 \\
= 0 + 2.5 + 3.2 + 4 + 12 + 10.5 + 1.5 \\
= 33.7 \text{ square inches.}
\]

c. Although the area of the piece is less than half the area of a 9 \( \times \) 9 inch piece of wood, you cannot get two identical pieces from such a square. Placing the \( x \) axis along one edge of the square gives a remaining bit of wood in which there is a lot of wasted space, and it is clearly impossible to fit another such shape into that bit.

5.7.43  

a. Using the Trapezoid rule to estimate, with \( n = 6 \), we see that the elevation of the balloon after five minutes is

\[
E \approx 5400 + \frac{0 + 100}{2} \cdot 1 + \frac{100 + 120}{2} \cdot 0.5 + \frac{120 + 150}{2} \cdot 1.5 + \frac{150 + 110}{2} \cdot 0.5 \\
\quad \quad \quad + \frac{110 + 90}{2} \cdot 0.5 + \frac{90 + 80}{2} \cdot 1 \\
\approx 5400 + 50 + 55 + 202.5 + 65 + 50 + 85 = 5907.5 \text{ feet.}
\]

b. Using a right Riemann sum gives

\[
E \approx 5400 + 100 \cdot 1 + 120 \cdot 0.5 + 150 \cdot 1.5 + 110 \cdot 0.5 + 90 \cdot 0.5 + 80 \cdot 1 \\
= 5400 + 100 + 60 + 225 + 55 + 45 + 80 = 5965 \text{ feet.}
\]

c. Since \( g(t) \) fits the data, it measures the total change in elevation after \( t \) minutes. So after 5 minutes, the elevation is

\[
E \approx 5400 + \int_0^5 (3.49t^3 - 43.21t^2 + 142.43t - 1.75) \, dt \\
\approx 5400 + [0.8725t^4 - 14.4033t^3 + 71.215t^2 - 1.75t]_{t=0}^{t=5} \\
\approx 5916.5
\]

5.7.44  

a. \( T(50) = \frac{1}{100} (1 + 2 \sum_{i=1}^{49} e^{2i/50^2} + e) \approx 1.463. \)

b. \( f'(x) = 2xe^{x^2} \), so \( f''(x) = 4x^2e^{x^2} + 2e^{x^2} = 2e^{x^2}(2x + 1). \)

c. Since both \( e^{x^2} \) and \( 2x + 1 \) are increasing and positive on \([0, 1]\), we have that \(|e^{x^2}| \leq e \) and \(|2x + 1| \leq 2 \cdot 1 + 1 = 3. \) Thus \(|f''(x)| = 2|e^{x^2}||2x + 1| \leq 2e \cdot 3 < 2 \cdot 3^2 = 18. \)

d. Since \( E_T(n) \leq \frac{k(b-a)^3}{12n^2} = \frac{18}{12(50^2)} = 6 \times 10^{-4}, T(50) \) is accurate to at least 3 decimal places.

5.7.45  

a. \( T(40) = \frac{1}{80} (\sin 1 + 2 \sum_{i=1}^{39} \sin e^{i/40} + \sin e) \approx 0.875. \)

b. \( f'(x) = e^x \cos e^x, \) so \( f''(x) = -e^{2x} \sin e^x + e^x \cos e^x = e^x(\cos e^x - e^x \sin e^x). \)

c. \(|f''(x)| = |e^x| \cdot |\cos e^x - e^x \sin e^x| \leq |e^x||\cos e^x| + |e^x \sin e^x|) \leq e(1 + e) < 10.11. \) However, the graph of the absolute value of \( f''(x) \) reveals that is is actually bounded by 5.75 on the interval \([0, 1]\).

d. Since \( E_T(n) \leq \frac{k(b-a)^3}{12n^2} = \frac{6}{12(40^2)} = .003125, T(40) \) is accurate to at least 3 decimal places.
Chapter Review 541

5.7.46

\[
\int_a^b mx + k \, dx = \left[ \frac{mx^2}{2} + kx \right]_a^b \\
= \frac{mb^2}{2} + kb - \frac{ma^2}{2} - ka \\
= \frac{m}{2} (b^2 - a^2) + k(b - a) \\
= \left( \frac{m}{2} (b + a) + k \right) (b - a) \\
= f(a) + f(b)(b - a) \\
= T_{[a,b]}(1).
\]

Now for any \( n \), the above argument shows that the trapezoidal rule gives the exact value of \( \int_{x_{i-1}}^{x_i} (mx + k) \, dx \).

Thus \( \int_a^b (mx + k) \, dx = \sum_{i=1}^n \int_{x_{i-1}}^{x_i} (mx + k) \, dx = \sum_{i=1}^n T_{[x_{i-1}, x_i]}(1) = T_{[a,b]}(n) \).

5.7.47

The trapezoidal rule will be an overestimate in this case. This is because of the fact that if the function is above the axis and concave up on the given interval, then each trapezoid on each subinterval lies over the area under the curve for that corresponding subinterval.

Chapter Review

1.
   a. True. The antiderivative of a linear function is a quadratic function.

   b. False. \( A'(x) = f(x) \), not \( F(x) \).

   c. True. Note that \( f \) is an antiderivative of \( f' \), so this follows from the Fundamental Theorem.

   d. True. Because \( |f(x)| \geq 0 \) for all \( x \), this integral must be positive, unless \( f \) is constantly 0.

   e. False. For example, the average value of \( \sin x \) on \( [0, 2\pi] \) is zero.

   f. True. This is equal to \( 2 \int_a^b f(x) \, dx - 3 \int_a^b g(x) \, dx = 2 \int_a^b f(x) \, dx + 3 \int_a^b g(x) \, dx \).

   g. True. The derivative of the right hand side is \( f'(g(x))g'(x) \) by the Chain Rule.

2. \( \int (x^8 - 3x^3 + 1) \, dx = \frac{x^9}{9} - 3 \cdot \frac{x^4}{4} + x + C = \frac{x^9}{9} - \frac{3}{4} x^4 + x + C \).

3. \( \int (2x + 1)^2 \, dx = \int (4x^2 + 4x + 1) \, dx = \frac{4}{3} x^3 + 2x^2 + x + C \).

4. \( \int \frac{x+1}{x} \, dx = \int \left( \frac{x}{x} + \frac{1}{x} \right) \, dx = \int \left( 1 + \frac{1}{x} \right) \, dx = x + \ln |x| + C \).

5. \( \int \left( \frac{1}{x^2} - \frac{2}{x^{5/2}} \right) \, dx = \int \left( x^{-2} - 2x^{-5/2} \right) \, dx = -x^{-1} - 2 \cdot \left( -\frac{2}{3} \right) x^{-3/2} = -\frac{1}{x} + \frac{4}{3} x^{-3/2} + C \).

Copyright © 2014 Pearson Education, Inc.
6. \[ \int \frac{x^4 - 2\sqrt{x} + 2}{x^2} \, dx = \int (x^2 - 2x^{-3/2} + 2x^{-2}) \, dx = \frac{x^3}{3} - 2 \cdot (-2x^{-1/2}) - 2x^{-1} + C = \frac{x^3}{3} + \frac{4}{\sqrt{x}} - \frac{2}{x} + C. \]

7. Using Table 5.1 (formula 1), \[ \int (1 + \cos 3\theta) \, d\theta = \theta + \frac{\sin 3\theta}{3} + C. \]

8. Using Table 5.1 (formula 3), \[ \int 2 \sec^2 \theta \, d\theta = 2 \tan \theta + C. \]

9. Using Table 5.1 (formula 5), \[ \int \sec 2x \tan 2x \, dx = \frac{1}{2} \sec 2x + C. \]

10. Using Table 5.2 (formula 7), \[ \int 2e^{2x} \, dx = e^{2x} + C. \]

11. Using Table 5.2 (formula 8), \[ \int \frac{12}{x} \, dx = 12 \ln |x| + C. \]

12. Using Table 5.2 (formula 9), \[ \int \frac{dx}{\sqrt{1 - x^2}} = \sin^{-1} x + C. \]

13. Using Table 5.2 (formula 10), \[ \int \frac{dx}{x^2 + 1} = \tan^{-1} x + C. \]

14. Note that \[ \frac{1 + \tan \theta}{\sec \theta} = \cos \theta + \sin \theta, \] so \[ \int \frac{1 + \tan \theta}{\sec \theta} \, d\theta = \sin \theta - \cos \theta + C. \]

15. \[ \int (\sqrt{x^3} + \sqrt{x^5}) \, dx = \int (x^{3/4} + x^{5/2}) \, dx = \frac{4}{7}x^{7/4} + \frac{2}{7}x^{7/2} + C. \]

16. We have \( f(x) = \int (3x^2 - 1) \, dx = x^3 - x + C, \) and \( f(0) = C = 10, \) so \( f(x) = x^3 - x + 10. \)

17. We have \( f(t) = \int (\sin t + 2t) \, dt = -\cos t + t^2 + C \) and \( f(0) = -1 + C = 5, \) so \( C = 6 \) and thus \( f(t) = -\cos t + t^2 + 6. \)

18. We have \( g(t) = \int (t^2 + t^{-2}) \, dt = \frac{t^3}{3} - \frac{1}{t} + C, \) and \( g(1) = \frac{1}{3} - 1 + C = C = \frac{2}{3} \) is 1, so \( C = \frac{5}{3} \) and \( g(t) = \frac{t^3}{3} - \frac{1}{t} + \frac{5}{3}. \)

19. Using the identity \( \sin^2 x = \frac{1}{2} (1 - \cos 2x) \) and Table 5.1 (formula 1), we see that

\[ h(x) = \frac{1}{2} \int (1 - \cos 2x) \, dx = \frac{1}{2} \left( x - \frac{\sin 2x}{2} \right) + C = \frac{x}{2} - \frac{\sin 2x}{4} + C. \]

We have \( h(1) = \frac{1}{2} - \frac{\sin 2}{4} + C = 1, \) so \( C = \frac{1}{2} + \frac{\sin 2}{4} \) and so \( h(x) = \frac{x}{2} - \frac{\sin 2x}{4} + \frac{1}{2} + \frac{\sin 2}{4}. \)

20. The difference in the positions of the objects is given by the function

\[ f(t) = 2 \sin t - \sin \left( t - \frac{\pi}{2} \right) = 2 \sin t + \cos t. \]

The objects meet when \( f(t) = 0, \) which occurs at \( t = \pi - \tan^{-1} \frac{1}{2} \approx 2.678 \) and \( t = 2\pi - \tan^{-1} \frac{1}{2} \approx 5.820. \)

The objects are furthest apart when \( f \) attains its absolute max or min; the critical points of \( f \) satisfy \( f'(t) = 2 \cos t - \sin t = 0, \) or \( t \neq 2; \) this gives \( t = \tan^{-1} 1 \approx 1.107 \) and \( t = \pi + \tan^{-1} \frac{1}{2} \approx 4.249. \)

The value of \( f \) is \( \approx \pm 2.236 \) at these points, so the objects are furthest apart at these two times.
21. The velocity of the rocket is given by $v(t) = -9.8t + v_0 = -9.8t + 120$, and the position function of the rocket is $s(t) = \int (-9.8t + 120) \, dt = -4.9t^2 + 120t + s_0 = -4.9t^2 + 120t + 125$. The rocket reaches its maximum height when $v(t) = 0$, which occurs at $t = \frac{120}{9.8} \approx 12.245$ s; the maximum height is $s \left( \frac{120}{9.8} \right) \approx 859.694$ m. The rocket hits the ground when $s(t) = 0$; solving this quadratic equation gives $t \approx 25.491$ s.

22.
   a. The distance traveled is given by $\int_0^4 (2t + 5) \, dt = \left. (t^2 + 5t) \right|_0^4 = 36$.

   b. The average value is $\frac{1}{4} \int_0^4 (2t + 5) \, dt = \frac{1}{4} \cdot 36 = 9$.

   c. True. If it traveled at a rate of 9 for a time of 4, it would have gone 36 units.

23.
   a. This region can be divided up into a $4 \times 2$ rectangle and a right triangle with base and height equal to 1. Thus, the integral is equal to $8 + \frac{1}{2} = 8.5$.

   b. $\int_6^7 f(x) \, dx = -\int_4^6 f(x) \, dx$. The region whose area is $\int_4^6 f(x) \, dx$ consists of a $1 \times 3$ rectangle, together with a right triangle with base 1 and height 3, so $\int_4^6 f(x) \, dx = 3 + \frac{3}{2} = 4.5$ and $\int_6^7 f(x) \, dx = -4.5$.

   c. $\int_5^7 f(x) \, dx = \int_5^6 f(x) \, dx + \int_6^7 f(x) \, dx$. The region lying over $[5, 6]$ is a right triangle with height 3 and base 1, so its area is $\frac{3}{2}$. The region lying under $[6, 7]$ has the same area, but is below the $x$-axis, so $\int_6^7 f(x) \, dx = -\frac{3}{2}$. Hence $\int_5^7 f(x) \, dx = \frac{3}{2} - \frac{3}{2} = 0$.

   d. Note that $\int_4^5 f(x) \, dx = 3$, because the area represented is that of a $1 \times 3$ rectangle. Now by the work above, $\int_0^7 f(x) \, dx = \int_0^4 f(x) \, dx + \int_4^5 f(x) \, dx + \int_5^7 f(x) \, dx = 8.5 + 3 + 0 = 11.5$.

24.
   i. We are seeking $\int_0^5 g(t) \, dt$. Because this represents the area of a region which can be divided into a $5 \times 1$ rectangle and a right triangle with base 2 and height 2, it is equal to $5 + 2 = 7$.

   ii. We are seeking $\int_3^7 g(t) \, dt$. Because this represents the area of a region which can be divided into a $4 \times 1$ rectangle and a right triangle with base 4 and height 2, its value is $4 + 4 = 8$.

   iii. We are seeking $\int_0^8 g(t) \, dt = \int_0^3 g(t) \, dt + \int_3^7 g(t) \, dt + \int_7^8 g(t) \, dt = 3 + 8 + 1 = 12$. The first term in this sum is represented by a $1 \times 3$ rectangle, the second term is from part ii), and the third is represented by a $1 \times 1$ square.
25. 

a. A plot of \( v(t) \) is 

```
\[\text{Graph of } v(t) \text{ vs. } t\]
```

Note that \( v(t) = 0 \) for \( 2 < t \leq 7 \), so that the graph of \( v \) lies on the \( x \) axis in that range.

b. The area under the curve consists of a \( 2 \times 30 \) rectangle over \([0, 2]\), a \( 5 \times 0 \) rectangle over \([2, 7]\), and a \( 1 \times 15 \) rectangle over \([7, 8]\), so the area under the curve is \( 60 + 0 + 15 = 75 \).

c. The area under the velocity curve is the total displacement; since the diver was always moving upwards, that means she started the ascent from 75 feet below the surface.

26. 

a. \( F(2) = \int_0^2 f(t) \, dt \) is the signed area under \( f \) between 0 and 2. The area between 0 and 1 is a triangle with height 2 and base 1; so is the area between 1 and 2. However, the first of these is below the axis (negative), while the second is positive. So they cancel, and \( F(2) = 0 \). Next, \( F(-2) = \int_{-2}^0 f(t) \, dt = -\int_0^{-2} f(t) \, dt \), so it is the negative of the signed area under \( f \) from \(-2\) to \(0\). That area is a quarter circle of radius 2, and is below the axis, so the signed area is \(-\frac{1}{4} \pi \cdot 2^2 = -\pi \). So the negative of the signed area is \( \pi = F(-2) \). Finally, 

\[
F(4) = \int_0^4 f(t) \, dt = \int_0^2 f(t) \, dt + \int_2^4 f(t) \, dt = F(2) + \int_2^4 f(t) \, dt = \int_2^4 f(t) \, dt
\]

since \( F(2) = 0 \) from the foregoing. Now, \( \int_2^4 f(t) \, dt \) is the signed area under the curve from 2 to 4, which is again the area of a quarter circle of radius 2, so \( \pi = F(4) \).

b. \( G(-2) = \int_{-2}^1 f(t) \, dt = -\int_{-2}^1 f(t) \, dt \). Now, \( \int_{-2}^1 f(t) \, dt \) is the signed area under \( f \) from \(-2\) to 1, which consists of a quarter circle of radius 2 plus a triangle with height 2 and base 1; since both are below the axis,

\[
\int_{-2}^1 f(t) \, dt = -\pi - 1, \quad \text{so} \quad G(-2) = -\int_{-2}^1 f(t) \, dt = \pi + 1.
\]

Next, \( G(0) = \int_1^0 f(t) \, dt = -\int_0^1 f(t) \, dt \), which is the negative of the signed area under \( f \) from 0 to 1. That signed area is the negative of the area of a triangle of height 2 and base 1, so it is \(-1\); hence \( G(0) = -(-1) = 1 \). Finally, \( G(4) = \int_1^4 f(t) \, dt \); this area is the area under \( f \) from 1 to 4, which consists of a triangle of height 2 and base 1 together with a quarter circle of radius 2, both above the \( x \) axis, so that \( G(4) = \pi + 1 \).

c. We have

\[
F(x) - G(x) = \int_0^x f(t) \, dt - \int_1^x f(t) \, dt = \int_0^1 f(t) \, dt = -1
\]

since the integral is the signed area under \( f \) from 0 to 1 which, as before, is the negative of the area of a triangle of height 2 and base 1. Thus \( F(x) = G(x) - 1 \) for \(-2 \leq x \leq 4 \).
27. \[\int_0^4 \sqrt{8x-x^2} \, dx = \int_0^4 \sqrt{16-(x^2-8x+16)} \, dx = \int_0^4 \sqrt{16-(x-4)^2} \, dx.\] This represents one quarter of the area inside the circle centered at (4,0) with radius 4, so its value is \(\frac{1}{4} \cdot 16\pi = 4\pi\).

28. Use minutes for the time intervals to keep the units straight, since the production rate is in bagels per minute. Then the Trapezoid sum is
\[
\frac{45 + 75}{2} \cdot 30 + \frac{75 + 60}{2} \cdot 15 + \frac{60 + 50}{2} \cdot 15 + \frac{50 + 40}{2} \cdot 30 = 1800 + \frac{2025}{2} + 825 + 1350 = 4987.5\] bagels,
so we round up to 4988 bagels. The left sum is
\[
45 \cdot \left(\frac{30 + 75}{2} \right) + 75 \cdot \left(\frac{15 + 60}{2} \right) + 60 \cdot \left(\frac{15 + 50}{2} \right) = 1350 + 1125 + 900 + 1500 = 4875\] bagels.
For the right sum we get
\[
75 \cdot \left(\frac{30 + 60}{2} \right) + 60 \cdot \left(\frac{15 + 50}{2} \right) + 40 \cdot \left(\frac{30}{2} \right) = 2250 + 900 + 750 + 1200 = 5100\] bagels.

29. 
\[a.\] The right Riemann sum is \(4 \cdot 1 + 7 \cdot 1 + 10 \cdot 1 = 21\).
\[b.\] The right Riemann sum is \(\sum_{k=1}^{n} \left(3 \left(1 + \frac{3k}{n}\right) - 2\right) \cdot \frac{3}{n}\).
\[c.\] The sum evaluates as \(\sum_{k=1}^{n} \frac{3}{n} + \sum_{k=1}^{n} \frac{27k}{n^2} = 3 + \frac{27}{n^2} \cdot \frac{n(n+1)}{2}\). As \(n \to \infty\), the limit of this expression is \(3 + 13.5 = 16.5\).

\[d.\] The area consists of a trapezoid with base 3 and heights 1 and 10, so the value is \(3 \cdot \left(\frac{1+10}{2}\right) = \frac{33}{2} = 16.5\). The Fundamental Theorem assures us that
\[
\int_{1}^{4} (3x-2) \, dx = \left(\frac{3x^2}{2} - 2x\right)\Big|_{1}^{4}
= (24 - 8) - \left(\frac{3}{2} - 2\right) = 16 + \frac{1}{2} = 16.5.
\]

30. Let \(\Delta x = \frac{1-0}{n} = \frac{1}{n}\). Let \(x_k = 0 + k\Delta x = \frac{k}{n}\). Then \(f(x_k) = \frac{4k}{n} - 2\). Thus,
\[
\lim_{n \to \infty} \sum_{k=1}^{n} f(x_k) \Delta x = \lim_{n \to \infty} \sum_{k=1}^{n} \left(\frac{4k}{n} - 2\right) \cdot \frac{1}{n}
= \lim_{n \to \infty} \left(\frac{4}{n^2} \sum_{k=1}^{n} k - \frac{2}{n} \sum_{k=1}^{n} 1\right)
= \lim_{n \to \infty} \left(\frac{4}{n^2} \left(\frac{n^2+n}{2}\right) - 2\right)
= 2 - 2 = 0.
\]

Copyright © 2014 Pearson Education, Inc.
31. Let $\Delta x = \frac{2-0}{n} = \frac{2}{n}$. Let $x_k = 0 + k\Delta x = \frac{2k}{n}$. Then $f(x_k) = \frac{4k^2}{n^2} - 4$. Thus,
\[
\lim_{n \to \infty} \sum_{k=1}^{n} f(x_k)\Delta x = \lim_{n \to \infty} \sum_{k=1}^{n} \left( \frac{4k^2}{n^2} - 4 \right) \cdot \frac{2}{n} = \lim_{n \to \infty} \left( \frac{8}{n^3} \sum_{k=1}^{n} k^2 - \frac{8}{n} \sum_{k=1}^{n} 1 \right) = \lim_{n \to \infty} \left( \frac{8}{n^3} \left( \frac{n(n+1)(2n+1)}{6} \right) - 8 \right) = \frac{8}{3} - 8 = -\frac{16}{3}.
\]

32. Let $\Delta x = \frac{2-1}{n} = \frac{1}{n}$. Let $x_k = 1 + k\Delta x = 1 + \frac{k+1}{n}$. Then $f(x_k) = 3 \cdot \frac{(n+k)^2}{n^2} + \frac{n+k}{n}$. Thus,
\[
\lim_{n \to \infty} \sum_{k=1}^{n} f(x_k)\Delta x = \lim_{n \to \infty} \sum_{k=1}^{n} \left( 3 \left( \frac{(n+k)^2}{n^2} + \frac{n+k}{n} \right) \right) \cdot \frac{1}{n} = \lim_{n \to \infty} \sum_{k=1}^{n} \left( \frac{3}{n} + \frac{6k}{n^2} + \frac{3k^2}{n^3} + \frac{1}{n} + \frac{k}{n^2} \right) = \lim_{n \to \infty} \left( 4 + \frac{7}{2} \cdot \frac{n^2 + n}{n^2} + \frac{3}{6} \cdot \frac{n(n+1)(2n+1)}{n^3} \right) = 4 + \frac{7}{2} + 1 = \frac{17}{2}.
\]

33. Let $\Delta x = \frac{4-0}{n} = \frac{4}{n}$. Let $x_k = 0 + k\Delta x = \frac{4k}{n}$. Then $f(x_k) = \frac{64k^3}{n^3} - \frac{4k}{n}$. Thus,
\[
\lim_{n \to \infty} \sum_{k=1}^{n} f(x_k)\Delta x = \lim_{n \to \infty} \sum_{k=1}^{n} \left( \frac{64k^3}{n^3} - \frac{4k}{n} \right) \cdot \frac{4}{n} = \lim_{n \to \infty} \left( \frac{256}{n^4} \sum_{k=1}^{n} k^3 - \frac{16}{n^2} \sum_{k=1}^{n} k \right) = \lim_{n \to \infty} \left( \frac{256}{n^4} \cdot \frac{n^2(n+1)^2}{4} - \frac{16}{n^2} \cdot \frac{n(n+1)}{2} \right) = 64 - 8 = 56.
\]

34. The midpoint Riemann sum is $(3 \cdot 3.5 + 4) + (3 \cdot 4.5 + 4) + (3 \cdot 5.5 + 4) + (3 \cdot 6.5 + 4) = 3 \cdot 20 + 16 = 76$. The exact area of the region is given by
\[
\int_{3}^{7} (3x+4) \, dx = \left( \frac{3x^2}{2} + 4x \right) \bigg|_{3}^{7} = \frac{147}{2} + 28 - \left( \frac{27}{2} + 12 \right) = 60 + 16 = 76.
\]

35. This sum is equal to
\[
\int_{0}^{4} (x^5 + 1) \, dx = \left( \frac{x^6}{6} + x \right) \bigg|_{0}^{4} = \frac{4^6}{6} + 4 = \frac{2060}{3}.
\]

36. The area represented is a triangle with base $x-2$ and height $2x-4$, so its area is $\frac{(x-2)(2x-4)}{2} = x^2 - 4x + 4$. If we call this quantity $A(x)$, then $A'(x) = 2x - 4$, as desired.

37. \[
\int_{-2}^{2} (3x^4 - 2x + 1) \, dx = \left( \frac{3x^5}{5} - x^2 + x \right) \bigg|_{-2}^{2} = \frac{96}{5} - 4 + 2 - \left( \frac{96}{5} - 4 - 2 \right) = \frac{192}{5} + 4 = \frac{212}{5}.
\]

38. \[
\int_{0}^{\pi/3} \cos 3x \, dx = \frac{\sin 3x}{3} \bigg|_{0}^{\pi/3} = \frac{\sin \frac{\pi}{3}}{3} - \frac{\sin 0}{3} = 0.
\]
39. \[ \int_0^2 (x + 1)^3 \, dx = \left[ \frac{(x + 1)^4}{4} \right]_0^2 = \frac{81}{4} - \frac{1}{4} = 20. \]

40. \[ \int_0^1 (4x^{21} - 2x^{16} + 1) \, dx = \left[ \frac{4x^{22}}{22} - \frac{2x^{17}}{17} + x \right]_0^1 = \frac{2}{11} - \frac{2}{17} + 1 = \frac{199}{187}. \]

41. \[ \int_{-1}^1 (9x^8 - 7x^6) \, dx = \left( x^9 - x^7 \right) \bigg|_{-1}^1 = 0. \]

42. \[ \int_{-2}^2 e^{4x^8} \, dx = \left( \frac{1}{4} \cdot e^{4x^8} \right) \bigg|_{-2}^2 = \frac{1}{4} (e^{16} - 1). \]

43. \[ \int_0^1 (x + \sqrt{x}) \, dx = \left( \frac{x^2}{2} + \frac{2x^{3/2}}{3} \right) \bigg|_0^1 = \frac{1}{2} + \frac{2}{3} = \frac{7}{6}. \]

44. Let \( u = x^3 + 27 \), and note that \( du = 3x^2 \, dx \). When \( x = 1 \), we have \( u = 28 \); when \( x = 2 \), we have \( u = 35 \). Substituting yields
\[ \int_1^2 \frac{x^2}{x^3 + 27} \, dx = \frac{1}{3} \int_{28}^{35} \frac{1}{u} \, du = \frac{1}{3} \ln |u| \bigg|_{28}^{35} = \frac{1}{3} (\ln 35 - \ln 28) = \frac{1}{3} \ln \frac{35}{28} = \frac{1}{3} \ln \frac{5}{4}. \]

45. \[ \frac{1}{2} \int_0^1 \frac{dx}{\sqrt{1 - (x/2)^2}} = \sin^{-1} \frac{x}{2} \bigg|_0^1 = \frac{\pi}{6}. \]

46. Let \( u = 3y^3 + 1 \), and note that \( du = 9y^2 \, dy \). When \( y = 0 \), we have \( u = 1 \); when \( y = 2 \), we have \( u = 25 \). Substituting yields
\[ \int_0^2 y^2(3y^3 + 1)^{-1} \, dy = \frac{1}{9} \int_1^{25} \frac{1}{u} \, du = \frac{1}{9} \ln |u| \bigg|_1^{25} = \frac{1}{9} \ln 25 = \frac{2}{9} \ln 5. \]

47. Let \( u = 25 - x^2 \), and note that \( du = -2x \, dx \). Substituting yields
\[ \frac{1}{2} \int_{25}^1 u^{-1/2} \, du = -\sqrt{u} \bigg|_{25}^1 = 5 - 4 = 1. \]

48. Let \( u = \cos x^2 \) and note that \( du = -\sin x^2 \cdot 2x \, dx \). When \( x = 0 \), we get \( u = 1 \); when \( x = \sqrt{\pi} \) we get \( u = -1 \). Substituting gives
\[ \int_0^{\sqrt{\pi}} x \sin x^2 \cos x^2 \, dx = -\frac{1}{2} \int_{-1}^1 u^8 \, du = -\frac{1}{2} \cdot \frac{1}{9} \bigg|_1^{-1} = \frac{1}{9}. \]

49. \[ \int_0^\pi \sin^2 5\theta \, d\theta = \int_0^\pi \frac{1 - \cos 10\theta}{2} \, d\theta = \left[ \frac{\theta}{2} - \frac{\sin 10\theta}{20} \right]_0^\pi = \frac{\pi}{2}. \]

50. \[ \int_0^\pi (1 - \cos^2 3\theta) \, d\theta = \int_0^\pi \sin^2 3\theta \, d\theta = \int_0^\pi \frac{1 - \cos 6\theta}{2} \, d\theta = \left[ \frac{\theta}{2} - \frac{\sin 6\theta}{12} \right]_0^\pi = \frac{\pi}{2}. \]

51. Let \( u = x^3 + 3x^2 - 6x \), and note that \( du = (3x^2 + 6x - 6) \, dx = 3(x^2 + 2x - 2) \, dx \). When \( x = 2 \), we have \( u = 8 \); when \( x = 3 \) we have \( u = 36 \). Substituting yields
\[ \int_2^3 \frac{x^2 + 2x - 2}{x^3 + 3x^2 - 6x} \, dx = \frac{1}{3} \int_8^{36} \frac{1}{u} \, du = \frac{1}{3} \ln |u| \bigg|_8^{36} = \frac{1}{3} (\ln 36 - \ln 8) = \frac{1}{3} \ln \frac{9}{2}. \]

52. Let \( u = e^x \), so that \( du = e^x \, dx \). Substituting yields
\[ \int_1^2 \frac{1}{1 + u^2} \, du = \tan^{-1} u \bigg|_1^2 = \tan^{-1} 2 - \frac{\pi}{4}. \]
53. Let \( u = x + \frac{\pi}{6} \) so that \( du = dx \). Note that when \( x = -\frac{\pi}{3} \) then \( u = -\frac{\pi}{6} \) and that when \( x = \frac{\pi}{6} \) then \( u = \frac{\pi}{3} \). Substituting gives

\[
\int_{-\pi/3}^{\pi/6} \tan \left( x + \frac{\pi}{6} \right) \, dx = \int_{-\pi/6}^{\pi/3} u \, du = -\ln |\cos u| \bigg|_{-\pi/6}^{\pi/3} \\
= -\ln \frac{1}{2} + \ln \sqrt{3} = \ln 2 + \ln \sqrt{3} - \ln 2 = \frac{1}{2} \ln 3.
\]

54. Use the substitution \( u = \sec x \), so that \( du = \sec x \tan x \, dx \). When \( x = 0 \), then \( u = \sec 0 = 1 \), and when \( x = \frac{\pi}{4} \), then \( u = \sec \frac{\pi}{4} = \sqrt{2} \). Then

\[
\int_{0}^{\pi/4} \sec^4 x \tan x \, dx = \int_{0}^{\pi/4} \sec^3 x (\sec x \tan x \, dx) = \int_{1}^{\sqrt{2}} u^3 \, du = \frac{1}{4} u^4 \bigg|_{1}^{\sqrt{2}} = 1 - \frac{1}{4} = \frac{3}{4}.
\]

55. Use the substitution \( u = x^2 \), so that \( du = 2x \, dx \). When \( x = \sqrt{\frac{\pi}{6}} \), then \( u = \frac{\pi}{6} \); when \( x = \sqrt{\frac{\pi}{2}} \) then \( u = \frac{\pi}{2} \). Then

\[
\int_{\sqrt{\frac{\pi}{6}}}^{\sqrt{\frac{\pi}{2}}} x \cot x^2 \, dx = \frac{1}{2} \int_{\pi/6}^{\pi/2} \cot u \, du = \frac{1}{2} \ln |\sin u| \bigg|_{\pi/6}^{\pi/2} = \frac{1}{2} \left( \ln \sin \frac{\pi}{2} - \ln \sin \frac{\pi}{6} \right) = \frac{1}{2} \left( -\ln \frac{1}{2} \right) = \frac{1}{2} \ln 2.
\]

56. Since \( \frac{1}{\cos^2 x} = \sec^2 x = \frac{d}{dx} \tan x \), use the substitution \( u = \tan x \). Then \( du = \sec^2 x \, dx \). When \( x = 0 \), then \( u = \tan 0 = 0 \); when \( x = \frac{\pi}{4} \), then \( u = \tan \frac{\pi}{4} = 1 \). So

\[
\int_{0}^{\pi/4} e^{\tan x} \cos^2 x \, dx = \int_{0}^{\pi/4} \sec^2 x e^{\tan x} \, dx = \int_{0}^{1} e^u \, du = e^u \bigg|_{0}^{1} = e - 1.
\]

57.

The area is given by

\[
\int_{-4}^{4} (16 - x^2) \, dx = \left( 16x - x^3 \right. \left. \frac{3}{3} \right) \bigg|_{-4}^{4} \\
= 64 - \frac{64}{3} - \left( -64 + \frac{64}{3} \right) = \frac{256}{3}.
\]

58.

The area is given by

\[
\int_{-1}^{0} (x^3 - x) \, dx = \left( \frac{x^4}{4} - \frac{x^2}{2} \right) \bigg|_{-1}^{0} \\
= 0 - \left( \frac{1}{4} - \frac{1}{2} \right) = \frac{1}{4}.
\]
59. The area is given by
\[ 2 \int_0^{2\pi} \sin \frac{x}{4} \, dx = 2 \left( -4 \cos \frac{x}{4} \right)_0^{2\pi} = -8(0 - 1) = 8. \]

60. The area is given by
\[ \int_{-1}^{\sqrt{3}} \frac{1}{1 + x^2} \, dx = (\tan^{-1} x)|_{-1}^{\sqrt{3}} = \frac{\pi}{3} - \left( -\frac{\pi}{4} \right) = \frac{7\pi}{12}. \]

61. i. \[ \int_{-1}^{1} (x^4 - x^2) \, dx = \left( \frac{x^5}{5} - \frac{x^3}{3} \right)|_{-1}^{1} = \left( \frac{1}{5} - \frac{1}{3} \right) - \left( -\frac{1}{5} - \left( -\frac{1}{3} \right) \right) = \frac{4}{15}. \]

ii. Because the region lies completely below the x-axis, the area bounded by the curve and the x-axis is
\[ -\int_{-1}^{1} (x^4 - x^2) \, dx = \frac{4}{15}. \]

62. i. \[ \int_0^{3} (x^2 - x) \, dx = \left( \frac{x^3}{3} - \frac{x^2}{2} \right)|_0^3 = 9 - \frac{9}{2} = \frac{9}{2}. \]

ii. Because the region is below the x-axis between 0 and 1 and above between 1 and 3, the area bounded by the curve and the x-axis is
\[ -\int_0^{1} (x^2 - x) \, dx + \int_1^{3} (x^2 - x) \, dx = -\left( \frac{x^3}{3} - \frac{x^2}{2} \right)|_0^1 + \left( \frac{x^3}{3} - \frac{x^2}{2} \right)|_1^3 = \frac{1}{3} - \frac{1}{2} + \left( 9 - \frac{9}{2} \right) - \left( \frac{1}{3} - \frac{1}{2} \right) = \frac{9}{2} + 2 \left( \frac{1}{2} - \frac{1}{3} \right) = \frac{9}{2} + \frac{1}{3} = \frac{29}{6}. \]
63.

a. \( \int_{-4}^{4} f(x) \, dx = 2 \int_{0}^{4} f(x) \, dx = 2 \cdot 10 = 20. \)

b. \( \int_{-4}^{4} 3g(x) \, dx = 3 \cdot 0 = 0. \)

c. \( \int_{-4}^{4} 4f(x) - 3g(x) \, dx = 2 \cdot 4 \int_{0}^{4} f(x) \, dx - 3 \cdot 0 = 8 \cdot 10 - 0 = 80. \)

d. Let \( u = 4x^2 \), so that \( du = 8x \, dx \). Substituting yields \( \int_{0}^{4} f(u) \, du = 10. \)

e. Because \( f \) is an even function, \( 3xf(x) \) is an odd function. Thus, \( \int_{-2}^{2} 3xf(x) \, dx = 0. \)

64.

a. \( \int_{a}^{c} f(x) \, dx = 20 - 12 = 8. \)

b. \( \int_{b}^{d} f(x) \, dx = 15 - 12 = 3. \)

c. \( 2 \int_{c}^{b} f(x) \, dx = -2 \int_{b}^{c} f(x) \, dx = -2(-12) = 24. \)

d. \( 4 \int_{a}^{d} f(x) \, dx = 80 - 48 + 60 = 92. \)

e. \( 3 \int_{b}^{d} f(x) \, dx = 3 \cdot 20 = 60. \)

65. \( 3 \int_{1}^{4} f(x) \, dx = 3 \int_{1}^{4} f(x) \, dx = 3 \cdot 6 = 18. \)

66. \( - \int_{4}^{1} 2f(x) \, dx = 2 \int_{1}^{4} f(x) \, dx = 2 \cdot 6 = 12. \)

67. \( \int_{1}^{4} (3f(x) - 2g(x)) \, dx = 3 \int_{1}^{4} f(x) \, dx - 2 \int_{1}^{4} g(x) \, dx = 3 \cdot 6 - 2 \cdot 4 = 18 - 8 = 10. \)

68. There is not enough information to compute this integral.

69. There is not enough information to compute this integral.

70. \( \int_{1}^{4} (f(x) - g(x)) \, dx = \int_{1}^{4} (g(x) - f(x)) \, dx = \int_{1}^{4} g(x) \, dx - \int_{1}^{4} f(x) \, dx = 4 - 6 = -2. \)
71. The displacement is \( \int_0^2 5 \sin(\pi t) \, dt = \left(-\frac{5}{\pi} \cos(\pi t)\right)_0^2 = 0 \). The distance traveled is
\[
\int_0^2 |5 \sin(\pi t)| \, dt = 5 \int_0^1 \sin \pi t \, dt + 5 \int_1^2 -\sin \pi t \, dt = \left(\frac{5}{\pi} \cos(\pi t)\right)_1^1 + \left(\frac{5}{\pi} \cos(\pi t)\right)_1^2 = \frac{10}{\pi} + \frac{10}{\pi} = \frac{20}{\pi}.
\]
72. The baseball is in the air for \( x \) in the interval \((0, 200)\). The average height is
\[
\frac{1}{200} \int_0^{200} (2x - 0.01x^2) \, dx = \frac{1}{200} \left(x^2 - \frac{0.01x^3}{3}\right)_0^{200} = 200 - \frac{400}{3} = \frac{200}{3}.
\]
73. a. The average value is 2.5. This is because for a straight line, the average value occurs at the midpoint of the interval, which is at the point \((3.5, 2.5)\), so \( c = 3.5 \).

b. The average value is 3 over the interval \([2, 4]\) and 3 over the interval \([4, 6]\), so is 3 over the interval \([2, 6]\). The function takes on this value at \( c = 3 \) and \( c = 5 \).

74. Differentiating both sides of the given equation gives \( 12x^3 = f(x) \). To check, we compute
\[
\int_2^x 12t^3 \, dt = 3t^4\big|_2^x = 3x^4 - 48,
\]
which gives the original equation.

75. Let \( u = 2x \), so that \( du = 2 \, dx \). We have
\[
\frac{1}{2} \int_2^4 f'(u) \, du = \frac{1}{2} \cdot (f(4) - f(2)) = \frac{f(4)}{2} - 2.
\]
Because we are given that this quantity is 10, we have \( f(4) = 24 \).

76. Note that \( H'(x) = \sqrt{4 - x^2} \) by the Fundamental Theorem.

a. \( H(0) = \int_0^2 \sqrt{4 - t^2} \, dt = 0 \).

b. \( H'(1) = \sqrt{3} \).

c. \( H'(2) = \sqrt{4 - 4} = 0 \).

d. \( H(2) = \int_0^2 \sqrt{4 - t^2} \, dt = \frac{1}{4} \cdot \pi \cdot 2^2 = \pi \). This follows because the given area represents \( \frac{1}{4} \) of the area inside a circle of radius 2.

e. \( H(-x) = \int_{-x}^0 \sqrt{4 - t^2} \, dt = -\int_0^x \sqrt{4 - t^2} \, dt = -H(x) \), because \( \sqrt{4 - t^2} \) is an even function. So \( s = -1 \).

77. By the Fundamental Theorem, \( f'(x) = \frac{1}{x} \), which is always positive for \( x > 1 \). Thus \( f \) is always increasing. Also, \( f(1) = \int_1^2 \frac{1}{t} \, dt = 0 \).

Finally, \( f''(x) = -\frac{1}{x^2} \), which is always negative, so \( f \) is always concave down.
78. a. We have

\[
F(-2) = \int_{-2}^{-1} f(t) \, dt = \int_{-2}^{-1} t \, dt = \left[ \frac{1}{2} t^2 \right]_{-2}^{-1} = \frac{3}{2},
\]

\[
F(2) = \int_{-1}^{2} f(t) \, dt = \int_{-1}^{0} f(t) \, dt + \int_{0}^{2} f(t) \, dt = \int_{-1}^{0} t \, dt + \int_{0}^{2} \frac{x^2}{2} \, dt = \left[ \frac{1}{2} t^2 \right]_{-1}^{0} + \left[ \frac{1}{6} x^3 \right]_{0}^{2} = \frac{5}{6}.
\]

b. By the Fundamental Theorem, \( F'(x) = f(x) \), so that for \(-2 \leq x < 0 \) we have \( F'(x) = f(x) = x \).

c. By the Fundamental Theorem, \( F'(x) = f(x) \), so that for \( 0 \leq x \leq 2 \) we have \( F'(x) = f(x) = \frac{x^2}{2} \).

d. From parts (b) and (c),

\[
F'(-1) = f(-1) = -1, \quad F'(1) = f(1) = \frac{1}{2}.
\]

These represent the rate of change of \( F \) at the given points. Since the graph in the exercise is the derivative of \( F \), this is just the value of \( f \) at the given points.

e. Since

\[
F''(x) = f'(x) = \begin{cases} 
1, & -2 \leq x < 0, \\
x, & 0 \leq x \leq 2,
\end{cases}
\]

we get

\[
F''(-1) = f'(-1) = 1, \quad F''(1) = f'(1) = 1.
\]

f. Since

\[
G(x) = \int_{-2}^{x} f(t) \, dt = \int_{-2}^{-1} f(t) \, dt + \int_{-1}^{x} f(t) \, dt = \int_{-2}^{-1} t \, dt + F(x) = \left[ \frac{1}{2} t^2 \right]_{-2}^{-1} + F(x) = -\frac{3}{2} + F(x),
\]

we get \( F(x) = G(x) + \frac{3}{2} \).

79. a. We have

\[
G(-1) = \int_{-2}^{-1} f(t) \, dt = \int_{-2}^{-1} t \, dt = \left[ \frac{1}{2} t^2 \right]_{-2}^{-1} = -\frac{3}{2},
\]

\[
G(1) = \int_{-2}^{1} f(t) \, dt = \int_{-2}^{0} f(t) \, dt + \int_{0}^{1} f(t) \, dt = \int_{-2}^{0} t \, dt + \int_{0}^{1} \frac{1}{2} t^2 \, dt = \left[ \frac{1}{2} t^2 \right]_{-2}^{0} + \left[ \frac{1}{6} t^3 \right]_{0}^{1} = -\frac{11}{6}.
\]

b. By the Fundamental Theorem, \( G'(x) = f(x) \), so that for \(-2 \leq x < 0 \) we have \( G'(x) = f(x) = x \).

c. By the Fundamental Theorem, \( G'(x) = f(x) \), so that for \( 0 \leq x \leq 2 \) we have \( G'(x) = f(x) = \frac{x^2}{2} \).

d. From parts (b) and (c),

\[
G'(0) = f(0) = 0, \quad G'(1) = f(1) = \frac{1}{2}.
\]

These represent the rate of change of \( G \) at the given points. Since the graph in the exercise is the derivative of \( G \), this is just the value of \( f \) at the given points.

e. As in part (e) of the previous exercise, \( F(x) = G(x) + \frac{3}{2} \). Note that \( F \) and \( G \) represent two antiderivatives of \( f \) which differ by the constant of integration \( C = \frac{3}{2} \).
80. It appears that $B$ is the derivative of $A$, and $C$ is the derivative of $B$. Thus we must have $A = \int_0^x f(t) dt$, $B = f(x)$, and $C = f'(x)$. Note that $A$ is decreasing where $B$ is negative and increasing where $B$ is positive, and has a minimum where $B$ is zero. Note also that $B$ is increasing where $C$ is positive, and is decreasing where $C$ is negative, and has a maximum where $C$ is zero.

81. Because $x^n$ and $\sqrt{x}$ are inverse functions of each other, they are symmetric in the square $[0,1] \times [0,1]$ about the line $y=x$. Together, the two regions completely fill up the 1 $\times$ 1 square, so these two areas add to one.

82. If we let $u^3 = x^2 - 1$, then $3u^2 du = 2x dx$, so $x dx = \frac{3u^2}{2} du$. Also, when $x = 1$ we have $u = 0$ and when $x = 3$ we have $u = 2$. Substituting gives $\int_1^3 x \sqrt{x^2 - 1} dx = \frac{3}{2} \int_0^2 u^2 \cdot u du = \frac{3}{2} \left( \frac{u^4}{4} \right) \bigg|_0^2 = 6$.

83. Factoring out $\frac{1}{b^2}$ gives $\frac{1}{b^2} \int \frac{dx}{(ax/b)^2 + 1}$. Now let $u = \frac{a}{b} x$, so that $du = \frac{a}{b} dx$.
Substituting yields $\frac{1}{b^2} \cdot \frac{b}{a} \int \frac{du}{u^2 + 1} = \frac{1}{ab} \tan^{-1} u + C = \frac{1}{ab} \tan^{-1} \left( \frac{a}{b} x \right) + C$.

84. Let $u = 1 + \cos^2 x$. Then $du = -2 \sin x \cos x dx$. Substituting yields
\[- \int \frac{1}{u} du = - \ln |u| + C = - \ln(1 + \cos^2 x) + C.\]

85. Let $u = \frac{1}{x}$. Then $du = -\frac{1}{x^2} dx$. Substituting yields $- \int \sin u du = \cos u + C = \cos \frac{1}{x} + C$.

86. Let $u = \tan^{-1} x$. Then $du = \frac{1}{1+x^2} dx$. Substituting yields $\int u^5 du = \frac{u^6}{6} + C = \frac{(\tan^{-1} x)^6}{6} + C$.

87. Let $u = \tan^{-1} x$. Then $du = \frac{1}{1+x^2} dx$. Substituting yields $\int \frac{1}{u} du = \ln |u| + C = \ln |\tan^{-1} x| + C$.

88. Let $u = \sin^{-1} x$. Then $du = \frac{1}{\sqrt{1-x^2}} dx$. Substituting yields $\int u du = \frac{u^2}{2} + C = \frac{(\sin^{-1} x)^2}{2} + C$.

89. Let $u = e^x + e^{-x}$. Then $du = (e^x - e^{-x}) dx$. Substituting yields $\int \frac{1}{u} du = \ln |u| + C = \ln (e^x + e^{-x}) + C$.
90. 

a. 

\[
\int_{0}^{\pi/a} \sin(ax) \, dx = \left( -\frac{\cos ax}{a} \right)_{0}^{\pi/a} = \frac{1}{a} + \frac{1}{a} = \frac{2}{a}.
\]

This is a decreasing function of \( a \).

b. 

\[
\int_{0}^{\pi/a} \sin(ax) \, dx = \left( -\frac{\cos ax}{a} \right)_{0}^{\pi/a} = \frac{1}{a} + \frac{1}{a} = \frac{2}{a}.
\]

91. This follows by differentiating each side of the equation. \( \frac{d}{dx} \left( u(x) + 2 \int_{0}^{x} u(t) \, dt \right) = u'(x) + 2u(x) \), and \( \frac{d}{dx} 10 = 0 \). The reverse is not true, because if \( u(x) + 2 \int_{0}^{x} u(t) \, dt = C \) for any constant \( C \), then it would satisfy the second equation, even if \( C \neq 10 \).

92. 

b. \( A(x) = \int (x^2 - 5x + 4) \, dx = \frac{1}{3}x^3 - \frac{5}{2}x^2 + 4x + C \); since \( A(0) = 0 \) we have \( C = 0 \), so that \( A(x) = \frac{1}{6}(2x^3 - 15x^2 + 24x) \).

c. The zeros of \( f \) are at 1 and 4, and \( A \) has a local maximum at \( x = 1 \) and a local minimum at \( x = 4 \).

d. Geometric: Because \( f \) is above the axis from 0 to 1 and then crosses below the axis at 1, the net area from 0 to \( x \) will switch from increasing to decreasing as \( x \) moves from the left of 1 to the right of 1. A similar (but opposite) thing can be said near 4, because \( f \) switches from below the axis to above, the net area switches from decreasing to increasing at \( x = 4 \).

Analytic: By the Fundamental Theorem, \( A'(x) = f(x) \), so the zeros of \( f \) are critical points of \( A \), and in this example, lead to extrema.

Copyright © 2014 Pearson Education, Inc.
e. Because \( A(x) = \frac{2}{3} \cdot (2x^2 - 15x + 24) \), the non-zero zeros of \( A \) occur at \( x = \frac{15 \pm \sqrt{225 - 4 \cdot 24}}{4} = \frac{15 \pm \sqrt{33}}{4} \).
So \( x_1 = \frac{15 - \sqrt{33}}{4} \approx 2.314 \) and \( x_2 = \frac{15 + \sqrt{33}}{4} \approx 5.186 \).

f. Since \( f(x) = A'(x) \), the area bounded by the graph of \( f \) and the \( x \)-axis on \([0, x_1]\) is
\[
\int_0^{x_1} f(x) \, dx - \int_1^{x_1} f(x) \, dx = A(1) - A(0) - (A(x_1) - A(1)) = 2A(1) = \frac{11}{3}.
\]
Now, note that the area bounded by the graph of \( f \) on \([x_1, 4]\) is \(-(A(4) - A(x_1)) = \frac{8}{3}\), so that \( b > 4 \).
Then the area bounded by the graph of \( f \) and the \( x \)-axis on \([x_1, b]\) is
\[
-\int_{x_1}^4 f(x) \, dx + \int_4^b f(x) \, dx = -(A(4) - A(x_1)) + A(b) - A(4) = A(b) - 2A(4) = A(b) + \frac{16}{3},
\]
Thus we want to solve \( A(b) = -\frac{2}{3} \); using technology, we get \( b \approx 4.756 \).

g. No. For example, consider the function
\[
f(x) = \begin{cases} 
1 & \text{if } 0 \leq x < 1, \\
-1 & \text{if } 1 \leq x \leq 2.
\end{cases}
\]
Then \( A(x) = \int_0^x f(t) \, dt \) has a maximum at \( x = 1 \), even though \( f \) is never zero. An extreme point of \( A \) can occur at points of discontinuity of \( f \).

93. Note that \( f'(x) = (x - 1)^{15}(x - 2)^9 \), and that the zeros of \( f' \) are at \( x = 1 \) and \( x = 2 \).

a. \( f' \) is positive and thus \( f \) is increasing on \((-\infty, 1) \) and on \((2, \infty) \), while \( f' \) is negative and \( f \) is decreasing on \((1, 2) \).

b. \( f''(x) = 15(x - 1)^{14}(x - 2)^9 + (x - 1)^{15} \cdot 9(x - 2)^8 = 3(x - 1)^{14}(x - 2)^8(8x - 13). \)
\( f \) is concave up on \((\frac{13}{8}, \infty) \) and concave down on \((-\infty, \frac{13}{8}) \).

c. \( f \) has a local maximum at \( x = 1 \) and a local minimum at \( x = 2 \).

d. \( f \) has an inflection point at \( x = \frac{13}{8} \).

94.

The first graph on the left above shows that the area of the rectangle with height \( e^m \) where \( m \) is the midpoint of \([a, b]\) is less than the area under the curve of \( e^x \) over \([a, b]\). The last graph on the right above shows that the area of the rectangle whose height is the average of \( e^a \) and \( e^b \) is greater than the area under the curve of \( e^x \) over that interval. Note that the area under the curve is \( \int_a^b e^x \, dx = (e^x) \bigg|_a^b = e^b - e^a \). Putting these ideas together, we have
\[
e^{(a+b)/2}(b-a) < e^b - e^a < \left( \frac{e^a + e^b}{2} \right) (b-a),
\]
and dividing through by \((b-a)\) yields
\[
e^{(a+b)/2} \frac{e^b - e^a}{b-a} < \frac{e^a + e^b}{2}.
\]
95. a. Evaluating numerically for the trapezoid and midpoint rules, we find that $T_6 \approx 9.125$, and $M_6 \approx 8.938$.

b. Similarly, $T_{12} \approx 9.031$, and $M_{12} \approx 8.984$.

96. a, b.

\begin{tabular}{|c|c|c|c|}
\hline
$n$ & $T(n)$ & $M(n)$ & Abs error in $T(n)$ & Abs error in $M(n)$ \\
\hline
4 & 8.74127 & -3.96138 & 8.7 & 4.0 \\
8 & 2.38995 & -1.16842 & 2.4 & 1.2 \\
16 & 0.61076 & -0.30371 & $6.1 \times 10^{-1}$ & $3.0 \times 10^{-1}$ \\
32 & 0.15353 & -0.07666 & $1.5 \times 10^{-1}$ & $7.7 \times 10^{-2}$ \\
64 & 0.03843 & -0.01921 & $3.8 \times 10^{-2}$ & $1.9 \times 10^{-2}$ \\
\hline
\end{tabular}

c. Each time $n$ is doubled, the errors in $T(n)$ are reduced approximately by a factor of 4.

d. Each time $n$ is doubled, the errors in $M(n)$ are reduced approximately by a factor of 4.

97. As $x \to 2$, the upper bound on the integration in the numerator approaches 2, so the integral approaches zero. Since the denominator approaches zero as well, this has the limit form $\frac{0}{0}$, so that L'Hôpital's rule applies, and using the Fundamental Theorem as well we get

$$\lim_{x \to 2} \frac{\int_x^2 e^t \, dt}{x - 2} = \lim_{x \to 2} \frac{\frac{d}{dx} \int_x^2 e^t \, dt}{x - 2} = \lim_{x \to 2} \frac{e^x}{1} = \lim_{x \to 2} e^x = e^4.$$ 

98. As $x \to 1$, the upper bound on the integration in the numerator approaches 1, so the integral approaches zero. Since the denominator approaches zero as well, this has the limit form $\frac{0}{0}$, so that L'Hôpital's rule applies, and using the Fundamental Theorem as well we get

$$\lim_{x \to 1} \frac{\int_1^x e^t \, dt}{x - 1} = \lim_{x \to 1} \frac{\frac{d}{dx} \int_1^x e^t \, dt}{x - 1} = \lim_{x \to 1} \frac{e^{(x^2)^3} \cdot 2x}{1} = \lim_{x \to 1} 2xe^{x^6} = 2e.$$

**AP Practice Questions**

**Multiple Choice**

1. The correct answer is A. Simplifying and then integrating gives

$$\int (5x - 1)\sqrt{x} \, dx = \int \left(5x^{3/2} - x^{1/2}\right) = 5 \cdot \frac{2}{5}x^{5/2} - \frac{2}{3}x^{3/2} + C = 2x^{5/2} - \frac{2}{3}x^{3/2} + C.$$ 

2. The correct answer is C. The total distance traveled is the area under the curve (since the velocity is the derivative of position, and the velocity is always positive so we don’t need to worry about signed areas, which represent the object moving backwards). The area under the curve consists of a $5 \times 3$ rectangle together with a right triangle of height 3 and base 3 sitting on top of it, for a total area of $5 \times 3 + \frac{1}{2} \cdot 3 = 19.5$ m.

3. D is correct. With $n = 4$, we have $\Delta x = \frac{1}{2}$, and $x_n = 0 + \frac{1}{2}n = \frac{1}{2}n$ for $n = 0, 1, 2, 3, 4$. Then the left Riemann sum is

$$\sum_{n=1}^{4} f(x_{n-1})\Delta x = 1 \cdot \frac{1}{2} + 3 \cdot \frac{1}{2} + 4 \cdot \frac{1}{2} + 4 \cdot \frac{1}{2} = 6.$$ 

4. C is correct. Since

$$\int_{-2}^{0} 2f(x) \, dx - \int_{0}^{3} |f(x)| \, dx = 2 \int_{-2}^{0} f(x) \, dx - 3 \int_{0}^{3} |f(x)| \, dx,$$

we want to take twice the signed area of $A$ and subtract three times the unsigned area $B$, so this is $2A - 3B$. 

Copyright © 2014 Pearson Education, Inc.
5. E is correct. First split the integrand into a difference of two integrals:
\[
\int_1^2 \frac{4x^3 - 3}{x^4} \, dx = \int_1^2 \left( \frac{4x^3}{x^4} - \frac{3}{x^4} \right) \, dx = \int_1^2 \left( \frac{4}{x} - \frac{3}{x^2} \right) \, dx = \left[ \frac{4 \ln |x| + \frac{1}{x^3}}{1} \right]_1^2 = -\frac{7}{8} + 4 \ln 2 = -\frac{7}{8} + \ln 16.
\]

6. B is correct. We have
\[
\int_{-1}^{\sqrt{3}} \frac{3}{1 + x^2} \, dx = 3 \int_{-1}^{\sqrt{3}} \frac{1}{1 + x^2} \, dx = 3 \left[ \tan^{-1} x \right]_{-1}^{\sqrt{3}} = 3 \left( \tan^{-1} \sqrt{3} - \tan^{-1} (-1) \right) = 3 \left( \frac{\pi}{3} - \left( -\frac{\pi}{4} \right) \right) = \frac{7\pi}{4}.
\]

7. A is correct. Use the substitution \( u = x^2 - 1 \); then \( du = 2x \, dx \). When \( x = 1 \), then \( u = 0 \), and when \( x = 3 \), then \( u = 8 \). So we get
\[
\int_1^3 x \sqrt{x^2 - 1} \, dx = \frac{1}{2} \int_0^8 \sqrt{u} \, du = \frac{1}{2} \left[ \frac{3}{4} u^{4/3} \right]_0^8 = \frac{1}{2} \cdot \frac{3}{4} \cdot 2^4 = 6.
\]

8. B is correct. By the Fundamental Theorem and the Chain Rule, we have
\[
\frac{d}{dx} \int_1^x \cos t^2 \, dt = \cos(x^2)^2 \cdot \frac{d}{dx} x^2 = 2x \cos x^4.
\]

9. C is correct. The average value is the integral over the interval divided by the length of the interval:
\[
\frac{1}{\pi - 0} \int_0^\pi \sin x \, dx = \frac{1}{\pi} \left[ -\cos x \right]_0^\pi = \frac{1}{\pi} (1 + 1) = \frac{2}{\pi}.
\]

10. D is correct. Integrating \( f'(t) \) gives
\[
f(t) = \int f'(t) \, dt = \int (e^t - 2t + 3) \, dt = e^t - t^2 + 3t + C.
\]
Then \( f(0) = e^0 + C = C + 1 \); since \( f(0) = 4 \) we must have \( C = 3 \) so that \( f(t) = e^t - t^2 + 3t + 3 \).

11. E is correct. The approximation is
\[
T(4) = \frac{f(0) + f(1)}{2} + \frac{f(1) + f(3)}{2} \cdot 2 + \frac{f(3) + f(4)}{2} \cdot 1 + \frac{f(4) + f(5)}{2} \cdot 1
= \frac{2}{2} + \frac{7}{2} + \frac{3}{2} = \frac{29}{2}.
\]

12. D is correct. We have
\[
\int_2^4 (3f(x) - 2g(x)) \, dx = 3 \int_2^4 f(x) \, dx - 2 \int_2^4 g(x) \, dx
= 3 \left( \int_0^4 f(x) \, dx - \int_0^2 f(x) \, dx \right) - 2 \cdot (-8)
= 3(12 - 5) + 16 = 37.
\]

13. B is correct. Let \( F(x) = \int_0^x f(t) \, dt \). Then the question is: which of these is the graph of \( F(x) \)? Clearly \( F(0) = 0 \), so that its graph must go through the origin. Thus the correct answer is either B or D. Note that since \( f(t) \) is positive up until \( t = 1 \), its integral will be positive in that range as well, so that \( F(x) > 0 \) for \( 0 < x \leq 1 \). Of curves B and D, only B satisfies that criterion. Note also that \( F(x) \) reaches its minimum when \( f(t) \) goes above the \( x \) axis again, at \( t = 3 \) (since that is when the integral stops accumulating negative area), and curve B does in fact reach a minimum at \( x = 3 \).

14. D is correct. Note that this has the limiting form \( \frac{0}{0} \), so that L'Hôpital's rule applies, and we get (using the Fundamental Theorem)
\[
\lim_{x \to 1} \frac{f(x)}{x - 1} = \lim_{x \to 1} \frac{f'(x)}{1} = \lim_{x \to 1} e^{-x^2} = \frac{1}{e}.
\]
15. A is correct. Use the substitution \( u = x^3 \) on \( \int_{-3}^{3} x^2 f(x^3) \, dx \). Then \( du = 3x^2 \, dx \); further, when \( x = -3 \) then \( u = -27 \), and when \( x = 3 \) then \( u = 27 \). So we get
\[
\int_{-3}^{3} x^2 f(x^3) \, dx = \frac{1}{3} \int_{-27}^{27} f(u) \, du.
\]
But \( f \) is even, so the integral above is just twice the integral from 0 to 27, and we know its value is 12:
\[
\frac{1}{3} \int_{-27}^{27} f(u) \, du = \frac{2}{3} \int_{0}^{27} f(u) \, du = \frac{2}{3} \cdot 12 = 8.
\]

16. The correct answer is A. A plot reveals that \( x = 2 \) is a root (alternatively, it is easy to see by inspection that \( x = -1 \) is a root). Factoring out the root and then factoring the remaining quadratic gives
\[
12x^3 + 24x^2 - 60x - 72 = 12(x + 1)(x - 2)(x + 3).
\]
So the two regions extend from \( x = -3 \) to \( x = -1 \), and from \( x = -1 \) to \( x = 2 \). A graph of the function is

Since the region from \(-1\) to 2 is below the \( x \) axis, the area we want is
\[
\int_{-3}^{-1} (12x^3 + 24x^2 - 60x - 72) \, dx - \int_{-1}^{2} (12x^3 + 24x^2 - 60x - 72) \, dx
= [3x^4 + 8x^3 - 30x^2 - 72x]_{-3}^{-1} - [3x^4 + 8x^3 - 30x^2 - 72x]_{-1}^{2}
= 37 - (-27) - (-152 - 37) = 253.
\]

17. C is correct. Since the interval length is 4, with \( n = 8 \) we have \( \Delta x = \frac{4}{8} = \frac{1}{2} \), so that \( x_i = 1 + \frac{1}{2}i \) for \( i = 0, 1, 2, \ldots, 8 \). The interval midpoints are then \( x^*_i = \frac{5}{4} + \frac{1}{2}i \) for \( i = 0, 1, 2, \ldots, 7 \), and the midpoint sum is
\[
M(8) = \sum_{i=0}^{7} f(x^*_i) \Delta x
= \frac{1}{2} \left( \frac{1}{4} \cdot \frac{5}{4} + \frac{1}{4} \cdot \frac{7}{4} + \frac{1}{4} \cdot \frac{9}{4} + \frac{1}{4} \cdot \frac{11}{4} + \frac{1}{4} \cdot \frac{13}{4} + \frac{1}{4} \cdot \frac{15}{4} + \frac{1}{4} \cdot \frac{17}{4} \right)
= \frac{1}{2} \left( \frac{5}{32} + \frac{7}{32} + \frac{9}{32} + \frac{11}{32} + \frac{13}{32} + \frac{15}{32} + \frac{17}{32} \right)
= \frac{5819248}{14549535} \approx 0.400.
\]

18. E is correct. We have
\[
\int_{-1}^{10} (2x + 0.5f'(x)) \, dx = \int_{-1}^{10} 2x \, dx + 0.5 \int_{-1}^{10} f'(x) \, dx = [x^2]_{-1}^{10} + 0.5 [f(x)]_{-1}^{10} = 99 + 0.5(f(10) - f(-1)) = 101.
\]
Free Response

1. a. Integrating gives

\[ A(x) = \int_0^x (\sin t - \cos t) \, dt = [-\cos t - \sin t]_0^x = -\cos x - \sin x + 1 = 1 - \sin x - \cos x. \]

b. A plot of \(A\) is

\[ \text{graph of } A(x) \]

c. The relative extrema of \(A\) occur when \(A'(x) = f(x) = 0\), so when \(\sin x = \cos x\). On \([0, 2\pi]\), this happens for \(x = \frac{\pi}{4}\) and for \(x = \frac{5\pi}{4}\). Since \(A''(x) = f'(x) = \cos x + \sin x\), we see that \(A'' \left( \frac{\pi}{4} \right) > 0\) while \(A'' \left( \frac{5\pi}{4} \right) < 0\), so that \(A\) has a local minimum at \(\frac{\pi}{4}\) and a local maximum at \(\frac{5\pi}{4}\).

d. Since \(f(x) = A'(x)\), the relative extrema of \(A\) occur where \(A'(x) = 0\), which is where \(f(x) = 0\). So the relative extrema of \(A\) correspond to the zeros of \(f\).

2. a. The points excluded from the domain of \(g\) are the points where the numerator or denominator is undefined, or where the denominator is zero. Both numerator and denominator are defined everywhere, but the denominator is zero at the roots of \(x^3 + 3x + 1\). Solving numerically we see that this equation has only one real root, \(x \approx -0.322\). So the domain of \(g\) is all real numbers except for \(x \approx -0.322\).

b. Since \(g(x)\) is continuous everywhere except where it is undefined, and since \(-0.322\) is in neither of the intervals \([-4, -1]\) or \([1, 4]\), we see that \(g\) is continuous on each of these intervals. Since \(3x^2 + 3\) is never zero, \(g\) has no zeros, so that \(g\) lies entirely above or entirely below the \(x\) axis on each of these intervals. Since

\[ g(-2) = \frac{3(-2)^2 + 3}{\sqrt[3]{(-2)^3 + 3(-2) + 1}} = \frac{15}{\sqrt[3]{-13}} < 0 \quad \text{and} \quad g(2) = \frac{3 \cdot 2^2 + 3}{\sqrt[3]{2^3 + 3 \cdot 2 + 1}} = \frac{15}{\sqrt[3]{15}} > 0, \]

\(g\) is negative on the first interval and positive on the second. Now, to integrate \(g\) we will use the substitution \(u = x^3 + 3x + 1\), so that \(du = 3x^2 + 3\, dx\). At \(x = -4\), we have \(u = -75\); at \(x = -1\), we have \(u = -3\); at \(x = 1\), we have \(u = 5\), and at \(x = 4\), we have \(u = 77\). Then on \([-4, -1]\), the area bounded by \(g\) and the \(x\) axis is

\[ -\int_{-4}^{-1} \frac{3x^2 + 3}{\sqrt[3]{x^3 + 3x + 1}} \, dx = -\int_{-75}^{-1} \frac{1}{u^{1/3}} \, du = -\frac{3}{2} \left[ u^{2/3} \right]_{-75}^{-1} = \frac{3}{2} \left( -3^{2/3} + 75^{2/3} \right) \approx 23.557, \]

and the area bounded by \(g\) and the \(x\) axis on \([1, 4]\) is

\[ \int_{1}^{4} \frac{3x^2 + 3}{\sqrt[3]{x^3 + 3x + 1}} \, dx = \int_{5}^{77} \frac{1}{u^{1/3}} \, du = \frac{3}{2} \left[ u^{2/3} \right]_{5}^{77} = \frac{3}{2} \left( 77^{2/3} - 5^{2/3} \right) \approx 22.763, \]

so the area over \([-4, -1]\) is larger.
c. Since
\[
g'(x) = \frac{\sqrt[3]{x^3 + 3x + 1} \cdot (6x) - (3x^2 + 3) \left( \frac{1}{3}(x^3 + 3x + 1)^{-2/3} \cdot (3x^2 + 3) \right)}{(x^3 + 3x + 1)^{2/3}}
\]
\[
= \frac{6x(x^3 + 3x + 1) - 3(x^2 + 1)(x^2 + 1)}{(x^3 + 3x + 1)^{4/3}}
\]
\[
= \frac{3x^4 + 12x^2 + 6x - 3}{(x^3 + 3x + 1)^{4/3}},
\]
we find the roots of the numerator numerically to be \(x \approx -0.738\) and \(x \approx 0.307\). Neither of these is a root of the denominator, so they are in the domain and may represent local extrema. Note that the denominator of \(g'(x)\) is always positive, so to determine the sign of \(g'(x)\) we need only consider the numerator \(n(x) = 3x^4 + 12x^2 + 6x - 3\). Now,
\[
n(-1) = 3 + 12 - 6 - 3 = 6 > 0, \quad n(-0.5) = 0.1875 + 3 - 3 - 3 < 0,
\]
\[
n(0) = -3 < 0, \quad n(1) = 3 + 12 + 6 + 3 > 0,
\]
so that \(g'(x)\) changes sign at each of these points, and \(x \approx -0.738\) is a local maximum while \(x \approx 0.307\) is a local minimum. Evaluating numerically we get \(g(0.307) \approx 2.628\).

3. 

a. Using the data points at \(t = 7\) and \(t = 9\) gives
\[
T'(8) \approx \frac{T(9) - T(7)}{9 - 7} = \frac{89 - 80}{2} = 4.5^\circ F/hr.
\]

b. By the Fundamental Theorem, \(\int_{0}^{12} T'(t) \, dt = T(12) - T(0) = 87 - 55 = 32^\circ F\). This represents the total change in temperature from 6AM to 6PM.

c. Use the intervals given. Then the approximation is
\[
\frac{1}{12} \int_{0}^{12} T(t) \, dt = \frac{1}{12} \left( T(0) \cdot (1 - 0) + T(1) \cdot (4 - 1) + T(4) \cdot (7 - 4) + T(7) \cdot (9 - 7) + T(9) \cdot (12 - 9) \right)
\]
\[
= \frac{1}{12} (55 + 186 + 225 + 160 + 267) = \frac{893}{12} \approx 74.417^\circ F.
\]
According to this approximation, the average temperature over the 12-hour period was about 74\(^\circ\)F.

d. Use the intervals given. Then the approximation is
\[
\frac{1}{12} \int_{0}^{12} T(t) \, dt = \frac{1}{12} \left( \frac{T(0) + T(1)}{2} \cdot (1 - 0) + \frac{T(1) + T(4)}{2} \cdot (4 - 1) + \frac{T(4) + T(7)}{2} \cdot (7 - 4) + \frac{T(7) + T(9)}{2} \cdot (9 - 7) + \frac{T(9) + T(12)}{2} \cdot (12 - 9) \right)
\]
\[
= \frac{1}{12} \left( \frac{117}{2} + \frac{411}{2} + \frac{465}{2} + 169 + 264 \right)
\]
\[
= \frac{1859}{24} \approx 77.458^\circ F.
\]
According to this approximation, the average temperature over the 12-hour period was about 77\(^\circ\)F.
4.

a. The graph is

b. \( f \) appears from the graph to be continuous, and in fact

\[
\lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} (1 - x^2) = 1 - 0^2 = 1, \\
\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} e^{-2x} = e^{-0} = 1.
\]

Since the one-sided limits are equal, and are both equal to \( f(0) = 1 \), it follows that \( f \) is continuous at \( x = 0 \).

c. Differentiating gives

\[
f'(x) = \begin{cases} -2x, & x < 0, \\ -2e^{-2x}, & x \geq 0. \end{cases}
\]

Since \( \lim_{x \to 0^-} f'(x) = \lim_{x \to 0^+} f'(x) dx = -2 \), we see that \( f \) is not differentiable at \( x = 0 \) so that \( f'(0) \) does not exist. Thus \( f' \) cannot be continuous at \( x = 0 \).

d. For \( x < 0 \) we have

\[
g(x) = \int_{-1}^{x} f(t) dt = \int_{-1}^{x} (1 - t^2) dt = \left[ t - \frac{t^3}{3} \right]_{-1}^{x} = x - \frac{x^3}{3} + \frac{2}{3},
\]

while for \( x \geq 0 \) we get

\[
g(x) = \int_{-1}^{x} f(t) dt = \int_{-1}^{0} (1 - t^2) dt + \int_{0}^{x} e^{-2t} dt = \left[ t - \frac{t^3}{3} \right]_{-1}^{0} + \left[ -\frac{1}{2}e^{-2t} \right]_{0}^{x}
\]

\[
= \frac{2}{3} + \frac{1}{2} - \frac{1}{2}e^{2x} = \frac{7}{6} - \frac{1}{2}e^{-2x}.
\]

So \( g \) is defined piecewise by

\[
g(x) = \begin{cases} x - \frac{x^3}{3} + \frac{2}{3}, & x < 0, \\ \frac{7}{6} - \frac{1}{2}e^{-2x}, & x \geq 0. \end{cases}
\]

Then \( g(0) = \frac{7}{6} - \frac{1}{2} = \frac{2}{3} \), and

\[
\lim_{x \to 0^-} g(x) = \lim_{x \to 0^-} \left( x - \frac{x^3}{3} + \frac{2}{3} \right) = 0 - 0 + \frac{2}{3} = \frac{2}{3}, \\
\lim_{x \to 0^+} g(x) = \lim_{x \to 0^+} \left( \frac{7}{6} - \frac{1}{2}e^{-2x} \right) = \frac{7}{6} - \frac{1}{2} = \frac{2}{3},
\]

so \( g \) is continuous at \( x = 0 \).
e. The average value of \( f \) on \([-1, 2] \) is
\[
\frac{1}{2 - (-1)} \int_{-1}^{2} f(t) \, dt = \frac{1}{3} g(2) = \frac{1}{3} (\frac{7}{6} - \frac{1}{2} e^{-4}) = \frac{7}{18} - \frac{1}{6} e^{-4} \approx 0.386.
\]

5.

a. Using the Fundamental Theorem, we have \( f'(x) = e^{-x^2} \), so that \( f''(x) = -2x e^{-x^2} \).

b. \( f \) is increasing where \( f'(x) > 0 \). But \( e^{-x^2} > 0 \) for all \( x \), so that \( f \) is increasing on \(( -\infty, \infty ) \) and decreasing nowhere.

c. \( f \) is concave up where \( f''(x) > 0 \); since \( e^{-x^2} > 0 \) always, this happens when \( x < 0 \). Thus \( f \) is concave up for \( x < 0 \) and concave down for \( x > 0 \). It has an inflection point at \( x = 0 \).

d. The maximum slope of \( f \) occurs where \( f'(x) \) is maximized, which occurs when \( f''(x) = 0 \), so at \( x = 0 \). This is a local maximum since \( f''(x) > 0 \) for \( x < 0 \) and \( f''(x) < 0 \) for \( x > 0 \), so that \( f'' = (f')' \) changes from positive to negative at \( x = 0 \). At \( x = 0 \), the slope is \( f'(0) = 1 \).

e. Since \( f(0) = 0 \) and \( e^{-x^2} \) is always positive and is continuous, it follows that \( f(x) \) is increasing for \( x > 0 \). Since \( \lim_{x \to \infty} f(x) = \frac{\sqrt{\pi}}{2} \), the range of \( f \) for \( x \geq 0 \) is \( [0, \frac{\sqrt{\pi}}{2}] \). Similarly, the range of \( f \) for negative \( x \) is \( (-\frac{\sqrt{\pi}}{2}, 0] \). Thus the range of \( f \) is \( (-\frac{\sqrt{\pi}}{2}, \frac{\sqrt{\pi}}{2}] \). A graph of \( f \), together with its horizontal asymptotes, is

![Graph of f](image)

6.

a. Since \( a(t) = -0.5 \), we have
\[
v(t) = \int a(t) \, dx = \int (-0.5) \, dt = -0.5t + C.
\]
But \( v(0) = 30 \), since that is the initial velocity, so that \( C = 30 \) and \( v(t) = 30 - 0.5t \) m/s.

b. The velocity is zero when \( v(t) = 30 - 0.5t = 0 \), so after 60 seconds.

c. The displacement (position) of the car is
\[
s(t) = \int v(t) \, dt = \int (30 - 0.5t) \, dt = 30t - 0.25t^2 + C.
\]
Placing the origin at the car’s initial position gives \( s(0) = 0 \), so that \( C = 0 \). Then after \( t \) seconds, the car has traveled \( s(t) = 30t - 0.25t^2 \) m. After 60 seconds, then, we have \( s(60) = 1800 - 0.25 \cdot 3600 = 900 \) m.
7.

a. \( g(-2) = \int_{-2}^{0} f(t) \, dt = -\int_{0}^{-2} f(t) \, dt \). The integral is the signed area under \( f(t) \) from \(-2\) to \(0\), which is the area of a triangle with height and base 2, so it is equal to 2, and thus \( g(-2) = -2 \). Also, \( g(4) = \int_{0}^{4} f(t) \, dt \) is the signed area under \( f(t) \) from \(0\) to \(4\). This consists of two pieces: a quarter-circle of radius 2 above the \( x \) axis, and a quarter-circle of radius 2 below the \( x \) axis. These cancel, so the signed area is \( g(4) = 0 \).

b. \( g(x) \) is increasing when \( g'(x) = f(x) \) is positive; from the graph, \( g(x) \) is increasing on \((-2, 2)\) and decreasing on \((2, 6)\).

c. By the Fundamental Theorem, \( g'(x) = f(x) \) everywhere on \((-2, 6)\), since \( f \) is continuous on \([-2, 6]\). Thus \( g'(0) = f(0) = 2 \).

d. \( g' \) is not differentiable at \( x = 0 \) since it has a corner there. Thus \( g''(0) \) does not exist.

e. Since \( g \) is increasing for \( x \in (-2, 2) \), and decreasing after that, \( x = 2 \) must correspond to the absolute maximum of \( g \) on \([-2, 6]\). This maximum value is \( \int_{0}^{2} f(t) \, dt \), which is the area of a quarter-circle of radius 2, or \( \pi \).
Chapter 6
Applications of Integration

6.1 Velocity and Net Change

6.1.1 The position of an object is the coordinate of the object on the line at a given time, often denoted \( s(t) \). The displacement over an interval \([a, b]\) is \( s(b) - s(a)\), the difference of the object’s ending position and beginning position. It can be written as \( \int_a^b v(t) \, dt \) where \( v(t) \) is the object’s velocity at time \( t \). The distance traveled by the object is \( \int_a^b |v(t)| \, dt \), the sum of the distance traveled along the line to the right and the distance traveled along the line to the left over the given time interval.

6.1.2 If velocity is positive, then \( |v(t)| = v(t) \), so the distance and displacement are equal.

6.1.3 The displacement is given by \( \int_a^b v(t) \, dt \), because this quantity is equal to \( s(b) - s(a) \).

6.1.4 The net change of a quantity is given by \( \int_a^b f'(t) \, dt \), if \( f'(t) \) is the rate of change of the quantity.

6.1.5 The value of \( Q \) at time \( t \) will be given by \( Q(t) = Q(0) + \int_0^t Q'(x) \, dx \).

6.1.6 If \( Q'(t) \) is the growth rate of a population \( Q \) at time \( t \), then \( \int_a^b Q'(t) \, dt = Q(b) - Q(a) \), the net change of the population over the time period \([a, b]\).

6.1.7

a. The motion is positive for \( 0 \leq t < 3 \) and negative for \( 3 < t \leq 6 \).

b. The displacement is \( \int_0^6 (6 - 2t) \, dt = (6t - t^2)|_0^6 = 0 \) m.

c. The distance traveled is \( \int_0^3 (6 - 2t) \, dt + \int_3^6 (2t - 6) \, dt = 9 + 9 = 18 \) m.
6.1.8

a. The motion is positive for $0 \leq t < \frac{\pi}{4}$ and $\pi < t < \frac{3\pi}{2}$, and negative for $\frac{\pi}{4} < t < \pi$ and for $\frac{3\pi}{2} < t < 2\pi$.

b. The displacement is $\int_0^{2\pi} 10 \sin 2t \, dt = (-5 \cos 2t) \bigg|_0^{2\pi} = 0 \text{ m}$.

c. Using symmetry, the distance traveled is $4 \cdot \int_0^{\pi/2} 10 \sin 2t \, dt = 4 \cdot (-5 \cos 2t) \bigg|_0^{\pi/2} = 4 \cdot 10 = 40 \text{ m}$.

6.1.9

a. The motion is positive for $0 \leq t < 2$ and $4 < t \leq 5$, and negative for $2 < t < 4$.

b. The displacement is $\int_0^5 (t^2 - 6t + 8) \, dt = \left( \frac{t^3}{3} - 3t^2 + 8t \right) \bigg|_0^5 = \frac{125}{3} - 75 + 40 = \frac{20}{3} \text{ m}$.

c. The distance traveled from time 0 to 2 is

$$\int_0^2 (t^2 - 6t + 8) \, dt = \left( \frac{t^3}{3} - 3t^2 + 8t \right) \bigg|_0^2 = \frac{8}{3} - 12 + 16 = \frac{20}{3} \text{ m}.$$  

The distance traveled from time 2 to 4 is

$$- \int_2^4 (t^2 - 6t + 8) \, dt = - \left( \frac{t^3}{3} - 3t^2 + 8t \right) \bigg|_2^4 = - \left( \frac{64}{3} - 48 + 32 \right) + \left( \frac{8}{3} - 12 + 16 \right) = \frac{4}{3} \text{ m}.$$  

The distance traveled from time 4 to 5 is

$$\int_4^5 (t^2 - 6t + 8) \, dt = \left( \frac{t^3}{3} - 3t^2 + 8t \right) \bigg|_4^5 = \left( \frac{125}{3} - 75 + 40 \right) - \left( \frac{64}{3} - 48 + 32 \right) = \frac{4}{3} \text{ m}.$$  

Thus the total distance traveled is $\frac{20}{3} + \frac{4}{3} + \frac{4}{3} = \frac{28}{3} \text{ m}$.

Copyright © 2014 Pearson Education, Inc.
6.1.10

a. The motion is positive for \(1 < t < 4\), and negative for \(0 \leq t < 1\) and \(4 < t \leq 5\).

b. The displacement is 
\[
\int_0^5 (-t^2 + 5t - 4) \, dt = \left. \left( \frac{-t^3}{3} + \frac{5t^2}{2} - 4t \right) \right|_0^5 = -\frac{125}{3} + \frac{125}{2} - 20 = \frac{5}{6} \text{ m.}
\]

c. The distance traveled from time 0 to 1 is
\[
- \int_0^1 (-t^2 + 5t - 4) \, dt = \left. \left( \frac{-t^3}{3} + \frac{5t^2}{2} - 4t \right) \right|_0^1 = - \left( -\frac{1}{3} + \frac{5}{2} - 4 \right) = \frac{11}{6} \text{ m.}
\]
The distance traveled from time 1 to 4 is
\[
\int_1^4 (-t^2 + 5t - 4) \, dt = \left. \left( \frac{-t^3}{3} + \frac{5t^2}{2} - 4t \right) \right|_1^4 = \left( -\frac{64}{3} + 40 - 16 \right) - \left( -\frac{1}{3} + \frac{5}{2} - 4 \right) = \frac{9}{2} \text{ m.}
\]
The distance traveled from time 4 to 5 is
\[
- \int_4^5 (-t^2 + 5t - 4) \, dt = \left. \left( \frac{-t^3}{3} + \frac{5t^2}{2} - 4t \right) \right|_4^5 = - \left( -\frac{125}{3} + \frac{125}{2} - 20 \right) + \left( -\frac{64}{3} + 40 - 16 \right) = \frac{11}{6} \text{ m.}
\]
Thus the total distance traveled is \(\frac{11}{6} + \frac{9}{2} + \frac{11}{6} = \frac{49}{6} \text{ m.}\)

6.1.11

a. The motion is positive for \(0 \leq t < 2\) and \(3 < t \leq 5\), and negative for \(2 < t < 3\).

b. The displacement is 
\[
\int_0^5 (t^3 - 5t^2 + 6) \, dt = \left. \left( \frac{t^4}{4} - \frac{5t^3}{3} + 3t^2 \right) \right|_0^5 = \frac{275}{12} \text{ m.}
\]
c. The distance traveled is
\[
\int_0^2 v(t) \, dt - \int_2^3 v(t) \, dt + \int_3^5 v(t) \, dt \\
= \left( \frac{t^4}{4} - \frac{5t^3}{3} + 3t^2 \right)
\bigg|_0^2 - \left( \frac{t^4}{4} - \frac{5t^3}{3} + 3t^2 \right)
\bigg|_2^3 + \left( \frac{t^4}{4} - \frac{5t^3}{3} + 3t^2 \right)
\bigg|_3^5 \\
= \frac{8}{3} + \frac{5}{12} + \frac{62}{3} = \frac{95}{4} = 23.75 \text{ m}.
\]

6.1.12

a. The motion is positive for \(0 \leq t \leq 4\).

![Graph showing motion](image)

b. The displacement is \(\int_0^4 50e^{-2t} \, dt = (\left( -25e^{-2t} \right)
\bigg|_0^4 = 25(1 - e^{-8}) \approx 24.992 \text{ m}.

C. Because the velocity is positive on the given interval, the distance traveled is the same as the displacement, given above.

6.1.13

a. The motion is positive for \(0 \leq t < \pi\), and negative for \(\pi < t \leq 2\pi\).

![Graph showing motion](image)

b. \(s(t) = \int \sin t \, dt = -\cos t + C\), and because \(s(0) = 1\), we must have \(C = 2\). Thus, \(s(t) = 2 - \cos t\). Also, \(s(t) = s(0) + \int_0^t \sin x \, dx = 1 + (\left( -\cos x \right)
\bigg|_0^t = 2 - \cos t\).
6.1. VELOCITY AND NET CHANGE

6.1.14

a.

The motion is positive for $1 < t < 2$, and negative for $0 \leq t < 1$ and $2 < t \leq 3$.

b. $s(t) = \int (-t^3 + 3t^2 - 2t) \, dt = -\frac{t^4}{4} + t^3 - t^2 + C$. Because $s(0) = 4$, we have $C = 4$, and thus $s(t) = -\frac{t^4}{4} + t^3 - t^2 + 4$.

Also, $s(t) = s(0) + \int_0^t (-x^3 + 3x^2 - 2x) \, dx = 4 + \left( -\frac{x^4}{4} + x^3 - x^2 \right) \bigg|_0^t = 4 - \frac{t^4}{4} + t^3 - t^2$.

c.

6.1.15

a.

The motion is positive for $0 \leq t < 3$, and negative for $3 < t \leq 5$.

b. $s(t) = \int (6 - 2t) \, dt = 6t - t^2 + C$, and because $s(0) = 0$, we must have $C = 0$. Thus, $s(t) = 6t - t^2$.

Also, $s(t) = s(0) + \int_0^t (6 - 2x) \, dx = (6x - x^2) \bigg|_0^t = 6t - t^2$. 

Copyright © 2014 Pearson Education, Inc.
6.1.16

a. The motion is positive for $0 \leq t < 1$ and $2 < t < 3$, and negative for $1 < t < 2$ and $3 < t \leq 4$.

b. $s(t) = \int 3 \sin \pi t \, dt = -\frac{3}{\pi} \cos \pi t + C$, and because $s(0) = 1$, we must have $C = 1 + \frac{3}{\pi}$. Thus, $s(t) = -\frac{3}{\pi} \cos \pi t + 1 + \frac{3}{\pi}$. Also, $s(t) = s(0) + \int_{0}^{t} 3 \sin \pi x \, dx = 1 + \left( -\frac{3}{\pi} \cos \pi x \right)^{t}_{0} = -\frac{3}{\pi} \cos \pi t + 1 + \frac{3}{\pi}$.
6.1. VELOCITY AND NET CHANGE

6.1.17

a. The motion is positive for \(0 \leq t < 3\), and negative for \(3 < t \leq 4\).

\[
v(t) = 9 - t^2
\]

b. \(s(t) = \int (9-t^2) \, dt = 9t - \frac{t^3}{3} + C\), and because \(s(0) = -2\), we must have \(C = -2\). Thus, \(s(t) = 9t - \frac{t^3}{3} - 2\). Also, \(s(t) = s(0) + \int_0^t (9-x^2) \, dx = -2 + \left(9x - \frac{x^3}{3}\right)|_0^t = 9t - \frac{t^3}{3} - 2\).

c.

6.1.18

a. The motion is positive for \(0 \leq t \leq 8\).

\[
s(t) = 9t - \frac{1}{3}t^3 - 2
\]

b. \(s(t) = \int \frac{1}{t+1} \, dt = \ln(t + 1) + C\), and because \(s(0) = -4\), we must have \(C = -4\). Thus, \(s(t) = -\ln(t + 1) - 4\). Also, \(s(t) = s(0) + \int_0^t \frac{1}{1+x} \, dx = -4 + (\ln(x + 1))|_0^t = \ln(t + 1) - 4\).
6.1.19

a. \( s(t) = s(0) + \int_0^t 2\pi \cos \pi x \, dx = 2\sin \pi x \bigg|_0^t = 2\sin \pi t. \)

c. The mass reaches its lowest point at \( t = 1.5, \ t = 3.5 \) and \( t = 5.5 \).

d. The mass reaches its highest point at \( t = 0.5, \ t = 2.5, \) and \( t = 4.5 \).

6.1.20

a. \( s(5) = \int_0^5 |400 - 20t| \, dt = \int_0^5 (400 - 20t) \, dt = (400t - 10t^2) \bigg|_0^5 = 1750 \text{ m}. \)

b. \( s(10) = \int_0^{10} |400 - 20t| \, dt = \int_0^{10} (400 - 20t) \, dt = (400t - 10t^2) \bigg|_0^{10} = 3000 \text{ m}. \)

c. Her velocity is 250 when \( 400 - 20t = 250, \) or \( t = 7.5 \), and thus

\[
 s(7.5) = \int_0^{7.5} (400 - 20t) \, dt = (400t - 10t^2) \bigg|_0^{7.5} = 2437.5.
\]

6.1.21

a. \[
 s(t) = s(0) + \int_0^t 30(16-x^2) \, dx = (480x - 10x^3) \bigg|_0^t \\
 = 480t - 10t^3 = 10t(48 - t^2).
\]

Copyright © 2014 Pearson Education, Inc.
b. Because the velocity is positive, this is given by $s(2) - s(0) = 960 - 80 = 880$ miles.

c. The velocity is 400 when $480 - 30t^2 = 400$, or $t = \sqrt{\frac{4}{3}}$. At this point the plane has traveled $s \left( \sqrt{\frac{4}{3}} \right) = 480 \sqrt{\frac{4}{3}} - 10 \left( \sqrt{\frac{4}{3}} \right)^3 \approx 740.290$ miles.

6.1.22
a.

$$s(t) = s(0) + \int_0^t 3 \sin^2 \frac{\pi x}{2} \, dx$$

$$= \frac{3}{2} \int_0^t (1 - \cos(\pi x)) \, dx$$

$$= \frac{3}{2} \left( \frac{1}{\pi} x - \sin(\pi x) \right) \bigg|_0^t$$

$$= \frac{3}{2} \left( t - \frac{1}{\pi} \sin(\pi t) \right).$$

b. Because the velocity is positive, this is given by $s(0.25) - s(0) = \frac{3}{2} \left( 0.25 - \frac{\sin(\pi/4)}{\pi} \right) = \frac{3}{8} - \frac{3\sqrt{2}}{4\pi} \approx 0.0374$ miles.

c. $s(3) = 4.5$ miles.

6.1.23
a.

The velocity has a maximum of 60 for $20 \leq t \leq 45$. The velocity is 0 at $t = 0$ and at $t = 60$.

b. $\int_0^{20} 3t \, dt + \int_{20}^{40} 60 \, dt = 1200$ m.

c. $1200 + \int_{30}^{45} 60 \, dt + \int_{45}^{60} (240 - 4t) \, dt = 1200 + 900 + (240t - 2t^2) \bigg|_{45}^{60} = 2550$ m.

d. At time $t = 60$ the automobile is at position 2550. In the following 15 seconds, it moves $\int_{60}^{75} (240 - 4t) \, dt = 450$ feet in the opposite direction, so it is at position $2550 - 450 = 2100$. 

Copyright © 2014 Pearson Education, Inc.
6.1.24

a.

The velocity is given by

\[ v(t) = \begin{cases} 
9.8t & \text{if } 0 \leq t \leq 10, \\
10 & \text{if } t > 10.
\end{cases} \]

b. \( s(30) = \int_0^{10} 9.8t \, dt + \int_{10}^{30} 10 \, dt = 490 + 200 = 690 \text{ m}. \)

c. We seek \( t \) so that \( 490 + \int_{10}^{t} 10 \, dx = 3000 \), which can be written \( 10t - 100 = 2510 \), so \( t = 261 \text{ s} \).

6.1.25 \( v(t) = \int a(t) \, dt = \int (-32) \, dt = -32t + C \), and because \( v(0) = 70 \), we have \( C = 70 \), so \( v(t) = -32t + 70 \).

\( s(t) = \int v(t) \, dt = \int (70 - 32t) \, dt = 70t - 16t^2 + D \), and because \( s(0) = 10 \), we must have \( D = 10 \). Thus \( s(t) = -16t^2 + 70t + 10 \).

6.1.26 \( v(t) = \int a(t) \, dt = \int (-32) \, dt = -32t + C \), and because \( v(0) = 50 \), we have \( C = 50 \), so \( v(t) = -32t + 50 \).

\( s(t) = \int v(t) \, dt = \int (50 - 32t) \, dt = 50t - 16t^2 + D \), and because \( s(0) = 0 \), we must have \( D = 0 \). Thus \( s(t) = -16t^2 + 50t \).

6.1.27 \( v(t) = \int a(t) \, dt = \int (-9.8) \, dt = -9.8t + C \), and because \( v(0) = 20 \), we have \( C = 20 \), so \( v(t) = -9.8t + 20 \).

\( s(t) = \int v(t) \, dt = \int (20 - 9.8t) \, dt = 20t - 4.9t^2 + D \), and because \( s(0) = 0 \), we must have \( D = 0 \). Thus \( s(t) = 20t - 4.9t^2 \).

6.1.28 \( v(t) = \int a(t) \, dt = \int e^{-t} \, dt = -e^{-t} + C \), and because \( v(0) = 60 \), we have \( C = 61 \), so \( v(t) = -e^{-t} + 61 \).

\( s(t) = \int v(t) \, dt = \int (61 - e^{-t}) \, dt = 61t + e^{-t} + D \), and because \( s(0) = 40 \), we must have \( D = 39 \). Thus \( s(t) = 39 + 61t + e^{-t} \).

6.1.29 \( v(t) = \int a(t) \, dt = \int (-0.01t) \, dt = -0.005t^2 + C \), and because \( v(0) = 10 \), we have \( C = 10 \), so \( v(t) = 10 - 0.005t^2 \).

\( s(t) = \int v(t) \, dt = \int (10 - 0.005t^2) \, dt = 10t - \frac{1}{600}t^3 + D \), and because \( s(0) = 0 \), we must have \( D = 0 \). Thus \( s(t) = 10t - \frac{1}{600}t^3 \).

6.1.30 \( v(t) = \int a(t) \, dt = \int \frac{20}{(t^2 + 2)^2} \, dt = \frac{-20}{t^2 + 2} + C \), and because \( v(0) = 20 \), we have \( C = 30 \), so \( v(t) = 30 - \frac{20}{t^2 + 2} \).

\( s(t) = \int v(t) \, dt = \int \left( 30 - \frac{20}{t^2 + 2} \right) \, dt = 30t - 20\ln|t + 2| + D \), and because \( s(0) = 10 \), we must have \( D = 10 + 20\ln 2 \). Thus \( s(t) = 10 + 20\ln 2 + 30t - 20\ln|t + 2| \).

6.1.31 \( v(t) = \int a(t) \, dt = \int \cos 2t \, dt = \frac{1}{2} \sin 2t + C \), and because \( v(0) = 5 \), we have \( C = 5 \), so \( v(t) = \frac{1}{2} \sin 2t + 5 \).

\( s(t) = \int v(t) \, dt = \int \left( \frac{1}{2} \sin 2t + 5 \right) \, dt = -\frac{1}{4} \cos 2t + 5t + D \), and because \( s(0) = 7 \), we must have \( D = \frac{29}{4} \). Thus \( s(t) = -\frac{1}{4} \cos 2t + 5t + \frac{29}{4} \).

6.1.32 \( v(t) = \int a(t) \, dt = \int \frac{2t}{(t^2 + 1)^2} \, dt \). Let \( u = t^2 + 1 \) so that \( du = 2t \, dt \). Then we have \( \int \frac{1}{u^2} \, du = -\frac{1}{u} + C = -\frac{1}{t^2 + 1} + C \), and because \( v(0) = 0 \), we have \( C = 1 \), so \( v(t) = -\frac{1}{t^2 + 1} + 1 \).

\( s(t) = \int v(t) \, dt = \int \left( -\frac{1}{t^2 + 1} + 1 \right) \, dt = -\tan^{-1} t + t + D \), and because \( s(0) = 0 \), we must have \( D = 0 \). Thus \( s(t) = -\tan^{-1} t + t \).
6.1.33

a. The velocity is given by \( \int 88 \, dt = 88t + C \), and \( C = 0 \) because \( v(0) = 0 \), so \( v(t) = 88t \) ft/s.
The position is given by \( \int 88 \, dt = 44t^2 + D \), but \( D = 0 \) because \( s(0) = 0 \), so \( s(t) = 44t^2 \) ft.

b. The car travels \( s(4) = 44 \cdot 16 = 704 \) feet.
c. Because a quarter mile is 1320 feet, we need \( 44t^2 = 1320 \), so \( t = \sqrt{30} \approx 5.477 \) seconds.
d. We need \( 44t^2 = 300 \), so \( t \approx 2.611 \) seconds.
e. It reaches that speed when \( 88t = 178 \), or \( t = \frac{89}{44} \) seconds. At that time the racer has traveled \( s \left( \frac{89}{44} \right) = 44 \left( \frac{89}{44} \right)^2 = \frac{89^2}{44} \approx 180.023 \) feet.

6.1.34

a. The velocity is given by \( \int (-15) \, dt = -15t + C \), and \( C = 60 \) because \( v(0) = 60 \), so \( v(t) = -15t + 60 \).
The position is given by \( \int (-15t + 60) \, dt = -7.5t^2 + 60t + D \), but \( D = 0 \) because \( s(0) = 0 \), so \( s(t) = -7.5t^2 + 60t \).

b. The car comes to rest when \( v(t) = 0 \), which occurs for \( t = 4 \). At that time \( s(4) = 120 \) feet.

6.1.35

\[ v(t) = \int a(t) \, dt = \int \frac{-1280}{(1+8t)^2} \, dt = \frac{80}{1+8t} + C, \] and \( C = 0 \), because \( v(0) = 80 \).
\[ s(t) = \int v(t) \, dt = \int \frac{80}{1+8t} \, dt = -\frac{10}{1+8t} + D, \] but we can take \( D = 0 \) because the initial position is unspecified.
Then in the first 0.2 seconds the train travels \( s(0.2) - s(0) = -\frac{10}{27} - (-10) = 10 - \frac{50}{13} = \frac{80}{13} \approx 6.154 \) miles.
Between time 0.2 and 0.4 the train travels \( s(0.4) - s(0.2) = -\frac{10}{42} - \left( -\frac{10}{22} \right) = \frac{50}{27} - \frac{50}{21} = \frac{100}{273} \approx 1.465 \) miles.

6.1.36

a. \( Q''(t) = 3t^2 \cdot 2 \cdot (40 - t) (-1) + (40 - t)^2 \cdot 6t = 12t(t - 20)(t - 40) \). This changes from positive to negative at \( t = 20 \), so \( Q' \) is maximized there on the given domain. So the peak extraction rate is at \( t = 20 \).
b. In the first 10 years, the amount is
\[
\int_0^{10} Q'(t) \, dt = \int_0^{10} \left( 3t^4 - 240t^3 + 4800t^2 \right) \, dt = \left[ \frac{3t^5}{5} - 60t^4 + 1600t^3 \right]_0^{10} = 1,060,000 \text{ millions of barrels.}
\]
In the first 20 years, the amount is
\[
\int_0^{20} Q'(t) \, dt = \int_0^{20} (3t^4 - 240t^3 + 4800t^2) \, dt = \left. \left( \frac{3t^5}{5} - 60t^4 + 1600t^3 \right) \right|_0^{20} = 5,120,000
\]
millions of barrels.

In the first 30 years, the amount is
\[
\int_0^{30} Q'(t) \, dt = \int_0^{30} (3t^4 - 240t^3 + 4800t^2) \, dt = \left. \left( \frac{3t^5}{5} - 60t^4 + 1600t^3 \right) \right|_0^{30} = 9,180,000
\]
millions of barrels.

c. In the first 40 years, the amount is
\[
\int_0^{40} Q'(t) \, dt = \int_0^{40} (3t^4 - 240t^3 + 4800t^2) \, dt = \left. \left( \frac{3t^5}{5} - 60t^4 + 1600t^3 \right) \right|_0^{40} = 10,240,000
\]
millions of barrels.

d. No. The amount extracted in the first 10 years is not \(\frac{1}{4}\) of the total amount extracted.

6.1.37

a. In the first 35 days the number of barrels produced is \(\int_0^{35} 800 \, dt + \int_{30}^{35} (2600 - 60t) \, dt = 24000 + 3250 = 27250\).

b. In the first 50 days the number of barrels produced is \(27250 + \int_{35}^{50} (2600 - 60t) \, dt + \int_{50}^{40} 200 \, dt = 27250 + 1750 + 2000 = 31000\).

c. A constant 200 barrels per day times 20 days yields 4000 barrels.

6.1.38

a. \(55 + \int_0^6 (20 - \frac{t^2}{5}) \, dt = 55 + \left( 20t - \frac{t^3}{15} \right)|_0^6 = \frac{857}{3} = 171.4\).

b. Since \(P'(t) = 20 - \frac{t^2}{5}\), we have \(P(t) = 20t - \frac{t^3}{15} + C\). Since \(P(0) = 55\), it follows that \(C = 55\) so that \(P(t) = 20t - \frac{t^3}{15} + 55\).

6.1.39

a. \(P(20) = 250 + \int_0^{20} (30 + 30\sqrt{t}) \, dt = 250 + (30t + 20t^{3/2})|_0^{20} = 250 + 600 + 800\sqrt{5} = 850 + 800\sqrt{5} \approx 2639\) people.

b. \(P(t) = 250 + \int_{15}^t (30 + 30\sqrt{x}) \, dx = 250 + (30x + 20x^{3/2})|_{15}^t = 250 + 30t + 20t^{3/2}\) people.

6.1.40

a. \(P(15) = 35 + \int_0^{15} (5 + 10\sin \frac{\pi}{3} \, dt = 35 + (5t - \frac{50}{\pi} \cos \frac{\pi}{3})|_0^{15} = 35 + (75 + \frac{50}{\pi}) - (0 - \frac{50}{\pi}) = 110 + \frac{100}{\pi} \approx 142\) foxes.

\(P(35) = 35 + \int_0^{35} (5 + 10\sin \frac{\pi}{3} \, dt = 35 + (5t - \frac{50}{\pi} \cos \frac{\pi}{3})|_0^{35} = 35 + (175 + \frac{50}{\pi}) - (0 - \frac{50}{\pi}) = 210 + \frac{100}{\pi} \approx 242\) foxes.

b. \(P(t) = 35 + \int_0^t (5 + 10\sin \frac{\pi}{3} \, dx = 35 + (5x - \frac{50}{\pi} \cos \frac{\pi}{3})|_0^t = 35 + 5t - \frac{50}{\pi} \cos \frac{\pi}{3} + \frac{50}{\pi} \) foxes.

6.1.41

a. \(N(20) = 1500 + \int_0^{20} 100e^{-25t} \, dt = 1500 + (-400e^{-25t})|_0^{20} = 1500 + (-400e^{-5} + 400) = 1900 - \frac{400}{e^{5}} \approx 1897\) cells.

\(N(40) = 1500 + \int_0^{40} 100e^{-25t} \, dt = 1500 + (-400e^{-25t})|_0^{40} = 1500 + (-400e^{-10} + 400) = 1900 - \frac{400}{e^{10}} \approx 1900\) cells.

Copyright © 2014 Pearson Education, Inc.
b. \( N(t) = 1500 + \int_0^t 100e^{-25x} \, dx = 1500 + \left( -400e^{-25x} \right) \bigg|_0^t = 1500 + (-400e^{-25t} + 400) = 1900 - 400e^{-0.25t} \) cells.

6.1.42

a. \( P(5) = 300 + \int_0^5 (30 - 20t) \, dt = 300 + (30t - 10t^2) \bigg|_0^5 = 300 + (150 - 250) = 200 \) individuals.

b. The population at time \( t \) is given by \( P(t) = 300 + \int_0^t (30 - 20x) \, dx = 300 + (30x - 10x^2) \bigg|_0^t = 300 + 30t - 10t^2 = -10(t^2 - 3t - 30). \) This is 0 for \( t \approx 7.179 \) years.

c. If the initial population size is 100, then \( P(t) = -10(t^2 - 3t - 10) \), and this is 0 for \( t = 5 \) years. If the initial size is 400, then \( P(t) = -10(t^2 - 3t - 40) \), and this is 0 for \( t = 8 \) years.

6.1.43 Computing using the trapezoid rule gives

\[
\begin{align*}
&-0.25 + 0 + \frac{-0.65 + (-0.25)}{2} + \frac{-0.60 + (-0.65)}{2} + \frac{0.1 + (-0.60)}{2} \\
&+ \frac{-0.40 + 0.1}{2} + \frac{-0.30 + (-0.40)}{2} = -0.125 - 0.9 - 0.625 - 0.5 - 0.15 - 0.35 = -2.65.
\end{align*}
\]

By this approximation, the level of atmospheric CO\(_2\) increased by 8.575 parts per million over the four year period.

6.1.44 Computing using the trapezoid rule gives

\[
\begin{align*}
&\frac{1.9 + 2.0}{2} (0.5) + \frac{2.0 + 1.4}{2} (0.5) + \frac{1.4 + 1.6}{2} (0.5) + \frac{1.6 + 2.3}{2} (0.5) + \frac{2.3 + 2.3}{2} (1) \\
&+ \frac{2.3 + 3.0}{2} (0.5) + \frac{3.0 + 2.6}{2} (0.5) = 0.975 + 0.85 + 0.75 + 0.975 + 2.3 + 1.325 + 1.4 = 8.575.
\end{align*}
\]

By this approximation, the level of atmospheric CO\(_2\) increased by 8.575 parts per million over the four year period.

6.1.45 Computing using the trapezoid rule gives

\[
\begin{align*}
&\frac{80 + 120}{2} (0.5) + \frac{120 + 150}{2} (0.5) + \frac{150 + 100}{2} (1) + \frac{100 + 100}{2} (0.5) \\
&+ \frac{100 + 120}{2} (0.5) + \frac{120 + 160}{2} (1) = 50 + 67.5 + 125 + 50 + 55 + 140 = 487.5.
\end{align*}
\]

By this approximation, the total vertical ascent over this 4 kilometer horizontal distance is about 487.5 m.

6.1.46 Computing using the trapezoid rule gives

\[
\begin{align*}
&\frac{150 + 210}{2} (0.25) + \frac{210 + 130}{2} (0.25) + \frac{130 + 250}{2} (0.5) + \frac{250 + 260}{2} (0.25) \\
&+ \frac{260 + 200}{2} (0.5) + \frac{200 + 140}{2} (0.25) = 45 + 42.5 + 95 + 63.75 + 115 + 42.5 = 403.75.
\end{align*}
\]

By this approximation, the cyclist used about 403.75 watt-hours of energy over the two hour ride.

6.1.47

a. False. This would only be the case if the motion was all in the same direction. If the object changes direction at all, then the distance traveled is greater than the displacement.

b. True. This is because \( v(t) = |v(t)| \) in this case.

c. True. This is because \( R(t) > 0 \) for \( 0 < t < 10 \), but \( R(t) < 0 \) for \( t > 10 \).

d. False. The accumulated change in \( Q \) between \( a \) and \( b \) is \( Q(b) - Q(a) \). Alternatively, the accumulated (or net) change in \( Q \) between \( a \) and \( b \) is \( \int_a^b Q'(t) \, dt \).

Copyright © 2014 Pearson Education, Inc.
6.1.48
a. The displacement is the net area, which is \( 3 \cdot 3 + \frac{1}{2} \cdot 3 \cdot 2 = 9 + 3 = 12 \).

b. Because \( v(t) > 0 \) on that interval, the distance traveled is the same as the displacement, so it is 12 also.

c. \( s(5) = s(0) + \int_0^5 v(t) \, dt = 0 + 12 = 12 \).

d. \( s(t) = \begin{cases} 
3t & \text{if } 0 \leq t \leq 3 \\
9 + \int_3^t \left(-\frac{3}{2}x + \frac{15}{2}\right) \, dx & \text{if } 3 < t \leq 5 \\
-\frac{3}{4}t^2 + \frac{15}{2}t - \frac{27}{4} & \text{if } 3 \leq t \leq 5.
\end{cases} \)

6.1.49
a. The displacement is the net area, which is \( \frac{1}{2} \cdot 2 \cdot 2 - \frac{1}{2} \cdot \frac{4}{3} \cdot 1 + \frac{1}{2} \cdot \frac{5}{3} \cdot 2 = 3 \).

b. The distance traveled is \( \frac{1}{2} \cdot 2 \cdot 2 + \frac{1}{2} \cdot \frac{4}{3} \cdot 1 + \frac{1}{2} \cdot \frac{5}{3} \cdot 2 = \frac{13}{3} \).

c. \( s(5) = s(0) + \int_0^5 v(t) \, dt = 0 + 3 = 3 \).

d. \( s(t) = \begin{cases} 
\int_0^t (-x + 2) \, dx & \text{if } 0 \leq t \leq 3 \\
\frac{3}{2} + \int_3^t (3x - 10) \, dx & \text{if } 3 < t \leq 4 \\
2 + \int_4^t (-2x + 10) \, dx & \text{if } 4 < t \leq 5 \\
\frac{-t^2 + 2t}{2} & \text{if } 0 \leq t \leq 3 \\
\frac{3t^2}{2} - 10t + 18 & \text{if } 3 < t \leq 4 \\
-t^2 + 10t - 22 & \text{if } 4 < t \leq 5.
\end{cases} \)

6.1.50 The distance traveled is \( \int_0^8 (2t + 6) \, dt = \left. (t^2 + 6t) \right|_0^8 = 112 \). So the same distance could have been traveled over the given time period at a constant velocity of \( \frac{112}{8} = 14 \).

6.1.51 The distance traveled is \( \int_0^4 \left(1 - \frac{t^2}{16}\right) \, dt = \left. \left(t - \frac{t^3}{48}\right) \right|_0^4 = \frac{8}{3} \). So the same distance could have been traveled over the given time period at a constant velocity of \( \frac{8/3}{4} = \frac{2}{3} \).

6.1.52 The distance traveled is \( \int_0^\pi 2 \sin t \, dt = \left. (-2 \cos t) \right|_0^\pi = 4 \). So the same distance could have been traveled over the given time period at a constant velocity of \( \frac{4}{\pi} \).

6.1.53 The distance traveled is \( \int_0^5 t \sqrt{25 - t^2} \, dt = \frac{1}{2} \int_0^{\pi/2} \sqrt{u} \, du = \left. \left(\frac{1}{3}u^{3/2}\right) \right|_0^{25} = \frac{125}{3} \). So the same distance could have been traveled over the given time period at a constant velocity of \( \frac{125/3}{\pi} = \frac{25}{\pi} \).

6.1.54

\[ s_K(t) = \int_0^t \frac{15}{x+1} \, dx = 15 - \frac{15}{t+1} = \frac{15t}{t+1} \quad \text{and} \quad s_S(t) = \int_0^t \frac{20}{t+1} \, dx = 20 - \frac{20}{t+1} = \frac{20t}{t+1}. \]

c. They meet when \( \frac{15t}{t+1} + \frac{20t}{t+1} = 20 \), which occurs for \( t = \frac{4}{7} \). (Which represents 1:20 PM.) At this time, Kelly has gone \( s_K \left(\frac{4}{7}\right) = \frac{20}{7} = \frac{60}{7} \) km, and Sandy has gone \( s_S \left(\frac{4}{7}\right) = \frac{80}{7} \) km.

d. We would need \( \frac{A}{t+1} + \frac{B}{t+1} = D \) to have a solution. If we solve for \( t \), we obtain \( t = \frac{D}{A+B-D} \), so we need \( A + B > D \).
6.1. VELOCITY AND NET CHANGE

579

e. The maximum distances are A and B respectively, because \( \lim_{t \to \infty} \frac{At}{t+1} = A \) and \( \lim_{t \to \infty} \frac{Bt}{t+1} = B \).

6.1.55

\[ \begin{array}{ccc}
\text{t} & 10 & 15 \\
\text{Theo} & 1 & 3/2 & 2 \\
\text{Sasha} & 7/6 & 3/2 & 11/6 \\
\end{array} \]

Note that Theo hits the 10 mile marker first, then they are tied as they hit the 15 mile marker, and Sasha hits the 20 mile marker first. The area under \( v_S \) is the same as the area under \( v_T \) for \( t = 1.5 \), for \( t < 1.5 \) the area under \( v_T \) is greater, and for \( t > 1.5 \), the area under \( v_S \) is greater.

e. Theo will then hit the 20 mile mark in \( \frac{18.8}{10} = 1.88 \) hours. Sasha hits the 20 mile mark at \( t = \frac{11}{6} \approx 1.833 \) hours, so Sasha will win.

f. A head start of 0.2 hours is equivalent for Theo of \( 10 \cdot 0.2 = 2 \) miles. It will take him \( \frac{18}{15} = 1.8 \) hours to ride the other 18 miles, while it still takes Sasha about 1.83 hours to cover 20 miles, so Theo will win.

6.1.56

a. \( s_A(t) = \int_0^t \frac{4}{x+1} \, dx = (4 \ln(x + 1))_0^t = 4 \ln(t + 1) \).

b. \( s_B(t) = 2 + \int_0^t \frac{2}{x+1} \, dx = 2 + (2 \ln(x + 1))_0^t = 2 + 2 \ln(t + 1) \).

b. This would occur if \( 4 \ln(t + 1) = 2 + 2 \ln(t + 1) \), or \( \ln(t + 1) = 1 \), which occurs for \( t = e - 1 \), which is about 1 hour and 43 minutes.

6.1.57

a. Abe starts out running into a headwind while Bess starts out running with a tailwind.

Copyright © 2014 Pearson Education, Inc.
b. The average of Abe’s speed function is \( \frac{1}{2\pi} \int_0^{2\pi} (3 - 2\cos \varphi)\, d\varphi = \frac{1}{2\pi} (3\theta - 2\sin \varphi) \bigg|_0^{2\pi} = 3 \) mph, and the average of Bess’s speed function is \( \frac{1}{2\pi} \int_0^{2\pi} (3 + 2\cos \theta)\, d\theta = \frac{1}{2\pi} (3\theta + 2\sin \theta) \bigg|_0^{2\pi} = 3 \) mph.

c. The track is \( \frac{1}{10} \) mile in radius. We have \( u = \frac{dx}{dt} \) where \( s = \frac{1}{10} \varphi \). Thus, \( u = \frac{dx}{dt} = \frac{1}{10} \frac{d\varphi}{dt} = 3 - 2\cos \varphi \), so \( dt = \frac{10}{3-2\cos \varphi} \). The time \( T \) for one lap is then

\[
T = \int_0^T dt = \int_0^{2\pi} \frac{d\varphi}{10(3-2\cos \varphi)} = \frac{\pi}{5\sqrt{5}} = \frac{\pi\sqrt{5}}{25}.
\]

You may need to use a computer algebra system to compute the integral, or wait until you have studied chapter 7. The calculation for Bess’ velocity function produces the same time. They tie the race. Both have average speed equal to \( \frac{2\pi}{10\sqrt{5}} = \sqrt{5} \).

6.1.58

a. \( \int_0^{60} 3\sqrt{t} \, dt = (2t^{3/2}) \bigg|_0^{60} \approx 929.516 \text{ L} \). The cistern will definitely be overflowing!

b. \( Q(t) = \int_0^t 3\sqrt{x} \, dx = (2x^{3/2}) \bigg|_0^t = 2t^{3/2} \text{ L} \), where \( t \) is measured in minutes.

c. The tank will be full when \( 2t^{3/2} = 2000 \), or \( t = 1000^{2/3} = 100 \) minutes.

6.1.59

a. \( Q(t) = \int r(t) \, dt = \int 107 e^{-kt} \, dt = \frac{107}{k} e^{-kt} + C \). When \( t = 0 \) we have \( Q(0) = 0 \), so \( C + \frac{107}{k} = 0 \), so \( C = \frac{107}{k} \). Thus \( Q(t) = \frac{107(1-e^{-kt})}{k} \).

b. \( \lim_{t \to \infty} Q(t) = \lim_{t \to \infty} \frac{107(1-e^{-kt})}{k} = \frac{107}{k} \). This represents the total number of barrels extracted if the nation extracts the oil indefinitely, where it is assumed that the nation has at least \( \frac{107}{k} \) barrels of oil in reserve.

c. We seek \( k \) so that the total number of barrels extracted, which was computed in part (b), equals \( 2 \times 10^9 \). So we want \( \frac{107}{k} = 2 \times 10^9 \), which gives \( k = \frac{1}{200} = 0.005 \).

d. We want \( T \) so that \( (2 \times 10^7) \int_0^T e^{-0.005t} \, dt = 2 \times 10^9 \), so \( (-200e^{-0.005t}) \bigg|_0^T = 100 \), so \( 1 - e^{-T/200} = 1/2 \), so \( T = 200 \ln 2 \approx 138.629 \) years.

6.1.60 Let the depth of the snow at time \( t \) be \( t \) units (adjusting your units as necessary.) The speed of the plow at time \( t \) will be \( \frac{1}{2} \). Let \( t = 0 \) be the time the snow started, and let time \( T > 0 \) represent noon. \( \int_T^{T+1} \frac{1}{2} \, dt \) represents the distance the plow goes in the first hour, and this quantity is equal to \( \ln(T+1) - \ln T = \ln \left( \frac{T+1}{T} \right) \).

The distance the plow goes in the 2nd hour is \( \int_{T+1}^{T+2} \frac{1}{2} \, dt = \ln \left( \frac{T+2}{T+1} \right) \).

Thus we have \( \ln \left( \frac{T+1}{T} \right) = 2 \ln \left( \frac{T+2}{T+1} \right) \), so \( \left( \frac{T+1}{T} \right) = \left( \frac{T+2}{T+1} \right)^2 \), which leads to the equation \( (T+1)^3 = T(T+2)^2 \), so \( T^3 + 3T^2 + 3T + 1 = T^3 + 4T^2 + 4T \), so \( T^2 + T - 1 = 0 \), and \( T = \frac{-1 + \sqrt{5}}{2} \approx .618 \).

So if noon corresponds to the 0.618 hours after the snow started falling, the snow must have started falling about 37 minutes before noon, so at about 11:23 AM.

6.1.61

a. \( \int_0^2 20 (1 + \cos \frac{t}{12}) \, dt = \left( 20t + \frac{240}{\pi} \sin \frac{t}{12} \right) \bigg|_0^2 = 40 + \frac{240}{\pi} \cdot \frac{1}{2} = 40 + \frac{120}{\pi} \approx 78.197 \text{ m}^3 \).
b. 

\[ Q(t) = \int_{0}^{1} 20 \left(1 + \cos \frac{\pi x}{12}\right) dx, \] which is equal to 

\[ (20x + \frac{240}{\pi} \sin \frac{\pi x}{12})\bigg|_{0}^{t} = 20t + \frac{240}{\pi} \cdot \sin \frac{\pi x}{12} \text{ m}^3. \]

c. The reservoir is full when \(20T + \frac{240}{\pi} \sin \frac{\pi T}{12} = 2500\), which occurs for \(T \approx 122.6\) hours.

6.1.62

a. 

\[ \int_{t}^{t+60} 70(1 + \sin 2\pi x) \, dx = \left(70x - \frac{70}{2\pi} \cos 2\pi x\right)\bigg|_{t}^{t+60} = 70(t + 60) - \frac{70}{2\pi} \cos(2\pi(t + 60)) - 70t + \frac{70}{2\pi} \cos 2\pi t \]

\[ = 70 \cdot 60 - \frac{70}{2\pi} \cos(2\pi t + 120\pi) + \frac{70}{2\pi} \cos 2\pi t \]

\[ = 70 \cdot 60 \text{ mL} = 4200 \text{ mL} = 4.2 \text{ L}. \]

b. Simply using algebra, each stroke pumps 70 mL, and there are 60 strokes per minute, so the total volume over one minute is 60 \cdot 70 mL, so we again get 4.2 L.

6.1.63

a. Using the substitution \(u = \frac{\pi t}{2}\) so that \(du = \frac{\pi}{2} \, dt\), we get

\[ V(t) = \int \left(\frac{\pi}{2} \sin \frac{\pi t}{2}\right) \, dt = \int (-\sin u) \, du = -\cos u + C = -\cos \frac{\pi t}{2} + C. \]
Since \( V(0) = \cos 0 + C = C + 1 = 6 \) we get \( C = 5 \) so that \( V(t) = \cos \frac{\pi t}{2} + 5 \):

\[
E = \int_0^{24} (300 - 200 \sin \frac{\pi t}{12}) \, dt = (300t + \frac{2400}{\pi} \cos \frac{\pi t}{12}) \bigg|_0^{24} = 7200 \text{ MWh. This is equivalent to } 7.2 \times 10^6 \cdot 3.6 \times 10^6 = 2.592 \times 10^{13} \text{ Joules.}
\]

b. Since \( \sin \frac{\pi t}{2} \) is periodic with period 4, the breathing cycle repeats every 4 seconds, so there are \( \frac{60}{4} = 15 \) breaths per minute.

c. The lungs are full at \( t = 0 \), at which time \( V(0) = 6 \text{ L} \), so this is the capacity of the lungs. The tidal volume is the difference between this amount and the amount in the lungs after each exhalation, which is the minimum value of \( V(t) \). This minimum occurs at the first positive zero of \( V'(t) \), which is at \( t = 2 \). Since \( V(2) = 4 \), the tidal volume is \( 6 - 4 = 2 \text{ L} \).

6.1.64

Note that the general solution for \( N(t) \) is

\[
N(t) = \int N'(t) \, dt = \int \left(A \sin \frac{2\pi t}{P} + r\right) \, dt = -\frac{PA}{2\pi} \cos \frac{2\pi t}{P} + rt + C,
\]

and \( C = N(0) + \frac{PA}{2\pi} \). Thus \( N(t) = -\frac{PA}{2\pi} \cos \frac{2\pi t}{P} + rt + N(0) + \frac{PA}{2\pi} = N(0) + rt + \frac{PA}{2\pi} (1 - \cos \frac{2\pi t}{P}) \).

a. Using the general solution above, we have \( N(t) = 10 + \frac{100}{2\pi} (1 - \cos \frac{\pi t}{5}) \). This is never 0, because it is always 10 or more.

b. Using the general solution above, we have that \( N(t) = 100 + \frac{100}{\pi} (1 - \cos \frac{\pi t}{5}) \). The population is never extinct, because it is always 100 or more.

c. Using the general solution above, we have \( N(t) = 10 + 5t + \frac{250}{\pi} (1 - \cos \frac{\pi t}{5}) \). Again, for \( t \geq 0 \) this is always at least 10, so the population never becomes extinct.

d. Using the general solution above, we have \( N(t) = N(0) - 5t + \frac{250}{\pi} (1 - \cos \frac{\pi t}{5}) \). Suppose \( t = 5k \) for a positive even integer \( k \). Then \( \cos \frac{\pi t}{5} = \cos(k\pi) = 1 \), so \( N(t) = N(0) - 25k + 0 \), which grows negatively without bound as \( k \to \infty \). Thus, there is no choice of \( N(0) \) which will ensure that the population won’t become extinct.

6.1.65

a. \( E = \int_0^{24} (300 - 200 \sin \frac{\pi t}{12}) \, dt = (300t + \frac{2400}{\pi} \cos \frac{\pi t}{12}) \bigg|_0^{24} = 7200 \text{ MWh. This is equivalent to } 7.2 \times 10^6 \cdot 3.6 \times 10^6 = 2.592 \times 10^{13} \text{ Joules.}
\]

b. For one day, \( \frac{7.2 \times 10^6 \text{ KWh}}{450 \text{ Kwh/kg}} = 16,000 \text{ kg coal needed.}
\]

For one year, \( 16000 \text{ kg} \times 365 = 5,840,000 \text{ kg coal needed.}
\]

c. For one day, \( \frac{7.2 \times 10^6 \text{ KWh}}{1.6 \times 10^4 \text{ Kwh/g}} = 450 \text{ g U-235 need.}
\]

For one year, \( 450 \times 365 = 164,250 \) g needed.
6.1. VELOCITY AND NET CHANGE

\[
\text{d. } \frac{7.2 \times 10^6 \text{ KWh/day}}{200 \text{ KW/turbine} \cdot (24 \text{ hours/day})} = 1500 \text{ turbines.}
\]

6.1.66

a. \(y(t)\) is the position of the projectile, and the derivative of position is velocity, and the derivative of velocity is acceleration. Note that the acceleration force is due to gravity, and only depends on the position \(y\) of the projectile.

b. \(\frac{1}{2} \frac{d}{dy} v^2 = \frac{1}{2} \cdot 2v \frac{dv}{dy} = \frac{dy}{dx} \cdot \frac{dv}{dx}\)

c. Because \(\frac{dv}{dt} = a(y)\) and \(\frac{dv}{dx} = \frac{1}{2} \frac{d}{dy} (v^2)\), we must have \(\frac{1}{2} \frac{d}{dy} (v^2) = a(y)\).

d. \(\frac{1}{2} \int \frac{d}{dy} (v^2) \, dy = \int a(y) \, dy\), so \(\frac{1}{2} v^2 = \int a(y) \, dy\). Now when \(t = 0\), we have \(v = v_0\) and \(y = 0\), so \(\frac{1}{2} v_0^2 = gR + D\), and we can write

\[
\frac{1}{2} (v^2 - v_0^2) = gR \left( \frac{1}{1 + y/R} - 1 \right).
\]

e. When \(v = 0\) we have

\[
-\frac{1}{2} v_0^2 \cdot \frac{1}{gR} + 1 = \frac{1}{1 + y/R} \Rightarrow \frac{1}{1 + y/R} = \frac{2gR - v_0^2}{2gR} \Rightarrow 1 + \frac{y}{R} = \frac{2gR}{2gR - v_0^2},
\]

and thus

\[
y = \frac{2gR^2}{2gR - v_0^2} - R = \frac{2gR^2}{2gR - v_0^2} - \frac{2gR^2 - Rv_0^2}{2gR - v_0^2} = \frac{Rv_0^2}{2gR - v_0^2}.
\]

f.

\[
y_{\text{max}}(500) \approx 12,780 \text{ m.}
\]
\[
y_{\text{max}}(1500) \approx 116,893 \text{ m.}
\]
\[
y_{\text{max}}(5000) \approx 1,592,990 \text{ m.}
\]

g. The denominator of the expression for \(y_{\text{max}}\) is 0 when \(2gR = v_0^2\), so when \(v_0 = \sqrt{2gR}\). As \(v_0 \to \sqrt{2gR}\), \(y_{\text{max}} \to \infty\).

6.1.67 If \(C'(x) = 200 - 0.05x\), then the relevant costs are

\[
\int_{300}^{400} C'(x) \, dx = [200x - 0.025x^2]_{300}^{400} = 18250
\]
\[
\int_{500}^{600} C'(x) \, dx = [200x - 0.025x^2]_{500}^{600} = 17250.
\]

The cost of manufacturing items 500 through 600 is \$1000 less than the cost of manufacturing items 300 through 400. A graph of \(C'(x)\) is
Since the marginal cost \( C'(x) \) represents the cost of producing the next item when \( x \) items have been produced, the fact that the marginal cost is decreasing implies that the cost of later items is lower. Costs decrease linearly with respect to the number of items produced.

**6.1.68** If \( C'(x) = 3000 - x - 0.001x^2 \), then the relevant costs are

\[
\int_{100}^{300} C'(x) \, dx = \left[ 3000x - \frac{1}{2}x^2 - \frac{1}{3000}x^3 \right]_{100}^{300} = 551333
\]

\[
\int_{700}^{900} C'(x) \, dx = \left[ 3000x - \frac{1}{2}x^2 - \frac{1}{3000}x^3 \right]_{700}^{900} = 311333.
\]

The cost of manufacturing items 700 through 900 is substantially lower than the cost of producing items 100 through 300. A graph of \( C'(x) \) is

Since the marginal cost \( C'(x) \) represents the cost of producing the next item when \( x \) items have been produced, the fact that the marginal cost is decreasing implies that the cost of later items is lower. With this cost curve, marginal costs decrease slowly at first, then more rapidly, perhaps due to an improved learning curve that reduces the amount of manual effort needed to create an item.

**6.1.69** By two applications of the Fundamental Theorem, we have

\[
\int_a^b f'(x) \, dx = f(b) - f(a) = g(b) - g(a) = \int_a^b g'(x) \, dx.
\]

**6.1.70** Let the velocity of the runners be \( v_1(t) \) and \( v_2(t) \), and their position functions be \( s_1(t) \) and \( s_2(t) \). Then the displacements of the two runners from time \( a \) to time \( b \) are \( \int_a^b v_1(t) \, dt \) and \( \int_a^b v_2(t) \, dt \). Since the runners start and finish at the same point, \( s_1(a) = s_2(a) \) and \( s_1(b) = s_2(b) \). Since \( s_1' = v_1 \) and \( s_2' = v_2 \), the previous exercise shows that the two integrals are equal, so the displacements are equal.

**6.1.71** Let the slopes of the two trails be \( s_1(t) \) and \( s_2(t) \), and their elevation functions be \( e_1(t) \) and \( e_2(t) \). Then the net change in elevations of the two trails are \( \int_a^b s_1(t) \, dt \) and \( \int_a^b s_2(t) \, dt \). Since the trails start and finish at the same point, \( e_1(a) = e_2(a) \) and \( e_1(b) = e_2(b) \). Since \( e_1' = s_1 \) and \( e_2' = s_2 \), Exercise 69 shows that the two integrals are equal, so the net changes in elevation are equal.
6.1.72 Let \( f(x) = 12\sin(\pi x^2) \) and \( g(x) = x^{10}(2 - x)^3 \). Then \( f(2) = 12\sin 4\pi = 0 = g(2) = 2^{10}(2 - 2)^3 \) and \( f(0) = 12\sin 0 = 0 = 0^{10}(2 - 0)^3 \), so by Exercise 69,

\[
\int_0^2 \frac{d}{dx}(12\sin(\pi x^2)) \, dx = \int_0^2 f'(x) \, dx = \int_0^2 g'(x) \, dx = \int_0^2 \frac{d}{dx}(x^{10}(2 - x)^3) \, dx.
\]

6.2 Regions Between Curves

6.2.1

If \( f \) and \( g \) intersect at \( x = a \) and \( x = b \) with \( a < b \) and if \( f(x) \geq g(x) \) on \([a, b]\), then the area between these curves is given by \( \int_a^b (f(x) - g(x)) \, dx \).

6.2.2

If \( f \) and \( g \) intersect exactly three times at \( x = a \), \( x = b \), and \( x = c \) with \( a < b < c \), and if \( f(x) \geq g(x) \) on \([a, b]\) and \( g(x) \geq f(x) \) on \([b, c]\), then the area is given by

\[
\int_a^b (f(x) - g(x)) \, dx + \int_b^c (g(x) - f(x)) \, dx.
\]

6.2.3

6.2.4

6.2.5 The curves intersect when \( x = x^2 - 2 \), or \((x + 1)(x - 2) = 0\), so at \( x = -1 \) and \( x = 2 \). The area is

\[
\int_{-1}^2 \left( x - (x^2 - 2) \right) \, dx = \left[ \frac{2x^2}{2} - \frac{x^3}{3} \right]_{-1}^2 = 4.5.
\]

6.2.6 The curves intersect when \( x = x^3 \), or \((x - 1)(x + 1) = 0\), so at \( x = 0 \), \( x = -1 \) and \( x = 1 \). The area is given by

\[
\int_{-1}^0 (x^3 - x) \, dx + \int_0^1 (x - x^3) \, dx = 2 \int_0^1 (x - x^3) \, dx = 2 \left( \frac{x^2}{2} - \frac{x^4}{4} \right) \bigg|_0^1 = \frac{1}{2}.
\]

6.2.7 By inspection, the curves intersect at \( x = 1 \). The area is given by

\[
\int_0^1 (3 - x - 2x^2) \, dx = \left( 3x - \frac{x^2}{2} - \frac{2x^3}{3} \right) \bigg|_0^1 = 3 - \frac{1}{2} - \frac{2}{3} - \left( -\frac{1}{3} \right) = 5 - \frac{1}{2} = \frac{9}{2}.
\]

Copyright © 2014 Pearson Education, Inc.
6.2.8 The curves intersect when \( \sec^2 x = 4 \cos^2 x \), which can be written as \( \cos^2 x = \frac{1}{16} = \frac{1}{2^4} \). This occurs when \( \cos x = \pm \frac{1}{2} \), which occurs at \( -\frac{\pi}{3} \) and \( \frac{\pi}{3} \). Using symmetry, the area is given by

\[
2 \int_{0}^{\pi/3} \left( 4 \cos^2 x - \frac{1}{4} \sec^2 x \right) dx = 2 \int_{0}^{\pi/3} \left( 2(1 + \cos(2x)) - \frac{1}{4} \sec^2 x \right) dx
\]

\[
= 2 \left( 2x + \sin(2x) - \frac{1}{4} \tan x \right) \bigg|_{0}^{\pi/3}
\]

\[
= \frac{4\pi}{3} + \sqrt{3} - \frac{\sqrt{3}}{2} = \frac{4\pi}{3} + \frac{\sqrt{3}}{2}.
\]

6.2.9 The nonvertical lines intersect when \( 2x + 2 = 3x + 3 \), or \( x = -1 \). The vertical line \( x = 4 \) intersects both nonvertical lines when \( x = 4 \). The area is given by

\[
\int_{-1}^{4} (3x + 3 - (2x + 2)) \, dx = \int_{-1}^{4} (x + 1) \, dx
\]

\[
= \left( \frac{x^2}{2} + x \right) \bigg|_{-1}^{4} = 8 + 4 - \left( \frac{1}{2} - 1 \right) = 12.5.
\]

6.2.10 \( \cos x = \sin x \) when \( \tan x = 1 \), or \( x = \tan^{-1} 1 = \frac{\pi}{4} \). They also intersect at \( \frac{\pi}{4} + \pi = \frac{5\pi}{4} \). The area is given by

\[
\int_{\pi/4}^{5\pi/4} (\sin x - \cos x) \, dx = (-\cos x + \sin x) \bigg|_{\pi/4}^{5\pi/4}
\]

\[
= - \left( \frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2} - \left( \frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2} \right) \right) = 2\sqrt{2}.
\]

6.2.11 The curves \( e^x \) and \( e^{-2x} \) intersect when \( e^x = e^{-2x} \), or \( e^{3x} = 1 \), which occurs only for \( x = 0 \). The vertical line \( x = \ln 4 \) clearly intersects the curves for \( x = \ln 4 \). The area is given by

\[
\int_{0}^{\ln 4} \left( e^x - e^{-2x} \right) \, dx = \left( e^x + \frac{e^{-2x}}{2} \right) \bigg|_{0}^{\ln 4}
\]

\[
= 4 + \frac{1}{32} - \left( 1 + \frac{1}{2} \right) = \frac{81}{32}.
\]
6.2.12
The curves intersect when \(2x = x^2 + 3x - 6\), which occurs when \(x^2 + x - 6 = 0\). Because \(x^2 + x - 6 = (x + 3)(x - 2)\), the curves intersect at \(x = -3\) and \(x = 2\). The area is given by

\[
\int_{-3}^{2} (2x - (x^2 + 3x - 6)) \, dx = \int_{-3}^{2} (-x^2 - x + 6) \, dx
\]

\[
= \left( \frac{-x^3}{3} - \frac{x^2}{2} + 6x \right)_{-3}^{2}
\]

\[
= -\frac{8}{3} - 2 + 12 - \left( 9 - \frac{9}{2} - 18 \right) = \frac{125}{6}.
\]

6.2.13
The curves intersect when \(\frac{2}{1+x^2} = 1\), or \(x^2 + 1 = 2\), or \(x^2 - 1 = (x - 1)(x + 1) = 0\). So the intersections occur when \(x = \pm 1\). Using symmetry, the area is

\[
2 \int_{0}^{1} \left( \frac{2}{1+x^2} - 1 \right) \, dx = 2 \left( 2 \tan^{-1} x - x \right)_{0}^{1} = \pi - 2.
\]

6.2.14
The curves intersect when \(24\sqrt{x} = 3x^2\), so when either \(x = 0\) or when \(8 = x^{3/2}\). Thus happens for \(x = 8^{2/3} = 4\). We have \(\int_{0}^{4} (24\sqrt{x} - 3x^2) \, dx = (16x^{3/2} - x^3)_{0}^{4} = 128 - 64 = 64\).

6.2.15 The curves intersect at \(\frac{\pi}{4}\), so the area is given by \(\int_{0}^{\pi/4} \sin x \, dx + \int_{\pi/4}^{\pi/2} \cos x \, dx = (-\cos x)_{0}^{\pi/4} + (\sin x)_{\pi/4}^{\pi/2} = \left( 1 - \frac{\sqrt{2}}{2} \right) + \left( 1 - \frac{\sqrt{2}}{2} \right) = 2 - \sqrt{2}\).

6.2.16 Note that \(\sin 2x = 2\sin x \cos x\), so the curves intersect where \(2\sin x \cos x = \sin x\), so the curves intersect at \(x = 0\) and \(x = \pi\), and \(x = \frac{\pi}{3}\), because \(\cos \frac{\pi}{3} = \frac{1}{2}\). The area is given by

\[
\int_{0}^{\pi/3} (\sin 2x - \sin x) \, dx + \int_{\pi/3}^{\pi} (\sin x - \sin 2x) \, dx = \left( -\frac{\cos 2x}{2} + \cos x \right)_{0}^{\pi/3} + \left( -\cos x + \frac{\cos 2x}{2} \right)_{\pi/3}^{\pi}
\]

\[
= \left( \frac{1}{4} + \frac{1}{2} \right) - \left( -\frac{1}{2} + 1 \right) + \left( 1 + \frac{1}{2} \right) - \left( -\frac{1}{2} - \frac{1}{4} \right) = \frac{1}{4} + \frac{9}{4} = \frac{5}{2}.
\]
6.2.17
The curves intersect when \( x = \frac{1}{x} \), or \( x^2 = 1 \). This occurs in the first quadrant when \( x = 1 \). The area is given by
\[
\int_0^1 x \, dx + \int_1^2 \frac{1}{x} \, dx = \left( \frac{x^2}{2} \right) \bigg|_0^1 + (\ln x) \bigg|_1^2 = \frac{1}{2} + \ln 2.
\]

6.2.18 A plot of the region is

Note that the curves intersect when \( 4x - x^2 = 4x - 4 \), or \( x^2 = 4 \), so they intersect in the first quadrant at \( x = 2 \). The line \( y = 4x - 4 \) intersects the \( x \)-axis at \( x = 1 \), so the area is given by
\[
\int_0^1 (4x - x^2) \, dx + \int_1^2 (4x - x^2 - (4x - 4)) \, dx = \int_0^1 (4x - x^2) \, dx + \int_1^2 (4 - x^2) \, dx = \left( 2x^2 - \frac{x^3}{3} \right) \bigg|_0^1 + \left( 4x - \frac{x^3}{3} \right) \bigg|_1^2 = \left( 2 - \frac{1}{3} \right) + \left( 8 - \frac{8}{3} \right) - \left( 4 - \frac{1}{3} \right) = \frac{10}{3}.
\]

6.2.19 A plot of the region is

The curves intersect at \( x = \pm 1 \), and the area is twice the area from 0 to 1, so it is
\[
2 \int_0^1 (2 - x - x^2) \, dx = 2 \left( 2x - \frac{1}{2}x^2 - \frac{1}{3}x^3 \right) \bigg|_0^1 = \frac{7}{3}.
\]
6.2.20

Using symmetry, the area is

\[ 2 \int_0^3 (9x - x^3) \, dx = 2 \left( \frac{9x^2}{2} - \frac{x^4}{4} \right)_0^3 \]
\[ = 2 \left( \frac{81}{2} - \frac{81}{4} \right) = \frac{81}{2}. \]

6.2.21 The region looks like

Splitting this into an integral over \([2, 3]\) and one over \([3, 6]\) gives

\[ \int_2^6 \left( \frac{x}{2} - |x - 3| \right) \, dx = \int_2^3 \left( \frac{x}{2} - (3 - x) \right) \, dx + \int_3^6 \left( \frac{x}{2} - (x - 3) \right) \, dx \]
\[ = \int_2^3 \left( \frac{3x}{2} - 3 \right) \, dx + \int_3^6 \left( 3 - \frac{x}{2} \right) \, dx \]
\[ = \left( \frac{3x^2}{4} - 3x \right)_2^3 + \left( 3x - \frac{x^2}{4} \right)_3^6 \]
\[ = \frac{27}{4} - 9 - (3 - 6) + \left( 18 - 9 - \left( 3 - \frac{9}{4} \right) \right) = \frac{3}{4} + \frac{9}{4} = 3. \]

6.2.22 The region looks like
6.2.23 The two curves meet where \( x = 0 \); at that point, \( y = \sqrt{1-0} = 1 \). So the integration is from \( y = 0 \) to \( y = 1 \). Solving for \( x \) gives the curves \( x = 2y^2 - 2 \) and \( x = 1 - y^2 \). Thus the area of the region is
\[
\int_0^1 ((1 - y^2) - (2y^2 - 2))\,dy = \int_0^1 (-3y^2 + 3)\,dy = [-y^3 + 3y]_0^1 = 2.
\]

6.2.24 It is easier to integrate with respect to \( y \). The curves \(-\sin 2y \) and \( \cos y \) intersect where \(-\sin 2y = \cos y \), but \(-\sin 2y = -2\sin y \cos y \), so we must solve \(-2\sin y \cos y = \cos y \). So either \( \cos y = 0 \) or \( \sin y = -\frac{1}{2} \).

The first positive value of \( y \) satisfying either of these conditions is \( y = \frac{\pi}{6} \), where \( \cos y = 0 \); the first negative value of \( y \) is \( y = -\frac{\pi}{6} \), where \( \sin y = -\frac{1}{2} \). So the area is
\[
\int_{-\pi/6}^{\pi/6} (\cos y - (-\sin 2y))\,dy = \left[ \sin y - \frac{1}{2} \cos 2y \right]_{-\pi/6}^{\pi/2}
= \sin \frac{\pi}{2} - \frac{1}{2} \cos \pi - \sin \left( -\frac{\pi}{6} \right) + \frac{1}{2} \cos \left( -\frac{\pi}{3} \right)
= 1 + \frac{1}{2} + \frac{1}{2} + \frac{1}{4} = \frac{9}{4}.
\]

6.2.25 The curves \( x = y^2 - 3y + 12 \) and \( x = -2y^2 - 6y + 30 \) intersect where \( y^2 - 3y + 12 = -2y^2 - 6y + 30 \), or \( 3y^2 + 3y - 18 = 3(y + 3)(y - 2) = 0 \). So the points of intersection are \( y = -3 \) and \( y = 2 \), and thus the area is
\[
\int_{-3}^{2} ((-2y^2 - 6y + 30) - (y^2 - 3y + 12))\,dy = \int_{-3}^{2} (-3y^2 - 3y + 18)\,dy = \left[ -y^3 - \frac{3}{2}y^2 + 18y \right]_{-3}^2
= -8 - 6 + 36 - 27 + \frac{27}{2} + 54 = \frac{125}{2}.
\]

6.2.26 These two curves intersect where \( y^3 - 4y^2 + 3y = y^2 - y \), or \( y^3 - 5y^2 + 4y = y(y - 4)(y - 1) = 0 \). So the three intersection points are at \( y = 0 \), \( y = 1 \), and \( y = 4 \). From \( y = 0 \) to \( y = 1 \), we have \( y^2 - y \leq y^3 - 4y^2 + 3y \); from \( y = 1 \) to \( y = 4 \) this is reversed. Thus the area between the curves is
\[
\int_0^1 (y^3 - 4y^2 + 3y - (y^2 - y))\,dy + \int_1^4 (y^2 - y - (y^3 - 4y^2 + 3y))\,dy
= \int_0^1 (y^3 - 5y^2 + 4y)\,dy + \int_1^4 (-y^3 + 5y^2 - 4y)\,dy
= \left[ \frac{1}{4}y^4 - \frac{5}{3}y^3 + 2y \right]_0^1 + \left[ -\frac{1}{4}y^4 + \frac{5}{3}y^3 - 2y \right]_1^4
= \frac{1}{4} - \frac{5}{3} + 2 - 64 + \frac{320}{3} - 32 + \frac{1}{4} - \frac{5}{3} + 2
= \frac{71}{6}.
\]
6.2.27
a. The area is given by \( \int_{-\sqrt{2}}^{-1} - (x^2 - 2) \, dx + \int_{-1}^{0} -x \, dx \).

b. The area can also be written as \( \int_{-1}^{0} (y - (\sqrt{y} + 2)) \, dy \).

6.2.28
a. The area is given by \( \int_{0}^{4} - (x^2 - 4x) \, dx + \int_{2}^{4} -(2x - 8) \, dx \).

b. The area can also be written as \( \int_{0}^{4} (\frac{y}{2} + 4 - (2 - \sqrt{y + 4})) \, dy \). Note that in order to solve \( y = x^2 - 4x \) for \( x \), we needed to complete the square to obtain \( y + 4 = x^2 - 4x + 4 = (x - 2)^2 \), so \( \sqrt{y + 4} + |x - 2| \), and the part of this we need is \( x = 2 - \sqrt{y + 4} \).

6.2.29
a. The area is given by \( \int_{-3}^{-2} \sqrt{x + 3} - (-\sqrt{x + 3}) \, dx + \int_{-2}^{6} \sqrt{x + 3} - \frac{x}{2} \, dx \).

b. The area can also be written \( \int_{-1}^{3} (2y - (y^2 - 3)) \, dy \).

6.2.30
a. The area is given by \( \int_{0}^{1} (\sqrt{x} - x^3) \, dx \).

b. The area can also be written \( \int_{0}^{1} (\sqrt{y} - y^2) \, dy \).

6.2.31 A plot of the region is

![Plot of the region](image)

Note that the two curves intersect where \( y = 2 - \frac{x}{2} = 2 - \frac{2y^2}{2} = 2 - y^2 \), so for \( y^2 + y - 2 = (y + 2)(y - 1) = 0 \). So they intersect at the points \((2, 1)\) and \((8, -2)\).

a. Integrating with respect to \( x \), we must solve the second equation for \( y \) to get \( y = \pm \sqrt{\frac{x}{2}} \). Then the
integrated must be split into two integrals, and the area is
\[
\int_0^2 \left( \sqrt{\frac{x}{2}} - \left( -\sqrt{\frac{x}{2}} \right) \right) \, dx + \int_2^8 \left( 2 - \frac{x}{2} - \left( -\sqrt{\frac{x}{2}} \right) \right) \, dx
\]
\[
= \frac{2}{\sqrt{2}} \int_0^2 x^{1/2} \, dx + \int_2^8 \left( 2 - \frac{x}{2} + \frac{1}{\sqrt{2}}x^{1/2} \right) \, dx
\]
\[
= \frac{2}{\sqrt{2}} \left[ \frac{2}{3} x^{3/2} \right]_0^2 + \left[ 2x - \frac{x^2}{4} + \frac{2}{3\sqrt{2}}x^{3/2} \right]_2^8
\]
\[
= \sqrt{2} \cdot \frac{2}{3} \cdot 2\sqrt{2} + 16 - \frac{2}{3\sqrt{2}} \cdot 16\sqrt{2} - 4 + 1 - \frac{2}{3\sqrt{2}} \cdot 2\sqrt{2}
\]
\[
= \frac{8}{3} + \frac{32}{3} - \frac{4}{3}
\]
\[
= 9.
\]

b. The integral is from \( y = -2 \) to \( y = 1 \). Solve the first equation for \( x \) to get \( x = 4 - 2y \); then the area is
\[
\int_{-2}^1 (4 - 2y - 2y^2) \, dy = \left[ 4y - y^2 - \frac{2}{3} y^3 \right]_{-2}^1 = 4 - 1 - \frac{2}{3} + 8 + 4 - \frac{16}{3} = 9.
\]

6.2.32 A plot of the region is

Note that the two curves intersect where \( 2 - y^2 = |y| \), so at \( y = \pm 1 \); there, \( x = 1 \). So the points of intersection are \((1, \pm 1)\).

a. Using symmetry, the area is given by
\[
2 \int_0^1 x \, dx + 2 \int_1^\sqrt{2-x} \sqrt{2-x} \, dx = (x^2) \bigg|_0^1 + 2 \left( -\frac{2}{3} (2-x)^{3/2} \right) \bigg|_1^2 = 1 + \left( 0 - \left( -\frac{4}{3} \right) \right) = \frac{7}{3}.
\]

b. Using symmetry, we have
\[
2 \int_0^1 (2 - y^2 - y) \, dy = 2 \left( 2y - \frac{y^3}{3} - \frac{y^3}{2} \right) \bigg|_0^1 = 2 \left( 2 - \frac{1}{3} - \frac{1}{2} \right) = 3 - \frac{2}{3} = \frac{7}{3}.
\]
6.2.33

The area is given by
\[
\int_0^8 \left(4 - \frac{3}{5} x^{5/3}\right) \, dx = \left(4x - \frac{96}{5}\right) \bigg|_0^8 = \frac{64}{5}.
\]

6.2.34

The area is given by
\[
\int_0^{\pi/2} \left(2 - 2 \sin x\right) \, dx = \left(2x + 2 \cos x\right) \bigg|_0^{\pi/2} = \pi - 2.
\]

6.2.35

The area is given by
\[
\int_0^{\ln 2} \left(2 e^{-x} + 1 - e^x\right) \, dx = \left(-2e^{-x} + x - e^x\right) \bigg|_0^{\ln 2} = -1 + \ln 2 - 2 - (-2 - 1) = \ln 2.
\]

6.2.36

The area is given by
\[
\int_0^{\pi/4} \left(2 - \sec^2 x\right) \, dx = \left(2x - \tan x\right) \bigg|_0^{\pi/4} = \frac{\pi}{2} - 1.
\]
6.2.37

The area is given by
\[
\int_{0}^{\sqrt{3}/2} (2x\sqrt{1-x^2} - x) \, dx
\]
\[
= \left( -\frac{2}{3}(1-x^2)^{3/2} - \frac{x^2}{2} \right)_{0}^{\sqrt{3}/2}
\]
\[
= -\frac{2}{24} - \frac{3}{8} + \frac{2}{3} = \frac{5}{24}.
\]

6.2.38

The area is given by
\[
\int_{-1}^{4} (3y - (y^2 - 4)) \, dy = (3y^2/2 - y^3/3 + 4y){}_{4}^{-1}
\]
\[
= 24 - 64/3 + 16 - (3/2 + 1/3 - 4)
\]
\[
= 44 - 65/3 - 3/2 = \frac{125}{6}.
\]

6.2.39

a. False. This can be done either with respect to \(x\) or with respect to \(y\). For the latter, the relevant integral is \(\int_{0}^{1} (y - y^2) \, dy\).

b. False. On the interval \((0, \pi/4)\) the cosine function is greater, but on \((\pi/4, \pi/2)\) the sine function is greater. The area is \(\int_{0}^{\pi/4} \cos x - \sin x \, dx + \int_{\pi/4}^{\pi/2} \sin x - \cos x \, dx\).

c. True. They both represent the area of the region in the first quadrant under \(y = x\) and above \(y = x^2\).

6.2.40

The area is given by
\[
\int_{0}^{\pi} (\sin x - x^2 + \pi x) \, dx = \left( -\cos x - \frac{x^3}{3} + \frac{\pi x^2}{2} \right)_{0}^{\pi}
\]
\[
= 1 - \frac{\pi^3}{3} + \frac{\pi^3}{2} - (-1) = 2 + \frac{\pi^3}{6}.
\]
6.2.41
The area is given by
\[ \int_{1}^{5} (7x - 19 - (x - 1)^2) \, dx \]
\[ = \left( \frac{7}{2}x^2 - 19x - \frac{(x - 1)^3}{3} \right) \bigg|_{1}^{5} \]
\[ = \left( \frac{175}{2} - 95 - \frac{64}{3} \right) - (56 - 76 - 9) \]
\[ = -\frac{173}{6} + 29 = \frac{1}{6}. \]

6.2.42
Using symmetry, the area is given by
\[ 2 \int_{0}^{\sqrt{3}/2} \left( 2 - \frac{1}{\sqrt{1-x^2}} \right) \, dx \]
\[ = 2 \left( 2x - \sin^{-1} x \right) \bigg|_{0}^{\sqrt{3}/2} \]
\[ = 2\sqrt{3} - \frac{2\pi}{3}. \]

6.2.43
The area is given by
\[ \int_{2}^{5} (5x - 9 - (x - 1)^2) \, dx \]
\[ = \left( \frac{5}{2}x^2 - 9x - \frac{(x - 1)^3}{3} \right) \bigg|_{2}^{5} \]
\[ = \frac{125}{2} - 45 - \frac{64}{3} - \left( 10 - 18 - \frac{1}{3} \right) = 4.5. \]

6.2.44 Using symmetry, this is
\[ 2 \int_{0}^{1} (-y(y - 1)) \, dy = 2 \left( -\frac{y^3}{3} + \frac{y^2}{2} \right) \bigg|_{0}^{1} = \frac{1}{2}. \]

6.2.45 This is given by
\[ \int_{0}^{4} (3y - (y^2 - y)) \, dy = \int_{0}^{4} (4y - y^2) \, dy = \left( 2y^2 - \frac{y^3}{3} \right) \bigg|_{0}^{4} = 32 - \frac{64}{3} = \frac{32}{3}. \]

6.2.46 The area is given by
\[ \int_{-1}^{0} \left( \frac{7}{3}x + \frac{10}{3} - (-x^3) \right) \, dx + \int_{0}^{2} \left( \frac{7}{3}x + \frac{10}{3} - x^3 \right) \, dx \]
\[ = \left( \frac{7}{6}x^2 + \frac{10}{3}x + \frac{x^4}{4} \right) \bigg|_{-1}^{0} + \left( \frac{7}{6}x^2 + \frac{10}{3}x - \frac{x^4}{4} \right) \bigg|_{0}^{2} \]
\[ = \left( -\frac{7}{6} + \frac{10}{3} - \frac{1}{4} \right) + \left( \frac{14}{3} + 20 - 4 \right) = \frac{37}{4}. \]
6.2.47 The area is given by
\[ \int_0^3 \left( \frac{y}{2} + \frac{15}{2} - y \right) dy = \left( \frac{y^2}{4} + \frac{15}{2} y - \frac{y^3}{3} \right) \bigg|_0^3 = \frac{9}{4} + \frac{45}{2} - 9 = \frac{63}{4} . \]

6.2.48 The region above the axis can be divided into a triangle over \([-1, 2]\) with height \(\frac{15}{4}\), plus the other region. The area of the triangle is \(\frac{1}{2} \cdot 3 \cdot \frac{15}{4} = \frac{45}{8}\). The area of the remaining region is given by
\[ \int_2^3 \left( \frac{5}{4} x + \frac{5}{4} - x^2 + 4 \right) dx = \left( \frac{5}{8} x^2 + \frac{21}{4} x - \frac{x^3}{3} \right) \bigg|_2^3 = \frac{49}{24} . \]
The total area is thus \(\frac{49}{24} + \frac{45}{8} = \frac{184}{24} = \frac{23}{3}\).

6.2.49 This area is given by
\[ \int_{1/2}^2 \left( \frac{5}{2} - \frac{1}{x} - x \right) dx = \left( \frac{5}{2} x - \ln x - \frac{x^2}{2} \right) \bigg|_{1/2}^2 = 5 - \ln 2 - 2 - \left( \frac{5}{4} - \ln \frac{1}{2} - \frac{1}{8} \right) = \frac{15}{8} - 2 \ln 2 . \]

6.2.50 This area is given by
\[ \int_0^{1/2} \left( 4x - \frac{x}{4} \right) dx + \int_{1/2}^2 \left( \frac{1}{x} - \frac{x}{4} \right) dx = \left( \frac{15}{8} x^2 \right) \bigg|_0^{1/2} + \left( \ln x - \frac{x^2}{8} \right) \bigg|_{1/2}^2 = \frac{15}{32} + \ln 2 - \frac{1}{2} - \left( \ln \frac{1}{2} - \frac{1}{32} \right) = 2 \ln 2 . \]

6.2.51
a. The area of \(R_1\) is \(\int_0^1 (x - x^p) dx = \left( \frac{x^2}{2} - \frac{x^{p+1}}{p+1} \right) \bigg|_0^1 = \frac{1}{2} - \frac{1}{p+1} = \frac{p-1}{2p+2} . \)

The area of \(R_2\) is \(\int_0^1 (x^{1/q} - x) dx = \left( \frac{x^{q+1}}{q+1} - x^2 \right) \bigg|_0^1 = q - \frac{1}{2} = \frac{q-1}{2q+2} . \)

Clearly, if \(q = p\) then \(R_1 = R_2\).

b. Using the results above, if \(p > q\), then \(R_1 - R_2 = \frac{(p-1)(2q+1) - (q-1)(2p+1)}{(2p+2)(2q+2)} = \frac{4p-4q}{(2p+2)(2q+2)} = \frac{p-q}{(p+1)(q+1)} > 0\), so \(R_1 > R_2\).

c. If \(p < q\), then \(R_1 - R_2\) computed above is less than 0, so \(R_1 < R_2\).

6.2.52
\[
A = \int_{1/2}^1 (4\sqrt{2}x - (4x + 6)) dx + \int_1^2 (4\sqrt{2}x - 2x^2) dx
\]
\[= \left( \frac{8\sqrt{2}}{3} x^{3/2} + 2x^2 - 6x \right) \bigg|_{1/2}^1 + \left( \frac{8\sqrt{2}}{3} x^{3/2} - 2x^3/3 \right) \bigg|_1^2 = \frac{19}{6} . \]

6.2.53 \(y = 8x\) and \(y = 9 - x^2\) intersect when \(x^2 + 8x - 9 = (x + 9)x - 1 = 0\), so at \(x = 1\) in the first quadrant. \(y = \frac{5}{2}x\) and \(y = 9 - x^2\) intersect when \(x^2 + \frac{5}{2}x - 9 = 0\), or \(2x^2 + 5x - 18 = 2(x + 9)(x - 2) = 0\), so at \(x = 2\) in the first quadrant. Thus the area of the region is
\[
A = \int_0^1 \left( 8x - \frac{5}{2}x \right) dx + \int_1^2 \left( 9 - x^2 - \frac{5}{2}x \right) dx
\]
\[= \int_0^1 \frac{11}{2} x dx + \int_1^2 \left( 9 - x^2 - \frac{5}{2}x \right) dx
\]
\[= \left( \frac{11}{4} x^2 \right) \bigg|_0^1 + \left( 9x - \frac{x^3}{3} - \frac{5}{4} x^2 \right) \bigg|_1^2
\]
\[= \frac{11}{4} + 18 - \frac{8}{3} - 5 - 9 + \frac{1}{3} + \frac{5}{4} = \frac{17}{3} . \]
6.2.54 Let $y_1$ be the $y$ coordinate of the lower point where the curves cross, and let $y_2$ be the $y$ coordinate of the higher point where the curves cross. Solving numerically gives $y_1 \approx 0.705$ and $y_2 \approx 2.120$. We have

$$A = \int_{0}^{y_1} (\sqrt{y} - 2 \sin^2 y) \, dy + \int_{y_1}^{y_2} (2 \sin^2 y - \sqrt{y}) \, dy$$

$$= \left[ \frac{2}{3} y^{3/2} - y + \frac{\sin 2y}{2} \right]_{0}^{y_1} + \left[ y - \frac{\sin 2y}{2} - \frac{2}{3} y^{3/2} \right]_{y_1}^{y_2}$$

$$= \frac{2}{3} y_1^{3/2} - y_1 + \frac{\sin 2y_1}{2} + \left( y_2 - \frac{\sin 2y_2}{2} - \frac{2}{3} y_2^{3/2} \right) - \left( y_1 - \frac{\sin 2y_1}{2} - \frac{2}{3} y_1^{3/2} \right)$$

$$\approx 0.874.$$

6.2.55 $y = 8 - x$ and $x = \frac{(y-2)^2}{3}$ intersect when $8 - y = \frac{(y-2)^2}{3}$. Simplifying gives $24 - 3y = y^2 - 4y + 4$, or $y^2 - y - 20 = (y-5)(y+4) = 0$. So the curves meet at $y = -4$ and $y = 5$, thus at the points $(12, -4)$ and $(3, 5)$. So the area bounded by the curves is

$$A = \int_{-4}^{5} \left( 8 - y - \frac{(y-2)^2}{3} \right) \, dy = \left( 8y - \frac{y^2}{2} - \frac{(y-2)^3}{9} \right) \bigg|_{-4}^{5} = 40 - \frac{25}{2} - 3 - (-32 + 8 + 24) = \frac{81}{2}.$$

6.2.56 $A_n = \int_{0}^{1} (x - x^n) \, dx = \left( \frac{x^{2} - x^{n+1}}{2} \right) \bigg|_{0}^{1} = \frac{1}{2} - \frac{1}{n+1} = \frac{n-1}{2n+2}.$

6.2.57 $A_n = \int_{0}^{1} (x^{1/n} - x) \, dx = \left( \frac{nx^{(n+1)/n}}{n+1} - \frac{x^{2}}{2} \right) \bigg|_{0}^{1} = \frac{n}{n+1} - \frac{1}{2} = \frac{n-1}{2n+2}.$

6.2.58 $A_n = \int_{0}^{1} (x^{1/n} - x^n) \, dx = \left( \frac{nx^{(n+1)/n}}{n+1} - \frac{x^{n+1}}{n+1} \right) \bigg|_{0}^{1} = \frac{n}{n+1} - \frac{1}{n+1} = \frac{n-1}{n+1}.$

6.2.59 Using the result of the previous problem, $\lim_{n \to \infty} A_n = \lim_{n \to \infty} \frac{n-1}{n+1} = 1$. As $n \to \infty$, the region in question approaches the $1 \times 1$ square over the interval $[0, 1]$, which has area 1.

6.2.60 $R$ is a right triangle with both legs equal to 1, so its area is $\frac{1}{2}$. Solving for $x$ gives $x = 1 - y$; we want $k$ so that $\int_{0}^{k} (1 - y) \, dy$ is half the area of the triangle, or $\frac{1}{4}$. Now,

$$\int_{0}^{k} (1 - y) \, dy = \left( y - \frac{y^2}{2} \right) \bigg|_{0}^{k} = k - \frac{k^2}{2}.$$

Simplify $k - \frac{k^2}{2} = \frac{1}{4}$ to get $2k^2 - 4k + 1 = 0$, which has roots $k = \frac{2 \pm \sqrt{2}}{2}$. Only the negative sign gives a value between 0 and 1, so we want $k = \frac{2 - \sqrt{2}}{2} = 1 - \frac{\sqrt{2}}{2}$.

6.2.61 A plot of this region is...
This is a triangle with base 2 and height 1, so it has area 1. The line on the left is \( x = y \), and the line on the right is \( x = 2 - y \), so we want \( k \) such that \( \int_0^k (2 - y - y) \, dy \) is half the area of the triangle, or \( \frac{1}{2} \). Now,

\[
\int_0^k (2 - y - y) \, dy = \int_0^k (2 - 2y) \, dy = (2y - y^2) \bigg|_0^k = 2k - k^2.
\]

Simplify \( 2k - k^2 = \frac{1}{2} \) to get \( 2k^2 - 4k + 1 = 0 \), which has roots \( k = \frac{2 \pm \sqrt{2}}{2} \). Only the negative sign gives a value between 0 and 1, so we want \( k = \frac{2 - \sqrt{2}}{2} = 1 - \frac{\sqrt{2}}{2} \).

6.2.62 The parabola intersects the \( x \) axis at \( x = \pm 2 \), so the total area under the parabola is

\[
\int_{-2}^{2} (4 - x^2) \, dx = \left( 4x - \frac{1}{3}x^3 \right) \bigg|_{-2}^{2} = \frac{32}{3}.
\]

Solving for \( x \) gives \( x = \pm \sqrt{4 - y} \), so we want to find \( k \) such that \( \int_0^k (\sqrt{4 - y} - (-\sqrt{4 - y})) \, dy \) is half the area under the parabola, or \( \frac{16}{3} \). Now,

\[
\int_0^k (\sqrt{4 - y} - (-\sqrt{4 - y})) \, dy = 2 \int_0^k (4 - y)^{1/2} \, dy = 2 \left( -\frac{2}{3}(4 - y)^{3/2} \right) \bigg|_0^k = -\frac{4}{3}((4 - k)^{3/2} - 8).
\]

Set this equal to \( \frac{16}{3} \) and simplify to get \( -4 = (4 - k)^{3/2} - 8 \), or \( 4 = (4 - k)^{3/2} \). Thus \( k = 4 - 4^{3/2} \).

6.2.63 From Exercise 57, the total area bounded by these two curves is \( \frac{3(4 - 1)}{2(2 + 2)} = \frac{1}{6} \). Solving for \( x \) gives \( x = y \) and \( x = y^2 \), so we want to find \( k \) such that \( \int_0^k (y - y^2) \, dy \) is half of the total area, or \( \frac{1}{12} \). Now,

\[
\int_0^k (y - y^2) \, dy = \left( \frac{1}{2}y^2 - \frac{1}{3}y^3 \right) \bigg|_0^k = \frac{1}{2}k^2 - \frac{1}{3}k^3.
\]

Set this equal to \( \frac{1}{12} \), multiply through by 12, and simplify to get \( 4k^3 - 6k^2 + 1 = 0 \). This has the roots \( k = \frac{1}{2} \) and \( k = \frac{1 + \sqrt{3}}{2} \) (\( k = \frac{1}{2} \) could be found by inspection; or, use a computer algebra system); of these, only \( k = \frac{1}{2} \) is in the range \( (0, 1) \), so this is the answer.

6.2.64

a. The proportion of the whole board which has the desired property is the same as the proportion of each “quarter board” with the desired property, so we can consider only the quarter board rather than the whole board.

b. Let \( P = (x, y) \) be a point on the curve \( C \), and let \( \overline{AB} \) be the line segment along the top of the square; that is, the line segment between \((-1, 1) \) and \((1, 1) \). Let \( Q \) be the point on \( \overline{AB} \) so that \( \overline{QP} \perp \overline{AB} \). Then, because the distance from \( O \) to \( P \) is the same as the distance from \( P \) to \( Q \), we must have \( \sqrt{x^2 + y^2} = 1 - y \), so \( y = \frac{1}{2}(1 - x^2) \).

c. The area of the region \( R \) is 1, since it is a triangle with base \( \overline{AB} \) equal to 1 and height 1. \( C \) intersects the line \( y = x \) when \( x = \frac{1}{2}(1 - x^2) \), so at \( x = \sqrt{2} - 1 \). Then the area inside \( R \) and \( C \) is twice the area inside \( R \) and \( C \) in the first quadrant, so it is

\[
2 \int_0^{\sqrt{2} - 1} \left( \frac{1}{2}(1 - x^2) - x \right) \, dx = \int_0^{\sqrt{2} - 1} (1 - x^2 - 2x) \, dx = \left( x - \frac{1}{2}x^3 - x^2 \right) \bigg|_0^{\sqrt{2} - 1}.
\]

\[
= \sqrt{2} - 1 - \frac{(\sqrt{2} - 1)^3}{3} - (\sqrt{2} - 1)^2
= \sqrt{2} - 1 - \frac{2}{3}\sqrt{2} + 2 - \sqrt{2} + \frac{1}{3} - 2 + 2\sqrt{2} - 1
= \frac{4}{3}\sqrt{2} - \frac{5}{3}.
\]

So the probability of landing in \( R_1 \) is \( 1 - \left( \frac{4}{3}\sqrt{2} - \frac{5}{3} \right) \approx 0.781 \).
6.2. REGIONS BETWEEN CURVES

6.2.65

a. The point \((n, n)\) on the curve \(y = x\) would represent the notion that the lowest \(p\%\) of the society owns \(p\%\) of the wealth, which would represent a form of equality.

b. The function must be one-to-one by its definition, so that \(L'(x) > 0\). Clearly \(L(0) = 0\) and \(L(1) = 1\) again working from the definition of \(L\). Finally, the poorest \(p\%\) cannot own more than \(p\%\) of the wealth, so that \(L(x) \leq x\).

c. \(y = x^{1.1}\) is closest to \(y = x\), and \(y = x^4\) is furthest from \(y = x\).

d. Note that \(B = \int_0^1 L(x) \, dx\), and \(A + B = \frac{1}{2}\), so \(A = \frac{1}{2} - \int_0^1 L(x) \, dx\). Then

\[
G = \frac{A}{A + B} = \frac{A}{1/2} = 2A = 1 - 2 \int_0^1 L(x) \, dx.
\]

e. For \(L(x) = x^p\), we have \(G = 1 - 2 \int_0^1 x^p \, dx = 1 - 2 \left( \frac{x^{p+1}}{p+1} \right) \bigg|_0^1 = 1 - \frac{2}{p+1} = \frac{p-1}{p+1}\). So we have

<table>
<thead>
<tr>
<th>(p)</th>
<th>1.1</th>
<th>1.5</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>(G)</td>
<td>(\frac{1}{21})</td>
<td>(\frac{1}{5})</td>
<td>(\frac{1}{3})</td>
<td>(\frac{1}{2})</td>
<td>(\frac{3}{5})</td>
</tr>
</tbody>
</table>

f. For \(p = 1\) we have \(G = 0\). Because \(\lim_{p \to \infty} \frac{p-1}{p+1} = 1\), the largest possible value of \(G\) approaches 1.

g. For \(L(x) = \frac{5}{6}x^2 + \frac{1}{5}x\), note that \(L(0) = 0\), \(L(1) = 1\), \(L'(x) = \frac{5}{3}x + \frac{1}{6} > 0\) on \([0,1]\), and \(L''(x) = \frac{5}{3} > 0\) as well. The Gini index is

\[
G = 1 - 2 \int_0^1 \left( \frac{5}{6}x^2 + \frac{1}{6}x \right) \, dx = 1 - 2 \left( \frac{5}{18}x^3 + \frac{1}{12}x^2 \right) \bigg|_0^1 = 1 - 2 \left( \frac{5}{18} + \frac{1}{12} \right) = 1 - \frac{5}{9} - \frac{1}{6} = \frac{5}{18}.
\]

6.2.66

a. \(\triangle PQR\) has height \(a^2\) and base (along the top) \(2a\), so its area is \(\frac{1}{2} \cdot 2a \cdot a^2 = a^3\). At \(x = a\), the slope of the curve is \(2a\), so \(l_Q\) is \(y - a^2 = 2a(x - a)\), or \(y = 2ax - a^2\). At \(x = -a\), the slope of the curve is \(-2a\), so \(l_P\) is \(y - a^2 = -2a(x + a)\), or \(y = -2ax - a^2\). Finally, \(l_R\) is the line \(y = 0\). Then \(R'\) is the point where \(2ax - a^2 = 2ax + a^2\), so that \(x = 0\) and thus \(y = -a^2\), so \(R'(0, -a^2)\). Next, \(P'\) is the point where \(l_Q\) intersects the \(y\) axis, which is \((\frac{a}{2}, 0)\); similarly \(Q'\) is the point \((-\frac{a}{2}, 0)\). So \(\triangle P'Q'R'\) has height \(a^2\) and base \(\frac{a}{2} - (-\frac{a}{2}) = a\), and thus its area is \(\frac{1}{2} \cdot a \cdot a^2 = \frac{1}{2}a^3\), or half the area of \(\triangle PQR\).

b. A diagram of this situation is

Copyright © 2014 Pearson Education, Inc.
To determine the area of \( \triangle PQR \), drop perpendiculars from \( P \) and \( Q \) to the \( x \) axis, intersecting it at \( P' \) and \( Q' \). Then \( PQQ''P'' \) is a trapezoid whose height is \( a+b \) and whose bases are \( a^2 \) and \( b^2 \), so its area is \( (a+b)\frac{a^2+b^2}{2} \). Now subtract the areas of the triangles \( PP''R \) and \( QQ''R \) to get the area of \( \triangle PQR \):

\[
\triangle PQR = (a+b)\frac{a^2+b^2}{2} - \triangle PP'R - \triangle QQ'R = \frac{a^3+b^3+a^2b+ab^2}{2} - \frac{a^3}{2} - \frac{b^3}{2} = \frac{1}{2}ab(a+b).
\]

Computing as in part (a) we get \( y = 2bx-b^2 \) for \( l_Q \) and \( y = -2ax-a^2 \) for \( l_P \), and again \( l_R \) is \( y = 0 \). So again as in part (a), \( P' = (\frac{a}{2},0) \) and \( Q' = (-\frac{a}{2},0) \). \( l_P \) and \( l_Q \) intersect where \( 2bx-b^2 = -2ax-a^2 \), or \( R' = (\frac{b-a}{2},-ab) \). Then the height of \( \triangle P'Q'R' \) is \( ab \) and its base is \( \frac{b}{2} - (\frac{a}{2}) = \frac{a+b}{2} \). So the area is

\[
\triangle P'Q'R' = \frac{1}{2}ab \cdot \frac{a+b}{2} = \frac{1}{4}ab(a+b) = \frac{1}{2} \triangle PQR.
\]

6.2.67

Some experimental data:

<table>
<thead>
<tr>
<th>( a )</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approximate Area</td>
<td>7.812</td>
<td>6.928</td>
<td>7.812</td>
<td>10.667</td>
</tr>
</tbody>
</table>

The area seems to be minimized for \( a = -1 \).

This can be confirmed using an computer algebra system. Note that \( y = (x+1)(x-2) \) and \( y = ax + 1 \) intersect at \( \frac{1}{2}(1+a \pm \sqrt{a^2+2a+13}) \). Then

\[
\int_{(1/2)(1+a+\sqrt{a^2+2a+13})}^{(1/2)(1+a-\sqrt{a^2+2a+13})} [ax + 1 - (x+1)(x-2)] \, dx = \frac{1}{6}(a^2 + 2a + 13)^{3/2}.
\]

Let \( f(a) = \frac{1}{8}(a^2 + 2a + 13)^{3/2} \). Then \( f'(a) = \frac{1}{2}(a+1)\sqrt{a^2 + 2a + 13} \), which is zero for \( a = -1 \). Also, \( f''(-1) = \sqrt{3} > 0 \), so by the Second Derivative test, there is a minimum for \( a = -1 \).

6.2.68 Plots of the two curves for several different values of \( a \) are
(note the different scales as \( a \) increases). The curves intersect at \( x = 0 \) and again when \( a^2 x^3 = \sqrt{x} \), so when \( a^4 x^6 = x \); this is for \( x = a^{-4/5} \). Then we have

\[
A(a) = \int_0^{a^{-4/5}} (x^{1/2} - a^2 x^3) \, dx = \left[ \left( \frac{2}{3} x^{3/2} - \frac{1}{4} a^2 x^4 \right) \right]_0^{a^{-4/5}} = \frac{2}{3} a^{-6/5} - \frac{1}{4} a^{-6/5} = \frac{5}{12} \sqrt[a]{a}.
\]

Then \( A(a) = 16 \) when \( a^{6/5} = \frac{5}{192} \), so \( a = \left( \frac{5}{192} \right)^{5/6} \approx 0.048 \). A plot of \( A(a) \) is

6.2.69 Solving for \( x \) gives \( x = \pm y^2 \sqrt{1 - y^3} \); when \( x = 0 \) then \( y = 0 \) or \( y = 1 \). By symmetry, we find the area of half the region and double it. Integrate using the substitution \( u = 1 - y^3 \), so that \( du = -3 y^2 \, dy \); then \( y = 0 \) corresponds to \( u = 1 \) and \( y = 1 \) to \( u = 0 \):

\[
A = 2 \int_0^1 y^2 \sqrt{1 - y^3} \, dy = -2 \int_0^1 \sqrt{u} \, du = -\frac{2}{3} \left( \frac{2}{3} u^{3/2} \right) \bigg|_0^1 = \frac{4}{9}.
\]

6.2.70 To solve for \( y \) in terms of \( x \), start with

\[
x = \frac{1}{2y} - \sqrt{\frac{1}{4y^2} - 1} = \frac{1}{2y} - \sqrt{1 - 4y^2} = \frac{1 - \sqrt{1 - 4y^2}}{2y}, \quad \text{so} \quad \frac{1}{x} = \frac{2y}{1 - \sqrt{1 - 4y^2}}.
\]

Now note that

\[
x + \frac{1}{x} = \frac{1 - \sqrt{1 - 4y^2}}{2y} + \frac{2y}{1 - \sqrt{1 - 4y^2}} = \frac{1 - 2\sqrt{1 - 4y^2} + (1 - 4y^2) + 4y^2}{2y(1 - \sqrt{1 - 4y^2})} = \frac{1}{y}.
\]

So \( y = \frac{x}{x^2 + 1} \). The area we seek is then (using the substitution \( u = x^2 + 1 \), so that \( du = 2x \, dx \), and \( x = 0 \) corresponds to \( u = 1 \) while \( x = 1 \) corresponds to \( u = 2 \)):

\[
\int_0^1 \frac{x}{x^2 + 1} \, dx = \frac{1}{2} \int_1^2 \frac{1}{u} \, du = \frac{1}{2} \left( \ln |u| \right) \bigg|_1^2 = \frac{1}{2} \ln 2.
\]

6.2.71

\[
F(a) = \int_0^b x(x - a)(x - b) \, dx
= \int_0^b (abx - ax^2 - bx^2 + x^3) \, dx
= \left( \frac{ab}{2} x^2 - \frac{a}{3} x^3 - \frac{b}{3} x^3 + \frac{x^4}{4} \right) \bigg|_0^b
= \frac{ab^3}{2} - \frac{ab^3}{3} - \frac{b^4}{3} + \frac{b^4}{4}
= \frac{ab^3}{6} - \frac{b^4}{12} = \frac{b^3}{12} (2a - b).
\]

Thus \( F(a) = 0 \) when \( b = 0 \) or when \( a = \frac{b}{2} \). If \( b = 0 \), then since \( 0 \leq a \leq b \), we have \( a = 0 \) as well. So in either case, even if \( b = 0 \), the required value of \( a \) is \( a = \frac{b}{2} \).
b. Note that \( f(x) \geq 0 \) for \( x \in [0, a] \) and \( f(x) \leq 0 \) for \( x \in [a, b] \). So the area under the curve is

\[
A(a) = \int_0^a x(x-a)(x-b) \, dx - \int_a^b x(x-a)(x-b) \, dx
= \left( \frac{ab}{2} x^2 - \frac{a}{3} x^3 - \frac{b}{3} x^3 + \frac{x^4}{4} \right) \bigg|_0^a - \left( \frac{ab}{2} x^2 - \frac{a}{3} x^3 - \frac{b}{3} x^3 + \frac{x^4}{4} \right) \bigg|_a^b
= -\frac{a^4}{6} + \frac{a^3 b}{3} - \frac{ab^3}{6} + \frac{b^4}{12}
\]

\[
A'(a) = -\frac{2}{3} a^3 + a^2 b - \frac{1}{6} b^3 = -\frac{1}{6} (2a-b)(2a^2-2ab-b^2)
\]
\[
A''(a) = -2a^2 + 2ab.
\]

Note that \( A'(b) = 0 \), and \( A''(b) = \frac{b^2}{2} + b^2 > 0 \), so there is a minimum at \( a = \frac{b}{2} \). The other critical numbers are \( a = \frac{2b \pm \sqrt{b^2-4(1-b)2}}{4} = \frac{b \pm \sqrt{3b^2}}{2} \); these do not lie in the interval \((0, b)\). The maximum value of \( A \) on \([0, b]\) is \( \frac{4a^4}{12} \) which occurs at \( a = 0 \) and \( a = b \).

6.2.72 Given \( \int_a^b (f(x) - g(x)) \, dx = 10 \), we have (by symmetry, since both functions are even) that \( \int_0^a (f(x) - g(x)) \, dx = 5 \). Then using the substitution \( u = x^2 \), so that \( du = 2x \, dx \) and \( x = 0 \) corresponds to \( u = 0 \) while \( x = \sqrt{a} \) corresponds to \( u = a \), we have

\[
\int_0^{\sqrt{a}} x (f(x^2) - g(x^2)) \, dx = \frac{1}{2} \int_0^a (f(u) - g(u)) \, du = \frac{5}{2}.
\]

6.2.73

a.

![Graphs of functions](image)

b. \( A_n(x) \) is the net area of the region between the graphs of \( f \) and \( g \) from 0 to \( x \).

c. We have

\[
\int_0^x (f(s) - g(s)) \, ds = \int_0^x (s^n - s^{n/2}) \, ds = \left( \frac{1}{n+1} s^{n+1} - \frac{n}{n+1} s^{(n+1)/2} \right) \bigg|_0^x
= \frac{1}{n+1} x^{n+1} - \frac{n}{n+1} x^{(n+1)/2}.
\]

We are looking for the smallest \( x > 0 \) such that the above expression is zero. Set it equal to zero and multiply through by \( n+1 \) to get

\[
x^{n+1} - n x^{(n+1)/2} = 0, \quad \text{so that} \quad x^{n+1} = n x^{(n+1)/2}, \quad \text{and thus} \quad x^{(n^2-1)/n} = n.
\]

Copyright © 2014 Pearson Education, Inc.
So the value we are looking for is $x = n^{1/(n^2-1)}$. This root decreases asymptotically to 1 as $n$ increases. To see this, we find the limit of this expression as $n \to \infty$. Take logs and compute:

$$\lim_{n \to \infty} \left( \frac{n}{n^2 - 1} \ln n \right) = \lim_{n \to \infty} \left( \frac{n}{n - 1} \right) \left( \frac{\ln n}{n + 1} \right).$$

The first factor approaches 1, while the second factor approaches zero since $n$ grows faster than $\ln n$. So the limit is zero and thus

$$\lim_{n \to \infty} n^{1/(n^2-1)} = e^0 = 1.$$

6.2.74

a. 

b. We seek a root of $a \sin 2x = \frac{1}{\pi} \sin x$, or $2 \sin x \cos x = \frac{1}{\pi} \sin x$, so that (ignoring $x = 0$, which is a root since $\sin 0 = 0$), $\cos x = \frac{1}{2a^2}$. This has a solution as long as $\frac{1}{2a^2} \leq 1$, which occurs when $a \geq \frac{1}{\sqrt{2}}$.

c. 

$$A = \int_0^x (\sin 2x - \sin x) \, dx \bigg|_0^x = \left( \cos x - \frac{1}{2} \cos 2x \right) \bigg|_0^x = \left( \cos x - \frac{1}{2} (2 \cos^2 x - 1) \right) \bigg|_0^x = \left( \cos x - \cos^2 x + \frac{1}{2} \right) \bigg|_0^x = \cos x - \cos^2 x + \frac{1}{2} - \left( 1 - 1 + \frac{1}{2} \right) = \frac{1}{2a^2} - \frac{1}{4a^4} = \frac{2a^2 - 1}{4a^4}.$$

When $a = 1$ this is equal to $\frac{1}{4}$.

d. Using the result of the previous calculation, we simply note that $\frac{2a^2 - 1}{4a^4} \to 0$ as $a \to \frac{1}{\sqrt{2}}$.

6.3 Volume by Slicing

6.3.1 $A(x)$ is the area of the cross section through the solid at the point $x$.

6.3.2 Suppose $f$ is a continuous function and $f(x) \geq 0$ on $[a, b]$. If we revolve the region $R$ bounded by the graph of $f$ and the $x$-axis and the vertical lines $x = a$ and $x = b$ around the $x$-axis, a 3-dimensional solid of revolution is generated.

6.3.3 $V = \pi \int_a^b (4x^2 - x^4) \, dx$. 

Copyright © 2014 Pearson Education, Inc.
6.3.4 $V = \pi \int_{0}^{4} (y - \frac{y^2}{4}) \, dy$.

6.3.5 The cross sections are disks and $A(x)$ is the area of a disk.

6.3.6 The general slicing method would be used.

6.3.7 The curves intersect when $2 - x^2 = x^2$, or $x = \pm 1$. The cross-sectional area at each $x$ is

$$A(x) = ((2 - x^2) - x^2)^2 = (2(1 - x^2))^2 = 4(1 - 2x^2 + x^4).$$

Thus the volume is given by

$$\int_{-1}^{1} 4(1 - 2x^2 + x^4) \, dx = 4 \left[ x - \frac{2}{3} x^3 + \frac{x^5}{5} \right]_{-1}^{1} = 4 \left( \left( 1 - \frac{2}{3} + \frac{1}{5} \right) - \left( -1 + \frac{2}{3} - \frac{1}{5} \right) \right) = \frac{64}{15}.$$

6.3.8 The curves intersect when $\sqrt{1 - x^2} = 0$, or $x = \pm 1$. The cross-sectional area at each $x$ is

$$A(x) = \left( \sqrt{1 - x^2} \right)^2 = 1 - x^2.$$

Thus the volume is given by

$$\int_{-1}^{1} (1 - x^2) \, dx = \left[ x - \frac{x^3}{3} \right]_{-1}^{1} = \left( 1 - \frac{1}{3} \right) - \left( -1 + \frac{1}{3} \right) = \frac{4}{3}.$$

6.3.9 The curves intersect when $\sqrt{\cos x} = 0$, or $x = \pm \frac{\pi}{2}$. The cross-sectional area at each $x$ is

$$A(x) = \frac{1}{2} \left( \sqrt{\cos x} \right)^2 = \frac{\cos x}{2}.$$

Thus the volume is given by

$$\int_{-\pi/2}^{\pi/2} \frac{\cos x}{2} \, dx = \frac{\sin x}{2} \bigg|_{-\pi/2}^{\pi/2} = \frac{1}{2} - \left( -\frac{1}{2} \right) = 1.$$

6.3.10 For each value of $y$, the base of the equilateral triangle is $2\sqrt{25 - y^2}$, so the area is

$$A(y) = \frac{\sqrt{3}}{4} \left( 2\sqrt{25 - y^2} \right)^2 = (25 - y^2)\sqrt{3},$$

since an equilateral triangle with side $s$ has area $\frac{\sqrt{3}}{4}s^2$. Then the volume is (by symmetry)

$$2 \int_{0}^{5} A(y) \, dy = 2\sqrt{3} \int_{0}^{5} (25 - y^2) \, dy = 2\sqrt{3} \left( 25y - \frac{y^3}{3} \right) \bigg|_{0}^{5} = \frac{500\sqrt{3}}{3}.$$ 

6.3.11 Assume the diameter is along the $y$ axis; then for each $x$, the cross-sectional area is

$$A(x) = (2\sqrt{25 - x^2})^2 = 100 - 4x^2.$$

Then the volume is

$$\int_{0}^{5} A(x) \, dx = \int_{0}^{5} (100 - 4x^2) \, dx = \left( 100x - \frac{4x^3}{3} \right) \bigg|_{0}^{5} = 500 - \frac{500}{3} = \frac{1000}{3}.$$

6.3.12 For each value of $y$, the base of the square has length $2\sqrt{y}$, so the cross-sectional area is $A(y) = (2\sqrt{y})^2 = 4y$. Thus the volume is

$$\int_{0}^{1} A(y) \, dy = \int_{0}^{1} 4y \, dy = 2y^2 \bigg|_{0}^{1} = 2.$$
6.3.13 For each value of \( x \), the height of the triangle is \( 2 - x \), which is the diameter of the semicircle, so the area of that semicircle is
\[
A(x) = \frac{1}{2} \pi \left( \frac{2 - x}{2} \right)^2 = \frac{\pi}{8} (x^2 - 4x + 4).
\]
Thus the volume is
\[
\int_0^2 A(x) \, dx = \int_0^2 \frac{\pi}{8} (x^2 - 4x + 4) \, dx = \frac{\pi}{8} \left[ \frac{x^3}{3} - 2x^2 + 4x \right]_0^2 = \frac{\pi}{3}.
\]

6.3.14 Place the \( z \) axis along the axis of the pyramid; then for each \( z \), using similarity, the side length of the cross-section of the pyramid at that height is \( 4 \cdot \frac{2z}{z} = 2(2 - z) \), so its area is \( A(z) = 4(z^2 - 4z + 4) \). Thus the volume is
\[
\int_0^2 A(z) \, dz = \int_0^2 4(z^2 - 4z + 4) \, dz = 4 \left[ \frac{z^3}{3} - 2z^2 + 4z \right]_0^2 = \frac{32}{3}.
\]

6.3.15 The relationship between the height \( h \) of tetrahedron and the edge length \( l \) is \( h = l \sqrt{\frac{2}{3}} \), which can be deduced using triangle geometry and the Pythagorean theorem. Orient the tetrahedron so that one vertex is at the origin and it is “balanced” at that point, so that the opposite face is on the plane \( z = 4 \). Then for any \( z \), the cross section at height \( z \) has, using similarity, side length \( z \sqrt{\frac{3}{2}} \), so the area of that cross section is
\[
A(z) = \frac{\sqrt{3}}{4} \left( \frac{z}{\sqrt{\frac{3}{2}}} \right)^2 = \frac{3\sqrt{3}}{8} z^2.
\]
Thus the volume is
\[
\int_0^{4\sqrt{2/3}} A(z) \, dz = \frac{3\sqrt{3}}{8} \int_0^{4\sqrt{2/3}} z^2 \, dz = \frac{3\sqrt{3}}{8} \left[ \frac{1}{3} z^3 \right]_0^{4\sqrt{2/3}} = \frac{\sqrt{3}}{3} \cdot 64 \cdot \frac{2\sqrt{2}}{3\sqrt{3}} = \frac{16\sqrt{2}}{3}.
\]

6.3.16 Because the cross sections are all circles with area \( \pi r^2 \), the volume is \( \int_0^h \pi r^2 \, dz = \pi r^2 h \). The 45 degree angle does not affect the volume.

6.3.17 \( V = \pi \int_0^3 (2x)^2 \, dx = \pi \int_0^3 4x^2 \, dx = 4\pi \left[ \frac{x^3}{3} \right]_0^3 = 36\pi \).

6.3.18 \( V = \pi \int_0^1 (2 - 2x)^2 \, dx = 4\pi \int_0^1 (1 - 2x + x^2) \, dx = 4\pi \left[ x - x^2 + \frac{x^3}{3} \right]_0^1 = \frac{4\pi}{3} \).

6.3.19 \( V = \pi \int_0^{\ln 4} (e^{-x})^2 \, dx = \pi \int_0^{\ln 4} e^{-2x} \, dx = -\frac{\pi}{2} \left( e^{-2x} \right)_0^{\ln 4} = -\frac{\pi}{2} \left( \frac{1}{16} - 1 \right) = \frac{15\pi}{32} \).

6.3.20 \( V = \pi \int_0^{\pi/2} \cos^2 x \, dx = \frac{\pi}{2} \int_0^{\pi/2} (1 + \cos 2x) \, dx = \frac{\pi}{2} \left[ x + \frac{\sin 2x}{2} \right]_0^{\pi/2} = \frac{\pi^2}{4} \).

6.3.21 \( V = \pi \int_0^\pi \sin^2 x \, dx = \frac{\pi}{2} \int_0^\pi (1 - \cos 2x) \, dx = \frac{\pi}{2} \left[ x - \frac{\sin 2x}{2} \right]_0^\pi = \frac{\pi^2}{2} \).

6.3.22 Using symmetry, \( V = 2\pi \int_0^{5/\sqrt{25 - x^2}} (25/2 - x)^5 \, dx = 2\pi \left( \frac{25x - x^3}{3} \right)_0^{500\pi/3} = \frac{500\pi}{3} \). The volume of a sphere of radius 5 is \( \frac{4}{3} \pi \cdot 5^3 = \frac{500\pi}{3} \).

6.3.23 \( V = \pi \int_0^{1/2} \left( \frac{1}{\sqrt{1 - x^2}} \right)^2 \, dx = \pi \int_0^{1/2} \frac{1}{\sqrt{1 - x^2}} \, dx = \pi \left[ \arcsin x \right]_0^{1/2} = \frac{\pi^2}{6} \).

Copyright © 2014 Pearson Education, Inc.
6.3.24 \( V = \pi \int_{0}^{\pi/4} \sec^2 x \, dx = \pi (\tan x)|_0^{\pi/4} = \pi \).

6.3.25 \( V = \pi \int_{-1}^{1} \frac{1}{\sqrt{1+x^2}} \, dx = \pi \left[ \tan^{-1} x \right]_{-1}^{1} = \pi \left( \frac{\pi}{4} + \frac{\pi}{4} \right) = \frac{\pi^2}{2} \).

6.3.26 \( V = \pi \int_{-1/2}^{1/2} \frac{1}{\sqrt{1-x^2}} \, dx = \pi \left[ \sin^{-1} x \right]_{-1/2}^{1/2} = \pi \left( \frac{\pi}{6} + \frac{\pi}{6} \right) = \frac{\pi^2}{3} \).

6.3.27 \( V = \pi \int_{0}^{4} \left( (2\sqrt{x})^2 - x^2 \right) \, dx = \pi \left( 2x^2 - \frac{x^3}{3} \right)|_0^{4} = \pi \left( \frac{2}{3} \cdot 3^3/2 - \frac{3^3}{3} \right) \left|_0^{4} \right. = \pi \left( \frac{2}{3} - \frac{1}{3} \right) = \frac{\pi}{3} \).

6.3.28 The curves intersect at \( x = 0 \) and \( x = 1 \). We have

\[
V = \pi \int_{0}^{1} (\sqrt{x}^2 - x^2) \, dx = \pi \int_{0}^{1} (\sqrt{x} - x^3) \, dx = \pi \left( \frac{2}{3} x^{3/2} - \frac{x^3}{3} \right)|_0^{1} = \pi \left( \frac{2}{3} - \frac{1}{3} \right) = \frac{\pi}{3} .
\]

6.3.29 We get

\[
V = \pi \int_{\ln 2}^{\ln 3} ((e^{x/2})^2 - (e^{-x/2})^2) \, dx = \pi \int_{\ln 2}^{\ln 3} (e^x - e^{-x}) \, dx = \pi \left( e^x + e^{-x} \right)|_{\ln 2}^{\ln 3} = \pi \left( 3 + \frac{1}{3} \right) - \left( 2 + \frac{1}{2} \right) = \frac{5\pi}{6} .
\]

6.3.30 \( V = \pi \int_{0}^{4} (x + 2)^2 - x^2 \, dx = \pi \int_{0}^{4} (4x + 4) \, dx = \pi \left( 2x^2 + 4x \right)|_0^{4} = 48\pi .
\]

6.3.31

\[
\begin{align*}
V & = \pi \int_{-1}^{2} (x + 3)^2 - (x^2 + 1)^2 \, dx \\
& = \pi \int_{-1}^{2} (x^2 + 6x + 9 - x^4 - 2x^2 - 1) \, dx \\
& = \pi \int_{-1}^{2} (-x^4 - x^2 + 6x + 8) \, dx \\
& = \pi \left( -\frac{1}{5} x^5 - \frac{1}{3} x^3 + 3x^2 + 8x \right)|_{-1}^{2} \\
& = \pi \left( -\frac{32}{5} - \frac{8}{3} + 12 + 16 - \left( \frac{1}{5} + \frac{1}{3} + 3 - 8 \right) \right) = \frac{117\pi}{5} .
\end{align*}
\]

6.3.32 \( V = \pi \int_{0}^{\pi/2} (1 - \sin x) \, dx = \pi (x + \cos x)|_{0}^{\pi/2} = \pi \left( \frac{\pi}{2} - 1 \right) .
\]

6.3.33

\[
\begin{align*}
V & = \pi \int_{0}^{\pi/2} (\sin x - \sin^2 x) \, dx = \pi \int_{0}^{\pi/2} \left( \sin x - \frac{1}{2} (1 - \cos 2x) \right) \, dx \\
& = \pi \left( \frac{\sin 2x}{4} - \cos x - \frac{x}{2} \right)|_{0}^{\pi/2} \\
& = \pi \left( 1 - \frac{\pi}{4} \right) = \frac{4\pi - \pi^2}{4} .
\end{align*}
\]
6.3.34 Note that the curves intersect at \( x = \pm 1 \). Split into two integrals to account for the absolute value. We get

\[
V = \pi \int_{-1}^{0} ((2 - x^2)^2 - (-x)^2) \, dx + \pi \int_{0}^{1} ((2 - x^2)^2 - x^2) \, dx
\]

\[
= \pi \int_{-1}^{1} (4 - 4x^2 + x^4 - x^2) \, dx
\]

\[
= \pi \int_{-1}^{1} (4 - 5x^2 + x^4) \, dx
\]

\[
= \pi \left( \left. \left( 4x - \frac{5}{3}x^3 + \frac{1}{5}x^5 \right) \right|_{-1}^{1} \right)
\]

\[
= \pi \left( \left( 4 - \frac{5}{3} + \frac{1}{5} \right) - \left( -4 + \frac{5}{3} - \frac{1}{5} \right) \right) = \frac{76\pi}{15}.
\]

6.3.35 \( V = \pi \int_{0}^{6} \left( y^2 - \frac{y^2}{4} \right) \, dy = \frac{3\pi}{4} \left( \frac{y^3}{3} \right)_{0}^{6} = 54\pi. \)

6.3.36 \( V = \pi \int_{0}^{2} e^{2y} \, dy = \frac{\pi(e^4 - 1)}{2}. \)

6.3.37 \( V = \pi \int_{0}^{8} (4 - y^{2/3}) \, dy = \pi \left( 4y - \frac{3}{5}y^{5/3} \right)_{0}^{8} = \frac{64\pi}{5}. \)

6.3.38 \( V = \pi \int_{0}^{2} (16 - y^4) \, dy = \pi \left( 16y - \frac{y^5}{5} \right)_{0}^{2} = \frac{128\pi}{5}. \)

6.3.39 \( V = \pi \int_{-2}^{2} \left( \sqrt{4 - y^2} \right)^2 \, dy = \pi \left( 4y - \frac{y^3}{3} \right)_{-2}^{2} = \pi \left( \left( 8 - \frac{8}{3} \right) - \left( -8 + \frac{8}{3} \right) \right) = \frac{32\pi}{3}. \)

6.3.40 \( V = \pi \int_{0}^{\pi/4} \sin^2 y \, dy = \frac{\pi}{2} \int_{0}^{\pi/4} (1 - \cos 2y) \, dy = \frac{\pi}{2} \left( y - \frac{\sin 2y}{2} \right)_{0}^{\pi/4} = \frac{\pi}{2} \left( \frac{\pi}{4} - \frac{1}{2} \right) = \frac{\pi(\pi - 2)}{8}. \)

6.3.41 About the \( x \)-axis, we get

\[
V_x = \pi \int_{0}^{5} 4x^2 \, dx = \pi \left( \frac{4}{3}x^3 \right)_{0}^{5} = \frac{500\pi}{3}.
\]

About the \( y \)-axis we get

\[
V_y = \pi \int_{0}^{10} \left( 25 - \frac{y^2}{4} \right) \, dy = \pi \left( 25y - \frac{y^3}{12} \right)_{0}^{10} = \frac{500\pi}{3}.
\]

The volumes are the same.

6.3.42 About the \( x \)-axis we get

\[
V_x = \pi \int_{0}^{2} (4 - 2x)^2 \, dx = 4\pi \left( 4x - 2x^2 + \frac{x^3}{3} \right)_{0}^{2} = \frac{32\pi}{3}.
\]

About the \( y \)-axis we get

\[
V_y = \pi \int_{0}^{4} \left( 2 - \frac{y}{2} \right)^2 \, dy = \pi \left( 4y - y^2 + \frac{y^3}{12} \right)_{0}^{4} = \frac{16\pi}{3}.
\]

The volume \( V_x \) is bigger.
6.3.43 About the $x$-axis we get

\[ V_x = \pi \int_0^1 (1 - x^3)^2 \, dx = \pi \int_0^1 (1 - 2x^3 + x^6) \, dx = \pi \left( x - \frac{x^4}{2} + \frac{x^7}{7} \right) \bigg|_0^1 = \frac{9\pi}{14}. \]

About the $y$-axis we get

\[ V_y = \pi \int_0^1 (\sqrt[3]{1 - y})^2 \, dy = -\pi \left( \frac{3}{5} (1 - y)^{5/3} \right) \bigg|_0^1 = -\pi \left( 0 - \frac{3}{5} \right) = \frac{3\pi}{5}. \]

The volume $V_x$ is bigger.

6.3.44 About the $x$-axis we get

\[ V_x = \pi \int_0^2 (8x - x^4) \, dx = \pi \left( 4x^2 - \frac{x^5}{5} \right) \bigg|_0^2 = \frac{48\pi}{5}. \]

About the $y$-axis we get

\[ V_y = \pi \int_0^4 \left( y - \frac{y^4}{64} \right) \, dy = \pi \left( \frac{y^2}{2} - \frac{y^5}{320} \right) \bigg|_0^4 = \frac{24\pi}{5}. \]

The volume $V_x$ is bigger.

6.3.45 A plot of the region and the line of revolution (dotted line) is

Using the disk method, a disk located at $x$ has a radius of $1 - \sqrt{x}$ when revolved about the line $y = 1$, so the volume is

\[ V = \pi \int_0^1 (1 - \sqrt{x})^2 \, dx = \pi \int_0^1 (1 - 2\sqrt{x} + x) \, dx = \pi \left( x - \frac{4}{3} x^{3/2} + \frac{1}{2} x^2 \right) \bigg|_0^1 = \pi \left( 1 - \frac{4}{3} + \frac{1}{2} \right) = \frac{\pi}{6}. \]

6.3.46 A plot of the region and the line of revolution (dotted line) is
Use the washer method. First solve \( y = \sqrt{x} \) for \( x \) to get \( x = y^2 \). Then for each value of \( y \), the washer has outer radius 4 and inner radius \( 4 - y^2 \), so that the volume is

\[
V = \pi \int_0^2 \left( 4^2 - (4 - y^2)^2 \right) dy = \pi \int_0^2 (8y^2 - y^4) \, dy = \pi \left( \frac{8}{3} y^3 - \frac{1}{5} y^5 \right) \bigg|_0^2 = \pi \left( \frac{64}{3} - \frac{32}{5} \right) = \frac{224}{15} \pi.
\]

6.3.47 A plot of the region and the line of revolution (dotted line) is

Use the washer method. For each \( x \), the washer has outer radius \( 2 + 2 \sin x \) and inner radius 2, so the volume is

\[
V = \pi \int_0^\pi \left( (2 + 2 \sin x)^2 - 2^2 \right) \, dx
\]

\[
= \pi \int_0^\pi (8 \sin x + 4 \sin^2 x) \, dx
\]

\[
= \pi \int_0^\pi (8 \sin x + 2(1 - \cos 2x)) \, dx
\]

\[
= \pi \left( -8 \cos x + 2x - \sin 2x \right) \bigg|_0^\pi
\]

\[
= \pi (8 + 2\pi + 8) = 2\pi(\pi + 8).
\]

6.3.48 A plot of the region and the line of revolution (dotted line) is

Use the washer method. First solve for \( x \) to get \( x = e^y \); then for each value of \( y \), the outer radius is \( e^y + 1 \) and the inner radius is 1, so the volume is

\[
V = \pi \int_0^1 \left( (e^y + 1)^2 - 1^2 \right) \, dy
\]

\[
= \pi \int_0^1 (2e^y + 2e^{2y}) \, dy = \pi \left( 2e^y + \frac{1}{2} e^{2y} \right) \bigg|_0^1
\]

\[
= \pi \left( 2e + \frac{1}{2} e^2 - \frac{5}{2} \right) = \frac{\pi}{2} (e^2 + 4e - 5).
\]
6.3.49 A plot of the region and the line of revolution (dotted line) is

![Plot of the region and the line of revolution](image)

The upper curve is \( \sin x \) and the lower curve is \( 1 - \sin x \). Use the washer method. For each \( x \), the outer radius is \( 1 + \sin x \) and the inner radius is \( 1 + (1 - \sin x) = 2 - \sin x \). Thus the volume is

\[
V = \pi \int_{\pi/6}^{5\pi/6} \left( (1 + \sin x)^2 - (2 - \sin x)^2 \right) dx
= \pi \int_{\pi/6}^{5\pi/6} (6 \sin x - 3) dx
= \pi \left. (-6 \cos x - 3x) \right|_{\pi/6}^{5\pi/6}
= \pi \left( 3\sqrt{3} - \frac{5\pi}{2} + 3\sqrt{3} + \frac{\pi}{2} \right) = \pi \left( 6\sqrt{3} - 2\pi \right).
\]

6.3.50 A plot of the region and the line of revolution (dotted line) is

![Plot of the region and the line of revolution](image)

The upper line is \( y = 1 + \frac{x^2}{2} \) and the lower line is \( y = x \). The two meet when \( x = 1 + \frac{\pi}{2} \), so when \( x = 2 \) (and \( y = 2 \)). Then for each \( x \) we get a washer with outer radius \( 3 - x \) and inner radius \( 3 - \left( 1 + \frac{\pi}{2} \right) = 2 - \frac{\pi}{2} \). Hence the volume is

\[
V = \pi \int_{0}^{2} \left( (3 - x)^2 - \left( 2 - \frac{x}{2} \right)^2 \right) dx = \pi \int_{0}^{2} \left( 5 - 4x + \frac{3}{4}x^2 \right) dx = \pi \left. \left( 5x - 2x^2 + \frac{1}{4}x^3 \right) \right|_{0}^{2} = 4\pi.
\]
### 6.3.51 A plot of the region and the line of revolution (dotted line) is

Solving the two equations for $x$ gives $x = 2 - y$ and $x = 1 - \frac{y}{2}$; the right-hand line is $x = 2 - y$. Then for each $y$, we get a washer whose outer radius is $3 - \left(1 - \frac{y}{2}\right) = 2 + \frac{y}{2}$ and whose inner radius is $3 - (2 - y) = y + 1$. Thus the volume is

$$V = \pi \int_{0}^{2} \left( \left(2 + \frac{y}{2}\right)^2 - (y + 1)^2 \right) dy = \pi \int_{0}^{2} \left( \frac{3}{4} y^2 + 3 \right) dy = \pi \left( -\frac{1}{4} y^3 + 3y \right)^{2}_{0} = 4\pi.$$

### 6.3.52 A plot of the region is

We would expect the volume to be greater when revolved about the line $y = 2$, since the wider portion of the figure then moves through a larger radius, so it traces out a larger volume. When revolving about $y = 0$, we get a disk with radius $2x(2 - x)$, so the volume is

$$V = \pi \int_{0}^{2} (2x(2 - x))^2 \, dx = \pi \int_{0}^{2} (16x^2 - 16x^3 + 4x^4) \, dx = \left( \frac{16}{3} x^3 - 4x^4 + \frac{4}{5} x^5 \right)^{2}_{0} = \frac{64\pi}{15}.$$
is

\[ V = \pi \int_{0}^{2} (4 - (2 - 2x(2 - x))^2) \, dx \]
\[ = \pi \int_{0}^{2} (8x(2 - x) - 4x^2(2 - x)^2) \, dx \]
\[ = \pi \int_{0}^{2} (-4x^4 + 16x^3 - 24x^2 + 16) \, dx \]
\[ = \pi \left( \frac{4}{5}x^5 + 4x^4 - 8x^3 + 8x^2 \right) \bigg|_{0}^{2} \]
\[ = \frac{32}{5} \pi. \]

Indeed, the second is larger.

6.3.53

a. False. The cross sections are not disks or washers.

b. True. The cross-section at \( x \) is a semicircle of radius \( \sqrt{R^2 - x^2} \) where \( R \) is the radius of the hemisphere, so the volume is given by
\[ V = \pi \int_{0}^{R} (\sqrt{R^2 - x^2})^2 \, dx = \pi \int_{0}^{R} (R^2 - x^2) \, dx. \]

c. True. This is because if we shift the sine function horizontally by \( \frac{\pi}{2} \) units, we obtain the cosine function.

6.3.54

\[ V = \pi \int_{1}^{2} \left( \frac{\ln x}{\sqrt{x}} \right)^2 \, dx = \pi \int_{1}^{2} \frac{\ln^2 x}{x} \, dx \]
\[ = \frac{\pi}{3} (\ln^3 x) \bigg|_{1}^{2} = \frac{\pi \ln^3 2}{3}. \]

6.3.55

\[ V = \pi \int_{2}^{6} \left( \frac{1}{\sqrt{x}} \right)^2 \, dx = \pi \ln x \bigg|_{2}^{6} = \pi \ln 3. \]
6.3.56

\[ V = \pi \int_{-1}^{1} \left( \frac{1}{x^2 + 1} - \frac{1}{2} \right) \, dx \]
\[ = \pi \left( \tan^{-1} x - \frac{x}{2} \right)_{-1}^{1} \]
\[ = \pi \left( \left( \frac{\pi}{4} - \frac{1}{2} \right) - \left( -\frac{\pi}{4} + \frac{1}{2} \right) \right) = \frac{\pi^2}{2} - \pi. \]

6.3.57

\[ V = \pi \int_{0}^{2} e^{2x} \, dx = \frac{\pi}{2} (e^{2x})_{0}^{2} = \frac{\pi}{2} (e^4 - 1). \]

6.3.58

\[ V = \pi \int_{0}^{\ln 4} (e^{2x} - e^{-2x}) \, dx = \frac{\pi}{2} (e^{2x} + e^{-2x})_{0}^{\ln 4} \]
\[ = \frac{\pi}{2} \left( 16 + \frac{1}{16} - 2 \right) = \frac{225\pi}{32}. \]

6.3.59

\[ V = \pi \int_{0}^{\ln 8} (e^{2y} - e^{y}) \, dy \]
\[ = \pi \left( \frac{e^{2y} - e^{y}}{2} \right)_{0}^{\ln 8} \]
\[ = \pi \left( 32 - 8 - \left( \frac{1}{2} \right) \right) = \frac{49}{2} \pi. \]

6.3.60 \( V(p) = \pi \int_{0}^{p} (e^{-x})^2 \, dx = \pi \int_{0}^{p} e^{-2x} \, dx = -\frac{\pi}{2} (e^{-2x})_{0}^{p} = \frac{\pi}{2} (1 - e^{-2p}). \) As \( p \to \infty, \) we get

\[ \lim_{p \to \infty} \frac{\pi}{2} \left( 1 - e^{-2p} \right) = \frac{\pi}{2} \left( 1 - \lim_{p \to \infty} e^{-2p} \right) = \frac{\pi}{2}. \]

Copyright © 2014 Pearson Education, Inc.
6.3.61 To compute $V_s$, first solve for $x$ to get $x = y^2 - a$; then for each $y$, we get a disk with radius $a - y^2$ (note this is $a - y^2$, not $y^2 - a$, since $x$ is negative), so

$$V_s = \pi \int_0^{\sqrt{a}} (a - y^2)^2 dy = \pi \int_0^{\sqrt{a}} (a^2 - 2ay^2 + y^4) dy = \pi \left[ a^2y - \frac{2a}{3}y^3 + \frac{1}{5}y^5 \right]_0^{\sqrt{a}}$$

$$= \pi \left( a^{5/2} - \frac{2}{3}a^{5/2} + \frac{1}{5}a^{5/2} \right) = \frac{8\pi}{15}a^{5/2}.$$

The volume of a cone is one third the area of the base times the height. Since the cone is inscribed in the solid, its circular base has diameter $2a$, so radius $a$ and its height is $\sqrt{a}$, so we get $V_T = \frac{1}{3} \pi \cdot a^2 \cdot \sqrt{a} = \frac{\pi}{3}a^{5/2}$, and $\frac{V_s}{V_T} = \frac{8\pi/15}{\pi/3} = \frac{8}{5}$.

6.3.62 We must split this into three separate integrals, each using the disk method:

$$V = \pi \int_0^2 x^2 \, dx + \pi \int_2^5 (2x - 2)^2 \, dx + \pi \int_5^6 (18 - 2x)^2 \, dx = \frac{8}{3}\pi + 84\pi + \frac{148\pi}{3} = 136\pi.$$

6.3.63

a. This comes from revolving the region in the first quadrant bounded by $\sin x$ and the line $y = 0$ between $x = 0$ and $x = \pi$ around the $x$ axis.

b. This comes from revolving the region in the first quadrant bounded by $y = x + 1$ and the line $y = 0$ between $x = 0$ and $x = 2$ around the $x$ axis.
6.3.64 Since each cross-section is a circle whose radius is half the number shown, the left Riemann sum is
(factoring out the \( \pi \))
\[
\pi \left( \left( \frac{12.6}{2} \right)^2 + \left( \frac{14.0}{2} \right)^2 + \left( \frac{16.8}{2} \right)^2 + \left( \frac{25.2}{2} \right)^2 + \left( \frac{36.4}{2} \right)^2 + \left( \frac{42.0}{2} \right)^2 \right) \left( \frac{50}{6} \right) \approx 28542.7 \text{ cm}^3.
\]

6.3.65

a. Think of the cone as being obtained by revolving the region under \( y = x \) in the first quadrant from \( x = 0 \) to \( x = R \) around the \( x \)-axis. The volume is \( \pi \int_0^R x^2 \, dx = \pi R^3/3 = \frac{1}{3} V_C \).

b. Think of the hemisphere as being obtained by revolving the region under \( y = \sqrt{R^2 - x^2} \) between \( x = 0 \) and \( x = R \) around the \( x \)-axis. The volume is \( \pi \int_0^R (R^2 - x^2) \, dx = \pi \left( R^2 x - \frac{x^3}{3} \right)_0^R = \frac{2\pi R^3}{3} = V_h \).

6.3.66 The bowl is the surface of revolution when \( y = -\sqrt{64 - x^2} \) for \( 0 \leq x \leq 8 \) is revolved about the \( y \)-axis. Solving for \( x \) gives \( x = \sqrt{64 - y^2} \). Thus the volume of water in the bowl up to height \( h \) is the volume integral for the bowl evaluated from \(-8 \) (the bottom) to \(-8 + h \) (\( h \) above the bottom):
\[
V(h) = \pi \int_{-8}^{-8+h} \left( \sqrt{64 - y^2} \right)^2 \, dy = \pi \left( 64y - \frac{y^3}{3} \right)_{-8}^{-8+h} = 8\pi h^2 - \frac{\pi h^3}{3}.
\]

Note that \( V(0) = 0 \), which is obviously correct. We also have
\[
V(8) = 8\pi \cdot 8^2 - \frac{\pi}{3} \cdot 8^3 = \frac{1024}{3} \pi.
\]

This number should be the volume of a hemisphere of radius 8, which is \( \frac{1}{2} \cdot \frac{4}{3} \pi \cdot 8^3 = \frac{1024}{3} \pi \). Thus \( V(8) \) is also correct.

6.3.67 The equation of the circle is \((x - 3)^2 + y^2 = 4\), or \( x = 3 \pm \sqrt{4 - y^2} \). So for each \( y \), we get a washer with outer radius \( 3 + \sqrt{4 - y^2} \) and inner radius \( 3 - \sqrt{4 - y^2} \), so the volume of the torus is
\[
V = \pi \int_{-2}^{2} \left( (3 + \sqrt{4 - y^2})^2 - (3 - \sqrt{4 - y^2})^2 \right) \, dy = 12\pi \int_{-2}^{2} \sqrt{4 - y^2} \, dy.
\]

The integral is the area of a semicircle of radius 2, so its value is \( 2\pi \) and thus \( V = 12\pi \cdot 2\pi = 24\pi^2 \).

6.3.68 The two curves meet at \( x = 0 \) and at \( x = 1 \). Revolving about the \( x \)-axis we get washers with outer radius \( \sqrt{x} \) and inner radius \( x^2 \), so the volume is
\[
V_x = \pi \int_0^1 \left( (\sqrt{x})^2 - (x^2) \right) \, dx = \pi \int_0^1 (x - x^4) \, dx = \pi \left( \frac{x^2}{2} - \frac{x^5}{5} \right)_0^1 = \pi \left( \frac{1}{2} - \frac{1}{5} \right) = \frac{3\pi}{10}.
\]

When revolving about \( y = 1 \) we first solve for \( x \) to get \( x = \sqrt{y} \) and \( x = y^2 \), so for each \( y \) we get washers with outer radius \( 1 - y^2 \) and inner radius \( 1 - \sqrt{y} \), so that
\[
V_1 = \pi \int_0^1 \left( (1 - y^2)^2 - (1 - \sqrt{y})^2 \right) \, dy
= \pi \int_0^1 \left( -2y^2 + y^4 + 2\sqrt{y} - y \right) \, dy
= \pi \left( \frac{2}{3}y^3 + \frac{1}{5}y^5 + \frac{4}{3}y^{3/2} - \frac{1}{2}y^2 \right)_0^1
= \pi \left( -\frac{2}{3} + \frac{1}{5} + \frac{4}{3} - \frac{1}{2} \right) = \frac{11\pi}{30}.
\]

Thus \( V_1 > V_x \).
6.3.69  
(a) By the general slicing method, \( V(x) = \int_a^b A(x) \, dx \). Because the two figures have the same cross sections \( A(x) \), they must therefore have the same volumes.

(b) We are seeking the value of \( r \) so that \( 10\pi r^2 = 40 \), so \( r^2 = \frac{4}{\pi} \), and \( r = \frac{2}{\sqrt{\pi}} \) meters.

6.3.70  
(a) \( V(n) = \pi \int_0^1 \left( x^{2/n} - x^{2n} \right) \, dx = \pi \left( \frac{n}{n + 2} x^{(n+2)/n} - \frac{1}{2n+1} x^{2n+1} \right) \bigg|_0^1 = \pi \left( \frac{n}{n + 2} - \frac{1}{2n+1} \right) = \frac{2\pi(n^2 - 1)}{(n+2)(2n+1)}. \)

(b) \( \lim_{n \to \infty} V(n) = \lim_{n \to \infty} \frac{2n^2 - 2n^2 + 5n + 2}{2n^2 + 5n + 2} \cdot \pi = \pi. \)

6.4 Volume by Shells

6.4.1 \( V = 2\pi \int_a^b x(f(x) - g(x)) \, dx. \)

6.4.2 ... revolved about the \( y \) axis. ... using the disk/washer method and integrating with respect to \( y \) or using the shell method and integrating with respect to \( x \).

6.4.3 ... revolved about the \( x \) axis. ... using the disk/washer method and integrating with respect to \( x \) or using the shell method and integrating with respect to \( y \).

6.4.4 No, it depends on the function. There are examples where the disk/washer method leads to easier-to-compute integrals, and examples where the shell method leads to easier-to-compute integrals.

6.4.5 \( V = 2\pi \int_0^1 x(x - x^2) \, dx = 2\pi \int_0^1 (x^2 - x^3) \, dx = 2\pi \left( \frac{x^3}{3} - \frac{x^4}{4} \right) \bigg|_0^1 = 2\pi \left( \frac{1}{3} - \frac{1}{4} \right) = \frac{\pi}{6}. \)

6.4.6

\[
V = 2\pi \int_1^4 x((-x^2 + 4x + 2) - (x^2 - 6x + 10)) \, dx \\
= 2\pi \int_1^4 (-2x^3 + 10x^2 - 8x) \, dx \\
= 2\pi \left( -\frac{1}{2} x^4 + \frac{10}{3} x^3 - 4x^2 \right) \bigg|_1^4 \\
= 2\pi \left( -128 + 640 - 64 - \left(-\frac{1}{2} + \frac{10}{3} - 4 \right) \right) = 45\pi.
\]

6.4.7 \( V = 2\pi \int_0^2 \frac{x}{1+x^2} \, dx = \pi \ln(1 + x^2) \bigg|_0^2 = \pi \ln 5. \)

6.4.8 \( V = 2\pi \int_2^4 x(6 - x) \, dx = 2\pi \left( 3x^2 - \frac{x^3}{3} \right) \bigg|_2^4 = \frac{104\pi}{3}. \)

6.4.9 \( V = 2\pi \int_0^1 x(3 - 3x) \, dx = 2\pi \left( \frac{3}{2} x^2 - \frac{x^3}{3} \right) \bigg|_0^1 = \pi. \)
6.4.10 $V = 2\pi \int_0^1 x(1 - x^2) \, dx = 2\pi \int_0^1 (x - x^3) \, dx = 2\pi \left( \frac{x^2}{2} - \frac{x^4}{4} \right)^1_0 = 2\pi \left( \frac{1}{2} - \frac{1}{4} \right) = \frac{\pi}{2}.$

6.4.11 Note that the line $y = 1$ intersects the curve $y = x^3 - x^8 + 1$ at $x = 0$ and $x = 1$. Then

$$V = 2\pi \int_0^1 x(x^3 - x^8 + 1 - 1) \, dx = 2\pi \int_0^1 (x^4 - x^9) \, dx = 2\pi \left( \frac{x^5}{5} - \frac{x^{10}}{10} \right)|^1_0 = 2\pi \left( \frac{1}{5} - \frac{1}{10} \right) = \frac{\pi}{5}.$$

6.4.12 $V = 2\pi \int_0^1 x\sqrt{x} \, dx = 2\pi \left( \frac{2}{5} x^{5/2} \right)|^1_0 = \frac{4\pi}{5}.$

6.4.13 $V = 2\pi \int_0^\sqrt{\frac{\pi}{2}} x\cos x^2 \, dx = \pi \sin x^2|_0^\sqrt{\frac{\pi}{2}} = \pi.$

6.4.14 $V = 2\pi \int_0^\sqrt{\pi} x\sqrt{4 - 2x^2} \, dx = 2\pi \left( -\frac{1}{6} (4 - 2x^2)^{3/2} \right)|^\sqrt{\pi}_0 = 2\pi \left( 0 + \frac{4}{3} \right) = \frac{8\pi}{3}.$

6.4.15 $V = 2\pi \int_0^2 y(4 - y^2) \, dy = 2\pi \left( 2y^2 - \frac{y^4}{4} \right)|^2_0 = 8\pi.$

6.4.16 $V = 2\pi \int_2^6 \frac{y(y - 2)}{2} \, dy + 2\pi \int_6^8 2y \, dy = 2\pi \left( \frac{y^3}{6} - \frac{y^2}{2} \right)|^6_2 + 2\pi \left( y^2 \right)|^8_6 = \frac{112\pi}{3} + 56\pi = \frac{280\pi}{3}.$

6.4.17 $V = 2\pi \int_2^4 y(4 - y) \, dy = 2\pi \left( 2y^2 - \frac{y^3}{3} \right)|^4_2 = \frac{32\pi}{3}.$

6.4.18

$$V = 2\pi \int_1^\sqrt{3} y \left( \frac{4}{y + y^3} - \frac{1}{\sqrt{3}} \right) \, dy$$

$$= 2\pi \int_1^\sqrt{3} \left( \frac{4}{1 + y^2} - \frac{y}{\sqrt{3}} \right) \, dy$$

$$= 2\pi \left( 4 \tan^{-1} y - \frac{y^2}{2\sqrt{3}} \right)|^\sqrt{3}_1$$

$$= 2\pi \left( \left( \frac{4\pi}{3} - \frac{3}{2\sqrt{3}} \right) - \left( \pi - \frac{1}{2\sqrt{3}} \right) \right)$$

$$= 2\pi \left( \frac{\pi}{3} - \frac{1}{\sqrt{3}} \right) = \frac{2\pi}{3} \left( \pi - \sqrt{3} \right).$$

6.4.19 Note that the lines intersect at $(0,0)$, $(2,0)$ and $(1,1)$. Thus

$$V = 2\pi \int_0^1 y((2 - y) - y) \, dy = 2\pi \int_0^1 (2y - 2y^2) \, dy = 2\pi \left( \frac{y^2}{3} - \frac{y^3}{2} \right)|^1_0 = \frac{2\pi}{3}.$$

6.4.20 Note that the line $x = 4$ intersects the curve $x = y^2$ at $(4,2)$, so that

$$V = 2\pi \int_0^2 y(4 - y^2) \, dy = 2\pi \int_0^2 (4y - y^3) \, dy = 2\pi \left( \frac{2y^2}{3} - \frac{y^4}{4} \right)|^2_0 = 8\pi.$$

6.4.21 $V = 2\pi \int_0^3 y(y^2) \, dy = 2\pi \int_0^3 y^3 \, dy = 2\pi \left( \frac{y^4}{4} \right)|^3_0 = \frac{81\pi}{2}.$

Copyright © 2014 Pearson Education, Inc.
6.4.22 \ V = 2\pi \int_{0}^{1} y (\sqrt[3]{y}) \, dy = 2\pi \int_{0}^{1} y^{4/3} \, dy = 2\pi \left(\frac{3}{4} y^{7/3}\right)|_{0}^{1} = \frac{6\pi}{7}.

6.4.23

\begin{align*}
V &= 2\pi \int_{2}^{16} y \left(\frac{2}{y}\right)^{2/3} \, dy = 2^{5/3}\pi \int_{2}^{16} y^{1/3} \, dy = 2^{5/3}\pi \left(\frac{3}{4} y^{4/3}\right)|_{2}^{16} \\
&= 2^{5/3}\pi (3 \cdot 2^{10/3} - 3 \cdot 2^{-2/3}) = 3\pi(2^{5} - 2) = 90\pi.
\end{align*}

6.4.24 \ V = 2\pi \int_{0}^{\sqrt[3]{2}} y \sin y^{2} \, dy = -\pi \cos y^{2}|_{0}^{\sqrt[3]{2}} = -\pi(0 - 1) = \pi.

6.4.25 Note that \( y = \sqrt[3]{\cos^{-1} x} \) intersects the axes at \((0, \sqrt[3]{2})\) and \((1, 0)\). Then

\begin{align*}
V &= 2\pi \int_{0}^{\sqrt[3]{2}} y \cos y^{2} \, dy = \pi \sin y^{2}|_{0}^{\sqrt[3]{2}} = \pi(1 - 0) = \pi.
\end{align*}

6.4.26

\begin{align*}
V &= 2\pi \int_{0}^{5\sqrt[2]{2}} y\sqrt{(50 - y^{2})/2} \, dy = \pi \sqrt{2} \int_{0}^{5\sqrt[2]{2}} y\sqrt{50 - y^{2}} \, dy.
\end{align*}

Now use the substitution \( u = 50 - y^{2}; \) then \( du = -2y \, dy, \) and \( x = 0 \) corresponds to \( u = 50 \) while \( x = 5\sqrt[2]{2} \) corresponds to \( u = 0, \) so we get

\begin{align*}
V &= -\pi \sqrt{2} \cdot \frac{1}{2} \int_{50}^{0} u^{1/2} \, du = -\pi \sqrt{2} \left(\frac{2}{3} u^{3/2}\right)|_{50}^{0} = -\pi \sqrt{2} \left(-\frac{2}{3} \cdot 50^{3/2}\right) = \frac{500\pi}{3}.
\end{align*}

6.4.27 Consider the region in the first quadrant bounded by the coordinate axes and the line \( y = 8 - \frac{8}{3}x. \) We can generate the desired cone by revolving this region around the \( y \)-axis. We then have

\begin{align*}
V &= 2\pi \int_{0}^{3} x \left(8 - \frac{8}{3} x\right) \, dx = 16\pi \int_{0}^{3} (3x - x^{2}) \, dx = 16\pi \left(\frac{3}{2} x^{2} - \frac{x^{3}}{3}\right)|_{0}^{3} = 24\pi.
\end{align*}

6.4.28 Consider the rectangle in the first quadrant bounded by \( x = 2, \ x = 4, \ y = 6 \text{ and } y = 0. \) The solid in question is formed by revolving this region around the \( y \)-axis. The volume is

\begin{align*}
V &= 2\pi \int_{0}^{4} 6x \, dx = 2\pi \left(3x^{2}\right)|_{2}^{4} = 72\pi.
\end{align*}

6.4.29 Consider the triangle in the first quadrant bounded by \( y = 0, \ x = 3, \) and \( y = 9 - \frac{3}{2}x. \) The solid in question is formed by revolving this region around the \( y \)-axis. The volume is

\begin{align*}
V &= 2\pi \int_{3}^{6} x \left(9 - \frac{3}{2} x\right) \, dx = 2\pi \left(\frac{9}{2} x^{2} - \frac{x^{3}}{2}\right)|_{3}^{6} = 54\pi.
\end{align*}

6.4.30 Consider the region in the first and second quadrants bounded by \( x = 3 \text{ and the circle } x^{2} + y^{2} = 36. \) The solid in question is formed by revolving this region around the \( y \)-axis. The volume is

\begin{align*}
V &= 4\pi \int_{3}^{6} x\sqrt{36 - x^{2}} \, dx.
\end{align*}

This integral can be computing using the substitution \( u = 36 - x^{2}, \) so that \( du = -2x \, dx, \) and \( x = 3 \) corresponds to \( u = 27 \) while \( x = 6 \) corresponds to \( u = 0. \) We then have

\begin{align*}
V &= -2\pi \int_{27}^{0} u^{1/2} \, du = -2\pi \left(\frac{2}{3} u^{3/2}\right)|_{27}^{0} = 108\sqrt{3}\pi.
\end{align*}
6.4.31 Consider the part of the ellipse which lies in the first quadrant. We can obtain half the ellipsoid by revolving this region around the $y$-axis. So the volume of the whole ellipsoid is

$$V = 4\pi \int_0^2 x \sqrt{2 - \frac{x^2}{2}} \, dx.$$ 

Let $u = 2 - \frac{x^2}{2}$, so that $du = -x \, dx$, and $x = 0$ corresponds to $u = 2$ while $x = 2$ corresponds to $u = 0$. Then

$$V = -4\pi \int_2^0 u^{1/2} \, du = -4\pi \left( \frac{2}{3} u^{3/2} \right)_2^0 = \frac{16\pi \sqrt{2}}{3}.$$ 

6.4.32 $V = 2\pi \int_r^R x \cdot 6 \left( 1 - \frac{x^2}{R^2} \right) \, dx = 12\pi \left( \frac{x^2}{2} - \frac{x^4}{4R^2} \right)_r^R = \frac{3\pi (R^2 - r^2)^2}{R^2}.$$

6.4.33 The shell radius at $x$ is $x + 2$ and the height is $x^2$:

$$V = 2\pi \int_0^1 (x + 2)x^2 \, dx = 2\pi \left( \frac{x^4}{4} + \frac{2}{3}x^3 \right)_0^1 = \frac{11\pi}{6}.$$ 

6.4.34 The shell radius is $1 - x$ and the height is $x^2$:

$$V = 2\pi \int_0^1 (1 - x)x^2 \, dx = 2\pi \left( \frac{x^3}{3} - \frac{x^4}{4} \right)_0^1 = \frac{\pi}{6}.$$ 

6.4.35 Solving for $x$ gives $x = \sqrt{y}$. For each $y$, the radius is $y + 2$ and the height is $1 - \sqrt{y}$:

$$V = 2\pi \int_0^1 (y + 2)(1 - \sqrt{y}) \, dy = 2\pi \int_0^1 (y + 2 - y^{3/2} - 2y^{1/2}) \, dy$$

$$= 2\pi \left( \frac{y^2}{2} + 2y - \frac{2}{5}y^{5/2} - \frac{4}{3}y^{3/2} \right)_0^1 = 2\pi \left( \frac{1}{2} + 2 - \frac{2}{5} - \frac{4}{3} \right) = \frac{23\pi}{15}.$$ 

6.4.36 Solving for $x$ gives $x = \sqrt{y}$. For each $y$, the radius is $2 - y$ and the height is $1 - \sqrt{y}$:

$$V = 2\pi \int_0^1 (1 - \sqrt{y})(2 - y) \, dy = 2\pi \int_0^1 (2 - y - 2y^{1/2} + y^{3/2}) \, dy$$

$$= 2\pi \left( 2y - \frac{y^2}{2} - \frac{4}{3}y^{3/2} + \frac{2}{5}y^{5/2} \right)_0^1 = \frac{17\pi}{15}.$$ 

6.4.37 The region is bounded above by $y = 1$, so its upper right corner is at $(1,1)$. Using washers, we have

$$V = \pi \int_0^1 (3^2 - (x^2 + 2)^2) \, dx$$

$$= \pi \int_0^1 (9 - x^4 - 4x^2 - 4) \, dx$$

$$= \pi \int_0^1 (5 - x^4 - 4x^2) \, dx$$

$$= \pi \left( 5x - \frac{x^5}{5} - \frac{4}{3}x^3 \right)_0^1$$

$$= \pi \left( 5 - \frac{1}{5} - \frac{4}{3} \right) = \frac{52\pi}{15}.$$
6.4.38 Using washers, we have, after solving for $x$, washers with an outer radius of $1 + \sqrt{y}$ and inner radius 1:

$$V = \pi \int_0^1 ((\sqrt{y} + 1)^2 - 1^2) \, dy = \pi \int_0^1 (y + 2\sqrt{y}) \, dy = \pi \left( \frac{y^2}{2} + \frac{4}{3} y^{3/2} \right) \bigg|_0^1 = \frac{11\pi}{6}.$$ 

6.4.39 Using washers, we have

$$V = \pi \int_0^1 ((6 - x^2)^2 - 5^2) \, dx = \pi \int_0^1 (x^4 - 12x^2 + 11) \, dx = \pi \left( \frac{x^5}{5} - 4x^3 + 11x \right) \bigg|_0^1 = \frac{36\pi}{5}.$$ 

6.4.40 Using washers, we have, after solving for $x$, washers with an outer radius of 2 and inner radius $2 - \sqrt{y}$:

$$V = \pi \int_0^1 (2^2 - (2 - \sqrt{y})^2) \, dy = \pi \int_0^1 (4\sqrt{y} - y) \, dy = \pi \left( \frac{8y^{3/2} - y^2}{2} \right) \bigg|_0^1 = \frac{13\pi}{6}.$$ 

6.4.41 With washers, we get

$$V = \pi \int_0^1 (x^{2/3} - x^2) \, dx = \pi \left( \frac{3}{5} x^{5/3} - \frac{x^3}{3} \right) \bigg|_0^1 = \frac{4\pi}{15}.$$ 

Shells gives

$$V = 2\pi \int_0^1 y(y - y^3) \, dy = 2\pi \left( \frac{y^3}{3} - \frac{y^5}{5} \right) \bigg|_0^1 = 2\pi \left( \frac{1}{3} - \frac{1}{5} \right) = \frac{4\pi}{15}.$$ 

The two methods are equally easy to apply.

6.4.42 $y = x^2$ and $y = 2 - x$ intersect when $x^2 = 2 - x$, so for $x = 1$ and $x = -2$. Only $x = 1$ is in the first quadrant; the corresponding $y$ coordinate is $y = 1$. Also, $2 - x$ is above $x^2$ on $[0,1]$. Using disks we must split this up into two integrals: one from $y = 0$ to $y = 1$, with radius $\sqrt{y}$, and one from $y = 1$ to $y = 2$, with radius $2 - y$. So the volume is

$$V = \pi \int_0^1 (\sqrt{y})^2 \, dy + \pi \int_1^2 (2 - y)^2 \, dy$$

$$= \pi \int_0^1 y \, dy + \pi \int_1^2 (4 - 4y + y^2) \, dy$$

$$= \pi \left( \frac{1}{2} y^2 \right) \bigg|_0^1 + \pi \left( 4y - 2y^2 + \frac{y^3}{3} \right) \bigg|_1^2$$

$$= \pi \left( \frac{1}{2} + 8 - 8 + \frac{8}{3} - 4 + \frac{1}{3} \right) = \frac{5\pi}{6}.$$ 

Using shells, the height of each shell is $2 - x - x^2$, so the volume is

$$V = 2\pi \int_0^1 x(2 - x - x^2) \, dx = 2\pi \left( x^2 - \frac{x^3}{3} - \frac{x^4}{4} \right) \bigg|_0^1 = \frac{5\pi}{6}.$$ 

The shell method is clearly easier to apply.

6.4.43 Using washers we get

$$V = \pi \int_0^2 \left( \left( 1 - \frac{x}{3} \right)^2 - \left( \frac{1}{x+1} \right)^2 \right) \, dx = \pi \int_0^2 \left( 1 - \frac{2}{3} x + \frac{1}{3} x^2 - \frac{1}{(x+1)^2} \right) \, dx$$

$$= \pi \left( x - \frac{x^2}{3} + \frac{x^3}{27} + \frac{1}{x+1} \right) \bigg|_0^2 = \frac{8\pi}{27}.$$
6.4. VOLUME BY SHELLS

Using shells gives

\[
V = 2\pi \int_{1/3}^{1} y \left(3 - 3y - \left(\frac{1}{y} - 1\right)\right) \, dy = 2\pi \int_{1/3}^{1} (4y - 3y^2 - 1) \, dy
\]

\[
= 2\pi \left(2y^2 - y^3 - y\right)_{1/3}^{1} = 2\pi \left(0 - \left(\frac{2}{9} - \frac{1}{27} - \frac{1}{3}\right)\right) = \frac{8\pi}{27}.
\]

The shell method seems a little easier to apply, although the two are really pretty close.

6.4.44 Using washers we get

\[
V = \pi \int_{-10}^{25} (\sqrt[3]{y^2 + 2} + 2)^2 \, dy = \pi \int_{-8}^{27} (u^{1/3} + 2)^2 \, du = \pi \int_{-8}^{27} (u^{2/3} + 4u^{1/3} + 4) \, du
\]

\[
= \pi \left(\frac{3}{5}u^{5/3} + 3u^{4/3} + 4u\right)_{-8}^{27} = \pi \left(\frac{36^6}{5} + 3^5 + 108 - \left(-\frac{96}{5} + 48 - 32\right)\right) = \pi \left(\frac{2484}{5} + \frac{16}{5}\right) = 500\pi.
\]

Using shells gives

\[
V = 2\pi \int_{0}^{5} x(25 - (x - 2)^3 + 2) \, dx = 2\pi \int_{0}^{5} (27x - x(x - 2)^3) \, dx
\]

\[
= 2\pi \int_{0}^{5} (-x^4 + 6x^3 - 12x^2 + 35x) \, dx = 2\pi \left(-\frac{x^5}{5} + \frac{3x^4}{2} - 4x^3 + \frac{35x^2}{2}\right)_{0}^{5} = 500\pi.
\]

The disk/washer method seems a little easier to apply.

6.4.45 Using washers we get

\[
V = \pi \int_{1}^{\sqrt{e}} (\ln x^2 - \ln x) \, dx + \pi \int_{\sqrt{e}}^{e} (1 - \ln x) \, dx
\]

\[
= \pi \int_{1}^{\sqrt{e}} \ln x \, dx + \pi \int_{\sqrt{e}}^{e} (1 - \ln x) \, dx
\]

\[
= \pi \left(x \ln x - x\right)_{1}^{\sqrt{e}} + \pi \left(x - (x \ln x - x)\right)_{\sqrt{e}}^{e}
\]

\[
= \pi \left(-\frac{1}{2}\sqrt{e} + 1\right) + \pi \left(e - \left(2\sqrt{e} - \frac{1}{2}\sqrt{e}\right)\right)
\]

\[
= \pi (e - 2\sqrt{e} + 1) = \pi (\sqrt{e} - 1)^2.
\]

Using shells gives

\[
V = 2\pi \int_{0}^{1} y(e^{y^2} - e^{y^2/2}) \, dy = 2\pi \left(e^{y^2/2} - e^{y^2/2}\right)_{0}^{1} = \pi (e - 2\sqrt{e} - (1 - 2)) = \pi (\sqrt{e} - 1)^2.
\]

The shell method is definitely easier to apply.

6.4.46 First, note that the curve and the line intersect at the points (-1, 3) and (0, 2). Then using washers we get

\[
V = \pi \int_{-1}^{0} \left(2 - x\right)^2 - \frac{36}{(x + 3)^2} \, dx
\]

\[
= \pi \int_{-1}^{0} \left(4 - 4x + x^2 - \frac{36}{(x + 3)^2}\right) \, dx
\]

\[
= \pi \left(4x - 2x^2 + \frac{36}{3} + \frac{36}{x + 3}\right)_{-1}^{0}
\]

\[
= \pi \left(12 - \left(-4 - 2 + \frac{1}{3} + 18\right)\right) = \frac{\pi}{3}.
\]
To use shells, first solve \( y = 2 - x \) and \( y = \frac{6}{x + 3} \) for \( x \) to get \( x = 2 - y \) and \( x = \frac{6}{y} - 3 \). Then

\[
V = 2\pi \int_2^3 y \left( (2 - y) - \left( \frac{6}{y} - 3 \right) \right) \, dy
\]

\[
= 2\pi \int_2^3 (2y - y^2 - 6 + 3y) \, dy
\]

\[
= 2\pi \left( \frac{5y^2}{2} - \frac{y^3}{3} - 6y \right) \bigg|_2^3
\]

\[
= 2\pi \cdot \frac{1}{6} = \frac{\pi}{3}.
\]

The shell method is easier to apply.

**6.4.47** First, note that the curve and the line intersect at \((0, 0)\) and \((1, 0)\). Then using washers, we get

\[
V = \pi \int_0^1 (x - x^4)^2 \, dx = \pi \int_0^1 (x^2 - 2x^5 + x^8) \, dx = \pi \left( \frac{x^3}{3} - \frac{x^6}{6} + \frac{x^9}{9} \right) \bigg|_0^1 = \frac{\pi}{9}.
\]

Since solving for \( x \) in terms of \( y \) is very complicated, the shell method really is not feasible.

**6.4.48** First, note that the curve and the line intersect at \((0, 0)\) and \((1, 0)\). It is not feasible to use washers, since solving for \( x \) in terms of \( y \) is very complicated. Using shells gives

\[
V = 2\pi \int_0^1 x(x - x^4) \, dx = 2\pi \int_0^1 (x^2 - x^5) \, dx = 2\pi \left( \frac{x^3}{3} - \frac{x^6}{6} \right) \bigg|_0^1 = 2\pi \left( \frac{1}{3} - \frac{1}{6} \right) = \frac{\pi}{3}.
\]

**6.4.49**

a. True. Otherwise, we wouldn’t have shells!

b. False. Either method can be used when revolving around either axis.

c. True. However, this is in principle only — it may be difficult or impossible to write \( y \) in terms of \( x \) and use the disk/washer method, or to solve for \( x \) in terms of \( y \) and use the shell method.

**6.4.50**

\[
V = 2\pi \int_1^3 \frac{\ln x}{x} \, dx = 2\pi \left. \frac{\ln^2 x}{2} \right|_1^3 = \pi \ln^2 3.
\]

**6.4.51**

\[
V = 2\pi \int_2^8 \frac{1}{x} \, dx = 2\pi \ln x \bigg|_2^8 = 2\pi \ln 4 = 4\pi \ln 2.
\]
6.4.52

\[ V = 2\pi \int_1^4 \frac{x}{x^2 + 1} \, dx = \pi \left( \ln(x^2 + 1) \right)_1^4 \]
\[ = \pi (\ln 17 - \ln 2) = \pi \ln \frac{17}{2}. \]

6.4.53

\[ V = 2\pi \int_1^2 x \left( \frac{e^x}{x} \right) \, dx = 2\pi e^2 \bigg|_1^2 = 2\pi (e^2 - e). \]

6.4.54

\[ V = 2\pi \int_0^1 y(e^{y^2} - e^{y^2/3}) \, dy = \pi \left( e^{y^2} - 3e^{y^2/3} \right)_0^1 = \pi (e^4 - 3e^{4/3} - (1 - 3)) = \pi (2 + e^4 - 3e^{4/3}). \]

6.4.55 \[ V = 2\pi \int_0^1 ((2 - x^2)^2 - (x^2)^2) \, dx = 2\pi \int_0^1 (4 - 4x^2) \, dx = 2\pi \left( 4x - \frac{4x^3}{3} \right)_0^1 = \frac{16\pi}{3}. \]

6.4.56

\[ V = \pi \int_{\pi/6}^{5\pi/6} (\sin^2 x - (1 - \sin x)^2) \, dx = \pi \int_{\pi/6}^{5\pi/6} (2 \sin x - 1) \, dx = -\pi \left( 2 \cos x + x \right)_{\pi/6}^{5\pi/6} = 2\sqrt{3}\pi - \frac{2\pi^2}{3}. \]

6.4.57 \[ V = 2\pi \int_2^6 x(2x - 2) \, dx = 2\pi \int_2^6 (x^2 + 2x) \, dx = 2\pi \left( \frac{x^3}{3} + x^2 \right)_2^6 = \frac{608\pi}{3}. \]

6.4.58 \[ V = \pi \int_0^2 (x^3)^2 \, dx = \pi \left( \frac{x^7}{7} \right)_0^2 = \frac{128\pi}{7}. \]

Copyright © 2014 Pearson Education, Inc.
6.4.59 \[ V = \int_{a}^{b} A(y) \, dy = \int_{0}^{1} \frac{\pi}{2} (\sqrt{y})^2 \, dy = \frac{\pi}{2} \left( \frac{y^2}{2} \right) \bigg|_{0}^{1} = \frac{\pi}{4}. \]

6.4.60 \[ V = 2\pi \int_{0}^{6} x(2x + 2) \, dx = 2\pi \left( \frac{2}{3} x^3 \right) \bigg|_{0}^{6} = 288\pi. \]

6.4.61 By symmetry, \[ V = 2 \int_{0}^{1} \frac{\pi}{2} (1-x)^2 \, dx = \pi \int_{0}^{1} (1-2x+x^2) \, dx = \pi \left( x-x^2 + \frac{x^3}{3} \right) \bigg|_{0}^{1} = \frac{\pi}{3}. \]

6.4.62 \[ V = \pi \int_{0}^{4} (\sqrt{x})^2 \, dx = \pi \left( \frac{x^2}{2} \right) \bigg|_{0}^{4} = 8\pi. \]

6.4.63 Since \( a \geq -1 \), we see that \( y = ax^2 + 1 \) is nonnegative for \( 0 \leq x \leq 1 \), so that \( R \) is bounded below by \( x = 0 \), above by \( ax^2 + 1 \), on the left by \( x = 0 \), and on the right by \( x = 1 \).

a. To revolve \( R \) about the \( x \) axis, use disks; each disk has radius \( ax^2 + 1 \), and we get

\[ V_1 = \pi \int_{0}^{1} (ax^2 + 1)^2 \, dx = \pi \int_{0}^{1} (a^2 x^4 + 2ax^2 + 1) \, dx = \pi \left( \frac{a^2}{5} x^5 + \frac{2a}{3} x^3 + x \right) \bigg|_{0}^{1} = \pi \left( \frac{a^2}{5} + \frac{2a}{3} + 1 \right). \]

Revolving \( R \) around the \( y \) axis, it is easier to use the shell method; then each shell has height \( ax^2 + 1 \), and we get

\[ V_2 = 2\pi \int_{0}^{1} x(ax^2 + 1) \, dx = 2\pi \left( \frac{a}{4} x^4 + \frac{x^2}{2} \right) \bigg|_{0}^{1} = 2\pi \left( \frac{a}{4} + \frac{1}{2} \right) = \pi \left( 1 + \frac{a}{2} \right). \]

b. \( V_1 = V_2 \) when

\[ \pi \left( 1 + \frac{a}{2} \right) = \pi \left( \frac{a^2}{5} + \frac{2a}{3} + 1 \right), \quad \text{so} \quad \frac{a^2}{5} + \frac{a}{6} = 0. \]

This occurs when \( a = 0 \) (so that the curve is actually the line \( y = 1 \) and the region is a unit square), and when \( a = -\frac{5}{6} \).

6.4.64

a. \[ V = \pi \int_{0}^{r} (r^2 - x^2) \, dx = \pi \left( r^2 x - \frac{x^3}{3} \right) \bigg|_{0}^{r} = \frac{2\pi}{3} r^3. \]

b. Solve for \( x \) to get \( x = \sqrt{r^2 - y^2} \); this is the height of each shell. So we get

\[ V = 2\pi \int_{0}^{r} y \sqrt{r^2 - y^2} \, dy = 2\pi \left( -\frac{1}{3} (r^2 - y^2)^{3/2} \right) \bigg|_{0}^{r} = \frac{2\pi}{3} (r^2)^{3/2} = \frac{2\pi}{3} r^3. \]

c. For each \( y \), the radius of the semicircle that forms the slice is \( \sqrt{r^2 - y^2} \), so its area is \( A(y) = \frac{\pi}{2} (r^2 - y^2) \). Then

\[ V = \int_{-r}^{r} A(y) \, dy = 2 \int_{0}^{r} \frac{1}{2} \pi (r^2 - y^2) \, dy = \pi \left( r^2 y - \frac{y^3}{3} \right) \bigg|_{0}^{r} = \frac{2\pi}{3} r^3. \]

6.4.65

a. \[ V = \pi \int_{0}^{h} \left( \frac{rx}{h} \right)^2 \, dx = \frac{\pi r^2}{h^2} \left( \frac{x^3}{3} \right) \bigg|_{0}^{h} = \frac{\pi r^2 h}{3}. \]

b. Using shells, solve for \( x \) to get \( x = \frac{hy}{r} \). Then for each \( y \) from 0 to \( r \), the height of the shell is \( h - \frac{hy}{r} \), so

\[ V = 2\pi \int_{0}^{r} y \left( h - \frac{hy}{r} \right) \, dy = 2\pi h \int_{0}^{r} \left( y - \frac{y^2}{r} \right) \, dy = 2\pi h \left( \frac{y^2}{2} - \frac{y^3}{3r} \right) \bigg|_{0}^{r} = 2\pi h \left( \frac{r^2}{2} - \frac{r^2}{3} \right) = \frac{\pi r^2 h}{3}. \]
6.4.66

a. For the disk/washer method, note that the upper hemisphere is obtained by rotating the quarter circle in the first quadrant given by \( x = \sqrt{r^2 - y^2} \) about the \( y \)-axis; each disk has radius \( \sqrt{r^2 - y^2} \). The spherical cap is the portion found by integrating only from \( r - h \) to \( r \), so it is

\[
V = \pi \int_{r-h}^{r} (r^2 - y^2) \, dy = \pi \left[ \left( r^2 y - \frac{y^3}{3} \right) \right]_{r-h}^{r} = \pi \left( \frac{2}{3} r^3 - \left( r^2 (r - h) - \frac{(r-h)^3}{3} \right) \right) = \frac{\pi h^2}{3} (3r - h).
\]

b. For the shell method, use the same region as in part (a) and use the equation \( y = \sqrt{r^2 - x^2} \). Then each shell has height \( \sqrt{r^2 - x^2} - (r-h) \). Further, the circle meets the line \( y = r-h \) when \( r-h = \sqrt{r^2 - x^2} \), or \( x = \sqrt{2rh-h^2} \), so we only integrate from \( x = 0 \) to this value. So we get

\[
V = 2\pi \int_{0}^{\sqrt{2rh-h^2}} x \left( \sqrt{r^2 - x^2} - (r-h) \right) \, dx \\
= 2\pi \left( -\frac{1}{3} (r^2 - x^2)^{3/2} - \frac{r-h}{2} x^2 \right) \bigg|_{0}^{\sqrt{2rh-h^2}} \\
= 2\pi \left( -\frac{1}{3} (r^2 - 2rh + h^2)^{3/2} - (r-h)(2rh-h^2) \frac{1}{2} + \frac{1}{3} r^3 \right) \\
= 2\pi \left( -\frac{(r-h)^3}{3} - r^2 h + \frac{rh^2}{2} + rh^2 - \frac{h^3}{2} + \frac{r^3}{3} \right) \\
= \pi h^2 r - \frac{\pi h^3}{3} = \frac{\pi h^2}{3} (3r - h).
\]

c. If we take slices perpendicular to the \( y \)-axis, we have circles whose areas are \( A(y) = \pi (r^2 - y^2) \). So

\[
V = \pi \int_{r-h}^{r} (r^2 - y^2) \, dy,
\]

which is exactly the integral computed in part (a) above.

Note that all three approaches led to the same result, and the result is consistent with other formulas. For example, when \( h = 0 \) we have an empty solid so the volume is 0. When \( h = r \), we have \( V = \frac{2\pi r^3}{3} \), the volume of a hemisphere.

6.4.67 The bowl is the surface of revolution when \( y = -\sqrt{64 - x^2} \) for \( 0 \leq x \leq 8 \) is revolved about the \( y \)-axis. The volume of water in the bowl up to height \( h \) is the volume integral for the bowl evaluated from \( -8 \) (the bottom) to \( -8 + h \) (\( h \) above the bottom). Using shells, each shell has height \( (8 + h) - (-\sqrt{64 - x^2}) = h - 8 + \sqrt{64 - x^2} \). Further, the quarter-circle meets the line \( y = h - 8 \) when \( h - 8 = -\sqrt{64 - x^2} \), so that \( x = \sqrt{16h-h^2} \). Thus the bound of integration are \( x = 0 \) to \( x = \sqrt{16h-h^2} \), and we get

\[
V = 2\pi \int_{0}^{\sqrt{16h-h^2}} x(h - 8 + \sqrt{64 - x^2}) \, dx \\
= 2\pi \left( \frac{h}{2} x^2 - 4x^2 - \frac{1}{3} (64 - x^2)^{3/2} \right) \bigg|_{0}^{\sqrt{16h-h^2}} \\
= \pi \left( 16h^2 - h^3 - 8(16h-h^2) - \frac{2}{3} (8 - h)^3 - \left( 0 - 0 - \frac{1024}{3} \right) \right) \\
= \frac{1}{3} (24 - h) \pi h^2.
\]

Note that when \( h = 0 \) the bowl is empty, and in fact the formula above gives 0. When \( h = 8 \) the bowl is full, so it is a hemisphere of radius 8, which has volume \( \frac{2}{3} \pi \cdot 8^3 = \frac{1024}{3} \pi \); evaluating the expression above at \( h = 8 \) gives \( \frac{1}{3} (24 - 8) \pi \cdot 64 = \frac{1024}{3} \pi \) as well.
6.4.68 Vertical slices of the wedge are triangles with area \( \frac{1}{2}xh \), where \( x \) is the base and \( h \) is the height. Note that \( h = x \tan \theta \), so the triangles have area \( \frac{1}{2}x^2 \tan \theta \). Now if we think of the curved part of the base of the wedge as having equation \( x^2 + y^2 = a^2 \), then we have \( x^2 = a^2 - y^2 \). So the volume of the wedge is given by
\[
\int_{-a}^{a} \frac{1}{2} \tan \theta (a^2 - y^2) \, dy = \int_{0}^{a} \tan \theta (a^2 - y^2) \, dy = \tan \theta \left( a^2 y - \frac{y^3}{3} \right) \bigg|_{0}^{a} = \frac{2a^3}{3} \tan \theta.
\]

6.4.69 Using shells, we will integrate from \( x = 1 \) to \( x = 5 \), and for each \( x \) the height of the shell is \( \sqrt{4 - (x - 3)^2} \). The cross sections of this object are also washers, and this time the inner radius is \( y \). Again use disks, this time integrating with respect to \( y \). The result of revolving a slice around the line \( x = k \) gives a cone with height \( 2\sqrt{x^2 + 6x - 5} \) and base radius \( 2 \). Thus the volume is
\[
V = 2\pi \int_{1}^{5} 2x \sqrt{-x^2 + 6x - 5} \, dx.
\]
Using a computer algebra system such as Mathematica, the value of the integral is \( 12\pi \), so the volume of the torus is \( 24\pi^2 \).

6.4.70
a. As in figure 6.44 in the text, the result of revolving a slice around the line \( x = x_0 \) is a shell with the same height as before, but with the radius being \( \pi_k - x_0 \) rather than \( \pi_k \). Thus, when the volumes of the shells are added and the limit is taken, the resulting integral is \( \int_{a}^{b} 2\pi(x - x_0)(f(x) - g(x)) \, dx \) instead of \( \int_{a}^{b} 2\pi(x)(f(x) - g(x)) \, dx \).

b. When \( x_0 > b \), the radius of a typical shell is given by \( x_0 - \pi_k \), so the volume is given by \( \int_{a}^{b} 2\pi(x_0 - x)(f(x) - g(x)) \, dx \).

6.4.71
a. The cross sections of such an object are washers, with inner radius given by \( g(x) - y_0 \) and outer radius given by \( f(x) - y_0 \), so the volume is given by \( \pi \int_{a}^{b} ((f(x) - y_0)^2 - (g(x) - y_0)^2) \, dx \).

b. The cross section of this object are also washers, and this time the inner radius is \( y_0 - f(x) \) and the outer radius is \( y_0 - g(x) \), so the volume is given by \( \pi \int_{a}^{b} ((y_0 - g(x))^2 - (y_0 - f(x))^2) \, dx \).

6.4.72
a. Using disks, we integrate from \( x = 0 \) to \( x = a \); the radius of each disk is \( y = \sqrt{b^2 \left( 1 - \frac{x^2}{a^2} \right)} \), so the volume is
\[
V = 2\pi \int_{0}^{a} b^2 \left( 1 - \frac{x^2}{a^2} \right) \, dx = 2\pi b^2 \left( x - \frac{x^3}{3a^2} \right) \bigg|_{0}^{a} = \frac{4\pi ab^2}{3}.
\]

b. Again use disks, this time integrating with respect to \( y \), from \( y = 0 \) to \( y = b \); the radius of each disk is then \( x = \sqrt{a^2 \left( 1 - \frac{y^2}{b^2} \right)} \), so the volume is
\[
V = 2\pi \int_{0}^{b} a^2 \left( 1 - \frac{y^2}{b^2} \right) \, dy = 2\pi a^2 \left( y - \frac{y^3}{3b^2} \right) \bigg|_{0}^{b} = \frac{4\pi a^2 b}{3}.
\]

c. The ellipsoids generated are different when \( a \neq b \), so there isn’t any reason to expect them to have the same volumes.

6.4.73 We want to compute (using shells) \( 2\pi \int_{0}^{2} xf(x^2) \, dx \). Make the substitution \( u = x^2 \), so that \( du = 2x \, dx \), and \( x = 0 \) corresponds to \( u = 0 \) and \( x = 2 \) to \( u = 4 \). Then we get
\[
V = 2\pi \int_{0}^{2} xf(x^2) \, dx = \pi \int_{0}^{4} f(u) \, du = 10\pi.
\]
6.4.74

a. A diagram of the region bounded by the coordinate axes and by \( y = 8 - 2x \) is

![Diagram of region bounded by coordinate axes and \( y = 8 - 2x \)](image)

The integral on the left represents the volume of the solid obtained when this region is revolved around the \( x \)-axis, using the disk/washer method, and the integral on the right represents the same volume calculated using the shell method (since solving \( y = 8 - 2x \) for \( x \) gives \( x = 4 - \frac{y}{2} \)). Hence, they are equal.

b. A diagram of the region bounded on the left by the \( y \) axis, above by \( y = 5 \), and below by \( y = x^2 + 1 \), is

![Diagram of region bounded by \( y = 5 \), \( y = x^2 + 1 \)](image)

The integral on the left represents \( \frac{1}{\pi} \) times the volume of the solid obtained when this region is revolved around the \( x \)-axis, using the disk/washer method. Solving \( y = x^2 + 1 \) for \( x \) gives \( x = \sqrt{y - 1} \), so that its volume using shells is \( 2\pi \int_1^5 y\sqrt{y - 1} \), so that the integral on the right represents \( \frac{1}{\pi} \) times the volume calculated using the shell method. Hence, they are equal.

6.4.75

a. The longest diagonal of the cube is equal to the diameter of the sphere, which is \( \sqrt{r^2 + r^2 + r^2} = \sqrt{3}r \). Thus, if \( R \) is the radius of the sphere, we must have \( R = \frac{\sqrt{3}}{2}r \). Now consider the cone, in which the
sphere is inscribed. Since its slant height is equal to the diameter of its base, a vertical cross-section through its vertex gives an equilateral triangle, and a circle of radius \( R \) inscribed in that triangle. But then the center of the circle is the intersection of the medians of the triangle, so it is one third of the way from a side to the opposite vertex. Thus the length of a median (which is also an altitude in an equilateral triangle) is \( 3R \), so this is the height \( h \) of the cone, and thus \( h = 3R = \frac{3\sqrt{3}}{2}r \).

Finally, \( h \) is also the height of the cylinder, and the base of the cylinder is the base of the cone, so it has radius \( \frac{h}{\sqrt{3}} = \frac{3}{2}r \). Thus the volume of the cylinder is

\[
V = \pi \left( \frac{3}{2}r \right)^2 \cdot \frac{3\sqrt{3}}{2}r = \frac{27\sqrt{3}}{2 \pi} r^3.
\]

b. Imagine the cone with its vertex up. Consider the plane which contains the vertex of the cone and two non-adjacent vertices of the cube’s bottom face. The cross section of this plane with the cone and cube consists of an \( r \times \sqrt{2}r \) rectangle (where \( r \) is the side length of the cube) and an isosceles triangle of base 2 and height 3, with the rectangle inscribed in the triangle, and the longer side of the rectangle lying on the base of the triangle:

Now, the large triangle to the right of the \( y \) axis is similar to the small triangle at lower right, so we have

\[
\frac{1}{3} = \frac{1 - \frac{r\sqrt{2}}{2}}{r}, \quad \text{or} \quad r = 3 - \frac{3}{\sqrt{2}}r, \quad \text{so} \quad r = \frac{3\sqrt{2}}{3 + \sqrt{2}}.
\]

It follows that the volume of the cube is

\[
r^3 = \frac{3^{3}2^{3/2}}{(3 + \sqrt{2})^3} = \frac{54\sqrt{2}}{(3 + \sqrt{2})^3}.
\]

c. Imagine the sphere with the hole as being obtained by revolving the region pictured below around the \( x \)-axis, where the relevant curves are \( y = r \) and \( y = \sqrt{R^2 - x^2} \) where \( r \) is the radius of the hole and \( R \) is the radius of the sphere. Note that if you draw the triangle with vertices \((0,0), (5,0), \) and \((5,r)\), you have a right triangle with legs of length 5 and \( r \), and hypotenuse of length \( R \), so \( 25 + r^2 = R^2 \).

The volume we are interested in is

\[
V = 2\pi \int_0^5 ((R^2 - x^2) - r^2) \, dx = 2\pi \int_0^5 (25 - x^2) \, dx = 2\pi \left( 25x - \frac{x^3}{3} \right) \bigg|_0^5 = \frac{500\pi}{3}.
\]

Note that (surprisingly!), the result doesn’t depend on the radius of the original sphere.

6.5 Length of Curves

6.5.1 Given \( f(x) \) and \( a \) and \( b \), compute \( f'(x) \) and then compute \( \int_a^b \sqrt{1 + f'(x)^2} \, dx \).

6.5.2 Given \( g(y) \) and \( c \) and \( d \), compute \( g'(y) \) and then compute \( \int_c^d \sqrt{1 + g'(y)^2} \, dy \).

6.5.3 Since \( f'(x) = 3x^2 \), the arc length is \( \int_{-2}^5 \sqrt{1 + f'(x)^2} \, dx = \int_{-2}^5 \sqrt{1 + 9x^4} \, dx \).

6.5.4 Since \( f'(x) = -6 \sin 3x \), the arc length is \( \int_{-\pi}^\pi \sqrt{1 + f'(x)^2} \, dx = \int_{-\pi}^\pi \sqrt{1 + 36 \sin^2 3x} \, dx \).

6.5.5 Since \( f'(x) = -2e^{-2x} \), the arc length is \( \int_0^2 \sqrt{1 + f'(x)^2} \, dx = \int_0^2 \sqrt{1 + 4e^{-4x}} \, dx \).

6.5.6 Since \( f'(x) = \frac{1}{x} \), the arc length is \( \int_1^{10} \sqrt{1 + f'(x)^2} \, dx = \int_1^{10} \sqrt{1 + \frac{1}{x^2}} \, dx = \int_1^{10} \sqrt{x^2 + 1} \, dx \).

6.5.7 \( L = \int_1^5 \sqrt{1 + (y')^2} \, dx = \int_1^5 \sqrt{1 + 2^2} \, dx = 4\sqrt{5} \).

6.5.8 \( L = \int_{-3}^2 \sqrt{1 + (y')^2} \, dx = \int_{-3}^2 \sqrt{1 + (-3)^2} \, dx = \int_{-3}^2 \sqrt{10} \, dx = 5\sqrt{10} \).

6.5.9 \( L = \int_{-2}^6 \sqrt{1 + (y')^2} \, dx = \int_{-2}^6 \sqrt{1 + (-8)^2} \, dx = \int_{-2}^6 \sqrt{65} \, dx = 8\sqrt{65} \).

6.5.10 \( y' = \frac{1}{2} (e^x - e^{-x}) \), so \( 1 + (y')^2 = 1 + \frac{1}{4} (e^{2x} - 2 + e^{-2x}) = \left(\frac{1}{2} (e^x + e^{-x})\right)^2 \). Thus,
\[
L = \int_{-\ln 2}^{\ln 2} \frac{1}{2} (e^x + e^{-x}) \, dx = \frac{1}{2} \left( e^x - e^{-x} \right) \bigg|_{-\ln 2}^{\ln 2} = \frac{1}{2} \left( 2 - \frac{1}{2} - \left( \frac{1}{2} - 2 \right) \right) = \frac{3}{2}.
\]

6.5.11 \( y' = \frac{\sqrt{x}}{x^2} \), so \( 1 + (y')^2 = 1 + \frac{x}{x^4} = \frac{1}{x^2} \). Thus
\[
L = \int_0^{60} \sqrt{1 + \frac{x}{4}} \, dx = \int_0^{60} \frac{1}{2} \sqrt{x^2 + 4} \, dx = \left( \frac{1}{3} (x + 4)^{3/2} \right) \bigg|_0^{60} = \frac{504}{3} = 168.
\]

6.5.12 \( y' = \frac{3}{x} - \frac{x}{12} \), so \( 1 + (y')^2 = 1 + \frac{9}{x^2} - \frac{1}{2} + \frac{x^2}{144} = \left(\frac{3}{x} + \frac{x}{12}\right)^2 \). Thus
\[
L = \int_1^6 \left( \frac{3}{x} + \frac{x}{12} \right) \, dx = \left( 3 \ln x + \frac{x^2}{24} \right) \bigg|_1^6 = 3 \ln 6 + \frac{35}{24}.
\]

Copyright © 2014 Pearson Education, Inc.
6.5.13 \( y' = x(x^2 + 2)^{1/2} \), so \( 1 + (y')^2 = 1 + x^2(x^2 + 2) = x^4 + 2x^2 + 1 = (x^2 + 1)^2 \). Thus
\[ L = \int_0^1 (x^2 + 1) \, dx = \left( \frac{x^3}{3} + x \right) \bigg|_0^1 = \frac{4}{3}. \]

6.5.14 \( y' = \frac{\sqrt{x}}{x} - \frac{1}{2\sqrt{x}} \), so
\[ 1 + (y')^2 = 1 + \frac{x}{4} - \frac{1}{2} + \frac{1}{4x} = \left( \frac{\sqrt{x}}{2} + \frac{1}{2\sqrt{x}} \right)^2. \]
Thus
\[ L = \int_4^{16} \left( \frac{1}{2}x^{1/2} + \frac{1}{2}x^{-1/2} \right) \, dx = \left( \frac{1}{3}x^{3/2} + x^{1/2} \right) \bigg|_4^{16} = \frac{64}{3} + 4 - \left( \frac{8}{3} + 2 \right) = 2 + \frac{56}{3} = \frac{62}{3}. \]

6.5.15 \( y' = x^3 - \frac{1}{4x^3} \), so \( 1 + (y')^2 = 1 + x^6 - \frac{1}{2} + \frac{1}{16x^6} = (x^3 + \frac{1}{4x^3})^2 \). Thus
\[ L = \int_1^2 (x^3 + \frac{1}{4x^3}) \, dx = \left( \frac{x^4}{4} - \frac{1}{8}x^{-2} \right) \bigg|_1^2 = 4 - \frac{1}{32} - \left( \frac{1}{4} - \frac{1}{8} \right) = \frac{123}{32}. \]

6.5.16 \( y' = x^{1/2} - \frac{1}{4x^{3/2}} \), so
\[ 1 + (y')^2 = 1 + x - \frac{1}{2} + \frac{1}{16x} = \left( x^{1/2} + \frac{1}{4x^{1/2}} \right)^2. \]
Thus
\[ L = \int_1^9 \left( x^{1/2} + \frac{1}{4x^{1/2}} \right) \, dx = \left( \frac{2}{3}x^{3/2} + \frac{1}{2}\sqrt{x} \right) \bigg|_1^9 = 18 + \frac{3}{2} - \left( \frac{2}{3} + \frac{1}{2} \right) = \frac{55}{3}. \]

6.5.17
a. \( y' = 2x \), so \( 1 + (y')^2 = 1 + 4x^2 \), so \( L = \int_{-1}^1 \sqrt{1 + 4x^2} \, dx \).
b. \( L = \int_{-1}^1 \sqrt{1 + 4x^2} \, dx \approx 2.958. \)

6.5.18
a. \( y' = \cos x \), so \( 1 + (y')^2 = 1 + \cos^2 x \), so \( L = \int_0^\pi \sqrt{1 + \cos^2 x} \, dx \).
b. \( L = \int_0^\pi \sqrt{1 + \cos^2 x} \, dx \approx 3.820. \)

6.5.19
a. \( y' = \frac{1}{x} \), so \( 1 + (y')^2 = 1 + \left( \frac{1}{x} \right)^2 = \frac{x^2 + 1}{x^2} \), so \( L = \int_1^4 \frac{\sqrt{x^2 + 1}}{x} \, dx \).
b. \( L = \int_1^4 \frac{\sqrt{x^2 + 1}}{x} \, dx \approx 3.343. \)

6.5.20
a. \( y' = x^2 \), so \( 1 + (y')^2 = 1 + x^4 \), so \( L = \int_{-1}^1 \sqrt{1 + x^4} \, dx \).
b. \( L = \int_{-1}^1 \sqrt{1 + x^4} \, dx \approx 2.179. \)

6.5.21
a. \( y' = \frac{1}{2\sqrt{x^2 - 8}} \), so \( 1 + (y')^2 = 1 + \frac{1}{4(x-2)} = \frac{4x-7}{4x-8} \), so \( L = \int_3^4 \sqrt{\frac{4x-7}{4x-8}} \, dx \).
b. \( L = \int_3^4 \sqrt{\frac{4x-7}{4x-8}} \, dx \approx 1.083. \)

6.5.22
a. \( y' = -\frac{16}{x^7} \), so \( 1 + (y')^2 = 1 + \frac{16^2}{x^8} = \frac{x^8 + 16^2}{x^8} \), so \( L = \int_1^4 \sqrt{\frac{x^8 + 16^2}{x^8}} \, dx \).
6.5. LENGTH OF CURVES

6.5.23

a. \( y' = -2 \sin 2x \), so \( 1 + (y')^2 = 1 + 4 \sin^2 2x \), so \( L = \int_0^\pi \sqrt{1 + 4 \sin^2 2x} \, dx \).

b. \( L = \int_0^\pi \sqrt{1 + 4 \sin^2 2x} \, dx \approx 5.270. \)

6.5.24

a. \( y' = 4 - 2x \), so \( 1 + (y')^2 = 1 + 16 - 16x + 4x^2 = 4x^2 - 16x + 17 \), so \( L = \int_0^4 \sqrt{4x^2 - 16x + 17} \, dx \).

b. \( L = \int_0^4 \sqrt{4x^2 - 16x + 17} \, dx \approx 9.294. \)

6.5.25

a. \( y' = -\frac{1}{x^2} \), so \( 1 + (y')^2 = 1 + \frac{1}{x^2} = \frac{x^2 + 1}{x^2} \). Thus, \( L = \int_1^x \sqrt{x^2 + 1} \, dx \).

b. \( L = \int_1^x \sqrt{x^2 + 1} \, dx \approx 9.153. \)

6.5.26

a. \( y' = \frac{-2x}{(x^2 + 1)^2} \), so \( 1 + (y')^2 = 1 + \frac{4x^2}{(x^2 + 1)^2} = \frac{(x^2 + 1)^2 + 4x^2}{(x^2 + 1)^2} \), so \( L = \int_{-5}^5 \sqrt{(x^2 + 1)^2 + 4x^2} \, dx \).

b. \( L = \int_{-5}^5 \sqrt{(x^2 + 1)^2 + 4x^2} \, dx \approx 10.369. \)

6.5.27 \( \frac{dx}{dy} = 2 \), so \( 1 + \left(\frac{dx}{dy}\right)^2 = 1 + 4 = 5 \), so \( L = \int_{-3}^4 \sqrt{5} \, dy = 7\sqrt{5}. \)

6.5.28 \( y = \ln(x - \sqrt{x^2 - 1}) \), so

\[
e^y = x - \sqrt{x^2 - 1} \quad \text{and} \quad e^{-y} = \frac{1}{x - \sqrt{x^2 - 1}} = \frac{x + \sqrt{x^2 - 1}}{x^2 - (x^2 - 1)} = x + \sqrt{x^2 - 1}.
\]

Thus \( \frac{e^y + e^{-y}}{2} = x \). Then \( \frac{dx}{dy} = \frac{e^y - e^{-y}}{2} \), so

\[
1 + \left(\frac{dx}{dy}\right)^2 = 1 + \frac{e^{2y}}{4} - \frac{1}{2} + \frac{e^{-2y}}{4} = \left(\frac{e^y + e^{-y}}{2}\right)^2.
\]

Thus

\[
L = \int_{\ln(\sqrt{2} - 1)}^0 \frac{e^y + e^{-y}}{2} \, dy = \left(\frac{e^y - e^{-y}}{2}\right)\Bigg|_{\ln(\sqrt{2} - 1)}^0
\]

\[
= 0 - \sqrt{2} - 1 - \frac{1}{\sqrt{2} - 1} = \frac{-2 + 2\sqrt{2} - 1 + 1}{2(\sqrt{2} - 1)} = 1.
\]

6.5.29 \( \frac{dx}{dy} = y^3 - \frac{1}{4y^3} \), so

\[
1 + \left(\frac{dx}{dy}\right)^2 = 1 + y^6 - \frac{1}{2} + \frac{1}{16y^6} = \left(y^3 + \frac{1}{4y^3}\right)^2.
\]

Thus

\[
L = \int_1^2 \left(y^3 + \frac{1}{4y^3}\right) \, dy = \left(\frac{y^4}{4} - \frac{1}{8y^2}\right)\Bigg|_1^2 = 4 - \frac{1}{32} - \left(\frac{1}{4} - \frac{1}{8}\right) = \frac{123}{32}.
\]

Copyright © 2014 Pearson Education, Inc.
6.5.30 \( \frac{dx}{dy} = 2 \sqrt{2} e^{y} - \frac{\sqrt{2}}{16} e^{-y} \), so
\[
1 + \left( \frac{dx}{dy} \right)^2 = 1 + 8e^{2y} - \frac{1}{2} + \frac{2}{16^2} e^{-2y} = \left( 2 \sqrt{2} e^{y} + \frac{\sqrt{2}}{16} e^{-y} \right)^2.
\]

Thus
\[
L = \int_{0}^{\ln(2)/\sqrt{2}} \left( 2 \sqrt{2} e^{y} + \frac{\sqrt{2}}{16} e^{-y} \right) dy = \left. \left( 2 \sqrt{2} e^{y} - \frac{1}{16} e^{-y} \right) \right|_{0}^{\ln(2)/\sqrt{2}} = \left( 4 - \frac{1}{32} \right) \left( 2 - \frac{1}{16} \right) = \frac{65}{32}.
\]

6.5.31
a. False. For example, if \( f(x) = x^2 \), the first integrand is \( \sqrt{1 + 4x^2} \) and the second is \( 1 + 2x \), which clearly yield different values for (for example) \( a = 0 \) and \( b = 1 \).
b. True. They are both equal to \( f_{a}^{b} \sqrt{1 + f'(x)^2} \) dx.
c. False. Because \( \sqrt{1 + f'(x)^2} > 0 \), arc length can’t be negative.

6.5.32 \( y' = m \), so \( 1 + (y')^2 = 1 + m^2 \), and \( L = \int_{a}^{b} \sqrt{1 + m^2} dx = (b - a) \sqrt{1 + m^2} \). To see that this is the same result as the one given by the distance formula, consider the points \( (a, ma + c) \) and \( (b, mb + c) \). The distance between them is
\[
\sqrt{(b - a)^2 + (mb + c - (ma + c))^2} = \sqrt{(b - a)^2 + m^2(b - a)^2} = \sqrt{(b - a)^2 \sqrt{1 + m^2}} = (b - a) \sqrt{1 + m^2}.
\]

6.5.33
a. We are seeking functions \( f(x) \) so that \( f'(x) = \pm 4x^2 \), so any function of the form \( f(x) = \pm \frac{2}{3}x^3 + C \) will work.

b. We are seeking functions \( f(x) \) so that \( f'(x) = \pm 6 \cos 2x \), so any function of the form \( f(x) = \pm 3 \sin 2x + C \) will work.

6.5.34 Because \( f'(x) = \pm 4x^{-3} \), we have \( f(x) = \pm \frac{2}{x^2} + C \). Because \( f(1) = 5 \), we must have either \( f(x) = \frac{7 - \frac{2}{x^2}}{2} \) or \( f(x) = \frac{3 + \frac{2}{x^2}}{2} \).

6.5.35 For the parabola, \( y' = -2x \), so the length is \( \int_{-1}^{1} \sqrt{1 + 4x^2} dx \approx 2.958 \). For the cosine function, \( y' = -\frac{\pi}{2} \sin \frac{\pi x}{2} \), so the length is
\[
\int_{-1}^{1} \sqrt{1 + \frac{\pi^2}{4} \sin^2 \frac{\pi x}{2}} dx \approx 2.927,
\]
and the parabola is longer.

6.5.36 \( f'(x) = \sin x \), so the arc length is given by \( \int_{0}^{\pi} \sqrt{1 + \sin^2 x} \) dx.

6.5.37 \( f'(x) = 0.00074x \), so \( L = \int_{-640}^{640} \sqrt{1 + (0.00074x)^2} dx \approx 1326.36 \) meters.

6.5.38 Since \( \frac{d}{dx} \cosh x = \frac{d}{dx} \left( \frac{e^x + e^{-x}}{2} \right) = \frac{e^x - e^{-x}}{2} \), (this function is called the hyperbolic sine, or sinh \( x \)), we have
\[
y' = -\frac{630}{239.2} \sinh \frac{x}{239.2}.
\]

So
\[
L = \int_{-315}^{315} \left( 1 + \left( -\frac{630}{239.2} \sinh \frac{x}{239.2} \right)^2 \right) dx \approx 1472.170 \text{ ft}.
\]
6.5.39
a. Let \( u = 2x \). Then the given integral is equal to \( \frac{1}{2} \int_a^b \sqrt{1 + f'(u)^2} \, du = \frac{L}{2} \).

b. Let \( u = cx \). Then the given integral is equal to \( \frac{1}{c} \int_a^b \sqrt{1 + f'(u)^2} \, du = \frac{L}{c} \).

6.5.40 If \( f \) is odd, then the symmetry of \( f \) assures that the portion of the curve from 0 to \( b \) matches exactly the portion of the curve from \(-b\) to 0, as can be seen by rotating the original curve about the \( y \)-axis and then about the \( x \)-axis. The same is true for \( f' \), although the two portions match up after just rotating about the \( y \)-axis. Thus the length from \(-b\) to \( b \) is twice the length from 0 to \( b \). To see this analytically, first suppose \( f \) is even, and recall that this means that \( f' \) is odd. Consider \( L_- = \int_{-b}^0 \sqrt{1 + f'(x)^2} \, dx \). The integral is

\[
L_- = \int_0^b \sqrt{1 + f'(-x)^2} \, dx = \int_0^b \sqrt{1 + (-f'(x))^2} \, dx = \int_0^b \sqrt{1 + f'(x)^2} \, dx = L_+.
\]

If on the other hand \( f \) is odd, so that \( f' \) is even, we have \( L_- = \int_{-b}^0 \sqrt{1 + f'(x)^2} \, dx \). Then the integral is

\[
L_- = \int_0^b \sqrt{1 + f'(-x)^2} \, dx = \int_0^b \sqrt{1 + f'(x)^2} \, dx = L_+.
\]

6.5.41
a. We have \( f'(x) = Aae^{ax} - \frac{1}{4Aa} e^{-ax} \), so

\[
1 + f'(x)^2 = 1 + (Aae^{ax})^2 - \frac{1}{2} + \left( \frac{1}{4Aa} e^{-ax} \right)^2 = (Aae^{ax})^2 + \frac{1}{2} + \left( \frac{1}{4Aa} e^{-ax} \right)^2 = \left( Aae^{ax} + \frac{1}{4Aa} e^{-ax} \right)^2.
\]

So the arc length for \( c \leq x \leq d \) is \( L = \int_c^d \left( Aae^{ax} + \frac{1}{4Aa} e^{-ax} \right) \, dx = \left( Aae^{ax} - \frac{1}{4Aa} e^{-ax} \right) \bigg|_c^d \).

b. Applying the previous result with \( c = 0 \) and \( d = \ln 2 \), we have

\[
L = \left( Aae^{ax} - \frac{1}{4Aa} e^{-ax} \right) \bigg|_0^{\ln 2} = 2A^2 - \frac{1}{4Aa} e^{-2a} - Aa + \frac{1}{4Aa} = A(2^a - 1) - \frac{1}{4a^2} (2^{-a} - 1).
\]

6.5.42
a. \( y' = \frac{2n+1}{2n} x^{1/(2n)} \), so \( 1 + (y')^2 = 1 + \left( \frac{2n+1}{2n} \right)^2 x^{1/n} \). Thus

\[
L = \int_0^a \sqrt{1 + \left( \frac{2n+1}{2n} \right)^2 x^{1/n}} \, dx.
\]

b. For the sake of simplicity, let \( r = \frac{2n+1}{2n} \), and let \( d = \sqrt{1 + r^2 a^{1/n}} \). If we let \( u^2 = 1 + r^2 x^{1/n} \), then \( x = \left( \frac{u^2 - 1}{r^2} \right)^{n} \), and \( dx = \frac{n}{r^2} (u^2 - 1)^{n-1} \cdot 2u \, du \), and our integral becomes

\[
\int_1^d u \cdot \frac{n}{r^2} (u^2 - 1)^{n-1} \cdot 2u \, du = \frac{2n}{r^2} \int_1^d u^2 (u^2 - 1)^{n-1} \, du.
\]

c. The binomial theorem assures us that

\[
(u^2 - 1)^{n-1} = u^{2n-2} - \binom{n-1}{1} u^{2n-4} + \binom{n-1}{2} u^{2n-6} - \ldots + (-1)^{n-1}.
\]
Thus
\[ u^2 (u^2 - 1)^{n-1} = u^2 \left( u^{2n-2} - \binom{n-1}{1} u^{2n-4} + \binom{n-1}{2} u^{2n-6} - \ldots + (-1)^{n-1} \right) \]
\[ = u^{2n} - \binom{n-1}{1} u^{2n-2} + \binom{n-1}{2} u^{2n-4} - \ldots + (-1)^{n-1} u^2. \]

Then
\[ L = \frac{2n}{r^{2n}} \frac{u^{2n+1}}{2n+1} - \left( \frac{n-1}{1} \right) \frac{u^{2n-1}}{2n-1} + \left( \frac{n-1}{2} \right) \frac{u^{2n-3}}{2n-3} - \ldots + (-1)^{n-1} \frac{u^3}{3} \bigg|_1^d. \]

d. For \( n = 2 \) and \( a = 1 \) we have \( r = \frac{5}{4} \) and \( d = \frac{\sqrt{\pi}}{4} \). Using the previous result, we have
\[ L = \frac{4^5}{5^4} \left( \frac{u^5}{5} - \frac{u^3}{3} \right) \bigg|_1^{\sqrt{\pi}/4} = \frac{2048}{9375} + \frac{1763\sqrt{\pi}}{9375} \approx 1.423. \]

For \( n = 3 \) and \( a = 1 \) we have \( r = \frac{7}{6} \) and \( d = \frac{\sqrt{\pi}}{6} \). Using the previous results, we have
\[ L = \frac{6^7}{7^6} \left( \frac{u^7}{7} - \frac{2}{5} u^5 + \frac{u^3}{3} \right) \bigg|_1^{\sqrt{5}/6} = \frac{142885\sqrt{85}}{823543} - \frac{746496}{4117715} \approx 1.418. \]

The arc length appears to decrease as \( n \) increases.

e.

6.6 Physical Applications

6.6.1 \( m = \rho_1 \cdot l_1 + \rho_2 \cdot l_2 = 1 \text{ g/cm} \cdot 50 \text{ cm} + 2 \text{ g/cm} \cdot 50 \text{ cm} = 150 \text{ g}. \)

6.6.2 The mass is given by \( m = \int_a^b \rho(x) \, dx. \)

6.6.3 The work is the product of 5 Newtons and 5 meters, which is 25 J.

6.6.4 If the force is not constant, the interval must be divided up into pieces, and on each small piece the work can be approximated by assuming a constant force. These approximations are then added up and then the sum is refined through a limiting process, which leads to a definite integral.

6.6.5 Different volumes of water are moved different distances.

6.6.6 Different parts of the dam have different depths and thus different amount of pressure.

6.6.7 \( F = \rho gh = 1000 \cdot 9.8 \cdot 4 = 39,200 \text{ N/m}^2. \)

6.6.8 Along a thin horizontal strip, the pressure is the same, because the depth is constant.
6.6.9 $m = \int_0^\pi (1 + \sin x) \, dx = (x - \cos x)\bigg|_0^\pi = (\pi - (-1)) - (0 - 1) = \pi + 2.$

6.6.10 $m = \int_0^1 (1 + x^3) \, dx = \left(x + \frac{x^4}{4}\right)\bigg|_0^1 = \frac{5}{4}.$

6.6.11 $m = \int_0^2 \left(2 - \frac{x}{2}\right) \, dx = \left(2x - \frac{x^2}{4}\right)\bigg|_0^2 = 3.$

6.6.12 $m = \int_0^4 5e^{-2x} \, dx = \left(-\frac{5}{2}e^{-2x}\right)\bigg|_0^4 = \frac{5}{2}(1 - e^{-8}).$

6.6.13 $m = \int_0^1 x\sqrt{2 - x^2} \, dx = \left(-\frac{1}{3}(2 - x^2)^{3/2}\right)\bigg|_0^1 = -\frac{1}{3} + \frac{2\sqrt{2}}{3} = \frac{2\sqrt{2} - 1}{3}.$

6.6.14 $m = \int_0^1 1 \, dx + \int_2^3 2 \, dx = 2 + 2 = 4.$

6.6.15 $m = \int_0^2 1 \, dx + \int_2^4 \big(1 + x\big) \, dx = 2 + \left(x + \frac{x^2}{2}\right)\bigg|_2^4 = 2 + (4 + 8) - (2 + 2) = 10.$

6.6.16 $m = \int_0^1 x^2 \, dx + \int_1^2 x(2 - x) \, dx = \left(\frac{x^3}{3}\right)\bigg|_0^1 + \left(x^2 - \frac{x^3}{3}\right)\bigg|_1^2 = \frac{1}{3} + \frac{1}{3} + \left(4 - \frac{8}{3} - \left(1 - \frac{1}{3}\right)\right) = 1.$

6.6.17 $W = \int_0^3 2x \, dx = x^2\bigg|_0^3 = 9 \text{ J}.$

6.6.18 $W = \int_1^3 2x^2 \, dx = \left(-\frac{2x}{3}\right)\bigg|_1^3 = \frac{2}{3} - (-2) = \frac{4}{3} \text{ J}.$

6.6.19
   a. Because $f(0.2) = 0.2k = 30$, we have $k = 150$.
   b. $W = \int_0^{0.4} 150x \, dx = 75x^2\bigg|_0^{0.4} = 75(0.16) = 12 \text{ J}.$
   c. $W = \int_0^{0.3} 150x \, dx = 75x^2\bigg|_0^{0.3} = 75(0.09) = 6.75 \text{ J}.$
   d. $W = \int_0^{0.4} 150x \, dx = 75x^2\bigg|_0^{0.4} = 75(0.16 - 0.04) = 9 \text{ J}.$

6.6.20
   a. $f(0.25) = 0.25k = 15$, so $k = 60$.
   b. $W = \int_0^{-0.2} 30x^2 \, dx = 30x^2\bigg|_0^{-0.2} = 30(0.04) = 1.2 \text{ J}.$
   c. $W = \int_0^{0.55} 30x^2 \, dx = 30x^2\bigg|_0^{0.55} = 30(0.3025 - 0.0625) = 30(0.24) = 7.2 \text{ J}.$

6.6.21
   a. $f(x) = kx$, and $f(0.5) = 50$, so $k(0.5) = 50$, so $k = 100$.
   Therefore $W = \int_0^{1.5} 100x \, dx = (50x^2)\bigg|_0^{1.5} = 112.5 \text{ J}.$
   b. $W = \int_0^{-0.5} 50x \, dx = (50x^2)\bigg|_0^{-0.5} = 12.5 \text{ J}.$

6.6.22 $f(x) = kx$, and $f(0.02) = 0.02k = 500 \cdot 9.8 = 4900$, so $k = 245000$. Then

$$W = \int_0^{0.04} 245000x \, dx = (122500x^2)\bigg|_0^{0.04} = 196 \text{ J}.$$
6.6.23
a. \( f(0.2) = 0.2k = 50, \) so \( k = 250. \) Thus

\[
W = \int_0^{0.5} 250x \, dx = 125x^2 \bigg|_0^{0.5} = 125 \cdot 0.25 = 31.25 \text{ J.}
\]

b. \( \int_0^{0.2} kx \, dx = \frac{k}{2}x^2 \bigg|_0^{0.2} = 0.02k = 50, \) so \( k = 2500. \) Then

\[
W = \int_0^{0.5} 2500x \, dx = 1250x^2 \bigg|_0^{0.5} = 1250 \cdot 0.25 = 312.5 \text{ J.}
\]

6.6.24
a. \( f(0.1) = 0.1k = 50, \) so \( k = 500. \) Then

\[
W = \int_0^{0.4} 500x \, dx = 250x^2 \bigg|_0^{0.4} = 250 \cdot 0.16 = 40 \text{ J.}
\]

b. \( \int_0^{0.1} kx \, dx = \frac{k}{2}x^2 \bigg|_0^{0.1} = 0.005k = 2, \) so \( k = 400. \) Thus

\[
W = \int_0^{0.4} 400x \, dx = 200x^2 \bigg|_0^{0.4} = 200 \cdot 0.16 = 32 \text{ J.}
\]

6.6.25
a. We have \( \int_0^{0.5} kx \, dx = \left( \frac{k}{2}x^2 \right) \bigg|_0^{0.5} = 0.125k = 100, \) so that \( k = 800. \) Then

\[
W = \int_0^{1.25} 800x \, dx = 400x^2 \bigg|_0^{1.25} = 625 \text{ J.}
\]

b. \( f(0.5) = 0.5k = 250, \) so \( k = 500, \) and thus

\[
W = \int_0^{1.25} 500x \, dx = 250x^2 \bigg|_0^{1.25} = 390.625 \text{ J.}
\]

6.6.26
\[W(x) = \int_0^x 25t \, dt = \left( \frac{25t^2}{2} \right) \bigg|_0^x = \frac{25}{2} x^2.\]

Note that \( W \) is an even function, so that \( W(-x) = W(x), \) and thus the work is the same to compress or stretch the spring a given distance from its equilibrium position.

6.6.27 We have

\[
W = \int_0^{2.5} \rho g A(y)(2.5 - y) \, dy = 1000 \cdot 9.8 \cdot 25 \cdot 15 \int_0^{2.5} (2.5 - y) \, dy
\]

\[
= 3675000 \left( 2.5y - \frac{y^2}{2} \right) \bigg|_0^{2.5} = 3675000 \cdot \frac{2.5^2}{2} = 1.148 \times 10^7 \text{ J.}
\]
6.6.28
a. \[ W = \int_{0}^{8} \rho g \pi \cdot 2^2 (8 - y) \, dy = 4\pi \rho g \left( 8y - \frac{y^2}{2} \right) \bigg|_{0}^{8} = 3.941 \times 10^6 \text{ J}. \]

b. Not true. Pumping half the water from a full tank the work is
\[ \int_{4}^{8} \rho g \pi \cdot 2^2 (8 - y) \, dy = 4\pi \rho g \left( 8y - \frac{y^2}{2} \right) \bigg|_{4}^{8} = 32\pi \rho g \approx 985203 \text{ J}. \]

To empty a half-full tank, the work is
\[ \int_{0}^{4} \rho g \pi \cdot 2^2 (8 - y) \, dy = 4\pi \rho g \left( 8y - \frac{y^2}{2} \right) \bigg|_{0}^{4} = 96\pi \rho g \approx 2.95561 \times 10^6 \text{ J}. \]

6.6.29 \[ W = \int_{0}^{4} \rho g \pi \cdot 2^2 (8 - y) \, dy = 4\pi \rho g \left( 8y - \frac{y^2}{2} \right) \bigg|_{0}^{4} = 4\pi \rho g (40 - 8) = 128\pi \rho g \approx 3.941 \times 10^6 \text{ J}. \]

6.6.30 \[ W = \int_{0}^{2} \rho g A(y) (3 - y) \, dy = 1000 \cdot 9.8 \cdot 25 \cdot 15 \int_{0}^{2} (3 - y) \, dy \]
\[ = 3675000 \left( 3y - \frac{y^2}{2} \right) \bigg|_{0}^{2} = 3675000 \cdot 4 = 1.47 \times 10^7 \text{ J}. \]

6.6.31
a. Let the vertex of the cone be at (0, 0), with the y-axis vertically oriented. Note that the area of a horizontal slice at height y is \( \frac{\pi y^2}{16} \), and it must move 6 – y meters to get to the top. Then
\[ W = \int_{0}^{6} \rho g \pi \frac{y^2}{16} (6 - y) \, dy = \pi \rho \frac{g}{16} \int_{0}^{6} (6y^2 - y^3) \, dy = \pi \rho \frac{g}{16} \left( 2y^3 - \frac{y^4}{4} \right) \bigg|_{0}^{6} = \pi \rho \frac{g}{16} \cdot 108 = 66,150\pi \text{ J}. \]

b. Not true. \( \int_{0}^{3} \rho g \pi \frac{y^2}{16} (6 - y) \, dy = \frac{135}{64} \rho g \pi \approx 20672\pi \text{ J} \), less than half the answer in part (a). Note that while the water must be raised further than water in the top half, due to the shape of the tank, there is far less water in the bottom half than in the top.

6.6.32 Orient the y-axis vertically, with the point (10, 0) representing a point on the bottom of the pool in one corner of the deep end, and (−10, 1) representing a point on the bottom of the pool in the shallow end on the same side of the pool. Note that the straight line between these two points is given by \( y = \frac{1}{20}(10 - x) \). So in the first 1 meter of depth, at a height of y the length of the pool is 10 – x = 20y, so the area of a slice is 20y · 10. In the 2nd meter of depth, the slices are uniformly of area 200 square meters.

\[ W = \int_{0}^{1} \rho g 200y(2.2 - y) \, dy + \int_{1}^{2} \rho g 200(2.2 - y) \, dy \]
\[ = 200\rho g \left( \left( 1.1y^2 - \frac{y^3}{3} \right) \bigg|_{0}^{1} + \left( 2.2y - \frac{y^2}{2} \right) \bigg|_{1}^{2} \right) \]
\[ = 200\rho g \left( 1.1 - \frac{1}{3} + \left( 4.4 - 2 \left( 2.2 - \frac{1}{2} \right) \right) \right) = \frac{880}{3} \rho g \approx 2.875 \times 10^6 \text{ J}. \]
6.6.33

a. Orient the axes so that the south pole of the tank is at \((0, 0)\) and the north pole is at \((0, 16)\). The cross section of the tank which contains the \(xy\) plane intersects the tank in the circle centered at \((0, 8)\) with radius 8, so the curve is \(x^2 + (y-8)^2 = 8^2\). A slice at height \(y\) has area \(\pi x^2 = \pi (16y - y^2)\). The water at height \(y\) must be lifted \(2 + y\) feet since the inflow pipe is 2 feet above the ground. Then the total work is

\[
W = \int_0^{16} \rho g \pi (2 + y)(16y - y^2) \, dy
\]

\[
= \pi \rho g \int_0^{16} (-y^3 + 14y^2 + 32y) \, dy
\]

\[
= \pi \rho g \left[ -\frac{y^4}{4} + \frac{14}{3} y^3 + 16y^2 \right]_0^{16}
\]

\[
= \pi \cdot 9800 \left[ -16384 + \frac{57344}{3} + 4096 \right] = \frac{200704000}{3} \pi \approx 2.102 \times 10^8 \text{ J}.
\]

b. In this case, the work performed is the work involved in lifting all of the water up 18 meters, which is

\[
W = (\frac{4\pi}{3}) \rho g \cdot 18 = \frac{4\pi}{3} 8^3 \cdot 1000 \cdot 9.8 \cdot 18 = 120,422,400 \pi \approx 3.783 \times 10^8 \text{ J}.
\]

6.6.34

a. Orient the axes so that the south pole of the semicircle at one end of the trough. The equation of the semicircle is \(x^2 + (y - \frac{1}{2})^2 = \left(\frac{1}{2}\right)^2\). At a height of \(y\), a slice has area \(2x \cdot 3 = 6\sqrt{\frac{1}{2}y - y^2}\). The distance it must travel to the top is \(\frac{1}{4} - y\). Thus

\[
W = \int_0^{1/4} \rho g 6 \sqrt{\frac{1}{2}y - y^2} \left(\frac{1}{4} - y\right) \, dy.
\]

Let \(u = \frac{1}{2}y - y^2\), so that \(du = \left(\frac{1}{2} - 2y\right) \, dy = 2 \left(\frac{1}{4} - y\right) \, dy\). Then we have

\[
W = 3 \rho g \int_0^{1/16} u^{1/2} \, du = 2 \rho g \left(\frac{u^{3/2}}{3}\right) \bigg|_0^{1/16} = \rho g \frac{9}{32} = 306.25 \text{ J}.
\]

b. Yes. If we double the length of the trough, the area of a slice is doubled, and the work integral is doubled.

c. No. If the radius is doubled, the work is more than doubled. (There are more slices, and each must travel farther to get to the top of the tank.)

6.6.35

a. Orient the axes so that the lower corners of the trough are at \((-0.25, 0)\) and at \((0.25, 0)\). Then the upper corners are at \((-0.5, 1)\) and at \((0.5, 1)\). Note that the line between \((0.25, 0)\) and \((0.5, 1)\) is given by \(y = 4x - 1\). The area of a slice at height \(y\) is \(2x \cdot 10 = 20 \cdot \frac{1}{2}(y + 1) = 5(y + 1)\). Thus

\[
W = \rho g \int_0^1 5(y + 1)(1-y) \, dy = 5\rho g \int_0^1 (1-y^2) \, dy = 5\rho g \left( y - \frac{y^3}{3} \right) \bigg|_0^1 = \frac{10\rho g}{3} \approx 32,667 \text{ J}.
\]

b. Yes. If the length is doubled, the area of each slice is doubled, so the work integral is doubled as well.

6.6.36 Note that this tank is full of water, rather than gasoline, so that \(\rho = 1000\). Then

\[
W = 1000 \cdot 9.8 \int_{-5}^{5} 20\sqrt{25 - y^2}(10 - y) \, dy = 196,000 \int_{-5}^{5} \sqrt{25 - y^2}(10 - y) \, dy.
\]
The integral can be divided into two integrals as in the example, giving

\[ 10 \int_{-5}^{5} \sqrt{25 - y^2} \, dy - \int_{-5}^{5} y \sqrt{25 - y^2} \, dy. \]

The first represents 10 times the area of a half-circle of radius 5, so the value is \(10 \cdot \frac{25\pi}{2} = 125\pi\). The second integral can be computed with the substitution \(u = 25 - y^2\), \(du = -2y \, dy\). Note that both bounds on \(y\) become \(u = 0\), so that the resulting integral is over an empty range, so is zero. Thus the total work is \(W = 196000 \cdot 125\pi \approx 7.697 \times 10^7\) J.

6.6.37 Let the vertex of the cone be at \((0, 0, 0)\), with the \(y\)-axis vertically oriented. Note that the area of a horizontal slice at height \(y\) is \(\frac{\pi y^2}{16}\), and it must move \(3 - y\) meters to get to the point 1 meter above the top. Thus

\[ W = \int_0^2 \rho g \frac{y^2}{16} (3 - y) \, dy = \pi \rho g \frac{9}{16} \int_0^2 (3y^2 - y^3) \, dy = \pi \rho g \frac{9}{16} \left[ \frac{y^3}{4} - \frac{y^4}{4} \right]_0^2 = \pi \rho g \frac{9}{4} \cdot 4 = \frac{9\rho g}{4} \approx 7696.9\text{ J.} \]

6.6.38 \(F = \int_0^{10} \rho g (10 - y) \cdot 40 \, dy = 40 \rho g \left(10y - \frac{y^2}{2}\right)|_0^{10} = 200 \rho g = 1.960 \times 10^6\text{ N.} \)

6.6.39 Orient the axes so that the lower corners of the trapezoid are at \((5, 0, 0)\) and \((-5, 0, 0)\), and the upper corners are at \((10, 15)\) and \((-10, 15)\). Note that the line between the corners for \(x > 0\) is given by \(y = 3(x - 5)\), so at level \(y\), we have a width of \(2x = \frac{2y}{3} + 10\). Then

\[ F = \rho g \int_0^{15} (15 - y) \left(\frac{2y + 30}{3}\right) \, dy = \frac{2 \rho g}{3} \int_0^{15} (225 - y^2) \, dy = \frac{2 \rho g}{3} \left[ 225y - \frac{y^3}{3} \right]|_0^{15} = \frac{2 \rho g}{3} \cdot 225 = 1500 \rho g = 1.470 \times 10^7\text{ N.} \]

6.6.40 Orient the axes so that \((0, 0, 0)\) is at the “south pole” of the semicircle. The center of the circle is \((0, 20)\) and the radius is 20, so the equation is \(x^2 + (y - 20)^2 = 20^2\), so \(x = \sqrt{40y - y^2}\). The width is \(2x = 2\sqrt{40y - y^2}\), and thus \(F = 2 \rho g \int_0^{20} (20 - y) \sqrt{40y - y^2} \, dy\). Let \(u = 40y - y^2\), so that \(du = 2(20 - y) \, dy\).

The integral becomes

\[ F = \rho g \int_0^{400} \sqrt{u} \, du = \rho g \left( \frac{2}{3} u^{3/2} \right)|_0^{400} = \frac{16000}{3} \rho g \approx 5.227 \times 10^7\text{ N.} \]

6.6.41 Orient the axes so that the bottom vertex is at \((0, 0, 0)\). The other vertices are at \((\pm 10, 30)\), and the line between \((0, 0)\) and \((10, 30)\) is given by \(y = 3x\). Thus, a slice at height \(y\) has width \(2x = \frac{2y}{3}\). Then

\[ F = \int_0^{30} \rho g (30 - y) \frac{2y}{3} \, dy = \frac{2 \rho g}{3} \left[ 15y^2 - \frac{y^3}{3} \right]|_0^{30} = \frac{2 \rho g}{3} \cdot 4500 = 3000 \rho g = 2.940 \times 10^7\text{ N.} \]

6.6.42 At a height of \(y\), the width of a slice is \(2x = 2\sqrt{4y} = 8y^{1/2}\). This gives

\[ F = 8 \rho g \int_0^{25} (25 - y) y^{1/2} \, dy = 8 \rho g \left( \frac{50}{3} y^{3/2} - \frac{2}{5} y^{5/2} \right)|_0^{25} = 8 \rho g \left( \frac{2500}{3} \right) \approx 6.533 \times 10^7\text{ N.} \]

6.6.43 The width of the plate at depth \(y\) is \(2 - y\), so the force on the plate is

\[ F = \int_1^2 \rho g (2 - y) y \, dy = \rho g \left( \frac{y^2}{3} - \frac{y^3}{3} \right)|_1^2 = \rho g \cdot \frac{2}{3} \approx 6533\text{ N.} \]

Copyright © 2014 Pearson Education, Inc.
6.6.44 Arrange the axes so that the origin is in the center of the circular end of the tank. The equation of
the circle is \(x^2 + y^2 = 25\), so the width of the tank at height \(y\) is \(2\sqrt{25 - y^2}\), and the depth is \(5 - y\). Thus
the force is given by

\[
\rho g \int_{-5}^{5} (5-y)2\sqrt{25-y^2} \, dy = 14445.2 \int_{-5}^{5} (5-y)\sqrt{25-y^2} \, dy
\]

\[
= 14445.2 \left( \int_{-5}^{5} 5\sqrt{25-y^2} \, dy + \int_{-5}^{5} y\sqrt{25-y^2} \, dy \right).
\]

The first integral is five times the area of a semicircle of radius 5, while the second integral is zero since it is
a symmetric integral of an odd function. So the total force is \(14445.2 \cdot \frac{125\pi}{2} \approx 2.836 \times 10^6\) N.

One can also do this problem by placing the origin at the bottom of the tank; then the equation of the
circle is \(x^2 + (y-5)^2 = 25\) and the first integral is \(\rho g \int_{0}^{10} (10-y)2\sqrt{25 - (y-5)^2} \, dy\). After the substitution \(u = y - 5\) we get the same integral as above.

6.6.45 \(F = \int_{0}^{50} (150 + 2y) \cdot 80 \, dy = 80 \left( 150y + y^2 \right) \bigg|_{0}^{50} = 8 \times 10^5\) N.

6.6.46 \(F = \int_{0}^{1/2} \rho g(4-y) \cdot 0.5 \, dy = 80 \left( 2y - \frac{y^2}{4} \right) \bigg|_{0}^{1/2} = \frac{15 \rho g}{16} = 9187.5\) N.

6.6.47 \(F = \int_{1}^{1.5} \rho g(4-y) \cdot 0.5 \, dy = 80 \left( 2y - \frac{y^2}{4} \right) \bigg|_{1}^{1.5} = \frac{11 \rho g}{16} = 6737.5\) N.

6.6.48 Orient the axes so that \((0,0)\) is at the bottom of the circle at the bottom of the pool. Then the
equation of the circle is \(x^2 + (y - \frac{1}{2})^2 = \left(\frac{3}{2}\right)^2\), so the width of a slice at a height of \(y\) is \(2x = 2\sqrt{y-y^2}\.

Thus

\[
F = 2\rho g \int_{0}^{1} (4-y)(\sqrt{y-y^2}) \, dy
\]

\[
= 2\rho g \int_{0}^{1} \frac{7}{2} \sqrt{y-y^2} \, dy + 2\rho g \int_{0}^{1} \left( \frac{1}{2} - y \right) \sqrt{y-y^2} \, dy
\]

\[
= \frac{7\rho g}{8} + 2\rho g \left( \frac{1}{3} (y-y^2)^{3/2} \right) \bigg|_{0}^{1}
\]

\[
= \frac{7\pi \rho g}{8} + 0 \approx 2.694 \times 10^4\) N.
\]

6.6.49

a. True. \(m = \int_{a}^{b} \rho(x) \, dx = \frac{1}{b-a} \int_{a}^{b} \rho(x) \, dx \cdot (b-a) = \overline{\rho} \cdot L\).

b. True. \(\int_{0}^{L} kx \, dx = \frac{kL^2}{2} = \int_{-L}^{0} kx \, dx\).

c. True. This follows because work is force times distance.

d. False. Although they have the same geometry, they are placed at different depths of the water, so the
force is different.

6.6.50

a. \(m_1 = \int_{0}^{L} 4e^{-x} \, dx = (-4e^{-x}) \bigg|_{0}^{L} = 4(1 - e^{-L})\).

\(m_2 = \int_{0}^{L} 6e^{-2x} \, dx = (-3e^{-2x}) \bigg|_{0}^{L} = 3(1 - e^{-2L})\).

These are the same when \(3(e^{-L})^2 - 4e^{-L} + 1 = 0\), or \((e^{-L} - 1)(3e^{-L} - 1) = 0\), so \(L = \ln 3\). \(m_2\) is
bigger on \((0, \ln 3)\) and \(m_1\) is bigger for \(L > \ln 3\).

b. No. \(\lim_{L \to \infty} m_1 = 4\) and \(\lim_{L \to \infty} m_2 = 3\).

Copyright © 2014 Pearson Education, Inc.
6.6.51

a.

Compared to the linear spring $F(x) = 16x$, the restoring force is less for large displacements.

\[ W = \int_0^{1.5} (16x - 0.1x^3) \, dx = \left( 8x^2 - 0.025x^4 \right) \bigg|_0^{1.5} = 17.873 \text{ J}. \]

b. $W = \int_0^{0.1} (16x - 0.1x^3) \, dx = \left( 8x^2 - 0.025x^4 \right) \bigg|_0^{0.1} = 31.6 \text{ J}$.

c. $W = \int_0^{-2} (16x - 0.1x^3) \, dx = \left( 8x^2 - 0.025x^4 \right) \bigg|_{-2}^0 = 31.6 \text{ J}$.

6.6.52

a, b. Assume that the mass is in equilibrium due to gravity when the spring is stretched 2 m, as stated in the problem. Then the forces acting on the mass due to gravity and the spring must cancel, so the spring constant $k$ satisfies $2k = 10g$, so that $k = 5g$. Let $x$ be the vertical displacement of the mass measured downwards from this equilibrium point. At position $x$, the sum of the forces on the mass is

\[ f(x) = 5g - 5g(x + 2) = -5gx. \]

Thus the work required to move the mass either up or down by 0.5 m is

\[ W = 5g \int_{0}^{0.5} x \, dx = 5g \cdot \left. \frac{x^2}{2} \right|_{0}^{0.5} = \frac{5}{8} g \approx 6.125 \text{ J}. \]

6.6.53 Orient the axes so that (0, 0) is in the middle of the bottom of the cup. Note that the line between (0.02, 0) and (0.025, 0.15) is given by $y = 30x - \frac{3}{5}$, so $x = \frac{y}{30} + \frac{1}{150}$. The area of a cross section at height $y$ is given by $\pi x^2 = \pi \left( \frac{5y+3}{150} \right)^2$. Note that the distance the slice must travel is $0.2 - y$, because it must go 0.05 above the top of the glass. Thus,

\[ W = \pi \rho g \int_{0}^{0.15} \left( \frac{5y+3}{150} \right)^2 (0.2 - y) \, dy \\
= \frac{\pi \rho g}{5 \cdot 150^2} \int_{0}^{0.15} (5y+3)^2 (1-5y) \, dy \\
= \frac{\pi \rho g}{5 \cdot 150^2} \int_{0}^{0.15} (-125y^3 - 125y^2 - 15y + 9) \, dy \\
= \left[ \frac{\pi \rho g}{5 \cdot 150^2} \left( \frac{-125}{4} y^4 - \frac{125}{3} y^3 - \frac{15}{2} y^2 + 9y \right) \right]_0^{0.15} \\
= \frac{\pi \rho g}{5 \cdot 150^2} \cdot 1.0248 \approx 0.280 \text{ J}. \]

6.6.54

a.

\[ W = \pi \rho g \int_{4}^{8} 9(10 - y) \, dy = \pi \rho g \left( 90y - \frac{9}{2} y^2 \right) \bigg|_{4}^{8} = (720 - 288 - (360 - 72)) \pi \rho g \\
= 144 \pi \rho g \approx 4.433 \times 10^6 \text{ J}. \]
b. 
\[ W = \pi \rho g \int_{0}^{4} 9(10 - y) \, dy = \pi \rho g \left( 90y - \frac{9}{2}y^2 \right) \bigg|_{0}^{4} = (360 - 72)\pi \rho g \approx 8.867 \times 10^6 \text{ J.} \]

c. The water in the lower part of the tank has to travel farther, so it requires more work to pump it out. In fact, on average, the water in the lower half travels twice as far, since the midpoint of the upper half is 2 + 2 = 4 m below the pipe while the midpoint of the lower half is 2 + 4 + 2 = 8 m below the pipe. This explains why the answer to part (b) is twice the answer to part (a).

6.6.55

a. 
\[ W = \int_{0}^{2500000} \frac{GMm}{(x + R)^2} \, dx \]
\[ = GMm \left( \frac{1}{R} - \frac{1}{R + 2500000} \right) \approx 8.874 \times 10^9 \text{ J.} \]

b. \[ W(x) = \int_{0}^{x} \frac{GMm}{(t + R)^2} \, dt = GMm \left( \frac{1}{t + R} \right) \bigg|_{0}^{x} = GMm \left( \frac{1}{R + x} \right) = \frac{GMmx}{R(R + x)} = \frac{500GMx}{R(R + x)}. \]

c. \[ \lim_{x \to \infty} \frac{GMmx}{R(R + x)} = \lim_{x \to \infty} \frac{GMm}{R(R + x) + 1} = \frac{GMm}{R}. \]

d. Suppose \( \frac{GMmx}{R(R + x)} = \frac{1}{2}mv^2. \) Then \( v^2 = \frac{2GMx}{R(R + x)}, \) and as \( x \to \infty \) we have
\[ \lim_{x \to \infty} v^2 = \lim_{x \to \infty} \left( \frac{2GM}{R} \cdot \frac{x}{x + R} \right) = \frac{2GM}{R}, \]
so the escape velocity is \( v = \sqrt{\frac{2GM}{R}}. \)

6.6.56

a. \[ W = \int_{50}^{60} 1000 \cdot 5 \cdot 2 \cdot 8 \, dx = 1600 \text{ J.} \]

b. \[ W = \int_{0}^{5} 2 \cdot 8 \, dt = 64 \cdot 5 = 320 \text{ J.} \]

6.6.57

a. \[ W_1 = \int_{30}^{50} 50 \cdot (30 - y) \, dy = 5g \left( 30y - \frac{y^2}{2} \right) \bigg|_{0}^{30} = 2250 \text{ J.} \]

b. \[ W = W_1 + W_2, \] where \( W_2 \) is the work to just lift the block. \( W_2 = 50g \cdot 30 = 1500g, \) so \( W = 2250g + 1500g = 3750g \text{ J.} \)

6.6.58 \[ W = \int_{0}^{60} 60 \cdot 5 \cdot g(60 - y) \, dy = 55g \left( 60y - \frac{y^2}{2} \right) \bigg|_{0}^{60} = 99g \text{ J.} \]

6.6.59

a. The acceleration due to gravity is \( F = mg, \) and is in the vertical direction. The tangent direction to the curve is perpendicular to the normal, which makes an angle of \( \theta \) with the the vertical. If we form a right triangle with hypotenuse of length \( mg, \) and angle \( \theta, \) then the two legs must have lengths \( mg \sin \theta \) (parallel to the curve) and \( mg \cos \theta \) (normal to the curve).
b. Note that the angle \( t \) is \( t = S/L \), where \( S \) is arc length. Then \( S = Lt \) and \( dS = L \, dt \). So

\[
W = \int_0^\theta F \, ds = \int_0^\theta mg \sin \theta \cdot L \, d\theta = mgL ( - \cos \theta ) \bigg|_0^\theta = mg(L - L \cos \theta) = mgh.
\]

6.6.60 The plate pictured on the left should have more force, because it has its wider part lower in the pool. In each case, place the origin at the surface of the water above the middle of the horizontal base of the triangle, with the positive \( y \) axis pointing down.

For the plate on the left, the triangle ranges from \( y = 1 \) to \( y = 1 + \frac{\sqrt{3}}{2} \). For each value of \( y \), the horizontal line at \( y \) forms an equilateral triangle with the two diagonal sides that it cuts off. The height of this triangle is \( y - 1 \), so the width is \( \frac{1}{2}(y - 1) \). Thus the force on the plate is

\[
F = \int_1^{1+\frac{\sqrt{3}}{2}} \rho g y \left( \frac{2(y - 1)}{\sqrt{3}} \right) \, dy
= \rho g \int_1^{1+\frac{\sqrt{3}}{2}} \left( \frac{2}{\sqrt{3}} y^2 - \frac{2}{\sqrt{3}} y \right) \, dy
= \frac{2}{\sqrt{3}} \rho g \left[ \left( \frac{y^3}{3} - \frac{y^2}{2} \right) \right]_{y=1}^{y=1+\frac{\sqrt{3}}{2}}
= \rho g \left( \frac{1}{4} + \frac{\sqrt{3}}{4} \right) \approx 9800 \cdot 0.683 \, \text{N} \approx 6694 \, \text{N}.
\]

For the plate on the right, again the triangle ranges from \( y = 1 \) to \( y = 1 + \frac{\sqrt{3}}{2} \). For each value of \( y \), the horizontal line at \( y \) forms an equilateral triangle with the two diagonal sides that it cuts off. The height of this triangle is \( 1 + \frac{\sqrt{3}}{2} - y \), so the width is \( \frac{2}{\sqrt{3}} + 1 - \frac{2y}{\sqrt{3}} \). Thus the force on the plate is

\[
F = \int_1^{1+\frac{\sqrt{3}}{2}} \rho g y \left( \frac{2}{\sqrt{3}} + 1 - \frac{2y}{\sqrt{3}} \right) \, dy
= \rho g \int_1^{1+\frac{\sqrt{3}}{2}} \left( \frac{2}{\sqrt{3}} y + y - \frac{2y^2}{\sqrt{3}} \right) \, dy
= \rho g \left( \frac{1}{\sqrt{3}} y^2 + \frac{y^2}{2} - \frac{2y^3}{3\sqrt{3}} \right) \bigg|_{y=1}^{y=1+\frac{\sqrt{3}}{2}}
= \rho g \frac{1 + 2\sqrt{3}}{8} \approx 9800 \cdot 0.558 \, \text{N} \approx 5469 \, \text{N}.
\]

6.6.61 The plate on the left has more than half of its area below the horizontal line which is \( \frac{1}{2} \) below the surface, while the plate on the right has exactly half its area below that line, so the plate on the left should have more force than the plate on the right. In each case, place the origin at the surface of the water above the center of the square, with the positive \( y \) axis pointing down.

For the left plate, note that \( y \) varies from \( 1 \) to \( 1 + \frac{\sqrt{3}}{2} \) as the plate widens, then from \( 1 + \frac{\sqrt{3}}{2} \) to \( 1 + \sqrt{2} \) as it narrows. For the first part, at height \( y \), we have an isosceles right triangle with altitude \( y - 1 \), so its width is \( 2(y - 1) \). For the second part, at height \( y \), we have an isosceles right triangle with altitude \( 1 + \sqrt{2} - y \), so...
its width is \(2(1 + \sqrt{2} - y)\). Hence the force on the plate is

\[
F = \rho g \int_1^{1+\sqrt{2}/2} y \cdot 2(y-1) \, dy + \rho g \int_1^{1+\sqrt{2}/2} 2y \left(1 + \sqrt{2} - y\right) \, dy
\]

\[
= \rho g \left(\frac{2}{3} y^3 - y^2\right) \bigg|_{y=1}^{y=1+\sqrt{2}/2} + \rho g \left(y^2 + \sqrt{2}y^2 - \frac{2y^3}{3}\right) \bigg|_{y=1+\sqrt{2}/2}^{y=1+\sqrt{2}}
\]

\[
= \rho g \left(\frac{1}{2} + \frac{1}{3\sqrt{2}}\right) + \rho g \left(\frac{1}{2} + \frac{\sqrt{2}}{3}\right)
\]

\[
= \rho g \left(1 + \frac{1}{\sqrt{2}}\right) \approx \rho g \cdot 1.707 \, N \approx 16730 \, N.
\]

For the right plate, the width is constant at 1, so the force is

\[
F = \int_1^2 \rho g y \, dy = \rho g \left(\frac{y^2}{2}\right) \bigg|_{y=1}^{y=2} = \frac{3\rho g}{2} \approx 9800 \cdot \frac{3}{2} \, N \approx 14700 \, N.
\]

**Chapter Review**

1. a. True. A vertical slice would lead to shells, while a horizontal slice would lead to either disks or washers.

b. True. In order to find position, you would also need to know either its initial position, or at least its position at some time.

c. True. If \(\frac{dV}{dt}\) is constant, then \(V\) is a linear function of time.

2. The displacement is \(\int_0^{1.5} 20 \cos \pi t \, dt = \left(\frac{20}{\pi} \sin \pi t\right) \bigg|_0^{1.5} = -\frac{20}{\pi}\).

3. The position \(s(t)\) and the displacement are the same, because the projectile started on the ground at position 0. \(s(t) = \int_0^t v(x) \, dx = \int_0^t (20 - 10x) \, dx = (20x - 5x^2) \bigg|_0^t = 20t - 5t^2\). Note that the projectile is moving up for \(0 \leq t < 2\) and down for \(2 < t \leq 4\). Thus the distance traveled is equal to the position for \(0 \leq t \leq 2\), but for \(2 \leq t \leq 4\) the distance traveled is \(20 + (20 - (20t - 5t^2)) = 40 - 20t + 5t^2\).

4. \(a(t) = -5\), so \(v(t) = -5t + C\), and because \(v(0) = 80\), we have \(v(t) = 80 - 5t\). The position function is \(s(t) = \int v(t) \, dt = \int (80 - 5t) \, dt = 80t - \frac{5}{2}t^2 + D\), and because \(s(0) = 0\) we have \(D = 0\). Thus, \(s(t) = 80t - \frac{5}{2}t^2\).
5. 
   a. \( v(t) = \int a(t) \, dt = \int 2 \sin \frac{\pi t}{4} \, dt = -\frac{8}{\pi} \cos \frac{\pi t}{4} + C \), and because \( v(0) = -\frac{8}{\pi} \), we have \( C = 0 \). Thus,
      \( v(t) = -\frac{8}{\pi} \cos \frac{\pi t}{4} \).
      \( s(t) = \int v(t) \, dt = \int \left( -\frac{8}{\pi} \cos \frac{\pi t}{4} \right) \, dt = -\frac{32}{\pi^2} \sin \frac{\pi t}{4} + D \), and because \( s(0) = 0 \) we have \( D = 0 \). Thus,
      \( s(t) = -\frac{32}{\pi^2} \sin \frac{\pi t}{4} \).
   b. \( s \) is periodic with period 8, so we only consider \( 0 \leq t \leq 8 \). There are critical numbers for \( s \) at \( t = 2 \) and \( t = 6 \). There is a maximum for \( s \) of \( \frac{32}{\pi^2} \) at \( t = 6 \) and a minimum of \( -\frac{32}{\pi^2} \) at \( t = 2 \).
   c. The average velocity is \( \frac{1}{8} \int_{0}^{8} \left( -\frac{8}{\pi} \cos \frac{\pi t}{4} \right) \, dt = -\frac{4}{\pi} \left( \sin \frac{\pi t}{4} \right)_{0}^{8} = 0 \).
      The average position is \( \frac{1}{8} \int_{0}^{8} \left( -\frac{32}{\pi^2} \sin \frac{\pi t}{4} \right) \, dt = \frac{16}{\pi^2} \left( \cos \frac{\pi t}{4} \right)_{0}^{8} = 0 \).

6.
   a. 

   b. Anna runs
      \[
      \int_{0}^{1} (2t + 1) \, dt = (t^2 + t)_{0}^{1} = 2, \quad \text{miles,}
      \]
      while Benny runs
      \[
      \int_{0}^{1} (4 - t) \, dt = \left( 4t - \frac{t^2}{2} \right)_{0}^{1} = 4 - \frac{1}{2} = 3.5, \quad \text{miles.}
      \]
      Note that the area under Anna’s graph from 0 to 1 is smaller than the corresponding area under Benny’s graph.
   c. \( s_A(t) = t^2 + t \), which is 6 for \( t = 2 \). \( s_B(t) = 4t - \frac{t^2}{2} \) which is 6 for \( t = 2 \), so they both take exactly two hours to run 6 miles. At \( t = 2 \), both velocity functions have the same area under them, namely 6.

7. 
   a. For \( 0 \leq t \leq 8 \) we have \( R'(t) = 4t^{1/3} \), so \( R(t) = 3t^{4/3} + C \), but \( C = 0 \), so \( R(t) = 3t^{4/3} \).
   b. Note that \( R(8) = 48 \), so for \( t > 8 \), \( R(t) = 48 + \int_{8}^{t} 2 \, dx = 48 + 2(t - 8) \).
      We have \( R(t) = \begin{cases} 
      3t^{4/3} & \text{if } 0 \leq t \leq 8; \\
      2t + 32 & \text{if } t > 8. 
      \end{cases} \)
   c. The fuel runs out when \( 150 = 48 + 2(t - 8) \), which occurs for \( t = 59 \).

8. Let \( V'(t) = -\frac{15}{7 + t} \). (We introduce a minus sign to keep the direction of flow straight — negative flow means out of the tank). Then \( V(t) = -15 \ln(t + 1) + C \), and because \( V(0) = 75 \), we have \( C = 75 \). Thus,
      \( V(t) = 75 - 15 \ln(t + 1) \). This is 0 when \( \ln(t + 1) = 5 \), which occurs when \( t = e^5 - 1 \approx 147.413 \) hours.

9. 
   a. 
   b. The velocity is 50 when \( 200e^{-t/10} = 50 \), which occurs when \( e^{-t/10} = 4 \), so when \( t = 10 \ln 4 \).
The position is given by
\[
\int_0^t 200e^{-x/10} \, dx = -2000e^{-x/10} \bigg|_0^t \\
= 2000(1 - e^{-t/10}).
\]

d. No. \( \lim_{t \to \infty} s(t) = 2000 < 2500. \)

10.

a. The position is given by
\[
\int_0^t \frac{200}{\sqrt{x+1}} \, dx = \left( \frac{400}{\sqrt{x+1}} \right) \bigg|_0^t \\
= 400(\sqrt{t+1} - 1).
\]

b. Yes, the position is 2500 when \( 400\sqrt{t+1} = 2900, \) which occurs when \( t + 1 = \left( \frac{29}{4} \right)^2, \) so
\( t = \left( \frac{29}{4} \right)^2 - 1 = 51.563. \)

c. Tom’s position function is given by
\[
\int_0^t 20e^{-2x} \, dx = (-10e^{-2x}) \bigg|_0^t = 10(1 - e^{-2t}).
\]

Sue’s position is given by
\[
\int_0^t 15e^{-x} \, dx = (-15e^{-x}) \bigg|_0^t = 15(1 - e^{-t}).
\]
b. We are looking for \( t \) so that

\[
10(1 - e^{-2t}) = 15(1 - e^{-t})
\]

which occurs when \( 10(e^{-t})^2 - 15e^{-t} + 5 = 0 \),

or \( 2u^2 - 3u + 1 = 0 \) where \( u = e^{-t} \). This quadratic factors as \((2u - 1)(u - 1)\), so if \( e^{-t} = 1 \) or \( e^{-t} = \frac{1}{2} \),

so \( t = 0 \) or \( t = \ln 2 \).

c. Sue takes the lead at \( t = \ln 2 \) and doesn’t relinquish it.

12. \[
\int_{0}^{1} (x^{1/p} - x^p) \, dx
\]
is evaluated as

\[
\left. \left( \frac{p}{p + 1} x^{(p+1)/p} - \frac{1}{p + 1} x^{p+1} \right) \right|_{0}^{1} = \frac{p}{p + 1} - \frac{1}{p + 1} = \frac{p - 1}{p + 1}.
\]

For \( p = 100 \) the area is \( \frac{999}{1001} \), and for \( p = 1000 \) the area is \( \frac{999}{1001} \).

13. These two curves meet when \( 4x = x\sqrt{25 - x^2} \), so at \( x = 0 \) and when \( 4 = \sqrt{25 - x^2} \), so when \( x = 3 \). A plot of the region is

On \([0, 3]\), we have \( x\sqrt{25 - x^2} > 4x \) (for example, check at \( x = 1 \)), so the area is

\[
A = \int_{0}^{3} (x\sqrt{25 - x^2} - 4x) \, dx.
\]

For the first term, use the substitution \( u = 25 - x^2 \), so that \( du = -2x \, dx \) and the integration bounds become \( u = 25 \) to \( u = 16 \). Then we get

\[
A = \frac{1}{2} \int_{25}^{16} u^{1/2} \, du - \int_{25}^{16} (2x^2) \, dx
\]

\[
= \frac{1}{2} \left( \frac{2}{3} u^{3/2} \right) \bigg|_{25}^{16} - 18 = \frac{64}{3} - \frac{125}{3} - 18 = \frac{7}{3}.
\]
14. The area of $R_1$ is, splitting the integral into two separate integrals,

$$A_{R_1} = \int_0^{8/5} (16 - x^2) \, dx + \int_{8/5}^3 (16 - x^2 - (5x - 8)) \, dx$$

$$= \left[ 16x - \frac{x^3}{3} \right]_0^{8/5} + \left[ 24x - \frac{5}{2}x^2 - \frac{x^3}{3} \right]_{8/5}^3$$

$$= \frac{341}{10}.$$ 

The area of $R_2$ is, again splitting up the integral,

$$A_{R_2} = \int_{8/5}^3 (5x - 8) \, dx + \int_3^4 (16 - x^2) \, dx$$

$$= \left[ \frac{5}{2}x^2 - 8x \right]_{8/5}^3 + \left[ 16x - \frac{x^3}{3} \right]_3^4$$

$$= \frac{257}{30}.$$ 

15. Note that (by inspection followed by an easy calculation) $2\sqrt{x}$ and $x(x - 3)$ meet at $(0, 0)$ and at $(4, 4)$. Also $2\sqrt{x}$ and $3 - x$ meet at $(1, 2)$ and $x(x - 3)$ and $3 - x$ meet at $(-1, 4)$ and $(3, 0)$. So the area of $R_1$, splitting it into two integrals, is

$$A_{R_1} = \int_{-1}^0 [(3 - x) - (x^2 - 3x)] \, dx + \int_0^1 (3 - x - 2\sqrt{x}) \, dx$$

$$= \int_{-1}^0 (3 + 2x - x^2) \, dx + \int_0^1 (3 - x - 2\sqrt{x}) \, dx$$

$$= \left[ 3x + x^2 - \frac{x^3}{3} \right]_{-1}^0 + \left[ 3x - \frac{x^2}{2} - \frac{4}{3}x^{3/2} \right]_0^1$$

$$= 0 - (-3 + 1 + \frac{1}{3}) + (3 - \frac{1}{2} - \frac{4}{3}) - (0) = \frac{17}{6}.$$ 

The area of $R_2$, again splitting up the integral, is

$$A_{R_2} = \int_0^1 (2\sqrt{x} - (x^2 - 3x)) \, dx + \int_1^3 ((3 - x) - (x^2 - 3x)) \, dx$$

$$= \int_0^1 (2\sqrt{x} - x^2 + 3x) \, dx + \int_1^3 (3 + 2x - x^2) \, dx$$

$$= \left[ \frac{4}{3}x^{3/2} - \frac{x^3}{3} + \frac{3}{2}x^2 \right]_0^1 + \left[ 3x + x^2 - \frac{x^3}{3} \right]_1^3$$

$$= \left( \frac{4}{3} - \frac{1}{3} + \frac{3}{2} \right) - 0 + (9 + 9 - 9) - \left( 3 + 1 - \frac{1}{3} \right) = \frac{47}{6}.$$ 

Finally, the area of $R_3$ is

$$A_{R_3} = \int_1^3 (2\sqrt{x} - (3 - x)) \, dx + \int_3^4 (2\sqrt{x} - (x^2 - 3x)) \, dx$$

$$= \left[ \frac{4}{3}x^{3/2} - 3x + \frac{x^2}{2} \right]_1^3 + \left[ \frac{4}{3}x^{3/2} - \frac{x^3}{3} + \frac{3}{2}x^2 \right]_3^4$$

$$= \left( 4\sqrt{3} - 9 + \frac{9}{2} \right) - \left( \frac{4}{3} - 3 + \frac{1}{2} \right) + \left( \frac{32}{3} - 64 + 24 \right) - \left( 4\sqrt{3} - 9 + \frac{27}{2} \right) = \frac{11}{2}.$$ 

Copyright © 2014 Pearson Education, Inc.
16.

\[
\int_{0}^{2\pi} (x - \sin x) \, dx = \left. \left( \frac{x^2}{2} + \cos x \right) \right|_{0}^{2\pi} = 2\pi^2 + 1 - (0 + 1) = 2\pi^2.
\]

17.

We could solve these equations for \(x\) and use a single integral on \(y\), but solving the equations is difficult, so we must split up the integral to get

\[
A = \int_{0}^{2} x^2 \, dx + \int_{2}^{4} (x^2 - 2x^2 + 4x) \, dx = \left. \frac{x^3}{3} \right|_{0}^{2} + \left. \left( -\frac{x^3}{3} + 2x^2 \right) \right|_{2}^{4} = \frac{8}{3} - \frac{64}{3} + 32 - \left( -\frac{8}{3} + 8 \right) = 8.
\]

18.

\[
\int_{0}^{1} (1 - \sqrt{x})^2 \, dx = \int_{0}^{1} (1 - 2\sqrt{x} + x) \, dx = \left. \left( x - \frac{4}{3}x^{3/2} + \frac{x^2}{2} \right) \right|_{0}^{1} = \frac{1}{6}.
\]
19. 

\[
\int_0^2 \left( \frac{x}{2} - \frac{x}{6} \right) \, dx + \int_2^3 \left( \left( \frac{2}{2} - \frac{x}{2} \right) - \frac{x}{6} \right) \, dx
\]

\[
= \frac{x^2}{6} \bigg|_0^2 + \left( 2x - \frac{x^2}{3} \right) \bigg|_2^3
\]

\[= \frac{2}{3} + 6 - 3 - \left( 4 - \frac{4}{3} \right) = 1.\]

20. 

a. The diagram below is for \( a \approx 1.9 \) and \( c \approx 5 \).

b. \( R(x) = \int_a^x (f(t) - g(t)) \, dt \), and \( R'(x) = f(x) - g(x) \).

21. \( A(a) = \int_0^{\sqrt[3]{\pi}} \left( \sqrt{x/a} - x^2/a \right) \, dx = \left( \frac{2}{3} \sqrt[3]{x^3/a} - \frac{x^3}{3a} \right) \bigg|_0^{\sqrt[3]{\pi}} = \frac{1}{3}. \)

22. 

a. \( V = \pi \int_0^4 (\sqrt{4 - y})^2 \, dy = \pi \int_0^4 (4 - y) \, dy = \pi \left( 4y - \frac{y^2}{2} \right) \bigg|_0^4 = \pi (16 - 8 - (0 - 0)) = 8\pi. \)

b. \( V = 2\pi \int_0^2 x(4 - x^2) \, dx = 2\pi \int_0^2 (4x - x^3) \, dx = 2\pi \left( 2x^2 - \frac{x^4}{4} \right) \bigg|_0^2 = 2\pi (8 - 4 - (0 - 0)) = 8\pi. \)

23. A plot of the region is.
From $x = 0$ to $x = 1$, the area function is $A(x) = (\sqrt{x})^2 = x$, while from $x = 1$ to $x = 2$ it is $A(x) = (2 - x)^2$, since the vertical cross-sections are squares. So the volume is, by the general slicing method,

$$\int_0^1 x \, dx + \int_1^2 (2 - x)^2 \, dx = \frac{1}{2} x^2 \bigg|_0^1 - \frac{1}{3} (2 - x)^3 \bigg|_1^2 = \frac{1}{2} + \frac{1}{3} = \frac{5}{6}.$$

24. The region is the same as in the previous exercise; see the diagram there. From $x = 0$ to $x = 1$, the slices are semicircles with diameter $\sqrt{x}$, so their area is $\pi \left(\frac{\sqrt{x}}{2}\right)^2 = \frac{\pi}{8} x$. From $x = 1$ to $x = 2$, the slices are semicircles with diameter $2 - x$, so their area is $\pi \left(\frac{2 - x}{2}\right)^2$. Thus by the general slicing method, the volume is

$$\pi \left(\frac{\sqrt{x}}{2}\right)^2 \bigg|_0^1 - \frac{\pi}{8} \left(\frac{2}{2} + \frac{1}{3}\right) = \frac{5\pi}{48}.$$

25. A plot of the region is

![Plot of the region](image)

Since the cross sections are parallel to the $x$ axis, solve for $x$ to get $x = y^2$ and $x = 2 - y$. Then from $y = 0$ to $y = 1$, the area function is $A(y) = (y^2)^2 = y^4$, while from $y = 1$ to $y = 2$ is it $A(y) = (2 - y)^2$. Thus the volume is, by the general slicing method,

$$\int_0^1 y^4 \, dy + \int_1^2 (2 - y)^2 \, dy = \frac{y^5}{5} \bigg|_0^1 - \frac{1}{3} (2 - y)^3 \bigg|_1^2 = \frac{1}{5} + \frac{1}{3} = \frac{8}{15}.$$

26.

$$V = \pi \int_0^2 ((-x^2 + 2x + 2)^2 - (2x^2 - 4x + 2)^2) \, dx = \frac{64\pi}{5}.$$

27.

a. Integrating with respect to $x$ we must use the shell method; the height of each shell is $(1 + \sqrt{x}) - (1 - \sqrt{x}) = 2\sqrt{x}$, so the volume is

$$V = 2\pi \int_0^1 x(2\sqrt{x}) \, dx = 4\pi \int_0^1 x^{3/2} \, dx = 4\pi \left(\frac{2x^{5/2}}{5}\right) \bigg|_0^1 = \frac{8\pi}{5}.$$

b. Integrating with respect to $y$ we use washers. Solving for $x$ gives $x = (1 - y)^2$ for both equations, so
we get washers whose outer radius is 1 and whose inner radius is \((1 - y)^2\), and the volume is

\[
V = \pi \int_0^2 \left( 1^2 - ((1 - y)^2)^2 \right) dy
\]

\[
= \pi \int_0^2 \left( 1 - (y^4 - 4y^3 + 6y^2 - 4y + 1) - y^4 + 6y^2 - 4y \right) dy
\]

\[
= \pi \left( \left( -\frac{y^5}{5} + y^4 - 2y^3 + 2y^2 \right) \right)_0^2
\]

\[
= \frac{8\pi}{5}.
\]

28. \(V = \pi \int_0^{(\ln 2)/2} \left( (2e^{-x})^2 - (e^x)^2 \right) dx = \pi \left( -2e^{-2x} - \frac{1}{2}e^{2x} \right) \left|_0^{(\ln 2)/2} \right. = \frac{\pi}{2}\)

29. A plot of the region is

Revolving around the \(y\) axis, we will use shells, since we don’t have to split the integral up, and also we can integrate the much simpler functions that result from solving for \(y\) to get \(y = e^{x^2}\) and \(y = e^{2-x^2}\). The height of each shell is then \(e^{2-x^2} - e^{x^2}\), and the volume is

\[
2\pi \int_0^1 x \left( e^{2-x^2} - e^{x^2} \right) dx = 2\pi \left( -\frac{1}{2}e^{2-x^2} - \frac{1}{2}e^{x^2} \right) \left|_0^1 \right. = \pi \left( -e - e + e^2 + 1 \right) = \pi(e^2 - 2e + 1) = \pi(e - 1)^2.
\]

30. Using washers, we have

\[
\pi \int_0^{\pi/3} (4 - \sec^2 x) dx = \pi(4x - \tan x) \left|_0^{\pi/3} \right. = \pi \left( \frac{4\pi}{3} - \sqrt{3} - (0 - 0) \right) = \frac{4}{3}\pi^2 - \pi\sqrt{3}.
\]

31. We use the shell method, so that \(V = 2\pi \int_0^{\sqrt{3}/2} \frac{x}{\sqrt{1 - x^2}} dx\). Let \(u = 1 - x^2\) so that \(du = -2x dx\), and the integration bounds become \(u = 1\) to \(u = \frac{1}{4}\). Substituting gives

\[
V = 2\pi \int_{1/4}^{1/2} \left( -\frac{1}{2\sqrt{u}} \right) du = \pi \int_{1/4}^{1} u^{-1/2} du = \pi \cdot 2\sqrt{u} \left|_{1/4}^{1} \right. = \pi(2 - 1) = \pi.
\]

32. Use the shell method. Then each shell has height \(4 - x^2\), and the radius of the shell at \(x\) is \(x - (-2) = x + 2\). Thus the volume is

\[
V = 2\pi \int_{-2}^{2} (x + 2)(4 - x^2) dx = 2\pi \int_{-2}^{2} (-x^3 - 2x^2 + 4x + 8) dx = 2\pi \left( -\frac{x^4}{4} - \frac{2}{3}x^3 + 2x^2 + 8x \right) \left|_{-2}^{2} \right.
\]

\[
= 2\pi \left( \frac{32}{3} + 32 \right) = \frac{128\pi}{3}.
\]

Copyright © 2014 Pearson Education, Inc.
33. A plot of the region is

Revolving about $y = 4$, use the disk method; the radius of each disk is $4 - (x - 2)^2 = 4x - x^2$, so the volume is

$$V = \pi \int_0^4 (4x - x^2)^2 \, dx = \pi \int_0^4 (x^4 - 8x^3 + 16x^2) \, dx = \pi \left( \frac{x^5}{5} - 2x^4 + \frac{16}{3}x^3 \right) \bigg|_0^4$$

$$= \pi \left( \frac{1024}{5} - 512 + \frac{1024}{3} \right) = \frac{512}{15} \pi.$$

34. A plot of the region is

The curves intersect when $6x = x^2 + 5$, or $x^2 - 6x + 5 = (x - 1)(x - 5) = 0$, thus at $x = 1$ and $x = 5$. To revolve about the line $y = -1$, use the washer method. The outer radius of each washer is $6x - (-1) = 6x + 1$ and the inner radius is $x^2 + 5 - (-1) = x^2 + 6$. Thus the volume is

$$V = \pi \int_1^5 ((6x + 1)^2 - (x^2 + 6)^2) \, dx = \pi \int_1^5 (-x^4 + 24x^2 + 12x - 35) \, dx$$

$$= \pi \left( -\frac{x^5}{5} + 8x^3 + 6x^2 - 35x \right) \bigg|_1^5 = \pi \left( -625 + 1000 + 150 - 175 + \frac{1}{5} - 8 - 6 + 35 \right)$$

$$= \pi \left( 371 + \frac{1}{5} \right) = \frac{1856\pi}{5}.$$

To revolve about the line $x = -1$, use the shell method. The height of each shell is $6x - (x^2 + 5) = 6x - x^2 - 5$, 
and the radius at \( x \) is \( x - (-1) = x + 1 \). Thus the volume is

\[
V = 2\pi \int_{1}^{5} (x + 1)(6x - x^2 - 5) \, dx = 2\pi \int_{1}^{5} (-x^3 + 5x^2 + x - 5) \, dx
\]

\[
= 2\pi \left( -\frac{x^4}{4} + \frac{5}{3}x^3 + \frac{1}{2}x^2 - 5x \right) \bigg|_{1}^{5}
\]

\[
= 2\pi \left( -\frac{625}{4} + \frac{625}{3} + \frac{25}{2} - 25 + \frac{1}{4} - \frac{5}{3} - \frac{1}{2} + 5 \right) = \frac{256\pi}{3}.
\]

Since \( \frac{1856}{3} = 371.2 \) while \( \frac{256}{3} \approx 85.3 \), the first volume is larger.

**35.** A plot of the region is shown below. The lines intersect at \((2, 4)\). To revolve about \( y = -2 \), use the shell method. First solve for \( x \) to get \( x = \frac{y}{2} \) and \( x = 6 - y \); then the height of each shell is \( 6 - y - \frac{y}{2} = 6 - \frac{3}{2}y \), and the radius at \( y \) is \( y - (-2) = y + 2 \). Thus the volume is

\[
V = 2\pi \int_{0}^{4} \left( y + 2 \right) \left( 6 - \frac{3}{2}y \right) \, dy = 2\pi \int_{0}^{4} \left( 12 + 3y - \frac{3}{2}y^2 \right) \, dy
\]

\[
= 2\pi \left( 12y + \frac{3}{2}y^2 - \frac{1}{2}y^3 \right) \bigg|_{0}^{4} = 80\pi.
\]

To revolve about \( x = -2 \), use the washer method. With the equations above, the outer radius of each washer is \( 6 - y - (-2) = 8 - y \) and the inner radius is \( \frac{y}{2} - (-2) = 2 + \frac{y}{2} \). Thus the volume is

\[
V = \pi \int_{0}^{4} \left( 8 - y \right)^2 - \left( 2 + \frac{y}{2} \right)^2 \, dy = \pi \int_{0}^{4} \left( \frac{3}{4}y^2 - 18y + 60 \right) \, dy
\]

\[
= \pi \left( \frac{1}{4}y^3 - 9y^2 + 60y \right) \bigg|_{0}^{4} = \pi(16 - 144 + 240) = 112\pi.
\]

The second volume is larger.

**36.**

a. \( A = \int_{0}^{2} ((4 + y) - (y^2 + 2)) \, dy \).

b. \( V = 2\pi \int_{0}^{2} y \left[ (4 + y) - (y^2 + 2) \right] \, dy \).

c. \( V = \pi \int_{0}^{2} \left[ (4 + y)^2 - (y^2 + 2)^2 \right] \, dy \).

d. \( V = \int_{0}^{2} A(y) \, dy = \frac{\pi}{2} \int_{0}^{2} \left( \frac{4 + y - (y^2 + 2)}{2} \right)^2 \, dy \).
37.  

a. \( V_x = \pi \int_1^2 \frac{1}{x^2} \, dx = \pi \left( -\frac{1}{x} \right)_1^2 = \pi \cdot \frac{1}{2} \), while \( V_y = 2\pi \int_1^2 x \cdot x^{-1} \, dx = 2\pi \), so \( V_y > V_x \).

b. \( V_x = \pi \int_1^4 \frac{1}{x^6} \, dx = \pi \left( -\frac{1}{5x^5} \right)_1^4 = \frac{\pi}{5} \left( 1 - \frac{1}{1024} \right) \), while \( V_y = 2\pi \int_1^4 x \cdot x^{-3} \, dx = 2\pi \left( -\frac{1}{x} \right)_1^4 = \frac{3\pi}{2} \), so \( V_y > V_x \).

c. \( V_x = \pi \int_1^a \frac{1}{x^{2p}} \, dx = \begin{cases} \pi \frac{1-2p}{1-2p} & \text{if } p \neq \frac{1}{2}, \\ \pi \ln a & \text{if } p = \frac{1}{2}. \end{cases} \)

d. \( V_y = 2\pi \int_1^a \frac{1}{x^{p-1}} \, dx = \begin{cases} \frac{2\pi(a^{2-p} - 1)}{2-p} & \text{if } p \neq 2, \\ 2\pi \ln a & \text{if } p = 2. \end{cases} \)

e. Using part d, let \( h = 2-p \), and note that \( V_y \) is continuous. So

\[
\lim_{h \to 0} V_y = \lim_{p \to 2} \frac{2\pi(a^{2-p} - 1)}{2-p} = \lim_{h \to 0} \frac{2\pi(a^h - 1)}{h} = 2\pi \ln a,
\]

so \( \lim_{h \to 0} \frac{(a^h - 1)}{h} = \ln a \). A similar calculation can be done with the result of part c.

f. No, \( V_y > V_x \) for all values of \( a \) and \( p \), because \( \frac{1}{x^{2p}} < \frac{1}{x^{p-1}} \) for \( x > 1 \) and \( p > 0 \).

38. \( L = \int_{-2}^2 \sqrt{1+4} \, dx = \sqrt{5}(2 - (-2)) = 4\sqrt{5} \).

39. Solve \( y = \ln(x + \sqrt{x^2 - 1}) \) for \( x \). First exponentiate both sides to get \( e^y = x + \sqrt{x^2 - 1} \); then \( e^y - x = \sqrt{x^2 - 1} \). Square both sides to get \( e^{2y} - 2xe^y + x^2 = x^2 - 1 \), so that \( e^{2y} - 2xe^y = -1 \). Isolate the \( x \) to get \( x = \frac{e^y + e^{-y}}{2} \). Then

\[
\frac{dx}{dy} = \frac{e^y - e^{-y}}{2},
\]

so that

\[
1 + \left( \frac{dx}{dy} \right)^2 = 1 + \frac{e^{2y} - 2 + e^{-2y}}{4} = \frac{e^{2y} + 2 + e^{-2y}}{4} = \left( \frac{e^y + e^{-y}}{2} \right)^2.
\]

Note that \( x \in [\sqrt{2}, \sqrt{5}] \) corresponds to \( y \in [\ln(1 + \sqrt{2}), \ln(2 + \sqrt{5})] \), so that the arc length is

\[
\int_{\ln(1 + \sqrt{2})}^{\ln(2 + \sqrt{5})} \frac{e^y + e^{-y}}{2} \, dy = \frac{1}{2} \left( e^y - e^{-y} \right)_{\ln(1 + \sqrt{2})}^{\ln(2 + \sqrt{5})}
\]

\[
= \frac{1}{2} \left( 2 + \sqrt{5} - \frac{1}{2 + \sqrt{5}} - (1 + \sqrt{2}) + \frac{1}{1 + \sqrt{2}} \right)
\]

\[
= \frac{1}{2} \left( 2 + \sqrt{5} - \frac{2 - \sqrt{5}}{(2 + \sqrt{5})(2 - \sqrt{5})} - 1 - \sqrt{2} + \frac{1 - \sqrt{2}}{(1 + \sqrt{2})(1 - \sqrt{2})} \right)
\]

\[
= \frac{1}{2} \left( 2 + \sqrt{5} + 2 - \sqrt{5} - 1 - \sqrt{2} - 1 + \sqrt{2} \right) = 1.
\]

40. We have \( y' = \frac{x^2}{2} - \frac{1}{2x^2} \), so

\[
1 + (y')^2 = 1 + \frac{x^4}{4} - \frac{1}{2} + \frac{1}{4x^4} = \frac{x^4}{4} + \frac{1}{2} + \frac{1}{4x^4} = \left( \frac{x^2}{2} + \frac{1}{2x^2} \right)^2.
\]
Thus
\[ L = \int_1^2 \sqrt{1 + (y')^2} \, dx = \int_1^2 \left( \frac{x^2}{2} + \frac{1}{2x^2} \right) \, dx = \left( \frac{x^3}{6} - \frac{1}{2x} \right)_1^2 = \frac{17}{12}. \]

41. We have \( y' = \frac{1}{2\sqrt{x}} - \frac{\sqrt{x}}{x} \), so
\[ 1 + (y')^2 = 1 + \frac{1}{4x} - \frac{1}{2} + \frac{x}{4} = \frac{1}{4x} + \frac{1}{2} + \frac{x}{4} = \left( \frac{1}{2\sqrt{x}} + \frac{\sqrt{x}}{2} \right)^2. \]
Thus
\[ L = \int_1^3 \sqrt{1 + (y')^2} \, dx = \int_1^3 \left( \frac{1}{2\sqrt{x}} + \frac{\sqrt{x}}{2} \right) \, dx = \left( \sqrt{x} + \frac{1}{3}x^{3/2} \right)_1^3 = 2\sqrt{3} - \frac{4}{3}. \]

42. We have \( y' = x^2 + 2x + 1 - \frac{4}{(x+1)^2} = (x+1)^2 - \frac{1}{(x+1)^2} \). Then
\[ 1 + (y')^2 = 1 + (x+1)^4 - \frac{1}{2} + \frac{1}{16(x+1)^4} = (x+1)^4 + \frac{1}{2} + \frac{1}{16(x+1)^4} = \left( (x+1)^2 + \frac{1}{4(x+1)^2} \right)^2. \]
Thus
\[ L = \int_0^4 \sqrt{1 + (y')^2} \, dx = \int_0^4 \left( (x+1)^2 + \frac{1}{4(x+1)^2} \right) \, dx = \left( \frac{1}{3}(x+1)^3 - \frac{1}{4(x+1)} \right)_0^4 = \frac{125}{3} - \frac{1}{20} - \frac{1}{3} + \frac{1}{4} = 623/15. \]

43. We have \( y' = \frac{1}{x} \), so \( 1 + (y')^2 = \frac{x^2+1}{x} \), and \( \sqrt{1+y'^2} = \frac{\sqrt{x^2+1}}{x} \). Then
\[ L = \int_1^b \frac{\sqrt{x^2+1}}{x} \, dx \\
= \left( \sqrt{x^2+1} - \ln \left( \frac{1 + \sqrt{x^2+1}}{x} \right) \right)_1^b \\
= \sqrt{b^2+1} - \sqrt{2} + \ln \left( \frac{(\sqrt{b^2+1} - 1)(1 + \sqrt{2})}{b} \right). \]

Using a computer algebra system, we see that this has value 2 for \( b \approx 2.715 \).

44. \( m = \int_0^9 (3 + 2\sqrt{x}) \, dx = \left( 3x + \frac{4}{3}x^{3/2} \right)_0^9 = 63 \) g.

45. \( m = \int_0^3 150e^{-x/3} \, dx = -450e^{-x/3} \bigg|_0^3 = 450(1 - e^{-1}) \) g.

46. \( m = \int_0^2 dx + \int_2^4 2 \, dx + \int_4^6 4 \, dx = 2 + 4 + 8 = 14. \)

47.

a. \( f(0.2) = 0.2k = 50 \), so \( k = 250 \), and thus
\[ W = \int_{0.2}^{0.7} 250x \, dx = 125x^2 \bigg|_{0.2}^{0.7} = 56.25 \) J.

b. We have \( \int_0^{0.2} kx \, dx = \left( \frac{k}{2}x^2 \right)_0^{0.2} = 0.02k = 50 \), so that \( k = 2500 \). Then
\[ W = \int_{0.2}^{0.7} 2500x \, dx = 1250x^2 \bigg|_{0.2}^{0.7} = 562.5 \) J.

Copyright © 2014 Pearson Education, Inc.
48. \[ W = \int_{0}^{6} \pi \rho g \cdot 16(6 - y) dy = 16\pi \rho g \left(6y - \frac{y^2}{2}\right)_{0}^{6} = 288\pi \rho g \approx 8.867 \times 10^6 \text{ N.} \]

49. Orient the semicircle so that the center is at the point \((0, 20)\). Then the equation of the semicircle is \[ x^2 + (y - 20)^2 = 400. \] For any \(y\), the depth of the water is \(20 - y\), and the cross-sectional width of the dam is \(2\sqrt{400 - (y - 20)^2} = 2\sqrt{40y - y^2}\). Thus the force is given by

\[ \int_{0}^{20} \rho g(20 - y) \cdot 2\sqrt{40y - y^2} dy. \]

Let \(u = 40y - y^2\) so that \(du = (40 - 2y) dy\); the bounds of integration become \(u = 0\) to \(u = 400\). Then we have

\[ \rho g \int_{0}^{400} u^{1/2} du = \rho g \left(\frac{2}{3} u^{3/2}\right) \bigg|_{0}^{400} = \frac{5.2 \times 10^7}{3} \text{ N.} \]

50. The slope of the tangent at \((p, f(p))\) is \(f'(p) = 2ap + b\), so the equation of \(L_1\) is

\[ y = (2ap + b)(x - p) + f(p) = (2ap + b)x - 2ap^2 - bp + f(p) = (2ap + b)x - ap^2 + c, \]

since \(f(p) = ap^2 + bp + c\). Similarly, the equation of \(L_2\) is \(y = (2aq + b)x - aq^2 + c\). These two lines intersect when

\[ (2ap + b)x - ap^2 + c = (2aq + b)x - aq^2 + c, \quad \text{or} \quad x = \frac{a(p^2 - q^2)}{2a(p - q)} = \frac{p + q}{2}. \]

Then with \(s = \frac{p + q}{2}\), we get

\[ R_1 = \int_{p}^{q} (f(x) - ((2ap + b)x - ap^2 + c)) \, dx = \int_{p}^{q} (ax^2 - 2apx + ap^2) \, dx = \left(\frac{a}{3}x^3 - apx^2 + ap^2x\right)_{p}^{q} = \frac{a}{3}s^3 - aps^2 + ap^2s - \frac{a}{3}p^3 = \frac{a}{24}(q - p)^3, \]

\[ R_2 = \int_{s}^{q} f(x) - ((2aq + b)x - aq^2 + c) \, dx = \int_{s}^{q} ax^2 - 2aqx + aq^2 \, dx = \left(\frac{a}{3}x^3 - aqx^2 + aq^2x\right)_{s}^{q} = \frac{a}{3}q^3 - \frac{a}{3}s^3 + aqs^2 - aq^2s = \frac{aq^3}{3} - \frac{as}{3}(s^2 - 3qs + 3q^2) = \frac{a}{24}(q - p)^3. \]

The two are equal.

### AP Practice Questions

**Multiple Choice**

1. C is correct. The two curves intersect where \(5 - x^2 = 2x - 3\), or \(x^2 + 2x - 8 = (x + 4)(x - 2) = 0\), so at \(x = -4\) and \(x = 2\). So the area between the curves is

\[ \int_{-4}^{2} (5 - x^2 - (2x - 3)) \, dx = \int_{-4}^{2} (-x^2 + 2x + 8) \, dx = \left(-\frac{1}{3}x^3 - x^2 + 8x\right)_{-4}^{2} = -\frac{8}{3} - 4 + 16 - \frac{64}{3} + 16 + 32 = 36. \]

2. B is correct. Solve \(y = 1 - x\) for \(x\) to get \(x = 1 - y\); then the two curves intersect where \(y^2 - y - 1 = 1\), or \(y^2 - 1 = (y + 1)(y - 1) = 0\), so at \(y = \pm 1\). Thus the area between the curves is

\[ \int_{-1}^{1} (1 - y - (y^2 - y)) \, dy = \int_{-1}^{1} (-y^2 + 1) \, dy = \left(-\frac{1}{3}y^3 + y\right)_{-1}^{1} = \frac{4}{3}. \]

3. The correct answer is A. The two curves intersect when \(2 = 2x^2\), so when \(x = 1\). For revolving around the \(y\) axis, use the shell method. The height of each shell is \(2 - 2x^2\), so the volume is

\[ 2\pi \int_{0}^{1} x(2 - 2x^2) \, dx = 4\pi \int_{0}^{1} (x - x^3) \, dx = 4\pi \left(\frac{x^2}{2} - \frac{x^4}{4}\right)_{0}^{1} = 4\pi \cdot \frac{1}{4} = \pi. \]

Copyright © 2014 Pearson Education, Inc.
4. The correct answer is C. From Exercise 3, the curves intersect at \( x = 1 \). Using the washer method, the outer radius is 2 and the inner radius is \( 2x^2 \), so the volume is

\[
\pi \int_0^1 (2^2 - (2x^2)^2) \, dx = 4\pi \int_0^1 (1 - x^4) \, dx = 4\pi \left( x - \frac{x^5}{5} \right) \bigg|_0^1 = 4\pi \cdot \frac{4}{5} = \frac{16\pi}{5}.
\]

5. The correct answer is A. From Exercise 3, the curves intersect at \( x = 1 \). Using the disk method, the disks have radius \( 2 - 2x^2 \), so the volume is

\[
\pi \int_0^1 (2 - 2x^2)^2 \, dx = 4\pi \int_0^1 (1 - 2x^2 + x^4) \, dx = 4\pi \left( x - \frac{2}{3}x^3 + \frac{x^5}{5} \right) \bigg|_0^1 = 4\pi \left( 1 - \frac{2}{3} + \frac{1}{5} \right) = \frac{32\pi}{15}.
\]

6. The correct answer is A. From Exercise 3, the curves intersect at the point \( (1,2) \). Using the general slicing method, with horizontal slices, we solve \( y = 2x^2 \) for \( x \) to get \( x = \sqrt{\frac{y}{2}} \), so that the side length of each slice is \( \sqrt{\frac{2}{y}} \) and thus the area function is \( A(y) = \frac{y}{2} \). Thus the volume is

\[
\int_0^2 A(y) \, dy = \int_0^2 \frac{y}{2} \, dy = \frac{1}{4} y^2 \bigg|_0^2 = 1.
\]

7. The correct answer is E. The radius of each semicircle is \( \frac{1}{2}(1 - x) \), so the area function is \( A(x) = \frac{\pi}{8} \cdot \frac{1}{2}(1 - x)^2 = \frac{\pi}{8}(1 - x)^2 \). We integrate from \( x = 0 \) to \( x = 1 \). The volume is

\[
\frac{\pi}{8} \int_0^1 (1 - x)^2 \, dx = \frac{\pi}{8} \left( -\frac{1}{3}(1-x)^3 \right) \bigg|_0^1 = \frac{\pi}{24}.
\]

8. The correct answer is D. Integrating gives \( s(t) = -20e^{-t} + C \). Since \( s(0) = -20e^0 + C = -20 + C = 2 \), we get \( C = 22 \), so that \( s(t) = -20e^{-t} + 22 \). So when \( t = \ln 6 \),

\[
s(\ln 6) = -20e^{-\ln 6} + 22 = -20 \cdot \frac{1}{6} + 22 = \frac{56}{3}.
\]

9. The correct answer is B. For \( t \in [0,6] \), we see that \( 0 \leq \frac{\pi t}{6} \leq \pi \), so that \( \sin \frac{\pi t}{6} \) is nonnegative. So the total distance traveled is the same as the displacement, which is

\[
\int_0^6 3\sin \frac{\pi t}{6} \, dt = \left( -\frac{18}{\pi} \cos \frac{\pi t}{6} \right) \bigg|_0^6 = \frac{36}{\pi}.
\]

10. Only statement (II) is false, so the correct answer is B. Statement (I) is true since for \( 3 \leq t \leq 8 \), B’s velocity curve is above A’s velocity curve, so B is always running faster than A, so runs farther. Statement (III) is true: runner A increases her speed from \( t = 0 \) to \( t = 1 \), while runner B’s velocity is always positive but decreasing, so his speed is always decreasing. Finally, statement (II) is false: since the two runners start at the same point, and since runner B’s velocity is greater than runner A’s over \( 0 \leq t \leq \frac{1}{2} \), he clearly runs farther, so they are not at the same position at \( t = \frac{1}{2} \).

11. The correct answer is E. The intersection points are where \( 4 - x = 4 - x^2 \), so that \( x = 0 \) or \( x = 1 \). So we want the arc length of \( g(x) = 4 - x^2 \) from \( x = 0 \) to \( x = 1 \). Since \( g'(x) = -2x \), we have \( 1 + (g'(x))^2 = 4x^2 + 1 \), so that the arc length is (evaluating using a computer algebra system)

\[
\int_0^1 \sqrt{4x^2 + 1} \, dx \approx 1.479.
\]
12. The correct answer is D. A plot of these two curves in the first quadrant is

![Graph](image)

Solving $2x + 1 = \sec^2 x$ near $x = 1$ gives the solution $x \approx 0.941$. Since the line lies above $\sec x$ on $[0, 0.941]$, the area between the curves is

$$
\int_0^{0.941} (2x + 1 - \sec^2 x) \, dx = (x^2 + x - \tan x)_0^{0.941} = 0.941^2 + 0.941 - \tan 0.941 \approx 0.454.
$$

13. The correct answer is A. A plot of these two curves in the first quadrant is

![Graph](image)

The area of the entire region is

$$
\int_0^1 (10 - 2x - 8x) \, dx = \int_0^1 (10 - 10x) \, dx = (10x - 5x^2)|_0^1 = 5.
$$

Thus we want $c$ such that

$$
\int_0^c (10 - 10x) \, dx = (10x - 5x^2)|_0^c = 10c - 5c^2 = \frac{5}{2}.
$$

Multiply $10c - 5c^2 = \frac{5}{2}$ through by $\frac{2}{5}$ to get $4c - 2c^2 = 1$, or $2c^2 - 4c + 1 = 0$. Solving gives

$$
c = \frac{4 \pm \sqrt{16 - 8}}{4} = 1 \pm \sqrt{2}.
$$

Of these two roots, only the one with the negative sign is in $[0, 1]$, so the correct answer is $c = 1 - \sqrt{2} \approx 0.293$.

14. The correct answer is C. Note that $R(t) > 0$ for all $t$, since the second term cannot exceed 10 in magnitude. Thus the outflow is the integral of this function from 0 to 10, so it is

$$
\int_0^{10} \left(20 + 10 \cos \frac{\pi t}{12}\right) \, dt = \left(20t + \frac{120}{\pi} \sin \frac{\pi t}{12}\right)|_0^{10} = 200 + \frac{120}{\pi} \sin \frac{5\pi}{6} = 200 + \frac{60}{\pi}.
$$
Free Response

1. a. Using the Trapezoid rule, the radii are approximately
   \[ r(1) = \frac{1}{2} \left( 1 + \frac{1}{2} \right) \cdot 1 = \frac{3}{4} \approx 0.75 \]
   \[ r(2) = \frac{1}{2} \left( 1 + 2 + \frac{1}{2} + \frac{1}{3} \right) \cdot 1 = \frac{1}{2} + \frac{1}{2} + \frac{1}{6} = \frac{7}{6} \approx 1.167 \]
   \[ r(3) = \frac{1}{2} \left( 1 + 2 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} \right) \cdot 1 = \frac{1}{2} + \frac{1}{2} + \frac{1}{3} + \frac{1}{8} = \frac{35}{24} \approx 1.458 \]
   \[ r(4) = \frac{1}{2} \left( 1 + 2 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} \right) \cdot 1 = \frac{1}{2} + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{10} = \frac{101}{60} \approx 1.683. \]

b. Since the volume at time \( t \) is \( v(t) = \frac{4}{3} \pi r(t)^3 \), we have \( v'(t) = 4 \pi r(t)^2 v'(t) \). From the above, we get
   \[
   \begin{array}{c|cccc}
   t (\text{min}) & 0 & 1 & 2 & 3 & 4 \\
   4 \pi r(t)^2 v'(t) (\text{in}^3/\text{min}) & 3.534 & 5.701 & 6.681 & 7.121 \\
   \end{array}
   \]

   So the volume can be approximated using the Trapezoid rule to integrate with respect to \( t \):
   \[
   \frac{1}{2} (0 + 2 \cdot 3.534 + 2 \cdot 5.701 + 2 \cdot 6.681 + 7.121) \approx 19.477 \text{ in}^3.
   \]

c. If \( r'(t) = \frac{1}{t+1} \), then \( r(t) = \ln(t+1) + C \); since \( r(0) = 0 \) we have \( C = 0 \) so that \( r(t) = \ln(t+1) \). Thus \( r(4) = \ln 5 \) so that the volume at \( t = 4 \) is \( \frac{4}{3} \pi \ln^3 5 \approx 17.463 \text{ in}^3 \).

2. a. 15 minutes is 0.25 hours; at \( t = 0.25 \), the slope of the velocity curve, which is the acceleration, is \( \frac{20 - 0}{0.5 - 0} = 40 \) miles per hour per hour.

   b. The car is moving south when the velocity is negative, which is between 1 and 2 hours into the trip.

   c. The integral is the signed area under the curve. The triangle from \( t = 0 \) to \( t = 0.75 \) has base 0.75 and height 20, so its area is \( \frac{1}{2} \cdot 0.75 \cdot 20 = 7.5 \). The triangle from \( t = 1 \) to \( t = 2 \) has base 1 and height -20, so its (signed) area is \( \frac{1}{2} \cdot 1 \cdot (-20) = -10 \). So at the end of two hours, the pilot car is \( 10 - 7.5 = 2.5 \) miles south of where it was at time \( t = 0 \).

d. The average velocity during the first hour is \( \frac{1}{t=0} \int_0^1 v(t) \, dt = 7.5 \) miles per hour (from part (c)).

e. From part (c), this integral is the sum of the unsigned areas of the two triangles, which is 17.5 miles.

   This is the total distance traveled by the pilot car over the two hour period.

3. a. Solve these equations for \( x \) and convert this to an integral in \( y \). \( y = \sqrt{x-1} \) becomes \( x = y^2 + 1 \), while \( y = 7 - x \) becomes \( x = 7 - y \). The intersection of these two curves is where \( y^2 + 1 = 7 - y \), or \( y^2 + y - 6 = (y + 3)(y - 2) = 0 \), so in the first quadrant they intersect at \( y = 2 \). So the area is
   \[
   \int_0^2 (7 - y - (y^2 + 1)) \, dy = \int_0^2 (6 - y - y^2) \, dy - \left( \frac{6y - y^2}{2} - \frac{y^3}{3} \right)
   \]

   b. Revolving \( R \) around the \( y \) axis, use the washer method; from part (a), the outer radius is \( 7 - y \) and the inner radius is \( y^2 + 1 \), so the volume is
   \[
   \pi \int_0^2 \left( (7 - y)^2 - (y^2 + 1)^2 \right) \, dy = \pi \int_0^2 \left( -y^4 - y^2 - 14y + 48 \right) \, dy
   \]

   \[
   = \pi \left( -\frac{y^5}{5} - \frac{y^3}{3} - 7y^2 + 48y \right) \bigg|_0^2 = \frac{884\pi}{15}.
   \]
c. Revolving $R$ around the $x$ axis, use shells. From part (a), the height of each shell is $7 - y - (y^2 + 1) = -y^2 - y + 6$, so the volume is
\[
2\pi \int_0^2 y(-y^2 - y + 6) \, dy = 2\pi \left( -\frac{y^4}{4} - \frac{y^3}{3} + 3y^2 \right) \bigg|_0^2 = \frac{32\pi}{3}.
\]

d. From part (d), the length of the leg is $-y^2 - y + 6$; since the cross-section is an isosceles right triangle, its area is $\frac{1}{2}(-y^2 - y + 6)^2$, so the volume of the solid is
\[
\int_0^2 \frac{1}{2}(-y^2 - y + 6)^2 \, dy = \frac{1}{2} \int_0^2 (y^4 + 2y^3 - 11y^2 - 12y + 36) \, dy
\]
\[
= \frac{1}{2} \left( \frac{y^5}{5} + \frac{y^4}{2} - \frac{11}{3}y^3 - 6y^2 + 36y \right) \bigg|_0^2 = \frac{248}{15}.
\]

4.

a. At $t = 10$, we have $a(t) = \frac{1}{20} e^{0.5\pi} \cos (\pi e^{0.5}) \approx 0.117$, so the velocity is increasing.

b. On $[0, 20]$, the average velocity is, using a computer algebra system,
\[
\frac{1}{20 - 0} \int_0^{20} \sin \left( \pi e^{t/20} \right) \, dt \approx -0.219.
\]

c. The total distance traveled is $\int_0^{20} |\sin \left( \pi e^{t/20} \right)| \, dt$. Again evaluating numerically gives $\approx 12.978$.

d. For $t > 0$, the object changes direction when $v(t)$ changes from positive to negative or the reverse. At $t = 0$, the acceleration is
\[
a(0) = \frac{1}{20} e^{0} \pi \cos (\pi e^{0}) = -\frac{1}{20} \pi < 0,
\]
so the velocity starts out negative. The first change of direction occurs when the velocity changes from negative to positive. Now, $\pi e^{t/20}$ is increasing, so $\sin \pi e^{t/20}$ first becomes positive when $e^{t/20} = 2$; i.e., at $t = 20 \ln 2 \approx 13.863$. At that time, the distance of the object from the origin is (since it has been traveling in the same direction the whole time)
\[
\left| \int_0^{13.863} \sin \left( \pi e^{t/20} \right) \, dt \right| \approx 8.676.
\]

5.

a. The amount of rain that has fallen is $\int_0^9 r(t) \, dt$, which is the area under $r(t)$ from 0 to 9. For $0 \leq t \leq 3$, this is $3 \cdot 0.5 = 1.5$ inches, for $3 < t \leq 4.5$ it is $1.5 \cdot 0.75 = 1.125$ inches, and for $4.5 < t \leq 9$ it is $4.5 \cdot 0.25 = 1.125$ inches, for a total of 3.75 inches of rain.

b. For each of the time intervals, the function $a(t)$ is computed by adding the total amount of rain up to the start of the time interval and adding the integral of $r(t)$:
\[
a(t) = \begin{cases} 
0.5t, & 0 \leq t \leq 3, \\
ar(3) + \int_3^t 0.75 \, dx, & 3 < t \leq 4.5, \\
ar(4.5) + \int_4.5^t 0.25 \, dx, & 4.5 < t \leq 9
\end{cases}
\]

c. 4 p.m. corresponds to $t = 7$, so the rate of rainfall at that time is 0.25 inches per hour. Also, since $a(7) = 2.625 + 0.25(7 - 4.5) = 3.25$, the cup has not overflowed, so the volume of water is still increasing. Since $\pi$ and $r$ are constants, we have
\[
\frac{dV}{dt} = \pi r^2 \frac{dh}{dt} = \pi \cdot 2^2 \cdot 0.25 = \pi \text{ cubic inches per hour}.
\]
d. At 6 p.m., the total amount of rain that has fallen is \( a(9) = 2.625 + 0.25(9 - 4.5) = 2.625 + 1.125 = 3.75 \) inches, so the total volume of water is \( V = \pi r^2 h = 4 \cdot 3.75\pi = 15\pi \approx 47.124 \) cubic inches.

6. a. After \( t \) minutes, the volume of water in the two tanks is

\[
V_A = 1 + \left[ \int_0^t 5e^{-3x/2} \, dx \right] = 1 + \left[ \frac{-10}{3} e^{-3x/2} \right]_0^t = \frac{13}{3} - \frac{10}{3} e^{-3t/2}
\]

\[
V_B = \int_0^t 4e^{-x/3} \, dx = \left[ -12e^{-x/3} \right]_0^t = 12 - 12e^{-t/3}.
\]

Thus after one minute, we have

\[
V_A(1) = \frac{13}{3} - \frac{10}{3} e^{-3/2} \approx 3.590 \text{ liters}, \quad V_B(1) = 12 - 12e^{-1/3} \approx 3.402 \text{ liters}.
\]

So tank A has more water after one minute.

b. We have

\[
\lim_{t \to \infty} V_A(t) = \lim_{t \to \infty} \left( \frac{13}{3} - \frac{10}{3} e^{-3t/2} \right) = \frac{13}{3} - \frac{10}{3} \lim_{t \to \infty} e^{-3t/2} = \frac{13}{3} \approx 4.333
\]

\[
\lim_{t \to \infty} V_B(t) = \lim_{t \to \infty} \left( 12 - 12e^{-t/3} \right) = 12 - 12 \lim_{t \to \infty} e^{-t/3} = 12.
\]

Thus Tank B will eventually have more water. The flow into Tank A decreases more rapidly than the flow into Tank B.

7. a. The slopes of the tangent lines are the values of \( f'(x) \). Since \( f'(x) = 1/3 \cdot 3/2 x^{1/2} = 1/2 x^{1/2} \), we have \( f''(x) = 1/4 x^{-1/2} > 0 \). Since \( f''(x) > 0 \) the slopes of the tangent lines to \( f \) are increasing.

b. We have \( 1 + (f'(x))^2 = 1 + \frac{1}{4} x = \frac{1}{4} (x + 4) \). Then the arc length is

\[
\int_0^5 \sqrt{1 + (f'(x))^2} \, dx = \frac{1}{2} \int_0^5 \sqrt{x + 4} \, dx = \frac{1}{2} \left( \frac{2}{3} (x + 4)^{3/2} \right)_0^5 = \frac{1}{3} (27 - 8) = \frac{19}{3}.
\]

c. We want to solve

\[
\int_0^a \sqrt{1 + (f'(x))^2} \, dx = \frac{1}{2} \int_0^a \sqrt{x + 4} \, dx = \frac{1}{2} \left( \frac{2}{3} (x + 4)^{3/2} \right)_0^a = \frac{1}{3} \left( (a + 4)^{3/2} - 8 \right) = 39.
\]

Thus \( (a + 4)^{3/2} - 8 = 117 \), so that \( (a + 4)^{3/2} = 125 \) and thus \( a + 4 = 125^{2/3} = 25 \). So \( a = 21 \).

8. a. The slope is \( y'(x) = \frac{\pi}{2} \cos \frac{\pi x}{4} = \frac{\pi}{2} \cos \frac{\pi}{6} = \frac{\pi \sqrt{3}}{4} \).

b. The curves intersect in the first quadrant when \( \frac{\pi x}{4} = \frac{\pi}{4} \), so at \( x = \frac{1}{2} \). Thus the area of \( R \) is

\[
\int_0^{1/2} \left( \cos \frac{\pi x}{2} - \sin \frac{\pi x}{2} \right) = \frac{2}{\pi} \left( \sin \frac{\pi x}{2} + \cos \frac{\pi x}{2} \right)_0^{1/2} = \frac{2}{\pi} \left( \sin \frac{\pi}{4} + \cos \frac{\pi}{4} - \sin 0 - \cos 0 \right) = \frac{2}{\pi} (\sqrt{2} - 1).
\]

c. \( y = 1 \) is the point of intersection of \( y = \cos \frac{\pi x}{4} \) and the \( y \) axis. Using the washer method, we see that the outer radius is \( 1 - \sin \frac{\pi x}{2} \) and the inner radius is \( 1 - \cos \frac{\pi x}{2} \), so that the volume is

\[
\pi \int_0^{1/2} \left( \left( 1 - \sin \frac{\pi x}{2} \right)^2 - \left( 1 - \cos \frac{\pi x}{2} \right)^2 \right) \, dx.
\]
d. The base of each rectangle is \( \cos \frac{\pi x}{2} - \sin \frac{\pi x}{2} \), so the area function is

\[
A(x) = 2 \left( \cos \frac{\pi x}{2} - \sin \frac{\pi x}{2} \right)^2.
\]

Thus the volume is

\[
\int_0^{1/2} A(x) \, dx = 2 \int_0^{1/2} \left( \cos \frac{\pi x}{2} - \sin \frac{\pi x}{2} \right)^2 \, dx.
\]
Chapter 7

Integration Techniques

7.1 Basic Approaches

7.1.1 Let \( u = 4 - 7x \). Then \( du = -7 \, dx \) and we get \( -\frac{1}{7} \int u^{-6} \, du \).

7.1.2 Expand the binomial to standard polynomial form: \( x^8 + 4x^4 + 4 \).

7.1.3 \( \sin^2 x = \frac{1}{2}(1 - \cos 2x) \). Since the integral of \( \cos 2x \) is \( \frac{1}{2} \sin 2x \), this expression can easily be integrated.

7.1.4 Divide the numerator by the denominator by long division, in order to write the integrand as the sum of a polynomial and a rational function.

7.1.5 Complete the square in the denominator to get

\[
\int \frac{10}{x^2 - 4x + 5} \, dx = \int \frac{10}{x^2 - 4x + 4 + 1} \, dx = \int \frac{10}{(x - 2)^2 + 1^2} \, dx,
\]

which matches item 12 in Table 7.1.

7.1.6 Rewrite the integrand as the sum of four terms, each with denominator 3x^3. Then cancel powers of x:

\[
\int \frac{x^{10} - 2x + 1}{3x^3} \, dx = \int \left( \frac{x^{10}}{3x^3} - \frac{2x^4}{3x^3} + \frac{10x^2}{3x^3} + \frac{1}{3x^3} \right) \, dx = \int \left( \frac{1}{3} x^7 - \frac{2}{3} x^3 + \frac{10}{3} x^{-1} + \frac{1}{3} x^{-3} \right) \, dx.
\]

7.1.7 Let \( u = 3 - 5x \) so that \( du = -5 \, dx \). Substituting gives \( -\frac{1}{5} \int u^{-4} \, du = \frac{1}{15} u^{-3} + C = \frac{1}{15(3 - 5x)^3} + C \).

7.1.8 Let \( u = 9x - 2 \) so that \( du = 9 \, dx \). Substituting gives

\[
\frac{1}{9} \int u^{-3} \, du = -\frac{1}{18} u^{-2} + C = -\frac{1}{18(9x - 2)^2} + C.
\]

7.1.9 Let \( u = 2x - \frac{x}{4} \) so that \( du = 2 \, dx \). Then \( x = 0 \) corresponds to \( u = -\frac{7}{4} \) and \( x = \frac{17}{8} \) to \( \frac{7}{2} \). Substituting gives

\[
\frac{1}{2} \int_{-\pi/4}^{\pi/2} \sin u \, du = \frac{1}{2} (-\cos u) \bigg|_{-\pi/4}^{\pi/2} = \frac{1}{2} \left( 0 + \frac{\sqrt{2}}{2} \right) = \frac{\sqrt{2}}{4}.
\]

7.1.10 Let \( u = 3 - 4x \) so that \( du = -4 \, dx \). Substituting gives \( -\frac{1}{4} \int e^u \, du = -\frac{1}{4} e^u + C = -\frac{1}{4} e^{3-4x} + C \).

7.1.11 Let \( u = \ln 2x \) so that \( du = \frac{dx}{x} \). Substituting gives \( \int u \, du = \frac{u^2}{2} + C = \frac{1}{2} \ln^2 2x + C \).
7.1.12 Let \( u = 4 - x \) so that \( du = -dx \). Then \( x = -5 \) corresponds to \( u = 9 \) and \( x = 0 \) to \( u = 4 \). Substituting gives
\[
-\int_9^4 u^{-1/2} \, du = \int_4^9 u^{-1/2} \, du = 2\sqrt{u}|_4^9 = 6 - 4 = 2.
\]

7.1.13 Let \( u = e^x + 1 \) so that \( du = e^x \, dx \) Substituting gives \( \int \frac{1}{u} \, du = \ln |u| + C = \ln(e^x + 1) + C \). Note that we can remove the absolute value signs since \( e^x + 1 \) is always positive.

7.1.14 Let \( u = 2\sqrt{x} + 1 \) so that \( du = \frac{dx}{\sqrt{x}} \). Substituting gives \( \int e^u \, du = e^u + C = e^{2\sqrt{x}+1} + C \).

7.1.15 We rewrite the integral by multiplying the numerator and denominator of the integrand by \( e^x \), giving
\[
\int \frac{e^x}{e^x - 2e^{-x}} \, dx = \int \frac{e^x}{e^x - 2e^{-x}} \cdot \frac{e^x}{e^x} \, dx = \int \frac{e^x}{e^{2x} - 2} \, dx.
\]
Now let \( u = e^{2x} - 2 \) so that \( du = 2e^{2x} \, dx \). Substituting gives \( \frac{1}{2} \int du = \frac{1}{2} \ln |u| + C = \frac{1}{2} \ln |e^{2x} - 2| + C \).

7.1.16 First,
\[
\int \frac{e^{2x}}{e^{2x} - 4e^{-x}} \, dx = \int \frac{e^{2x}}{e^{2x} - 4e^{-x}} \cdot \frac{e^x}{e^x} \, dx = \int \frac{e^{3x}}{e^{2x} - 4} \, dx.
\]
Let \( u = e^{3x} - 4 \) so that \( du = 3e^{3x} \, dx \). Substituting gives \( \frac{1}{3} \int du = \frac{1}{3} \ln |u| + C = \frac{1}{3} \ln |e^{3x} - 4| + C \).

7.1.17 Let \( u = \ln x^2 = 2 \ln x \). Then \( du = \frac{2}{x} \, dx \), and \( x = 1 \) corresponds to \( u = \ln 1^2 = 0 \) while \( x = e^2 \) corresponds to \( u = \ln \left( (e^2)^2 \right) = 4 \). Then substituting gives
\[
\frac{1}{2} \int_0^4 u^2 \, du = \frac{u^3}{6}|_0^4 = \frac{32}{3}.
\]

7.1.18 The integral can be written as
\[
\int \frac{\sin^3 x}{\cos^5 x} \, dx = \int \left( \frac{\sin^3 x}{\cos^3 x} \cdot \frac{1}{\cos^2 x} \right) \, dx = \int \tan^3 x \sec^2 x \, dx.
\]
Let \( u = \tan x \) so that \( du = \sec^2 x \, dx \). Substituting gives \( \int u^3 \, du = \frac{u^4}{4} + C = \frac{\tan^4 x}{4} + C \).

7.1.19 The integral can be written as
\[
\int \frac{\cos^4 x}{\sin^6 x} \, dx = \int \left( \frac{\cos^4 x}{\sin^4 x} \cdot \frac{1}{\sin^2 x} \right) \, dx = \int \cot^4 x \csc^2 x \, dx.
\]
Let \( u = \cot x \) so that \( du = -\csc^2 x \, dx \). Substituting gives \( -\int u^4 \, du = \frac{u^5}{5} + C = -\frac{\cot^5 x}{5} + C \).

7.1.20 Let \( u = x^3 + x^2 + 4 \) so that \( du = 3x^2 + 2x \, dx = x(3x + 2) \, dx \). Then \( x = 0 \) corresponds to \( u = 4 \) and \( x = 2 \) to \( u = 16 \), and substituting gives
\[
\int_4^{16} \frac{du}{\sqrt{u}} = 2\sqrt{u}|_4^{16} = 8 - 4 = 4.
\]

7.1.21 We have \( \int \frac{dx}{x^{-1} + 1} = \int \frac{dx}{x^{-1} + 1} \cdot \frac{x}{x} = \int \frac{x}{x^2 + 1} \, dx \). Using long division, we have \( \frac{x}{x^2 + 1} = 1 - \frac{1}{x^2 + 1} \). Finally,
\[
\int \left( 1 - \frac{1}{x + 1} \right) \, dx = x - \ln |x + 1| + C.
\]

Copyright © 2014 Pearson Education, Inc.
7.1.22 We have \( \int \frac{dx}{x^{11} + x^{-3}} = \int \frac{dx}{x^{-5} + x^{-3}} \cdot \frac{x^3}{x^4} \, dx = \int \frac{x^3}{x^2 + 1} \, dx \). Using polynomial long division, we have \( \frac{x^3}{x^2 + 1} = x - \frac{x}{x^2 + 1} \). Thus our integral is equal to
\[
\int \left( x - \frac{x}{x^2 + 1} \right) \, dx = \frac{x^2}{2} - \int \frac{x}{x^2 + 1} \, dx.
\]
To compute this last integral, let \( u = x^2 + 1 \) so that \( du = 2x \, dx \). We have
\[
\frac{x^2}{2} - \frac{1}{2} \int \frac{1}{u} \, du = \frac{x^2}{2} - \frac{1}{2} \ln |u| + C = \frac{x^2}{2} - \frac{1}{2} \ln (x^2 + 1) + C.
\]

7.1.23 \( \int \frac{x + 2}{x^2 + 4} \, dx = \int \frac{x}{x^2 + 4} \, dx + 2 \int \frac{1}{x^2 + 4} \, dx = \frac{1}{2} \ln (x^2 + 4) + \tan^{-1} \frac{x}{2} + C. \)

7.1.24 \[
\int_4^9 \frac{x^{5/2} - x^{1/2}}{x^{3/2}} \, dx = \int_4^9 \left( \frac{x^{5/2}}{x^{3/2}} - \frac{x^{1/2}}{x^{3/2}} \right) \, dx = \int_4^9 x \, dx - \int_4^9 x^{-1} \, dx = \left[ \frac{x^2}{2} \right]_4^9 - \left[ \ln x \right]_4^9 = \frac{81}{2} - \frac{16}{2} - (\ln 9 - \ln 4) = 65 \frac{2}{7} - \frac{9}{4}.
\]

7.1.25 Start with
\[
\int \frac{\sin t + \tan t}{\cos^2 t} \, dt = \int \left( \frac{\sin t}{\cos^2 t} + \frac{\tan t}{\cos^2 t} \right) \, dt = \int \left( \frac{\sin t}{\cos t} \cdot \frac{1}{\cos t} + \frac{\sin t}{\cos^3 t} \right) \, dt
\]
\[
= \int \tan t \sec t \, dt + \int \frac{\sin t}{\cos^3 t} \, dt = \sec t + \int \frac{\sin t}{\cos^3 t} \, dt.
\]
Now let \( u = \cos t \) so that \( du = -\sin t \, dt \). Substituting gives
\[
\sec t - \int u^{-3} \, du = \sec t + \frac{1}{2 u^2} + C = \sec t + \frac{1}{2 \cos^2 t} + C = \sec t + \frac{1}{2} \sec^2 t + C.
\]

7.1.26 \[
\int \frac{4 + e^{-2x}}{e^{3x}} \, dx = \int 4e^{-3x} \, dx + \int e^{-5x} \, dx = -\frac{4}{3} e^{-3x} - \frac{1}{5} e^{-5x} + C.
\]

7.1.27 \[
\int \frac{2 - 3x}{\sqrt{1 - x^2}} \, dx = \int \frac{2}{\sqrt{1 - x^2}} \, dx - 3 \int \frac{x}{\sqrt{1 - x^2}} \, dx = 2 \sin^{-1} x - 3 \int \frac{x}{\sqrt{1 - x^2}} \, dx \] (from Table 7.1.11).
Let \( u = 1 - x^2 \) so that \( du = -2x \, dx \). Substituting gives
\[
2 \sin^{-1} x + \frac{3}{2} u^{-1/2} \, du = 2 \sin^{-1} x + 3 \sqrt{u} + C = 2 \sin^{-1} x + 3 \sqrt{1 - x^2} + C.
\]

7.1.28 \[
\int \frac{3x + 1}{\sqrt{4 - x^2}} \, dx = -\int \frac{3x}{\sqrt{4 - x^2}} \, dx + \int \frac{1}{\sqrt{4 - x^2}} \, dx = \int \frac{3x}{\sqrt{4 - x^2}} \, dx + \sin^{-1} \frac{x}{2} \] (from Table 7.1.11) Let \( u = 4 - x^2 \) so that \( du = -2x \, dx \). Substituting gives
\[
-\frac{3}{2} \int u^{-1/2} \, du + \sin^{-1} \frac{x}{2} = -3 \sqrt{u} + \sin^{-1} \frac{x}{2} + C = -3 \sqrt{4 - x^2} + \sin^{-1} \frac{x}{2} + C.
\]

7.1.29 Note that long division gives \( \frac{x + 2}{x + 4} = 1 - \frac{2}{x + 4} \). Thus the integral is equal to
\[
\int \left( 1 - \frac{2}{x + 4} \right) \, dx = x - 2 \ln |x + 4| + C.
\]
7.1.30 Note that long division gives \( \frac{x^2 + 2}{x - 1} = x + 1 + \frac{3}{x - 1} \), so we have
\[
\int_{2}^{4} \left( x + 1 + \frac{3}{x - 1} \right) \, dx = \left( \frac{x^2}{2} + x + 3 \ln |x - 1| \right)_{2}^{4} = 8 + 4 + 3 \ln 3 - (2 + 2 + 0) = 8 + 3 \ln 3.
\]

7.1.31 Note that long division gives \( \frac{t^3 - 2}{t + 1} = t^2 - t + 1 - \frac{3}{t + 1} \). The integral is therefore
\[
\int \left( t^2 - t + 1 - \frac{3}{t + 1} \right) \, dt = \frac{t^3}{3} - \frac{t^2}{2} + t - 3 \ln |t + 1| + C.
\]

7.1.32
\[
\int \frac{6 - x^4}{x^2 + 4} \, dx = \int \frac{6}{x^2 + 4} \, dx - \int \frac{x^4}{x^2 + 4} \, dx = \int \frac{6}{x^2 + 4} \, dx - \int \left( x^2 - 4 + \frac{16}{x^2 + 4} \right) \, dx = -\frac{x^3}{3} + 4x - 10 \int \frac{1}{x^2 + 4} \, dx = -\frac{x^3}{3} + 4x - 5 \tan^{-1} \frac{x}{2} + C.
\]

7.1.33 Completing the square gives \( x^2 - 2x + 10 = (x^2 - 2x + 1) + 9 = (x - 1)^2 + 9 \), so we have, using Table 7.1.12,
\[
\int \frac{dx}{(x - 1)^2 + 3^2} = \frac{1}{3} \tan^{-1} \left( \frac{x - 1}{3} \right) + C.
\]

7.1.34 Completing the square gives \( x^2 + 4x + 8 = x^2 + 4x + 4 + 4 = (x + 2)^2 + 4 \), so that the integral is
\[
\int_{0}^{2} \frac{x}{x^2 + 4x + 8} \, dx = \int_{0}^{2} \frac{(x + 2) - 2}{(x + 2)^2 + 4} \, dx = \frac{1}{2} \int_{0}^{2} \frac{2x + 4}{(x + 2)^2 + 4} \, dx - \int_{0}^{2} \frac{1}{(x + 2)^2 + 4} \, dx.
\]
For the first integral, use the substitution \( u = (x + 2)^2 + 4 \), so that \( du = 2(x + 2) = 2x + 4 \); then \( x = 0 \) corresponds to \( u = 8 \) and \( x = 2 \) to \( u = 20 \). For the second, use Table 7.1.11. This gives
\[
\frac{1}{2} \int_{8}^{20} \frac{1}{u} \, du - \frac{2}{2} \tan^{-1} \frac{x + 2}{2} \bigg|_{0}^{20} = \frac{1}{2} \ln |u| \bigg|_{8}^{20} - \tan^{-1} \frac{1}{2} + \tan^{-1} 1
\]
\[
= \frac{1}{2} (\ln 20 - \ln 8) - \tan^{-1} \frac{1}{2} + \tan^{-1} 1
\]
\[
= \frac{1}{2} \ln \frac{5}{2} - \tan^{-1} \frac{1}{2} + \frac{\pi}{4}.
\]

7.1.35 Note that \( 27 - 6\theta - \theta^2 = -(\theta^2 + 6\theta + 9 - 36) = -((\theta + 3)^2 - 36) = 36 - (\theta + 3)^2 \). Thus the integral is
\[
\int \frac{d\theta}{\sqrt{36 - (\theta + 3)^2}} = \sin^{-1} \left( \frac{\theta + 3}{6} \right) + C.
\]

7.1.36 Since \( x^4 + 2x^2 + 1 = (x^2 + 1)^2 \), the integral can be written \( \int \frac{x}{(x^2 + 1)^2} \, dx \). Let \( u = x^2 + 1 \) so that \( du = 2x \, dx \). Substitution gives
\[
\int \frac{x}{(x^2 + 1)^2} \, dx = \frac{1}{2} \int u^{-2} \, du = -\frac{1}{2u} + C = -\frac{1}{2(x^2 + 1)} + C.
\]

7.1.37 Multiplying by \( \frac{1 - \sin \theta}{1 + \sin \theta} = 1 \) gives
\[
\int \frac{1}{1 + \sin \theta} \cdot \frac{1 - \sin \theta}{1 - \sin \theta} \, d\theta = \int \frac{1 - \sin \theta}{1 - \sin^2 \theta} \, d\theta = \int \frac{1 - \sin \theta}{\cos^2 \theta} \, d\theta = \int \sec^2 \theta \, d\theta - \int \frac{\sin \theta}{\cos^2 \theta} \, d\theta = \tan \theta - \int \sec \theta \, d\theta.
\]
Let \( u = \cos \theta \) so that \( du = -\sin \theta \, d\theta \). Substituting gives
\[
\tan \theta + \int u^{-2} \, du = \tan \theta - \frac{1}{u} + C = \tan \theta - \sec \theta + C.
\]
7.1.38 Multiplying by \( \frac{1+\sqrt{x}}{1+\sqrt{x}} = 1 \) gives
\[
\int \frac{1-x}{1-\sqrt{x}} \cdot \frac{1+\sqrt{x}}{1+\sqrt{x}} \, dx = \int \frac{(1-x)(1+\sqrt{x})}{1-x} \, dx = \int (1+\sqrt{x}) \, dx = x + \frac{2}{3} x^{3/2} + C.
\]

7.1.39 Multiplying by \( \frac{\sec x+1}{\sec x+1} = 1 \) gives
\[
\int \frac{1}{\sec x-1} \cdot \frac{\sec x+1}{\sec x+1} \, dx = \int \frac{\sec x+1}{\sec^2 x-1} \, dx = \int \frac{\sec x+1}{\tan^2 x} \, dx = \int \frac{\sec x}{\tan^2 x} \, dx + \int \cot^2 x \, dx
\]
\[
= \int \cot x \csc x \, dx + \int \cot^2 x \, dx = -\csc x + \int (\csc^2 x - 1) \, dx = -\csc x - \cot x - x + C.
\]

7.1.40 Multiplying by \( \frac{1+\csc \theta}{1+\csc \theta} = 1 \) and using the identities \( \csc^2 \theta - 1 = \cot^2 \theta \) and \( \tan^2 \theta = \sec^2 \theta + 1 \) gives
\[
\int \frac{1}{1-\csc \theta} \cdot \frac{1+\csc \theta}{1+\csc \theta} \, d\theta = \int \frac{1+\csc \theta}{1-\csc^2 \theta} \, d\theta = \int \frac{1+\csc \theta}{-\cot^2 \theta} \, d\theta
\]
\[
= -\int \frac{\csc \theta}{\cot^2 \theta} \, d\theta - \int \frac{1}{\cot^2 \theta} \, d\theta = -\int \tan \theta \sec \theta \, d\theta - \int \tan^2 \theta \, d\theta
\]
\[
= -\sec \theta - \int (\sec^2 \theta - 1) \, d\theta = -\sec \theta - \tan \theta + \theta + C.
\]

7.1.41
a. False. This seems to use the untrue “identity” that \( \frac{a}{b+c} = \frac{b}{a} + \frac{c}{a} \).

b. False. The degree of the numerator is already less than the degree of the denominator, so long division won’t help.

c. False. This is false because \( \frac{d}{dx} \ln |\sin x + 1| + C \neq \frac{1}{\sin x + 1} \). The substitution \( u = \sin x + 1 \) can’t be carried out because \( du = \cos x \, dx \) can’t be accounted for.

d. False. In fact, \( \int e^{-x} \, dx = -e^{-x} + C \neq \ln e^x + C \).

7.1.42 Let \( u = \sqrt{x} \) so that \( du = \frac{1}{2\sqrt{x}} \, dx \), or \( dx = 2u \, du \), and \( x = 4 \) corresponds to \( u = 2 \) while \( x = 9 \) corresponds to \( u = 3 \). Substituting gives \( \int_2^3 2u \frac{2u}{1-u} \, du = -\int_2^3 2u \frac{1}{u-1} \, du \). By long division, \( \frac{2u}{u-1} = 2 + \frac{2}{u-1} \). Thus we get
\[
-\int_2^3 \left( 2 + \frac{2}{u-1} \right) \, du = \left. (-2u - 2 \ln |u-1|) \right|_2^3 = -6 - 2 \ln 2 - (-4 - 0) = -2 - 2 \ln 2.
\]

7.1.43 Completing the square gives \( \int_0^x \frac{x}{x^2 + 2x + 2} \, dx = \int_0^x \frac{x}{(x+1)^2 + 1} \, dx \). Let \( u = x + 1 \) so that \( du = dx \), and \( x = -1 \) corresponds to \( u = 0 \) while \( x = 0 \) corresponds to \( u = 1 \). Substituting gives
\[
\int_0^1 \frac{u-1}{u^2 + 1} \, du = \int_0^1 \frac{1}{u^2 + 1} \, du - \int_0^1 \frac{1}{u^2 + 1} \, du = \left( \frac{1}{2} \ln (u^2 + 1) - \tan^{-1} u \right|_0^1 = \frac{1}{2} \ln 2 - \frac{\pi}{4} = \frac{1}{4} (\ln 4 - \pi).
\]

7.1.44 Let \( u = 1 + \sqrt{x} \) so that \( du = \frac{1}{2\sqrt{x}} \, dx \), or \( dx = 2\sqrt{x} \, du = 2(u-1) \, du \); further, \( x = 0 \) corresponds to \( u = 1 \) while \( x = 1 \) corresponds to \( u = 2 \). Substituting gives
\[
2 \int_1^2 \sqrt{u(u-1)} \, du = 2 \int_1^2 (u^{3/2} - u^{1/2}) \, du = 2 \left( \frac{2}{5} u^{5/2} - \frac{2}{3} u^{3/2} \right|_1^2
\]
\[
= 2 \left( \frac{8\sqrt{2}}{5} - 4\sqrt{2} - \left( \frac{2}{5} \cdot \frac{2}{3} \right) \right) = \frac{8}{15} (1 + \sqrt{2}).
\]
7.1.45 Using the identity \( \sin 2x = 2 \sin x \cos x \), we have \( 2 \int \sin^2 x \cos x \, dx \). Let \( u = \sin x \) so that \( du = \cos x \, dx \). We have \( 2 \int u^2 \, du = \frac{2}{3} u^3 + C = \frac{2}{3} \sin^3 x + C \).

7.1.46 Using the double angle identity \( \cos 2x = 2 \cos^2 x - 1 \), we have
\[
\int_0^{\pi/2} \sqrt{2 \cos^2 x} \, dx = \int_0^{\pi/2} \sqrt{2} \cos x \, dx = \sqrt{2} \sin x \bigg|_0^{\pi/2} = \sqrt{2}(1 - 0) = \sqrt{2}.
\]

7.1.47 Rewrite the integral as \( \int \frac{1}{\sqrt{2}} \frac{1}{1 + (\sqrt{x})^2} \, dx \) and let \( u = \sqrt{x} \). Then \( du = \frac{1}{2\sqrt{x}} \, dx \), and substituting gives \( 2 \int \frac{1}{1 + u^2} \, du = 2 \tan^{-1} u + C = 2 \tan^{-1} \sqrt{x} + C \).

7.1.48 Let \( u = \sqrt{x} \) so that \( u^2 = x \) and \( 2u \, du = \, dx \). Substituting gives
\[
\int_0^1 \frac{2u}{4 - u} \, du = 2 \int_0^1 \left( -1 - \frac{4}{u - 4} \right) \, du = 2 \left( -u - 4 \ln |u - 4| \right) \bigg|_0^1 = 2 \left( -1 - 4 \ln 3 - (0 - 4 \ln 4) \right) = 2 \left( \ln \frac{256}{81} - 1 \right).
\]

7.1.49 Note that \( x^2 + 6x + 13 = (x^2 + 6x + 9) + 4 = (x + 3)^2 + 4 \). Also note that we can write the numerator \( x - 2 = x + 3 - 5 = \frac{1}{2}(2x + 6) - 5 \). We have \( \int \frac{1}{2(x + 6)} \, dx - \int \frac{5}{(x + 3)^2 + 4} \, dx \). For the first integral, let \( u = x^2 + 6x + 13 \) so that \( du = (2x + 6) \, dx \). We have (for just the first integral) \( \frac{1}{2} \int_0^1 \, du = \frac{1}{2} \ln |u| + C = \frac{1}{2} \ln(x^2 + 6x + 13) + C \). The second integrand has antiderivative equal to \( \frac{5}{2} \tan^{-1} \left( \frac{x + 3}{2} \right) \), so the original integral is equal to \( \frac{1}{2} \ln(x^2 + 6x + 13) - \frac{5}{2} \tan^{-1} \frac{x + 3}{2} + C \).

7.1.50 We have
\[
\int_0^{\pi/4} 3 \sqrt{1 + \sin 2x} \, dx = 3 \int_0^{\pi/4} \sqrt{1 + \sin 2x} \cdot \frac{\sqrt{1 - \sin 2x}}{1 - \sin 2x} \, dx = 3 \int_0^{\pi/4} \frac{\cos 2x}{\sqrt{1 - \sin 2x}} \, dx.
\]
Let \( u = 1 - \sin 2x \) so that \( du = -2 \cos 2x \, dx \), and \( x = 0 \) corresponds to \( u = 1 \) while \( x = \frac{\pi}{4} \) corresponds to \( u = 0 \). Substituting gives \( \frac{3}{2} \int_1^0 u^{-1/2} \, du = 3 \sqrt{u} \bigg|_0^1 = 3 \).

7.1.51 Let \( u = e^x \) so that \( du = e^x \, dx \). Substituting gives
\[
\int \frac{1}{u^2 + 2u + 1} \, du = \int (u + 1)^{-2} \, du = -\frac{1}{u + 1} + C = -\frac{1}{e^x + 1} + C.
\]

7.1.52 By a double angle identity, \( \cos 4x = \cos 2(2x) = 1 - 2 \sin^2 2x \). Thus
\[
\int_0^{\pi/8} \sqrt{1 - \cos 4x} \, dx = \int_0^{\pi/8} \sqrt{2 \sin^2 2x} \, dx = \sqrt{2} \int_0^{\pi/8} \sin 2x \, dx = -\frac{\sqrt{2}}{2} \left( \cos 2x \right) \bigg|_0^{\pi/8} = -\frac{\sqrt{2}}{2} \left( \frac{\sqrt{2}}{2} - 1 \right) = \frac{\sqrt{2} - 1}{2}.
\]
7.1.53  \[ \int_{1}^{3} \frac{2}{(x+1)^2} \, dx = -2 \left( \frac{1}{x+1} \right) \bigg|_{1}^{3} = -2 \left( \frac{1}{4} - \frac{1}{2} \right) = \frac{1}{2}. \]

7.1.54  \[ \int_{0}^{2} \frac{2}{(x+1)^3} \, dx = -(x+1)^{-2} \bigg|_{0}^{2} = - \left( \frac{1}{9} - 1 \right) = \frac{8}{9}. \]

7.1.55  

a. If \( u = \tan x \) then \( du = \sec^2 x \, dx \). Substituting gives \( \int u \, du = \frac{u^2}{2} + C = \frac{1}{2} \tan^2 x + C. \)

b. If \( u = \sec x \), then \( du = \sec x \tan x \, dx \). Substituting gives \( \int u \, du = \frac{u^2}{2} + C = \frac{1}{2} \sec^2 x + C. \)

c. The seemingly different answers are the same, since \( \frac{1}{2} \tan^2 x \) and \( \frac{1}{2} \sec^2 x \) differ by a constant. In fact, \( \frac{1}{2} \tan^2 x - \frac{1}{2} \sec^2 x = -\frac{1}{2} \) since \( \tan^2 x + 1 = \sec^2 x. \)

7.1.56  

a. If \( u = \cot x \), then \( du = -\csc^2 x \, dx \). Substituting gives \( -\int u \, du = -\frac{u^2}{2} + C = -\frac{1}{2} \cot^2 x + C. \)

b. If \( u = \csc x \), then \( du = -\csc x \cot x \, dx \). Substituting gives \( -\int u \, du = -\frac{u^2}{2} + C = -\frac{1}{2} \csc^2 x + C. \)

c. The seemingly different answers are the same, since \( -\frac{1}{2} \cot^2 x \) and \( -\frac{1}{2} \csc^2 x \) differ by a constant. In fact, \( -\frac{1}{2} \cot^2 x - \left( -\frac{1}{2} \csc^2 x \right) = \frac{1}{2}, \) because \( \cot^2 x + 1 = \csc^2 x. \)

7.1.57  

a. Let \( u = x + 1 \) so that \( du = dx \). Note that \( x = u - 1 \), so that \( x^2 = (u - 1)^2 \). Substituting gives
\[
\int \frac{u^2 - 2u + 1}{u} \, du = \int \left( u - 2 + \frac{1}{u} \right) \, du = \frac{u^2}{2} - 2u + \ln |u| + C = \frac{1}{2} (x+1)^2 - 2(x+1) + \ln |x+1| + C.
\]

b. By long division, \( \frac{x^2}{x+1} = x - 1 + \frac{1}{x+1}. \) Thus, \( \int \frac{x^2}{x+1} \, dx = \int \left( x - 1 + \frac{1}{x+1} \right) \, dx = \frac{x^2}{2} - x + \ln |x+1| + C. \)

c. The seemingly different answers are the same, because they differ by a constant. In fact,
\[
\frac{1}{2} (x+1)^2 - 2(x+1) + \ln |x+1| - \left( \frac{1}{2} x^2 - x + \ln |x+1| \right) = \frac{1}{2} x^2 + x + \frac{1}{2} - 2x - 2 + \ln |x+1| - \frac{1}{2} x^2 + x - \ln |x+1| = -\frac{3}{2}.
\]

7.1.58  

a. Note that \( x - x^2 = -(x^2 - x + \frac{1}{4} - \frac{1}{4}) = -\left( \left( x - \frac{1}{2} \right)^2 - \frac{1}{4} \right) = \frac{1}{4} - \left( x - \frac{1}{2} \right)^2. \) Thus we can write the integral as \( \int \frac{dx}{\sqrt{\frac{1}{4} - (x - \frac{1}{2})^2}} = 2 \int \frac{dx}{\sqrt{1 - ((2x-1)^2)}}. \) Let \( u = 2x - 1. \) Then \( du = 2 \, dx. \) Substituting gives
\[
\int \frac{du}{\sqrt{1 - u^2}} = \sin^{-1} u + C = \sin^{-1}(2x - 1) + C.
\]

b. We can write the integral as \( \int \frac{dx}{\sqrt{x} \, \sqrt{1 - x}}. \) Let \( u = \sqrt{x} \) so that \( du = \frac{1}{2 \sqrt{x}} \, dx. \) Substituting gives
\[
2 \int \frac{du}{\sqrt{1 - u^2}} = 2 \sin^{-1} u + C = 2 \sin^{-1} \sqrt{x} + C.
\]

c. By parts a and b, it follows that both \( \sin^{-1}(2x - 1) \) and \( 2 \sin^{-1} \sqrt{x} \) are antiderivatives of \( \frac{1}{\sqrt{x^2 - x^2}}. \) Therefore, \( 2 \sin^{-1} \sqrt{x} - \sin^{-1}(2x - 1) = C \) for some constant \( C. \) To determine \( C, \) we let \( x = 0, \) giving \( 2 \sin^{-1} 0 - \sin^{-1}(-1) = C. \) Thus \( 0 - (-\frac{\pi}{2}) = C, \) so \( C = \frac{\pi}{2}. \)
7.1.59  
\[ A = \int_{2}^{4} \frac{x^2 - 1}{x^3 - 3x} \, dx. \]  
Let \( u = x^3 - 3x \) so that \( du = 3x^2 - 3 \, dx \), and \( x = 2 \) corresponds to \( u = 2 \) while \( x = 4 \) corresponds to \( u = 52 \). Substituting gives
\[ A = \frac{1}{3} \int_{2}^{52} \frac{1}{u} \, du = \frac{1}{3} \ln u \bigg|_{2}^{52} = \frac{1}{3} (\ln 52 - \ln 2) = \frac{1}{3} \ln 26. \]

7.1.60  
The curves intersect when \( x^3 = 8x \), so at \( x = 0 \) and \( x = \pm \sqrt[3]{8} \). By symmetry, we have
\[ A = 2 \int_{0}^{\sqrt[3]{8}} \frac{8x - x^3}{x^2 + 1} \, dx. \]  
Using long division, we can write \( \frac{8x - x^3}{x^2 + 1} = -x + \frac{9x}{x^2 + 1} \). Thus,
\[ A = 2 \int_{0}^{\sqrt[3]{8}} \left(-x + \frac{9x}{x^2 + 1}\right) \, dx = 2 \int_{0}^{\sqrt[3]{8}} (-x) \, dx + 2 \int_{0}^{\sqrt[3]{8}} \frac{9x}{x^2 + 1} \, dx \]
\[ = -2 \left[ \frac{x^2}{2} \right]_{0}^{\sqrt[3]{8}} + 2 \int_{0}^{\sqrt[3]{8}} \frac{9x}{x^2 + 1} \, dx \]
\[ = -8 + 2 \int_{0}^{\sqrt[3]{8}} \frac{9x}{x^2 + 1} \, dx. \]
To compute this last integral, let \( u = x^2 + 1 \) so that \( du = 2x \, dx \). Then we have
\[ A = -8 + 9 \int_{1}^{9} \frac{1}{5} \, du = -8 + 9 \ln u \bigg|_{1}^{9} = -8 + 9 \ln 9 \approx 11.775. \]

7.1.61  
a.  
\[ V = \pi \int_{0}^{2} (x^2 + 1) \, dx = \pi \left[ \frac{x^3}{3} + x \right]_{0}^{2} = \pi \left( \frac{8}{3} + 2 \right) = \frac{14\pi}{3}. \]

b.  
\[ V = 2\pi \int_{0}^{2} x \sqrt{x^2 + 1} \, dx. \]  
Let \( u = x^2 + 1 \) so that \( du = 2x \, dx \). Substituting gives
\[ \pi \int_{1}^{5} u^{1/2} \, du = \pi \left[ \frac{2}{3} u^{3/2} \right]_{1}^{5} = \frac{2}{3} \pi \left( 5\sqrt[3]{5} - 1 \right). \]

7.1.62  
a.  
\[ V = \pi \int_{0}^{3} \frac{1}{(x + 2)^2} \, dx = \pi \left[ -\frac{1}{x + 2}\right]_{0}^{3} = \pi \left( -\frac{1}{5} + \frac{1}{2} \right) = \frac{3\pi}{10}. \]

b.  
\[ V = 2\pi \int_{0}^{3} \frac{x}{x + 2} \, dx = 2\pi \int_{0}^{3} \left( 1 - \frac{2}{x + 2} \right) \, dx = 2\pi \left( x - 2 \ln(x + 2) \right)_{0}^{3} \]
\[ = 2\pi (3 - 2 \ln 5 - (0 - 2 \ln 2)) = 2\pi \left( 3 + 2 \ln \frac{2}{5} \right). \]

7.1.63  
We have \( L = \int_{0}^{1} \sqrt{1 + \frac{25x^{1/2}}{16}} \, dx \). Let \( u^2 = 1 + \frac{25x^{1/2}}{16} \). Then \( 2u \, du = \frac{25}{32\sqrt{x}} \, dx \). Note that
\[ \sqrt{x} = \frac{16}{25} (u^2 - 1), \text{ so that } \quad dx = \frac{64\sqrt{x}}{25} u \, du = \frac{1024}{625} (u^3 - u) \, du. \]
Further, \( x = 0 \) corresponds to \( u = 1 \) while \( x = 1 \) corresponds to \( u^2 = 1 + \frac{25}{16} = \frac{41}{16} \), so that \( u = \frac{\sqrt{41}}{4} \). Finally, note that the integrand becomes
\[ \sqrt{1 + \frac{25x^{1/2}}{16}} \, dx = u \cdot \frac{1024}{625} (u^3 - u) \, du = \frac{1024}{625} (u^4 - u^2) \, du. \]
Thus substituting gives

\[ L = \int_1^{\sqrt{41}/4} \frac{1024}{625} (u^4 - u^2) \, du \]

\[ = \frac{1024}{625} \left( \left. \frac{u^5}{5} - \frac{u^3}{3} \right|_1^{\sqrt{41}/4} \right) \]

\[ = \frac{1024}{625} \left( \frac{1}{5} \left( \frac{\sqrt{41}}{4} \right)^5 - \frac{1}{3} \left( \frac{\sqrt{41}}{4} \right)^3 - \left( \frac{1}{5} - \frac{1}{3} \right) \right) \]

\[ = \frac{1024}{625} \left( \frac{2}{15} + \frac{1763\sqrt{41}}{15360} \right) \]

\[ = \frac{2048 + 1763\sqrt{41}}{9375} \approx 1.423. \]

7.2 Integration by Parts

7.2.1 It is based on the product rule. In fact, the rule can be obtained by writing down the product rule, then integrating both sides and rearranging the terms in the result.

7.2.2 It is generally a good idea to let \( dv \) be something easy to integrate. In this case, we would let \( dv = e^{ax} \, dx \), leaving \( u = x^n \). Note that differentiating \( x^n \) results in something simpler (lower degree), while integrating it make it more complicated (higher degree). However, differentiating or integrating \( e^{ax} \) yields essentially the same thing (a constant times the function \( e^{ax} \)).

7.2.3 It is generally a good idea to let \( u \) be something easy to differentiate, keeping in mind that whatever is left for \( dv \) is something which you will need to be able to integrate. In this case, it would be prudent to let \( u = x^n \) and \( dv = \cos(ax) \, dx \). Note that differentiating \( x^n \) results in something simpler (lower degree), while integrating it make it more complicated (higher degree). However, differentiating or integrating \( \cos(ax) \) yields essentially the same thing (a constant times the sine function).

7.2.4 One can use integration by parts for definite integrals via the formula

\[ \int_a^b u(x)v'(x) \, dx = u(x) v(x) \bigg|_a^b - \int_a^b v(x) u'(x) \, dx. \]

7.2.5 Those for which the choice for \( dv \) is easily integrated and when the resulting new integral is no more difficult than the original.

7.2.6 Because \( x^4 \) becomes “simpler” when differentiated (it becomes a degree 3 polynomial) and less simple when integrated (it becomes a degree 5 polynomial) while \( e^{-2x} \) remains essentially the same when either differentiated or integrated, it would make sense to let \( u = x^4 \) and \( dv = e^{-2x} \, dx \).

7.2.7 Let \( u = x \) and \( dv = \cos x \, dx \). Then \( du = dx \) and \( v = \sin x \). Then

\[ \int x \cos x \, dx = x \sin x - \int \sin x \, dx = x \sin x + \cos x + C. \]

7.2.8 Let \( u = x \) and \( dv = \sin 2x \, dx \). Then \( du = dx \) and \( v = -\frac{1}{2} \cos(2x) \). Then

\[ \int x \sin 2x \, dx = -\frac{1}{2} x \cos 2x + \frac{1}{2} \int \cos 2x \, dx = -\frac{1}{2} x \cos 2x + \frac{1}{4} \sin 2x + C. \]

7.2.9 Let \( u = t \) and \( dv = e^t \, dt \). Then \( du = dt \) and \( v = e^t \). Then

\[ \int t e^t \, dt = te^t - \int e^t \, dt = te^t - e^t + C. \]
7.2.10 Let \( u = 2x \) and \( dv = e^{3x} \, dx \). Then \( du = 2 \, dx \) and \( v = \frac{e^{3x}}{3} \). Then

\[
\int 2xe^{3x} \, dx = \frac{2xe^{3x}}{3} - \frac{2}{3} \int e^{3x} \, dx = \frac{2xe^{3x}}{3} - \frac{2e^{3x}}{9} + C.
\]

7.2.11 Let \( u = x \) and \( dv = \frac{dx}{\sqrt{x+1}} \). Then \( du = dx \) and \( v = 2\sqrt{x+1} \). Then

\[
\int \frac{x}{\sqrt{x+1}} \, dx = 2x\sqrt{x+1} - \frac{2}{3} \int (x+1)^{3/2} \, dx = \frac{2}{3}(x-2)\sqrt{x+1} + C.
\]

7.2.12 Let \( u = s \) and \( dv = e^{-2s} \, ds \). Then \( du = ds \) and \( v = -\frac{1}{2}e^{-2s} \). Then

\[
\int se^{-2s} \, ds = -\frac{1}{2}se^{-2s} + \frac{1}{2} \int e^{-2s} \, ds = -\frac{1}{2}se^{-2s} - \frac{1}{4}e^{-2s} + C.
\]

7.2.13 Let \( u = \ln x^3 = 3 \ln x \) and let \( dv = x^2 \, dx \). Then \( du = \frac{3 \, dx}{x} \) and \( v = \frac{x^3}{3} \). Then

\[
\int x^2 \ln x^3 \, dx = x^3 \ln x - \int x^2 \, dx = x^3 \ln x - \frac{x^3}{3} + C.
\]

7.2.14 Let \( u = \theta \) and \( dv = \sec^2 \, \theta \, d\theta \). Then \( du = d\theta \) and \( v = \tan \theta \). Then

\[
\int \theta \sec^2 \, \theta \, d\theta = \theta \tan \theta - \int \tan \theta \, d\theta = \theta \tan \theta + \ln |\cos \theta| + C.
\]

7.2.15 Let \( u = \ln x \) and \( dv = x^2 \, dx \). Then \( du = \frac{1}{x} \, dx \) and \( v = \frac{x^3}{3} \). Then

\[
\int x^2 \ln x \, dx = \frac{x^3}{3} \ln x - \frac{1}{3} \int x^2 \, dx = \frac{x^3}{3} \ln x - \frac{x^3}{9} + C = \frac{x^3}{9} \left( 3 \ln x - 1 \right) + C.
\]

7.2.16 Let \( u = \ln x \) and \( dv = x \, dx \). Then \( du = \frac{1}{x} \, dx \) and \( v = \frac{x^2}{2} \). Then

\[
\int x \ln x \, dx = \frac{x^2}{2} \ln x - \frac{1}{2} \int x \, dx = \frac{x^2}{2} \ln x - \frac{x^2}{4} + C.
\]

7.2.17 Let \( u = \ln x \) and \( dv = x^{-10} \, dx \). Then \( du = \frac{1}{x} \, dx \) and \( v = -\frac{1}{9}x^{-9} \). Then

\[
\int \ln x \, x^{-10} \, dx = -\frac{1}{9}x^{-9} \ln x + \frac{1}{9} \int x^{-10} \, dx = -\frac{1}{9}x^{-9} \ln x - \frac{1}{81x^9} + C.
\]

7.2.18 Let \( u = \sin^{-1} x \) and \( dv = \, dx \). Then \( du = \frac{1}{\sqrt{1-x^2}} \, dx \) and \( v = x \). Then

\[
\int \sin^{-1} x \, dx = x \sin^{-1} x - \int \frac{x}{\sqrt{1-x^2}} \, dx = x \sin^{-1} x + \sqrt{1-x^2} + C.
\]

The fact that \(-\int \frac{x}{\sqrt{1-x^2}} \, dx = \sqrt{1-x^2} + C\) follows from the ordinary substitution \( u = 1 - x^2 \).

7.2.19 Let \( u = \tan^{-1} x \) and \( dv = \, dx \). Then \( du = \frac{1}{1+x^2} \, dx \) and \( v = x \). Then

\[
\int \tan^{-1} x \, dx = x \tan^{-1} x - \int \frac{x}{1+x^2} \, dx = x \tan^{-1} x - \frac{1}{2} \ln(1+x^2) + C.
\]

The fact that \(-\int \frac{x}{1+x^2} \, dx = -\frac{1}{2} \ln(1+x^2) + C\) follows from the ordinary substitution \( u = 1 + x^2 \).
7.2.20 Let \( u = \sec^{-1} x \) and \( dv = x \, dx \). Then \( du = \frac{1}{|x|\sqrt{x^2 - 1}} \, dx \) and \( v = \frac{x^2}{2} \), so
\[
\int x \sec^{-1} x \, dx = \frac{x^2}{2} \sec^{-1} x - \frac{1}{2} \int \frac{|x|}{\sqrt{x^2 - 1}} \, dx.
\]
Now to compute this last integral, we make the ordinary substitution \( u = x^2 - 1 \), so that \( du = 2x \, dx \). Then
\[
\int \frac{|x|}{\sqrt{x^2 - 1}} \, dx = \pm \frac{1}{2} \int u^{-1/2} \, du = \pm u^{1/2} + C = \sqrt{x^2 - 1} + C,
\]
where we may use the positive square root since \( x \geq 1 \). Combining these results yields
\[
\int x \sec^{-1} x = \frac{1}{2} x^2 \sec^{-1} x - \frac{1}{2} \sqrt{x^2 - 1} + C.
\]

7.2.21 \( \int x \sin x \cos x \, dx \) \( \frac{1}{2} \int x \cdot (2 \sin x \cos x) \, dx = \frac{1}{2} \int x \sin 2x \, dx \). Now using the result of problem 8, we have
\[
\int x \sin x \cos x \, dx = \frac{1}{2} \cdot \left( -\frac{1}{2} x \cos 2x + \frac{1}{4} \sin 2x \right) + C = -\frac{1}{4} x \cos 2x + \frac{1}{8} \sin 2x + C.
\]

7.2.22 Let \( u = x^2 \), so that \( du = 2x \, dx \). Substituting yields \( \frac{1}{2} \int \tan^{-1} u \, du \). Problem 19 gives
\[
\int \tan^{-1} u \, du = u \tan^{-1} u - \frac{1}{2} \ln(1 + u^2) + C,
\]
so
\[
\int x \tan^{-1} x^2 \, dx = \frac{1}{2} x^2 \tan^{-1} x^2 - \frac{1}{4} \ln(1 + x^4) + C.
\]

7.2.23 Let \( u = t^2 \) and \( dv = e^{-t} \, dt \). Then \( du = 2t \, dt \) and \( v = -e^{-t} \). We have
\[
\int t^2 e^{-t} \, dt = -t^2 e^{-t} + 2 \int e^{-t} \, dt.
\]
To compute this last integral, we let \( u = t \) and \( dv = e^{-t} \, dt \). Then
\[
\int e^{-t} \, dt = -e^{-t} + \int e^{-t} \, dt = -e^{-t} - e^{-t} + C.
\]
Putting these results together, we obtain
\[
\int t^2 e^{-t} \, dt = -t^2 e^{-t} + 2(-te^{-t} - e^{-t}) + C = -e^{-t}(t^2 + 2t + 2) + C.
\]

7.2.24 Let \( u = \cos 2x \) and \( dv = e^{3x} \, dx \). Then \( du = -2 \sin 2x \, dx \) and \( v = \frac{1}{3} e^{3x} \). We have
\[
\int e^{3x} \cos 2x \, dx = \frac{1}{3} e^{3x} \cos 2x + \frac{2}{3} \int e^{3x} \sin 2x \, dx.
\]
In order to compute the integral which comprises this last term, we let \( u = \sin 2x \) and \( dv = e^{3x} \, dx \). Then \( du = 2 \cos 2x \, dx \) and \( v = \frac{1}{3} e^{3x} \). Thus,
\[
\int e^{3x} \sin 2x \, dx = \frac{1}{3} e^{3x} \sin 2x - \frac{2}{3} \int e^{3x} \cos 2x \, dx.
\]
Putting these results together gives
\[
\int e^{3x} \cos 2x \, dx = \frac{1}{3} e^{3x} \cos 2x + \frac{2}{9} e^{3x} \sin 2x - \frac{4}{9} \int e^{3x} \cos 2x \, dx, \quad \text{so}
\]
\[
\frac{13}{9} \int e^{3x} \cos 2x \, dx = \frac{1}{3} e^{3x} \left( \cos 2x + \frac{2}{3} \sin 2x \right) + C, \quad \text{so}
\]
\[
\int e^{3x} \cos 2x \, dx = \frac{3}{13} e^{3x} \left( \cos 2x + \frac{2}{3} \sin 2x \right) + C.
\]
7.2.25 Let \( u = \sin 4x \) and \( dv = e^{-x} \, dx \). Then \( du = 4 \cos 4x \, dx \) and \( v = -e^{-x} \). We have
\[
\int e^{-x} \sin 4x \, dx = -e^{-x} \sin 4x + 4 \int e^{-x} \cos 4x \, dx.
\]
Now in order to compute the integral which comprises this last term, we let \( u = \cos 4x \) and \( dv = e^{-x} \, dx \). Then \( du = -4 \sin 4x \, dx \) and \( v = -e^{-x} \). Thus,
\[
\int e^{-x} \cos 4x \, dx = -e^{-x} \cos 4x - 4 \int e^{-x} \sin 4x \, dx.
\]
Putting these results together gives
\[
\int e^{-x} \sin 4x \, dx = -e^{-x} \sin 4x - 4e^{-x} \cos 4x - 16 \int e^{-x} \sin 4x \, dx, \quad \text{so}
\]
\[
17 \int e^{-x} \sin 4x \, dx = -e^{-x} \sin 4x - 4e^{-x} \cos 4x + C, \quad \text{so}
\]
\[
\int e^{-x} \sin 4x \, dx = -\frac{1}{17} e^{-x} (\sin 4x + 4 \cos 4x) + C.
\]

7.2.26 Let \( u = \ln^2 x \) and \( dv = x^2 \, dx \). Then \( du = \frac{2 \ln x}{x} \, dx \) and \( v = \frac{x^3}{3} \). We have
\[
\int x^2 \ln^2 x \, dx = \frac{1}{3} x^3 \ln^2 x - \frac{2}{3} \int x^2 \ln x \, dx.
\]
Note that we already computed \( \int x^2 \ln x \, dx \) in problem 15, obtaining \( \frac{x^3}{9} (3 \ln x - 1) + C \). Thus,
\[
\int x^2 \ln^2 x \, dx = \frac{x^3}{3} \ln^2 x - \frac{2x^3}{27} (3 \ln x - 1) + C = \frac{x^3}{27} (9 \ln^2 x - 6 \ln x + 2) + C.
\]

7.2.27 Let \( u = \cos x \) and \( dv = e^x \, dx \). Then \( du = -\sin x \, dx \) and \( v = e^x \). We have
\[
\int e^x \cos x \, dx = e^x \cos x + \int e^x \sin x \, dx.
\]
Now in order to compute the integral which comprises this last term, we let \( u = \sin x \) and \( dv = e^x \, dx \). Then \( du = \cos x \, dx \) and \( v = e^x \). Thus,
\[
\int e^x \sin x \, dx = e^x \sin x - \int e^x \cos x \, dx \]
Putting these results together gives
\[
\int e^x \cos x \, dx = e^x \cos x + e^x \sin x - \int e^x \cos x \, dx, \quad \text{so}
\]
\[
2 \int e^x \cos x \, dx = e^x (\cos x + \sin x) + C, \quad \text{so}
\]
\[
\int e^x \cos x \, dx = \frac{e^x}{2} (\cos x + \sin x) + C.
\]

7.2.28 Let \( u = \sin 6\theta \) and \( dv = e^{-2\theta} \, d\theta \). Then \( du = 6 \cos 6\theta \, d\theta \) and \( v = -\frac{1}{2} e^{-2\theta} \). We have
\[
\int e^{-2\theta} \sin 6\theta \, d\theta = -\frac{1}{2} e^{-2\theta} \sin 6\theta + 3 \int e^{-2\theta} \cos 6\theta \, d\theta.
\]
Now in order to compute the integral which comprises this last term, we let \( u = \cos 6\theta \) and \( dv = e^{-2\theta} \, d\theta \). Then \( du = -6 \sin 6\theta \, d\theta \) and \( v = -\frac{1}{2} e^{-2\theta} \). Thus,
\[
\int e^{-2\theta} \cos 6\theta \, d\theta = -\frac{1}{2} e^{-2\theta} \cos 6\theta - 3 \int e^{-2\theta} \sin 6\theta \, d\theta.
\]
Putting these results together gives
\[ \int e^{-2\theta} \sin 6\theta \, d\theta = -\frac{1}{2} e^{-2\theta} \sin 6\theta - \frac{3}{2} e^{-2\theta} \cos 6\theta - 9 \int e^{-2\theta} \sin 6\theta \, d\theta, \quad \text{so} \]
\[ 10 \int e^{-2\theta} \sin 6\theta \, d\theta = -\frac{1}{2} e^{-2\theta} (\sin 6\theta + 3 \cos 6\theta) + C, \quad \text{so} \]
\[ \int e^{-2\theta} \sin 6\theta \, d\theta = -\frac{1}{20} e^{-2\theta} (\sin 6\theta + 3 \cos 6\theta) + C. \]

**7.2.29** Let \( u = x^2 \) and \( dv = \sin 2x \, dx \). Then \( du = 2x \, dx \) and \( v = -\frac{1}{2} \cos 2x \). Then
\[ \int x^2 \sin 2x \, dx = -\frac{1}{2} x^2 \cos 2x + \int x \cos 2x \, dx. \]

Now we consider computing this last term \( \int x \cos 2x \, dx \) as a new problem. Let \( u = x \) and \( dv = \cos 2x \, dx \). Then \( du = dx \) and \( v = \frac{1}{2} \sin 2x \). So
\[ \int x \cos 2x \, dx = \frac{1}{2} x \sin 2x - \frac{1}{2} \int \sin 2x \, dx = \frac{1}{2} x \sin 2x + \frac{1}{4} \cos 2x + C. \]

Combining these results we have
\[ \int x^2 \sin 2x \, dx = -\frac{1}{2} x^2 \cos 2x + \frac{1}{2} x \sin 2x + \frac{1}{4} \cos 2x + C. \]

**7.2.30** Let \( u = x^2 \) and \( dv = e^{4x} \, dx \). Then \( du = 2x \, dx \) and \( v = \frac{e^{4x}}{4} \). Then
\[ \int x^2 e^{4x} \, dx = \frac{1}{4} x^2 e^{4x} - \frac{1}{2} \int x e^{4x} \, dx. \]

Now we consider computing this last integral \( \int x e^{4x} \, dx \) as a new problem. Let \( u = x \) and \( dv = e^{4x} \, dx \). Then \( du = dx \) and \( v = \frac{e^{4x}}{4} \), so that
\[ \int x e^{4x} \, dx = \frac{1}{4} x e^{4x} - \frac{1}{4} \int e^{4x} \, dx = \frac{1}{4} x e^{4x} - \frac{1}{16} e^{4x} + C. \]
Combining these results gives
\[ \int x^2 e^{4x} \, dx = \frac{1}{4} x^2 e^{4x} - \frac{1}{8} x e^{4x} + \frac{1}{32} e^{4x} + C = e^{4x} \left( \frac{x^2}{4} - \frac{x}{8} + \frac{1}{32} \right) + C. \]

**7.2.31** Let \( u = x \) and \( dv = \sin x \, dx \). Then \( du = dx \) and \( v = -\cos x \). Then
\[ \int_0^\pi x \sin x \, dx = -x \cos x \Big|_0^\pi + \int_0^\pi \cos x \, dx = \pi - 0 + \sin x \Big|_0^\pi = \pi - 0 + 0 = \pi. \]

**7.2.32** First note that \( \int_1^e \ln 2x \, dx = \int_1^e \ln 2 \, dx + \int_1^e \ln x \, dx = (e - 1) \ln 2 + \int_1^e \ln x \, dx \).
Let \( u = \ln x \) and \( dv = dx \). Then \( du = \frac{1}{x} \, dx \) and \( v = x \). Then
\[ \int_1^e \ln x \, dx = x \ln x \bigg|_1^e - \int_1^e dx = e - (e - 1) = 1. \]
Thus
\[ \int_1^e 2x \, dx = (e - 1) \ln 2 + 1. \]

**7.2.33** Let \( u = x \) and \( dv = \cos 2x \, dx \). Then \( du = dx \) and \( v = \frac{1}{2} \sin 2x \). Then
\[ \int_0^{\pi/2} x \cos 2x \, dx = \frac{1}{2} x \sin 2x \bigg|_0^{\pi/2} - \frac{1}{2} \int_0^{\pi/2} \sin 2x \, dx = 0 - \frac{1}{2} \left[ -\frac{\cos 2x}{2} \right]_0^{\pi/2} = -\frac{1}{4} - \frac{1}{4} = -\frac{1}{2}. \]

**7.2.34** Let \( u = x \) and \( dv = e^x \, dx \). Then \( du = dx \) and \( v = e^x \). Then
\[ \int_0^{\ln 2} x e^x \, dx = xe^x \bigg|_0^{\ln 2} - \int_0^{\ln 2} e^x \, dx = 2 \ln 2 - e^x \bigg|_0^{\ln 2} = 2 \ln 2 - (2 - 1) = 2 \ln 2 - 1. \]

**7.2.35** Let \( u = \ln x \) and \( dv = x^2 \, dx \). Then \( du = \frac{1}{x} \, dx \) and \( v = \frac{x^3}{3} \). Then
\[ \int_1^e x^2 \ln x \, dx = \frac{1}{3} x^3 \ln x \bigg|_1^e - \frac{1}{3} \int_1^e x^2 \, dx = \frac{2}{3} e^6 - \frac{1}{9} e^3 \bigg|_1^e = \frac{2}{3} e^6 - \frac{1}{9} (e^6 - 1) = \frac{5}{9} e^6 + \frac{1}{9}. \]
7.2.36 By problem 22, we have \( \int y \tan^{-1} y^2 \, dy = \frac{1}{2} y^2 \tan^{-1} y^2 - \frac{1}{4} \ln(1 + y^4) + C. \) Thus,
\[
\int_{0}^{\sqrt{2}} y \tan^{-1} y^2 \, dy = \left( \frac{1}{2} y^2 \tan^{-1} y^2 - \frac{1}{4} \ln(1 + y^4) \right){1/\sqrt{2}} = \frac{1}{4} \tan^{-1} \frac{1}{2} - \frac{1}{4} \ln \frac{5}{4}.
\]

7.2.37 By problem 18, \( \int \sin^{-1} x \, dx = x \sin^{-1} x + \sqrt{1 - x^2}. \) Thus,
\[
\int_{1/2}^{\sqrt{3}/2} \sin^{-1} x \, dx = \left( x \sin^{-1} x + \sqrt{1 - x^2} \right){\sqrt{3}/2} = \frac{\sqrt{3}}{2} \cdot \frac{\pi}{3} + \frac{1}{2} = \frac{\pi}{2} - \frac{\sqrt{3}}{2} \cdot \frac{1}{2} + \frac{1}{2} \left( 1 - \sqrt{3} \right).
\]

7.2.38 Let \( u = \sec^{-1} z \) and \( dv = z \, dz. \) Then \( du = \frac{1}{|z|^{2/3} - 1} \, dz \) and \( v = \frac{z^2}{2}. \) Then
\[
\int_{2/\sqrt{3}}^{2} z \sec^{-1} z \, dz = \frac{z^2}{2} \sec^{-1} z \bigg|_{2/\sqrt{3}}^{2} - \frac{1}{2} \int_{2/\sqrt{3}}^{2} \frac{z}{\sqrt{z^2 - 1}} \, dz.
\]
We can compute this last integral via a regular substitution. Let \( u = z^2 - 1 \) so that \( du = 2z \, dz. \) Then
\[
\int_{2/\sqrt{3}}^{2} \frac{z}{\sqrt{z^2 - 1}} \, dz = \frac{1}{2} \int_{1/3}^{3} u^{-1/2} \, du = \sqrt{u}{1/3} = \sqrt{3} - \frac{\sqrt{3}}{3} = 2\sqrt{3},
\]
so that
\[
\int_{2/\sqrt{3}}^{2} z \sec^{-1} z \, dz = 2\pi \cdot \frac{2\pi}{3} - \frac{\sqrt{3}}{3} = 5\pi - \frac{\sqrt{3}}{3}.
\]

7.2.39 Using shells, we have \( V = \frac{2\pi}{2} = \int_{0}^{\ln 2} xe^{-x} \, dx. \) Let \( u = x \) and \( dv = e^{-x} \, dx, \) so that \( du = dx \) and \( v = -e^{-x}. \) Then
\[
V = -xe^{-x}{\ln 2} + \int_{0}^{\ln 2} e^{-x} \, dx = -\frac{1}{2} \ln 2 - e^{-x}{\ln 2} = -\frac{\ln 2}{2} - \left( \frac{1}{2} - 1 \right) = \frac{1}{2} (1 - \ln 2).
\]
Thus \( V = \pi (1 - \ln 2). \)

7.2.40 Using shells, we have \( V = \frac{2\pi}{2} = \int_{0}^{\pi} x \sin x \, dx. \) Let \( u = x \) and \( dv = \sin x \, dx, \) so that \( du = dx \) and \( v = -\cos x. \) Then \( V = -x \cos x{\pi} + \int_{0}^{\pi} \cos x \, dx = \pi + \sin x{\pi} = \pi. \) Thus \( V = 2\pi^2. \)

7.2.41 Using disks, we have \( V = \frac{\pi}{\pi} = \int_{0}^{\pi} x^2 \ln^2 x \, dx. \) By problem 26, we have
\[
\int x^3 \ln^2 x \, dx = \frac{1}{3} x^3 \ln^2 x - \frac{2}{9} x^3 \ln x + \frac{2}{27} x^3 + C.
\]
Thus,
\[
V = \left( \frac{1}{3} x^3 \ln^2 x - \frac{2}{9} x^3 \ln x + \frac{2}{27} x^3 \right){\pi} = \left( \frac{4}{3} e^6 - \frac{4}{9} e^6 + \frac{2}{27} e^6 \right) - \left( \frac{2}{27} \right) = \frac{26}{27} e^6 - \frac{2}{27}
\]
so that \( V = \frac{2\pi}{27} (13e^6 - 1). \)

Copyright © 2014 Pearson Education, Inc.
7.2.42 Using shells, we have \( V = \int_0^{\ln 2} (\ln 2 - x)e^{-x} \, dx = \ln 2 \int_0^{\ln 2} e^{-x} \, dx - \int_0^{\ln 2} xe^{-x} \, dx \). In the course of solving problem 39, we deduced that \( \int_0^{\ln 2} xe^{-x} \, dx = \frac{1 - \ln 2}{2} \). Thus,

\[
\frac{V}{2\pi} = \ln 2 \left( -e^{-x} \right) \bigg|_0^{\ln 2} - \frac{1 - \ln 2}{2} = \ln 2 \left( -\frac{1}{2} + 1 \right) - \frac{1 - \ln 2}{2} = \ln 2 - \frac{1}{2},
\]

so that \( V = 2\pi \left( \ln 2 - \frac{1}{2} \right) = \pi (\ln 4 - 1) \).

7.2.43

a. False. For example, suppose \( u = x \) and \( dv = x \, dx \). Then

\[
\int uv' \, dx = \int x^2 \, dx = \frac{x^3}{3} + C,
\]

but

\[
\int uv \, dx = \int \left( \int x \, dx \right)^2 = \left( \frac{x^2}{2} + C \right)^2.
\]

b. True. This is one way to write the integration by parts formula.

c. True. This is the integration by parts formula with the roles of \( u \) and \( v \) reversed.

7.2.44 Let \( u = x^n \) and \( dv = e^{ax} \, dx \). Then \( du = nx^{n-1} \, dx \) and \( v = \frac{e^{ax}}{a} \), so that

\[
\int x^n e^{ax} \, dx = \frac{x^ne^{ax}}{a} - \frac{n}{a} \int x^{n-1} e^{ax} \, dx.
\]

7.2.45 Let \( u = x^n \) and \( dv = \cos ax \, dx \). Then \( du = nx^{n-1} \, dx \) and \( v = \frac{\sin ax}{a} \), so that

\[
\int x^n \cos ax \, dx = \frac{x^n \sin ax}{a} - \frac{n}{a} \int x^{n-1} \sin ax \, dx.
\]

7.2.46 Let \( u = x^n \) and \( dv = \sin ax \, dx \). Then \( du = nx^{n-1} \, dx \) and \( v = \frac{-\cos ax}{a} \), so that

\[
\int x^n \sin ax \, dx = -\frac{x^n \cos ax}{a} + \frac{n}{a} \int x^{n-1} \cos ax \, dx.
\]

7.2.47 Let \( u = \ln^n x \) and \( dv = dx \). Then \( du = \frac{n\ln^{n-1} x}{x} \, dx \) and \( v = x \), so that

\[
\int \ln^n x \, dx = x \ln^n x - n \int \ln^{n-1} x \, dx.
\]

7.2.48

\[
\int x^2 e^{3x} \, dx = \frac{x^2 e^{3x}}{3} - \frac{2}{3} \int xe^{3x} \, dx
\]

\[
= \frac{x^2 e^{3x}}{3} - \frac{2}{3} \left( \frac{xe^{3x}}{3} - \frac{1}{3} \int e^{3x} \, dx \right)
\]

\[
= \frac{1}{3} \left( x^2 e^{3x} - \frac{2}{3} xe^{3x} + \frac{2}{9} e^{3x} \right) + C
\]

\[
= \frac{e^{3x}}{9} \left( x^2 - \frac{2}{3} x + \frac{2}{9} \right) + C.
\]

7.2.49

\[
\int x^2 \cos 5x \, dx = \frac{x^2 \sin 5x}{5} - \frac{2}{5} \int x \sin 5x \, dx
\]

\[
= \frac{x^2 \sin 5x}{5} - \frac{2}{5} \left( -\frac{x \cos 5x}{5} + \frac{1}{5} \int \cos 5x \, dx \right)
\]

\[
= \frac{1}{5} \left( x^2 \sin 5x + \frac{2}{5} x \cos 5x - \frac{2}{25} \sin 5x \right) + C.
\]
7.2.50
\[ \int x^3 \sin x \, dx = -x^3 \cos x + 3 \int x^2 \cos x \, dx \]
\[ = -x^3 \cos x + 3 \left( x^2 \sin x - 2 \int x \sin x \, dx \right) \]
\[ = -x^3 \cos x + 3x^2 \sin x - 6 \left( -x \cos x + \int \cos x \, dx \right) \]
\[ = -x^3 \cos x + 3x^2 \sin x + 6x \cos x - 6 \sin x + C. \]

7.2.51
\[ \int \ln^4 x \, dx = x \ln^4 x - 4 \int \ln^3 x \, dx \]
\[ = x \ln^4 x - 4 \left( x \ln^3 x - 3 \int \ln^2 x \, dx \right) \]
\[ = x \ln^4 x - 4x \ln^3 x + 12 \left( x \ln^2 x - 2 \int \ln x \, dx \right) \]
\[ = x \ln^4 x - 4x \ln^3 x + 12x \ln^2 x - 24 (x \ln x - x) + C. \]

7.2.52 Let \( u = \sin x \) so that \( du = \cos x \, dx \). Then
\[ \int \cos x \ln(\sin x) \, dx = \int \ln u \, du = u \ln u - u + C = x \ln(\sin x) - x + C. \]

7.2.53 Let \( u = \tan x + 2 \), so that \( du = \sec^2 x \, dx \). The
\[ \int \sec^2 x \ln(\tan x + 2) \, dx = \int \ln u \, du = u \ln u - u + C = (\tan x + 2) \ln(\tan x + 2) - \tan x + C. \]

7.2.54
a. Let \( u = x^2 \), so that \( du = 2x \, dx \). Then
\[ \int x \ln x^2 \, dx = \frac{1}{2} \int \ln u \, du = \frac{1}{2} \left( u \ln u - u \right) + C = \frac{1}{2} \left( x^2 \ln x^2 - x^2 \right) + C. \]
b. Let \( u = \ln x \) and \( dv = x \, dx \). Then \( du = \frac{1}{x} \, dx \) and \( v = \frac{x^2}{2} \). Then
\[ \int x \ln x^2 \, dx = 2 \int x \ln x \, dx = 2 \left( \frac{x^2}{2} \ln x - \frac{1}{2} \int x \, dx \right) = x^2 \ln x - \frac{x^2}{2} + C. \]
c. The answer to the first part is \( \frac{1}{2} \left( x^2 \ln x^2 - x^2 \right) + C = x^2 \ln x - \frac{x^2}{2} + C \), which is the answer to the second part.

7.2.55 Using the change of base formula, we have
\[ \int \log_b x \, dx = \int \frac{\ln x}{\ln b} \, dx = \frac{1}{\ln b} \left( x \ln x - x \right) + C. \]

7.2.56 By parts: Let \( u = \sin x \) and \( dv = \cos x \, dx \), so that \( du = \cos x \, dx \) and \( v = \sin x \). Then
\[ \int \sin x \cos x \, dx = \sin^2 x - \int \sin x \cos x \, dx, \]
so \( \int \sin x \cos x \, dx = \frac{\sin^2 x}{2} + C \). Using substitution, let \( u = \sin x \), so that \( du = \cos x \, dx \). Then we have
\[ \int \sin x \cos x \, dx = \int u \, du = \frac{u^2}{2} + C = \frac{\sin^2 x}{2} + C. \]

The two answers are the same.

Copyright © 2014 Pearson Education, Inc.
7.2.57 Let \( z = \sqrt{x} \), so that \( dz = \frac{1}{2\sqrt{x}} \, dx \). Substituting yields \( 2 \int \frac{\sqrt{x} \cos \sqrt{x}}{2\sqrt{x}} \, dx = 2 \int z \cos zdz \). Now let \( u = z \) and \( dv = \cos zdz \). Then \( du = dz \) and \( v = \sin z \). Then by Integration by Parts, we have \( 2 \int z \cos zdz = 2 \left( z \sin z - \int \sin zdz \right) = 2z \sin z + 2 \cos z + C \). Thus, the original given integral is equal to \( 2(\sqrt{x} \sin \sqrt{x} + \cos \sqrt{x}) + C \).

7.2.58 Let \( z = \sqrt{x} \), so that \( dz = \frac{1}{2\sqrt{x}} \, dx \). Substituting yields \( \int_0^{\pi/2} \sin zdz = 2 \int_0^{\pi/2} z \sin zdz \). Now let \( u = z \) and \( dv = \sin zdz \). Then \( du = dz \) and \( v = -\cos z \). Then by Integration by Parts, we have \( 2 \int_0^{\pi/2} z \sin zdz = 2(-\cos z) \bigg|_0^{\pi/2} + 2 \int_0^{\pi/2} \cos z = 0 + 2 \sin z \bigg|_0^{\pi/2} = 2 \).

7.2.59 By the Fundamental Theorem, \( f'(x) = \sqrt{\ln^2 x - 1} \). So the arc length is

\[
\int_0^e \sqrt{1 + (f'(x))^2} \, dx = \int_0^e \ln x \, dx = (x \ln x - x)|_e^3 = 3e^3 - e^3 - (e - e) = 2e^3.
\]

7.2.60

a. This is given by \( \int_0^4 xe^{-x} \, dx \). Let \( u = x \) and \( dv = e^{-x} \, dx \). Then \( du = dx \) and \( v = -e^{-x} \) and thus

\[
\int_0^4 xe^{-x} \, dx = -xe^{-x} \bigg|_0^4 + \int_0^4 e^{-x} \, dx = -4 \frac{1}{e^4} + (-e^{-x}) \bigg|_0^4 = -4 \frac{1}{e^4} - \frac{1}{e^4} + 1 = 1 - \frac{5}{e^4}.
\]

b. This is given by \( \int_0^4 xe^{-ax} \, dx \). Let \( u = x \) and \( dv = e^{-ax} \, dx \). Then \( du = dx \) and \( v = -\frac{1}{a} e^{-ax} \), and thus

\[
\int_0^4 xe^{-ax} \, dx = -\frac{1}{a} xe^{-ax} \bigg|_0^4 + \frac{1}{a} \int_0^4 e^{-ax} \, dx \\
= -\frac{4}{ae^{4a}} + \left(-\frac{1}{a^2} e^{-ax}\right) \bigg|_0^4 \\
= -\frac{4}{ae^{4a}} - \frac{1}{a^2} \cdot \left(\frac{1}{e^{4a}} - 1\right) \\
= \frac{1}{a^2} \left(1 - \frac{4a + 1}{e^{4a}}\right).
\]

c. This is given by \( \int_0^b xe^{-ax} \, dx \). Let \( u = x \) and \( dv = e^{-ax} \, dx \). Then \( du = dx \) and \( v = -\frac{1}{a} e^{-ax} \), and thus

\[
\int_0^b xe^{-ax} \, dx = -\frac{1}{a} xe^{-ax} \bigg|_0^b + \frac{1}{a} \int_0^b e^{-ax} \, dx \\
= -\frac{b}{ae^{ba}} + \left(-\frac{1}{a^2} e^{-ax}\right) \bigg|_0^b \\
= -\frac{b}{ae^{ba}} - \frac{1}{a^2} \cdot \left(\frac{1}{e^{ba}} - 1\right) \\
= \frac{1}{a^2} \left(1 - \frac{ba + 1}{e^{ba}}\right).
\]

d. \( A(1, \ln b) = 1 - \frac{\ln b + 1}{e^{\ln b}} = 1 - \frac{\ln b + 1}{b} \),

\( A(2, \ln \frac{b}{2}) = \frac{1}{4} \left(1 - \frac{\ln b + 1}{e^{\ln b}}\right) = \frac{1}{4} \left(1 - \frac{\ln b + 1}{b}\right) = \frac{1}{4} A(1, \ln b) \). So \( A(1, \ln b) = 4A(2, \ln \frac{b}{2}) \).

Copyright © 2014 Pearson Education, Inc.
e. Yes. \( A(a, \ln b) = \frac{1}{a^2} (1 - \frac{\ln b + 1}{a}) = \frac{1}{a^2} (1 - \frac{\ln b + 1}{a}) = \frac{1}{a^2} A(1, \ln b) \). So \( A(1, \ln b) = a^2 A(a, \ln b) \).

7.2.61 Using shells, we have \( \frac{V}{2\pi} = \int_0^{\pi/2} x \cos x \, dx \). Let \( u = x \) and \( dv = \cos x \, dx \), so that \( du = dx \) and \( v = \sin x \). We have \( \frac{V}{2\pi} = x \sin x \bigg|_0^{\pi/2} - \int_0^{\pi/2} \sin x \, dx = \frac{\pi}{2} - 1 \). Thus, \( V = \pi (\pi - 2) \).

7.2.62 We are looking to compute
\[ \int_0^{1/2} (\sin^{-1} x - \sin x) \, dx = \int_0^{1/2} \sin^{-1} x \, dx - \int_0^{1/2} \sin x \, dx = \frac{\cos 1}{2} - \int_0^{1/2} \frac{x}{\sqrt{1 - x^2}} \, dx \]
Integrate by parts with \( u = \sin^{-1} x \) and \( dv = dx \). Then \( du = \frac{1}{\sqrt{1-x^2}} \, dx \) and \( v = x \), giving
\[ \cos \frac{1}{2} - 1 + \int_0^{1/2} \sin^{-1} x \, dx = \cos \frac{1}{2} - 1 + (x \sin^{-1} x) \bigg|_0^{1/2} - \int_0^{1/2} \frac{x}{\sqrt{1 - x^2}} \, dx \]
\[ = \cos \frac{1}{2} - 1 + \frac{\pi}{12} - \int_0^{1/2} \frac{x}{\sqrt{1 - x^2}} \, dx \]
Now perform the ordinary substitution \( u = 1 - x^2 \), so that \( du = -2x \, dx \). Then \( x = 0 \) corresponds to \( u = 1 \) and \( x = \frac{1}{2} \) to \( u = \frac{1}{4} \), giving
\[ \cos \frac{1}{2} - 1 + \frac{\pi}{12} - \int_0^{1/2} \frac{x}{\sqrt{1 - x^2}} \, dx = \cos \frac{1}{2} - 1 + \frac{\pi}{12} + \frac{1}{2} \int_1^{3/4} u^{-1/2} \, du \]
\[ = \cos \frac{1}{2} - 1 + \frac{\pi}{12} + \frac{1}{2} \left( 2u^{1/2} \right) \bigg|_1^{3/4} \]
\[ = \cos \frac{1}{2} - 1 + \frac{\pi}{12} + \sqrt{3} - 1 \]
\[ = \cos \frac{1}{2} + \frac{\pi}{12} + \frac{\sqrt{3}}{2} - 2. \]

7.2.63 Let \( V_1 \) be the volume generated when \( R \) is revolved about the \( x \)-axis, and \( V_2 \) the volume generated when \( R \) is revolved about the \( y \)-axis.

Using disks, we have
\[ V_1 = \pi \int_0^\pi \sin^2 x \, dx = \frac{\pi}{2} \int_0^\pi (1 - \cos 2x) \, dx = \frac{\pi}{2} \left( \pi - \frac{1}{2} \int_0^\pi 2 \cos 2x \, dx \right) = \frac{\pi}{2} \left( \pi - \frac{1}{2} \int_0^{2\pi} \cos u \, du \right) = \frac{\pi^2}{2}, \]
using the substitution \( u = 2x \). Using shells to compute \( V_2 \), we have \( V_2 = 2\pi \int_0^\pi x \sin x \, dx \). Letting \( u = x \) and \( dv = \sin x \, dx \), we have \( du = dx \) and \( v = -\cos x \). It follows that
\[ V_2 = 2\pi (-x \cos x) \bigg|_0^\pi + 2\pi \int_0^\pi \cos x \, dx = 2\pi^2 + 2\pi \sin x \bigg|_0^\pi = 2\pi^2, \]
so that \( V_2 > V_1 \).

7.2.64 Suppose \( m \neq -1 \) and let \( u = \ln x \) and \( dv = x^m \, dx \). Then \( du = \frac{1}{x} \, dx \) and \( v = \frac{x^{m+1}}{m+1} \). Then
\[ \int x^m \ln x \, dx = \frac{x^{m+1}}{m+1} \ln x - \frac{1}{m+1} \int x^m \, dx = \frac{x^{m+1}}{m+1} \left( \ln x - \frac{1}{m+1} \right) + C. \]
For the case \( m = -1 \) we are computing \( \int \frac{1}{x} \ln x \, dx \), so letting \( u = \ln x \) so that \( du = \frac{1}{x} \, dx \) yields

\[
\int u \, du = \frac{u^2}{2} + C = \frac{\ln^2 x}{2} + C.
\]

7.2.65

a. Let \( u = x \) and \( dv = f'(x) \, dx \). Then \( du = dx \) and \( v = f(x) \). So \( \int xf'(x) \, dx = xf(x) - \int f(x) \, dx \).

b. Letting \( f'(x) = e^{3x} \) we have \( \int xe^{3x} \, dx = \frac{1}{3} xe^{3x} - \frac{1}{9} e^{3x} + C = \frac{1}{9} e^{3x} (3x - 1) + C \).

7.2.66

a. Use the substitution \( y = f^{-1}(x) \) in the integral \( \int f^{-1}(x) \, dx \). Then \( x = f(y) \), so that \( dx = f'(y) \, dy \), and making the substitution gives

\[
\int f^{-1}(x) \, dx = \int yf'(y) \, dy
\]
as desired.

b. From part (a), \( \int f^{-1}(x) \, dx = \int yf'(y) \, dy \). Then Exercise 65(a) tells us that the latter integral is equal to \( yf(y) - \int f(y) \, dy \).

c. \( \int \ln x \, dx = x \ln x - \int e^y \, dy = x \ln x - e^y + C = x \ln x - x + C \).

d. \( \int \sin^{-1} x \, dx = x \sin^{-1} x - \int \sin y \, dy = x \sin^{-1} x + \cos y + C = x \sin^{-1} x + \sqrt{1 - x^2} + C \).

e. \( \int \tan^{-1} x \, dx = x \tan^{-1} x - \int \tan y \, dy = x \tan^{-1} x + \ln |\cos y| + C = x \tan^{-1} x + \ln \frac{1}{\sqrt{1 + x^2}} + C = x \tan^{-1} x - \frac{1}{2} \ln(1 + x^2) + C \).

7.2.67 Let \( u = \sec x \) and \( dv = \sec^2 x \, dx \), so that \( du = \sec x \tan x \, dx \) and \( v = \tan x \). Then

\[
\int \sec^3 x \, dx = \sec x \tan x - \int \sec x \tan^2 x \, dx
= \sec x \tan x - \int \sec x (\sec^2 x - 1) \, dx
= \sec x \tan x - \int \sec^3 x \, dx + \int \sec x \, dx.
\]
Collect the two integrals of \( \sec^3 x \) together, giving \( 2 \int \sec^3 x \, dx = \sec x \tan x + \int \sec x \, dx \), so that finally

\[
\int \sec^3 x \, dx = \frac{1}{2} \sec x \tan x + \frac{1}{2} \int \sec x \, dx.
\]

7.2.68 Let \( u = \sin bx \) and \( dv = e^{ax} \, dx \) so that \( du = b \cos bx \, dx \) and \( v = \frac{e^{ax}}{a} \). Then

\[
\int e^{ax} \sin bx \, dx = \frac{e^{ax}}{a} \sin bx - \frac{b}{a} \int e^{ax} \cos bx \, dx.
\]

Similarly,

\[
\int e^{ax} \cos bx \, dx = \frac{e^{ax}}{a} \cos bx + \frac{b}{a} \int e^{ax} \sin bx \, dx.
\]
Putting these together yields
\[
\int e^{ax} \sin bx \, dx = \frac{e^{ax}}{a} \sin bx - \frac{b}{a} \left( \frac{e^{ax}}{a} \cos bx + \frac{b}{a} \int e^{ax} \sin bx \, dx \right).
\]

Multiplying through by \(a^2\) and combining like terms yields
\[
(a^2 + b^2) \int e^{ax} \sin bx \, dx = e^{ax} (a \sin bx - b \cos bx) + C,
\]
so \( \int e^{ax} \sin bx \, dx = \frac{e^{ax}}{a^2 + b^2} (a \sin bx - b \cos bx) + C \) as desired.

For the second integral, let \(u = \cos bx\) and \(dv = e^{ax}\), so that \(du = -b \sin bx\) and \(v = \frac{e^{ax}}{a}\). Then
\[
\int e^{ax} \cos bx \, dx = \frac{e^{ax}}{a} \cos bx + \frac{b}{a} \int e^{ax} \sin bx \, dx
\]
\[
= \frac{e^{ax}}{a} \cos bx + \frac{b}{a} \left( \frac{e^{ax}}{a^2 + b^2} (a \sin bx - b \cos bx) \right) + C
\]
\[
= \frac{e^{ax}}{a} \cdot \left( a^2 + b^2 \right) \cos bx - b(a \sin bx - b \cos bx) + C
\]
\[
= \frac{e^{ax}}{a^2 + b^2} + C.
\]

7.2.69

a.

We have \(s(t) = 0\) when \(\sin t = 0\), which occurs for \(t = k\pi\), where \(k\) is an integer.

b. This is given by \(\frac{1}{\pi} \int_0^\pi e^{-t} \sin t \, dt\). Using the previous problem, this is equal to
\[
\frac{1}{\pi} \left. e^{-t} \cdot \frac{-\sin t - \cos t}{2} \right|_0^\pi = \frac{1}{2\pi} \left( e^{-\pi} + 1 \right).
\]
7.2. INTEGRATION BY PARTS

685

c. This is given by \( \frac{1}{\pi} \int_{n\pi}^{(n+1)\pi} e^{-t} \sin t \, dt \). Using part (b), this is equal to

\[
\frac{1}{\pi} e^{-t} \left. - \sin t - \cos t \right|_{n\pi}^{(n+1)\pi} = \frac{1}{2\pi} \left( e^{-(n+1)\pi} (-\sin(n+1)\pi - \cos(n+1)\pi) - e^{-n\pi} (-\sin(n\pi) - \cos(n\pi)) \right)
\]

\[
= \frac{1}{2\pi} \left( -e^{-(n+1)\pi} \cos(n+1)\pi + e^{-n\pi} \cos(n\pi) \right)
\]

\[
= \frac{e^{-n\pi}}{2\pi} \left( \cos(n\pi) - e^{-\pi} \cos(n+1)\pi \right)
\]

\[
= \frac{e^{-n\pi}}{2\pi} \left( (-1)^n - e^{-\pi}(-1)^{n+1} \right)
\]

\[
= (-1)^n \frac{e^{-n\pi}}{2\pi} \left( 1 + e^{-\pi} \right).
\]

d. Each \( a_i \) is \( e^{-\pi} \) times \( a_{i-1} \).

7.2.70 The fallacy comes from thinking that \( \int \frac{dx}{x} \) represents a unique quantity, as opposed to a family of functions which differ by a constant. When we subtract this quantity from both sides, we should write the arbitrary constant, giving \( 0 + C_1 = 1 + C_2 \), which is a valid statement.

7.2.71

a. If \( n = 1 \), then \( p_1 \) is a linear polynomial, so that its derivative \( p'_1 \) is a constant. Then using integration by parts with \( u = p_1(x) \) and \( v = f(x) \, dx \), so that \( du = p'_1(x) \, dx \) (a constant times \( dx \)) and \( v = F_1(x) \), we get

\[
\int p_1(x) f(x) \, dx = p_1 F_1 - \int p'_1(x) F_1(x) \, dx = p_1 F_1 - p'_1 \int F_1(x) \, dx = p_1 F_1 - p'_1 F_2.
\]

We need only use integration by parts once since \( p'_1 \) is a constant and we know how to integrate a constant times \( F_k \).

b. If \( n = 2 \), then \( p_2 \) is a quadratic, so that \( p'_2 \) is linear. Then using integration by parts with \( u = p_2(x) \) and \( v = f(x) \, dx \), so that \( du = p'_2(x) \, dx \) and \( v = F_1(x) \), we get

\[
\int p_2(x) f(x) \, dx = p_2 F_1 - \int p'_2(x) F_1(x) \, dx.
\]

Now use part (a) with \( p'_2 \) (which is linear) taking the place of \( p_1 \), and \( F_1 \) taking the place of \( f \). We get

\[
p_2 F_1 - \int p'_2(x) F_1(x) \, dx = p_2 F_1 - (p'_2 F_2 - p''_2 F_3) = p_2 F_1 - p'_2 F_2 + p''_2 F_3.
\]

Here two integrations by parts are required essentially for the same reason as in part (a) — because \( p''_2(x) \) is a constant.

c. With \( p_2(x) = 2x^2 - 3x + 1 \) and \( f(x) = e^{2x} \), we have the following table:

<table>
<thead>
<tr>
<th>( k )</th>
<th>( p^{(k)}_2 )</th>
<th>( F_{k+1}^{(k)} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>2x² - 3x + 1</td>
<td>( \frac{1}{2} e^{2x} )</td>
</tr>
<tr>
<td>1</td>
<td>4x - 3</td>
<td>( \frac{1}{3} e^{2x} )</td>
</tr>
<tr>
<td>2</td>
<td>4</td>
<td>( \frac{1}{8} e^{2x} )</td>

So from part (b), we have
\[
\int p_2(x)f(x)\,dx = p_2F_1 - p_2'F_2 + p_2''F_3 \\
= \frac{1}{2}(2x^2 - 3x + 1)e^{2x} - \frac{1}{4}(4x - 3)e^{2x} + \frac{1}{2}e^{2x} \\
= \frac{1}{4}(4x^2 - 10x + 7)e^{2x}.
\]

d. From parts (a) and (b) we see that the formula holds when \( k = 1 \) or \( k = 2 \). Suppose that it holds the case for \( k = n - 1 \). Then for \( k = n \), use integration by parts with \( u = p_n(x) \) and \( dv = f(x)\,dx \); then \( du = p_{n-1}(x)\,dx \), which is a polynomial of degree \( n - 1 \), and \( v = F_1(x) \), so that, using the inductive hypothesis,
\[
\int p_n(x)f(x)\,dx = p_nF_1 - \int p_{n-1}(x)F_1(x)\,dx \\
= p_nF_1 - \left(p_{n-1}F_2 - p''_{n-1}F_3 + \cdots + (-1)^{n-1}p^{(n-1)}_{n-1}F_{n+1}\right) \\
= p_nF_1 - \left(p_n'F_2 - p''_nF_3 + \cdots + (-1)^{n-1}p^{(n)}_nF_{n+1}\right) \\
= p_nF_1 - p_n'F_2 + p''_nF_3 - \cdots + (-1)^np^{(n)}_nF_{n+1}.
\]

7.2.72 Let \( u = f(x) \) and \( dv = f'(x)\,dx \). Then \( du = f'(x)\,dx \) and \( v = f(x) \). We have
\[
\int_a^b f(x)f'(x)\,dx = f(x)^2\bigg|_a^b - \int_a^b f(x)f'(x)\,dx.
\]
Thus,
\[
2 \int_a^b f(x)f'(x)\,dx = f(x)^2\bigg|_a^b, \quad \text{so} \quad \int_a^b f(x)f'(x)\,dx = \frac{1}{2}f(x)^2\bigg|_a^b = \frac{1}{2}(f(b)^2 - f(a)^2).
\]

7.2.73 Let \( u = x \) and \( dv = f''(x)\,dx \). Then \( du = dx \) and \( v = f'(x) \). We have
\[
\int_a^b xf''(x)\,dx = xf'(x)\bigg|_a^b - \int_a^b f'(x)\,dx = (0 - 0) - f(x)_{|_a^b} = -(f(b) - f(a)) = f(a) - f(b).
\]

7.2.74 Let \( u = g(x) \) and \( dv = f''(x)\,dx \). Then \( du = g'(x)\,dx \) and \( v = f'(x) \). Then
\[
\int_0^1 f''(x)g(x)\,dx = f'(x)g(x)\bigg|_0^1 - \int_0^1 f'(x)g'(x)\,dx = -\int_0^1 f'(x)\,g'(x)\,dx.
\]
Now let \( u = g'(x) \) and \( dv = f'(x)\,dx \). Then \( du = g''(x)\,dx \) and \( v = f(x) \). Then
\[
\int_0^1 f'(x)g'(x)\,dx = f(x)g'(x)\bigg|_0^1 - \int_0^1 f(x)g''(x)\,dx = -\int_0^1 f(x)\,g''(x)\,dx.
\]
Thus,
\[
\int_0^1 f''(x)g(x)\,dx = \int_0^1 f(x)g''(x)\,dx.
\]

7.2.75
\begin{enumerate}
\item To compute \( I_1 \), we let \( u = -x^2 \), so that \( du = -2x\,dx \). Then an ordinary substitution yields
\[
-\frac{1}{2} \int e^u\,du = -\frac{1}{2}e^u + C = -\frac{1}{2}e^{-x^2} + C.
\]
\item To compute \( I_3 \), we let \( u = x^2 \) and \( dv = xe^{-x^2}\,dx \), so that \( du = 2x\,dx \) and \( v = -\frac{1}{2}e^{-x^2} \) (by part (a)). Then
\[
I_3 = -\frac{1}{2}2e^{-x^2} + \int xe^{-x^2}\,dx = -\frac{1}{2}2xe^{-x^2} - \frac{1}{2}e^{-x^2} + C = -\frac{1}{2}e^{-x^2}(x^2 + 1) + C.
\]
\end{enumerate}
7.2. INTEGRATION BY PARTS

To compute $I_5$, we let $u = x^4$ and $dv = e^{-x^2} \, dx$. Then $du = 4x^3 \, dx$ and $v = -\frac{1}{2} e^{-x^2}$. Then

$$I_5 = -\frac{1}{2} x^4 e^{-x^2} + 2 \int x^3 e^{-x^2} \, dx = -\frac{1}{2} x^4 e^{-x^2} + 2 I_3 = -\frac{1}{2} e^{-x^2} (x^4 + 2x^2 + 2).$$

d. Suppose that $n$ is odd and that it is true that $I_n = -\frac{1}{2} e^{-x^2} p_{n-1}(x)$ where $p_{n-1}(x)$ is an even polynomial of degree $n - 1$. We will show that $I_{n+2}$ also has this property, so the result will follow by induction. Let $u = x^{n+1}$ and let $dv = e^{-x^2} \, dx$, so that $du = (n+1) x^n \, dx$ and $v = -\frac{1}{2} e^{-x^2}$. Then

$$I_{n+2} = -\frac{1}{2} x^{n+1} e^{-x^2} + \frac{n+1}{2} I_n = -\frac{1}{2} e^{-x^2} (x^{n+1} + \frac{n+1}{2} p_{n-1}(x)) + C = -\frac{1}{2} e^{-x^2} p_{n+1}(x) + C.$$

Note that if $p_{n-1}(x)$ is an even polynomial of degree $n - 1$ then $\frac{n+1}{2} p_{n-1}(x) + x^{n+1}$ is an even polynomial of degree $n + 1$.

e. Using a technique similar to that above, we also get $I_2 = -\frac{1}{2} x e^{-x^2} + \frac{1}{2} I_0$. Now if $I_2$ were expressible in terms of elementary functions, then $I_0$ would be as well, but we are given that it isn’t. Similarly, we can express $I_{2k}$ in terms of $I_{2k-2}$ using Integration by Parts, and if any of these were expressible in terms of elementary functions, then the even numbered one below it would be. So the inability to express $I_0$ that way implies the inability to express $I_2$ that way, which implies the inability to express $I_4$ that way, and so on.

7.2.76

a. Let $u = f’(t)$ and $dv = dt$. Then $du = f''(t) \, dt$. We are free to choose any antiderivative for $dv$ with respect to $t$, so we choose $v = t - x$. Then we have

$$f(x) = f(0) + \int_0^x f’(t) \, dt = f(0) + (t - x) f’(t) \bigg|_0^x - \int_0^x (t - x) f''(t) \, dt$$

$$= f(0) + x f’(0) + \int_0^x f’’(t)(x - t) \, dt.$$

b. Using integration by parts again, we let $u = f’’(t)$ and $dv = (x - t) \, dt$, so that $du = f’’’(t) \, dt$ and $v = -\frac{(x-t)^2}{2}$. We then have

$$f(x) = f(0) + x f’(0) + \int_0^x f’’(t)(x - t) \, dt$$

$$= f(0) + x f’(0) - \frac{(x-t)^2}{2} f’’(t) \bigg|_0^x + \frac{1}{2} \int_0^x f’’’(t)(x - t)^2 \, dt$$

$$= f(0) + x f’(0) + \frac{1}{2} x^2 f’’(0) + \frac{1}{2} \int_0^x f’’’(t)(x - t)^2 \, dt.$$
7.3 Partial Fractions

7.3.1 Proper rational functions can be integrated using partial fraction decomposition.

7.3.2 Since \( x^2 - 3x - 18 = (x - 6)(x + 3) \), the partial fraction decomposition is

\[
\frac{x - 2}{x^2 - 3x - 18} = \frac{A}{x - 6} + \frac{B}{x + 3}.
\]

7.3.3 Since \( x^3 + 5x^2 + 6x = x(x^2 + 5x + 6) = x(x + 2)(x + 3) \), the partial fraction decomposition will be of the form

\[
\frac{A}{x} + \frac{B}{x + 2} + \frac{C}{x + 3}.
\]

7.3.4 The first step is to divide the numerator by the denominator via long division in order to write the quotient as the sum of a polynomial and a proper rational function. Thus we would write

\[
\frac{x^2 + 2x - 3}{x + 1} = x + 1 - \frac{4}{x + 1}.
\]

7.3.5 Start with \( \frac{2}{x^2 - 2x - 8} = \frac{2}{(x - 4)(x + 2)} = \frac{A}{x - 4} + \frac{B}{x + 2} \). Thus, \( 2 = A(x + 2) + B(x - 4) \). Equating coefficients gives \( A + B = 0 \) and \( 2A - 4B = 2 \). Solving this system yields \( A = \frac{1}{3} \) and \( B = -\frac{1}{3} \). So

\[
\frac{2}{x^2 - 2x - 8} = \frac{1/3}{x - 4} - \frac{1/3}{x + 2}.
\]

7.3.6 Start with \( \frac{x - 9}{x^2 - 3x - 18} = \frac{x - 9}{(x - 6)(x + 3)} = \frac{A}{x - 6} + \frac{B}{x + 3} \). Thus, \( x - 9 = A(x + 3) + B(x - 6) \). Equating coefficients gives \( A + B = 1 \) and \( 3A - 6B = -9 \). Solving this system yields \( A = \frac{1}{7} \), \( B = \frac{4}{7} \). So

\[
\frac{x - 9}{x^2 - 3x - 18} = -\frac{1/3}{x - 6} + \frac{4/3}{x + 3}.
\]

7.3.7 Start with \( \frac{5x - 7}{x^2 - 3x + 2} = \frac{5x - 7}{(x - 1)(x - 2)} = \frac{A}{x - 1} + \frac{B}{x - 2} \). Thus, \( A(x - 2) + B(x - 1) = 5x - 7 \). Equating coefficients gives \( A + B = 5 \) and \( -2A - B = -7 \). Solving this system yields \( A = 2 \), \( B = 3 \). So

\[
\frac{5x - 7}{x^2 - 3x + 2} = \frac{2}{x - 1} + \frac{3}{x - 2}.
\]

7.3.8 Start with \( \frac{11x - 10}{x(x - 1)} = \frac{A}{x} + \frac{B}{x - 1} \). Thus \( A(x - 1) + Bx = 11x - 10 \). Equating coefficients gives \( A + B = 11 \), \( -A = -10 \). Solving this system yields \( A = 10 \), \( B = 1 \). So

\[
\frac{11x - 10}{x^2 - x} = \frac{10}{x} + \frac{1}{x - 1}.
\]

7.3.9 Start with \( \frac{x^2}{x^3 - 16x} = \frac{x}{(x - 4)(x + 4)} = \frac{A}{x - 4} + \frac{B}{x + 4} \). Thus \( x = A(x + 4) + B(x - 4) \). Equating coefficients gives \( A + B = 1 \), \( 4A - 4B = 0 \). Solving this system yields \( A = B = \frac{1}{2} \). So

\[
\frac{x^2}{x^3 - 16x} = \frac{1/2}{x - 4} + \frac{1/2}{x + 4}.
\]

7.3.10 Start with \( \frac{x^2 - 3x}{x^3 - 3x^2 - 4x} = \frac{x - 3}{x^2 - 3x - 4} = \frac{x - 3}{(x - 4)(x + 1)} = \frac{A}{x - 4} + \frac{B}{x + 1} \). Thus \( x - 3 = A(x + 1) + B(x - 4) \). Letting \( x = -1 \) yields \( B = \frac{4}{5} \), and letting \( x = 4 \) yields \( A = \frac{1}{5} \). So

\[
\frac{x^2 - 3x}{x^3 - 3x^2 - 4x} = \frac{1/5}{x - 4} + \frac{4/5}{x + 1}.
\]

Copyright © 2014 Pearson Education, Inc.
7.3.11 Start with
\[ \frac{x + 2}{x^3 - 3x^2 + 2x} = \frac{x + 2}{x(x - 1)(x - 2)} = \frac{A}{x - 1} + \frac{B}{x} + \frac{C}{x - 2}. \]
Thus \( x + 2 = Ax(x - 2) + B(x - 1)(x - 2) + Cx(x - 1) \). Letting \( x = 1 \) gives \( A = -3 \), letting \( x = 0 \) gives \( B = 1 \), and letting \( x = 2 \) gives \( C = 2 \). Therefore
\[ \frac{x + 2}{x^3 - 3x^2 + 2x} = -\frac{3}{x - 1} + \frac{1}{x} + \frac{2}{x - 2}. \]

7.3.12 Start with
\[ \frac{x^2 - 4x + 11}{(x - 3)(x - 1)(x + 1)} = \frac{A}{x - 3} + \frac{B}{x - 1} + \frac{C}{x + 1}. \] Thus
\[ x^2 - 4x + 11 = A(x - 1)(x + 1) + B(x - 3)(x + 1) + C(x - 3)(x - 1). \]
Letting \( x = 1 \) gives \( B = -2 \), letting \( x = -1 \) gives \( C = 2 \), and letting \( x = 3 \) gives \( A = 1 \). Thus,
\[ \frac{x^2 - 4x + 11}{(x - 3)(x - 1)(x + 1)} = \frac{1}{x - 3} - \frac{2}{x - 1} + \frac{2}{x + 1}. \]

7.3.13 If we write \( \frac{3}{(x - 1)(x + 2)} = \frac{A}{x - 1} + \frac{B}{x + 2} \), we have \( 3 = A(x + 2) + B(x - 1) \). Letting \( x = -2 \) yields \( B = -1 \) and letting \( x = 1 \) yields \( A = 1 \). Thus, the original integral is equal to
\[ \int \left( \frac{1}{x - 1} - \frac{1}{x + 2} \right) dx = \ln |x - 1| - \ln |x + 2| + C = \ln \frac{x - 1}{x + 2} + C. \]

7.3.14 If we write \( \frac{8}{(x - 2)(x + 6)} = \frac{A}{x - 2} + \frac{B}{x + 6} \), we have \( 8 = A(x + 6) + B(x - 2) \). Letting \( x = -6 \) yields \( B = -1 \) and letting \( x = 2 \) yields \( A = 1 \). Thus the original integral is equal to
\[ \int \left( \frac{1}{x - 2} - \frac{1}{x + 6} \right) dx = \ln |x - 2| - \ln |x + 6| + C. \]

7.3.15 If we write \( \frac{6}{x^2 - 1} = \frac{6}{(x - 1)(x + 1)} = \frac{A}{x - 1} + \frac{B}{x + 1} \), then we have \( 6 = A(x + 1) + B(x - 1) \). Letting \( x = -1 \) yields \( B = -3 \) and letting \( x = 1 \) yields \( A = 3 \). Thus, the original integral is equal to
\[ \int \left( \frac{3}{x - 1} - \frac{3}{x + 1} \right) dx = 3 \ln |x - 1| - 3 \ln |x + 1| + C = 3 \ln \frac{x - 1}{x + 1} + C. \]

7.3.16 If we write \( \frac{1}{t^2 - 9} = \frac{A}{t - 3} + \frac{B}{t + 3} \), then we have \( 1 = A(t + 3) + B(t - 3) \). Letting \( t = -3 \) yields \( B = -\frac{1}{6} \) and letting \( t = 3 \) yields \( A = \frac{1}{6} \). Thus the original integral is equal to
\[ \int \left( \frac{1/6}{t - 3} - \frac{1/6}{t + 3} \right) dt = \frac{1}{6} \ln |t - 3| - \ln |t + 3| + C = \frac{1}{6} \ln \frac{t - 3}{t + 3} + C. \]

7.3.17 If we write \( \frac{5x}{x^2 - x - 6} = \frac{A}{x - 3} + \frac{B}{x + 2} \), then we have \( 5x = A(x + 2) + B(x - 3) \). Letting \( x = -2 \) yields \( B = 2 \) and letting \( x = 3 \) yields \( A = 3 \). Thus the original integral is equal to
\[ \int \left( \frac{3}{x - 3} + \frac{2}{x + 2} \right) dx \]
\[ = 3 \ln |x - 3| + 2 \ln |x + 2| + C \]
\[ = \ln |(x - 3)^3(x + 2)^2| + C. \]

7.3.18 If we write
\[ \frac{21x^2}{x^3 - x^2 - 12x} = \frac{21x}{(x - 4)(x + 3)} = \frac{A}{x - 4} + \frac{B}{x + 3}, \]
then we have \( 21x = A(x + 3) + B(x - 4) \). Letting \( x = 4 \) yields \( A = 12 \), while letting \( x = -3 \) yields \( B = 9 \). Thus, the original integral is equal to
\[ \int \left( \frac{12}{x - 4} + \frac{9}{x + 3} \right) dx = 12 \ln |x - 4| + 9 \ln |x + 3| + C \]
\[ = \ln |(x - 4)^{12}(x + 3)^9| + C. \]
7.3.19 If we write \( \frac{10x}{x^2 - 2x - 24} = \frac{10x}{(x - 6)(x + 4)} = \frac{A}{x - 6} + \frac{B}{x + 4} \), then we have \( 10x = A(x + 4) + B(x - 6) \). Letting \( x = -4 \) yields \( B = 4 \) and letting \( x = 6 \) yields \( A = 6 \). Thus the original integral is equal to
\[
\int \left( \frac{6}{x - 6} + \frac{4}{x + 4} \right) \, dx = 6 \ln |x - 6| + 4 \ln |x + 4| + C = \ln |x - 6|^6(x + 4)^4 + C.
\]

7.3.20 If we write \( \frac{y + 1}{y^3 + 3y^2 - 18y} = \frac{y + 1}{y(y + 6)(y - 3)} = \frac{A}{y} + \frac{B}{y + 6} + \frac{C}{y - 3} \), then
\[
y + 1 = A(y + 6)(y - 3) + By(y - 3) + Cy(y + 6).
\]
Letting \( y = -6 \) yields \( B = -\frac{5}{27} \). Letting \( y = 3 \) yields \( C = \frac{4}{27} \), and letting \( y = 0 \) yields \( A = -\frac{1}{18} \). Thus, the original integral is equal to
\[
\int \left( \frac{1/18}{y} - \frac{5/54}{y + 6} + \frac{4/27}{y - 3} \right) \, dy = -\frac{1}{18} \ln |y| - \frac{5}{54} \ln |y + 6| + \frac{4}{27} \ln |y - 3| + C.
\]

7.3.21 Let \( \frac{6x^2}{x^4 - 5x^2 + 4} = \frac{6x^2}{(x - 2)(x + 2)(x - 1)(x + 1)} = \frac{A}{x - 2} + \frac{B}{x + 2} + \frac{C}{x - 1} + \frac{D}{x + 1} \). Then
\[
6x^2 = A(x + 2)(x - 1)(x + 1) + B(x - 2)(x - 1)(x + 1) + C(x - 2)(x + 2)(x + 1) + D(x - 2)(x + 2)(x - 1).
\]
Letting \( x = 2 \) gives \( A = 2 \), letting \( x = -2 \) gives \( B = -2 \), letting \( x = 1 \) gives \( C = -1 \), and letting \( x = -1 \) gives \( D = 1 \). Thus, the original integral is equal to
\[
\int \left( \frac{2}{x - 2} - \frac{2}{x + 2} - \frac{1}{x - 1} + \frac{1}{x + 1} \right) \, dx = 2 \ln |x - 2| - 2 \ln |x + 2| - \ln |x - 1| + \ln |x + 1| + C
= \ln \left| \frac{(x - 2)^2(x + 1)}{(x + 2)(x - 1)} \right| + C.
\]

7.3.22 Let \( \frac{4x - 2}{x(x - 1)(x + 1)} = \frac{A}{x} + \frac{B}{x - 1} + \frac{C}{x + 1} \). Then \( 4x - 2 = A(x - 1)(x + 1) + B(x + 1) + Cx(x - 1) \). Letting \( x = 0 \) gives \( A = 2 \), letting \( x = 1 \) gives \( B = 1 \), and letting \( x = -1 \) gives \( C = -3 \). Thus, the original integral is equal to
\[
\int \left( \frac{2}{x} + \frac{1}{x - 1} - \frac{3}{x + 1} \right) \, dx = 2 \ln |x| + \ln |x - 1| - 3 \ln |x + 1| + C = \ln \left| \frac{x^2(x - 1)}{(x + 1)^3} \right| + C.
\]

7.3.23 Let \( \frac{x^2 + 12x - 4}{x(x - 2)(x + 2)} = \frac{A}{x} + \frac{B}{x - 2} + \frac{C}{x + 2} \). Then \( x^2 + 12x - 4 = A(x - 2)(x + 2) + Bx(x + 2) + Cx(x - 2) \). Letting \( x = 0 \) gives \( A = 1 \), letting \( x = 2 \) gives \( B = 3 \), and letting \( x = -2 \) gives \( C = -3 \). Thus, the original integral is equal to
\[
\int \left( \frac{1}{x} + \frac{3}{x - 2} - \frac{3}{x + 2} \right) \, dx = \ln |x| + 3 \ln |x - 2| - 3 \ln |x + 2| + C = \ln \left| \frac{(x - 2)^3(x + 2)}{x^3} \right| + C.
\]

7.3.24 Let \( \frac{x^2 + 20x - 15}{x(x + 3)(x - 1)} = \frac{A}{x} + \frac{B}{x + 3} + \frac{C}{x - 1} \). Then \( x^2 + 20x - 15 = A(x + 3)(x - 1) + Bx(x - 1) + Cx(x + 3) \). Letting \( x = 0 \) gives \( A = 3 \), letting \( x = -3 \) gives \( B = -3 \), and letting \( x = 1 \) gives \( C = 1 \). Thus, the original integral is equal to
\[
\int \left( \frac{3}{x} - \frac{3}{x + 5} + \frac{1}{x - 1} \right) \, dx = 3 \ln |x| - 3 \ln |x + 5| + \ln |x - 1| + C = \ln \left| \frac{x^3(x - 1)}{(x + 5)^3} \right| + C.
\]

7.3.25 If we write \( \frac{1}{x^3 - 10x^2 + 9} = \frac{1}{(x - 1)(x + 3)(x + 3)} = \frac{A}{x - 1} + \frac{B}{x + 3} + \frac{C}{x + 3} + \frac{D}{x + 3} \) then
\[
1 = A(x - 1)(x + 3) + B(x - 1)(x - 3)(x + 3) + C(x - 1)(x + 1)(x + 3) + D(x - 1)(x + 1)(x - 3).
\]

Copyright © 2014 Pearson Education, Inc.
Letting $x = -1$ yields $B = \frac{1}{16}$. Letting $x = 3$ yields $C = \frac{1}{32}$. Letting $x = -3$ yields $D = -\frac{1}{16}$, and letting $x = 1$ yields $A = -\frac{1}{16}$. Thus the original integral is equal to

$$
\int \left( \frac{-1/16}{x-1} + \frac{1/16}{x+1} + \frac{1/48}{x-3} - \frac{1/48}{x+3} \right) \, dx = \frac{1}{48} (-3 \ln |x-1| + 3 \ln |x+1| + \ln |x-3| - \ln |x+3|) + C
$$

$$
= \ln \left| \frac{(x+1)^3(x-3)}{(x-1)^3(x+3)} \right|^{1/48} + C.
$$

7.3.26 If we write

$$
\frac{2}{x^2-4x-32} = \frac{A}{x-8} + \frac{B}{x+4},
$$

then we have $2 = A(x+4) + B(x-8)$. Letting $x = -4$ yields $B = \frac{1}{6}$ and letting $x = 8$ yields $A = \frac{1}{6}$. Thus, the original integral is equal to

$$
\int \left( \frac{1/6}{x-8} - \frac{1/6}{x+4} \right) \, dx = \frac{1}{6} \left( \ln |x-8| - \ln |x+4| \right) + C = \frac{1}{6} \ln \left| \frac{x-8}{x+4} \right| + C.
$$

7.3.27 Using long division, we have

$$
\frac{x^2 - 5x + 10}{x-2} = x - 3 + \frac{4}{x-2},
$$

so that

$$
\int \frac{x^2 - 5x + 10}{x-2} \, dx = \int \left( x - 3 + \frac{4}{x-2} \right) \, dx = \frac{1}{2} x^2 - 3x + 4 \ln |x-2| + C.
$$

7.3.28 Using long division, we have

$$
\frac{4x^2 + 13x - 3}{x+3} = 4x + 1 - \frac{6}{x+3},
$$

so that

$$
\int \frac{4x^2 + 13x - 3}{x+3} \, dx = \int \left( 4x + 1 - \frac{6}{x+3} \right) \, dx = 2x^2 + x - 6 \ln |x+3| + C.
$$

7.3.29 Using long division, we have

$$
\frac{4x^3 + 3x^2 - 25x + 7}{x^2 + x - 6} = 4x - 1 + \frac{1}{x^2 + x - 6} = 4x - 1 + \frac{1}{(x-2)(x+3)}.
$$

To integrate, we must find the partial fraction representation of the final term. Write

$$
\frac{1}{(x-2)(x+3)} = \frac{A}{x-2} + \frac{B}{x+3},
$$

so that $1 = A(x+3) + B(x-2)$.

Setting $x = -3$ gives $B = \frac{1}{6}$; setting $x = 2$ gives $A = \frac{1}{6}$. So we have

$$
\int \frac{4x^3 + 3x^2 - 25x + 7}{x^2 + x - 6} \, dx = \int \left( 4x - 1 + \frac{1}{(x-2)(x+3)} \right) \, dx
$$

$$
= \int \left( 4x - 1 + \frac{1/5}{x-2} - \frac{1/5}{x+3} \right) \, dx
$$

$$
= 2x^2 - x + \frac{1}{5} \left( \ln |x-2| - \ln |x+3| \right) + C
$$

$$
= 2x^2 - x + \frac{1}{5} \ln \left| \frac{x-2}{x+3} \right| + C.
$$

7.3.30 Using long division, we have

$$
\frac{x^3 - 8x^2 + 11x + 21}{x^2 - 3x - 4} = x - 5 + \frac{1}{x^2 - 3x - 4} = x - 5 + \frac{1}{(x-4)(x+1)}.
$$

To integrate, we must find the partial fraction representation of the final term. Write

$$
\frac{1}{(x-4)(x+1)} = \frac{A}{x-4} + \frac{B}{x+1},
$$

so that $1 = A(x+1) + B(x-4)$.

Copyright © 2014 Pearson Education, Inc.
Setting $x = -1$ gives $B = -\frac{1}{5}$; setting $x = 4$ gives $A = \frac{1}{5}$. So we have

\[
\int \frac{x^3 - 8x^2 + 11x + 21}{x^2 - 3x - 4} \, dx = \int \left( x - 5 + \frac{1}{(x - 4)(x + 1)} \right) \, dx
\]

\[
= \int \left( x - 5 + \frac{1/5}{x - 4} - \frac{1/5}{x + 1} \right) \, dx
\]

\[
= \frac{1}{2} x^2 - 5x + \frac{1}{5} (\ln |x - 4| - \ln |x + 1|) + C
\]

\[
= \frac{1}{2} x^2 - 5x + \frac{1}{5} \ln \left| \frac{x - 4}{x + 1} \right| + C.
\]

7.3.31 Using long division, we have \(\frac{x^3 - 2x^2 - x + 3}{x - 2} = x^2 - 1 + \frac{1}{x - 2}\), so that

\[
\int \frac{x^3 - 2x^2 - x + 3}{x - 2} \, dx = \int \left( x^2 - 1 + \frac{1}{x - 2} \right) \, dx = \frac{1}{3} x^3 - x + \ln |x - 2| + C.
\]

7.3.32 Using long division, we have

\[
\frac{x^4 - x^3 - 2x^2 + 1}{x^3 - x^2 - 2x} = x + \frac{1}{x^3 - x^2 - 2x} = x + \frac{1}{x(x - 2)(x + 1)}.
\]

To integrate, we must find the partial fraction representation of the final term. Write

\[
\frac{1}{x(x - 2)(x + 1)} = \frac{A}{x} + \frac{B}{x - 2} + \frac{C}{x + 1},
\]

so that \(1 = A(x - 2)(x + 1) + Bx(x + 1) + Cx(x - 2)\).

Setting \(x = 0\) gives \(A = -\frac{1}{2}\); setting \(x = 2\) gives \(B = \frac{1}{6}\); setting \(x = -1\) gives \(C = \frac{1}{3}\). So we get

\[
\int \frac{x^4 - x^3 - 2x^2 + 1}{x^3 - x^2 - 2x} \, dx = \int \left( x + \frac{1}{x(x - 2)(x + 1)} \right) \, dx
\]

\[
= \int \left( x - \frac{1/2}{x} + \frac{1/6}{x - 2} + \frac{1/3}{x + 1} \right) \, dx
\]

\[
= \frac{1}{2} x^2 - \frac{1}{2} \ln |x| + \frac{1}{6} \ln |x - 2| + \frac{1}{3} \ln |x + 1| + C.
\]

7.3.33

a. False. Since the given integrand is improper, the first step would be to use long division to write the integrand as the sum of a polynomial and a proper rational function.

b. False. This is easy to evaluate via the substitution \(u = 3x^2 + x\).

c. True. The discriminant of the denominator is \(b^2 - 4ac = 169 - 168 = 1 > 0\), so the denominator factors into distinct linear factors using real numbers. In fact \(x^2 - 13x + 42 = (x - 7)(x - 6)\).

7.3.34 A graph of the region is
Note that we can write $\frac{x}{1 + x} = 1 - \frac{1}{x + 1}$. Thus the area is given by

$$\int_0^4 \left( 1 - \frac{1}{x + 1} \right) \, dx = (x - \ln(x + 1))\bigg|_0^4 = 4 - \ln 5.$$  

7.3.35 A graph of the region is

![Graph of the region](image1)

Note that the region is below the $x$ axis, so we must negate the integral to get the area of the region. If we write

$$\frac{10}{x^2 - 2x - 24} = \frac{10}{(x - 6)(x + 4)} = \frac{A}{x - 6} + \frac{B}{x + 4},$$

then $10 = A(x + 4) + B(x - 6)$. Letting $x = -4$ gives $B = -1$ and letting $x = 6$ gives $A = 1$. Thus the area in question is given by

$$- \int_{-2}^{2} \left( -\frac{1}{x + 4} + \frac{1}{x - 6} \right) \, dx = (\ln(x + 4) - \ln|x - 6|)\bigg|_{-2}^{2} = \ln 6 - \ln 4 - (\ln 2 - \ln 8) = \ln 6.$$  

7.3.36 A graph of the region is

![Graph of the region](image2)

Note that the curves intersect when $x^2 = 3x + 4$, or at $x = 4$ and $x = -1$. However, because of the vertical asymptotes at $x = 0$ and $x = -\frac{4}{3}$, the region we want must be the region between $x = 4$ and $x = 10$; in that range of $x$ values, $\frac{1}{x} \leq \frac{x}{3x + 4}$. Thus the area is given by $\int_{4}^{10} \frac{x}{3x + 4} - \frac{1}{x} \, dx$. Rewriting the first term after performing long division yields

$$\int_{4}^{10} \left( \frac{1}{3} - \frac{4}{9} \frac{1}{x + (4/3)} - \frac{1}{x} \right) \, dx = \left( \frac{x}{3} - \frac{4}{9} \ln \left| x + \frac{4}{3} \right| - \ln |x| \right)\bigg|_4^{10}$$

$$= \frac{10}{3} - \frac{4}{9} \ln \frac{34}{3} - \ln 10 - \left( \frac{4}{3} - \frac{4}{9} \ln \frac{16}{3} - \ln 4 \right)$$

$$= 2 - \frac{4}{9} \ln \frac{17}{8} + \ln \frac{2}{5}.$$  

Copyright © 2014 Pearson Education, Inc.
7.3.37 A graph of the region is

The curve intersects the x-axis at \( x = 2 \pm 2\sqrt{2} \). We can write the integrand as

\[
1 + \frac{1}{x^2 - 4x - 5} = 1 + \frac{1}{(x - 5)(x + 1)}.
\]

If we write this second term in the form \( \frac{A}{x - 5} + \frac{B}{x + 1} \), then \( 1 = A(x + 1) + B(x - 5) \). Letting \( x = -1 \) yields \( B = -\frac{1}{6} \) and letting \( x = 5 \) yields \( A = \frac{1}{6} \). Thus the area in question is given by

\[
\int_{2 - 2\sqrt{2}}^{2 + 2\sqrt{2}} \left( 1 + \frac{1/6}{x - 5} - \frac{1/6}{x + 1} \right) dx = \left( x + \frac{1}{6} \ln |x - 5| - \frac{1}{6} \ln |x + 1| \right) \bigg|_{2 - 2\sqrt{2}}^{2 + 2\sqrt{2}} = 4\sqrt{2} + \frac{1}{3} \ln \frac{3 - 2\sqrt{2}}{3 + 2\sqrt{2}}.
\]

7.3.38 Using shells, we see that the height of each shell is \( \frac{1}{x + 1} \) and the radius is \( x \), so the volume is

\[
2\pi \int_0^2 \frac{x}{x + 1} \, dx = 2\pi \int_0^2 \left( 1 - \frac{1}{x + 1} \right) \, dx = 2\pi (x - \ln(x + 1)) \bigg|_0^2 = 2\pi (2 - \ln 3).
\]

7.3.39 Use the disk method. Each disk has a radius of \( \frac{1}{\sqrt{x^2 - 1}} \), so the volume is

\[
\pi \int_2^4 \left( \frac{1}{\sqrt{x^2 - 1}} \right)^2 \, dx = \pi \int_2^4 \frac{1}{x^2 - 1} \, dx = \pi \int_2^4 \frac{1}{(x - 1)(x + 1)} \, dx.
\]

Now determine the partial fraction representation of the integrand:

\[
\frac{1}{(x - 1)(x + 1)} = \frac{A}{x - 1} + \frac{B}{x + 1}, \quad \text{so that} \quad 1 = A(x + 1) + B(x - 1).
\]

Setting \( x = 1 \) gives \( A = \frac{1}{2} \); setting \( x = -1 \) gives \( B = -\frac{1}{2} \). So the integral becomes

\[
\pi \int_2^4 \left( \frac{1}{\sqrt{x^2 - 1}} \right)^2 \, dx = \pi \int_2^4 \frac{1}{(x - 1)(x + 1)} \, dx = \pi \int_2^4 \left( \frac{1/2}{x - 1} - \frac{1/2}{x + 1} \right) \, dx = \frac{\pi}{2} \ln \frac{9}{5} - \frac{\pi}{2} \ln \frac{1}{3} = \frac{\pi}{2} \ln 9.
\]
7.3. PARTIAL FRACTIONS

7.3.40 First note that \( \frac{1}{\sqrt{1 - x^2}} = 4 \) when \( x = \pm \frac{\sqrt{15}}{4} \). Use the disk method. By symmetry, we can integrate for \( x \geq 0 \) and double the result, so

\[
V = 2\pi \int_{0}^{\sqrt{15}/4} \left( 4^2 - \left( \frac{1}{\sqrt{1 - x^2}} \right)^2 \right) \, dx
\]

\[
= 2\pi \int_{0}^{\sqrt{15}/4} \left( 16 - \frac{1}{1 - x^2} \right) \, dx
\]

\[
= 2\pi (16x) \bigg|_{\frac{\sqrt{15}}{4}}^{0} - 2\pi \int_{0}^{\sqrt{15}/4} \frac{1}{1 - x^2} \, dx
\]

\[
= 8\pi \sqrt{15} - 2\pi \int_{0}^{\sqrt{15}/4} \frac{1}{1 - x^2} \, dx.
\]

To evaluate the final integral, use partial fractions. If we write \( \frac{1}{1 - x^2} = \frac{A}{1 + x} + \frac{B}{1 - x} \), then we have

\[
1 = A(1 + x) + B(1 - x);
\]

letting \( x = 1 \) yields \( A = \frac{1}{2} \) and letting \( x = -1 \) yields \( B = \frac{1}{2} \). Thus we get

\[
V = 8\pi \sqrt{15} - 2\pi \int_{0}^{\sqrt{15}/4} \frac{1}{1 - x^2} \, dx
\]

\[
= 8\pi \sqrt{15} - 2\pi \int_{0}^{\sqrt{15}/4} \left( \frac{1/2}{1 + x} + \frac{1/2}{1 - x} \right) \, dx
\]

\[
= 8\pi \sqrt{15} - \pi \ln \left| \frac{1 + x}{1 - x} \right|_{0}^{\sqrt{15}/4}
\]

\[
= 8\pi \sqrt{15} - \pi \ln \left( 4 + \sqrt{15} \right)
\]

\[
= 8\pi \sqrt{15} - 2\pi \ln (4 + \sqrt{15}).
\]

7.3.41 Using disks, we have \( V = \pi \int_{1}^{2} \frac{1}{x(3 - x)} \, dx \). Now write

\[
\frac{1}{x(3 - x)} = \frac{A}{x} + \frac{B}{3 - x}, \quad \text{so that} \quad 1 = A(3 - x) + Bx.
\]

Letting \( x = 0 \) yields \( A = \frac{1}{3} \) and letting \( x = 3 \) yields \( B = \frac{1}{3} \). Thus we have

\[
V = \frac{\pi}{3} \int_{1}^{2} \left( \frac{1}{x} - \frac{1}{x - 3} \right) \, dx = \frac{\pi}{3} \ln x - \ln |x - 3| \bigg|_{1}^{2} = \frac{2}{3} \pi \ln 2.
\]

7.3.42 Using disks, we have \( V = \pi \int_{-1}^{1} \frac{1}{4 - x^2} \, dx = 2\pi \int_{0}^{1} \frac{1}{4 - x^2} \, dx \). Now write

\[
\frac{1}{4 - x^2} = \frac{A}{2 - x} + \frac{B}{2 + x}, \quad \text{so that} \quad 1 = A(2 + x) + B(2 - x).
\]

Letting \( x = 2 \) yields \( A = \frac{1}{4} \), and letting \( x = -2 \) yields \( B = \frac{1}{4} \). Thus we have

\[
V = \frac{\pi}{2} \int_{0}^{1} \left( \frac{1}{x + 2} - \frac{1}{x - 2} \right) \, dx = \frac{\pi}{2} \left( \ln |x + 2| - \ln |x - 2| \right|_{0}^{1} = \frac{\pi}{2} \ln 3.
\]

Copyright © 2014 Pearson Education, Inc.
7.3.43 Using shells, we have
\[ V = 2\pi \int_0^3 \frac{x + 1}{x + 2} \, dx = 2\pi \int_0^3 \left(1 - \frac{1}{x + 2}\right) \, dx = 2\pi \left(x - \ln |x + 2|\right)_0^3 = 2\pi \left(3 + \ln \frac{2}{3}\right). \]

7.3.44 Since \( \frac{x^2}{(x - 4)(x + 5)} \) is not proper, it is not of the proper form to be decomposed via partial fractions. Long division must first be used to reduce this to a proper fraction.

7.3.45 Let \( u = e^x \), so that \( du = e^x \, dx \). Then
\[ \int \frac{1}{1 + e^x} \cdot e^x \, dx = \int \frac{1}{u(1 + u)} \, du. \]
Now write
\[ \frac{1}{u(1 + u)} = \frac{A}{u} + \frac{B}{1 + u}, \]
so that \( 1 = A(1 + u) + Bu \).

Letting \( u = 0 \) yields \( A = 1 \) and letting \( u = -1 \) yields \( B = -1 \), so the original integral is equal to
\[ \int \left( \frac{1}{u} - \frac{1}{1 + u} \right) \, du = \ln |u| - \ln |1 + u| + C = x - \ln(1 + e^x) + C. \]

7.3.46 After performing long division, we have that the original integrand is equal to \( x + \frac{9x^2 + 1}{x(x^2 - 9)} \). Now write
\[ \frac{9x^2 + 1}{x(x^2 - 9)} = \frac{9x^2 + 1}{x(x - 3)(x + 3)} = \frac{A}{x} + \frac{B}{x - 3} + \frac{C}{x + 3}, \]
so that \( 9x^2 + 1 = A(x - 3) + Bx(x + 3) + Cx(x - 3) \).

Letting \( x = 0 \) yields \( A = -\frac{1}{9} \), letting \( x = 3 \) yields \( B = \frac{41}{9} \), and letting \( x = -3 \) yields \( C = \frac{41}{9} \). Therefore the original integral is
\[ \int \frac{x^4 + 1}{x^3 - 9x} \, dx = \int \left( x + \frac{9x^2 + 1}{x(x^2 - 9)} \right) \, dx \]
\[ = \int \left( x - \frac{1/9}{x} + \frac{41/9}{x - 3} + \frac{41/9}{x + 3} \right) \, dx \]
\[ = \frac{1}{2} x^2 - \frac{1}{9} \ln |x| + \frac{41}{9} \ln |x^2 - 9| + C. \]

7.3.47 After performing long division, we see that the original integrand is equal to \( 3 + \frac{13x - 12}{(x - 1)(x - 2)} \). Now write
\[ \frac{13x - 12}{(x - 1)(x - 2)} = \frac{A}{x - 1} + \frac{B}{x - 2}, \]
so that \( 13x - 12 = A(x - 2) + B(x - 1) \).

Letting \( x = 1 \) yields \( A = -1 \), and letting \( x = 2 \) yields \( B = 14 \). Thus the original integral is equal to
\[ \int \frac{3x^2 + 4x - 6}{x^2 - 3x + 2} \, dx = \int \left( 3 + \frac{13x - 12}{(x - 1)(x - 2)} \right) \, dx \]
\[ = \int \left( 3 - \frac{1}{x - 1} + \frac{14}{x - 2} \right) \, dx \]
\[ = 3x - \ln |x - 1| + 14 \ln |x - 2| + C. \]

7.3.48 After performing long division, we see that the original integrand is equal to \( 2x - 1 + \frac{7x + 1}{(x + 3)(x - 2)} \). Now write
\[ \frac{7x + 1}{(x + 3)(x - 2)} = \frac{A}{x + 3} + \frac{B}{x - 2}, \]
so that \( 7x + 1 = A(x - 2) + B(x + 3) \).
Letting $x = 2$ yields $B = 3$, and letting $x = -3$ yields $A = 4$. Thus, the original integral is equal to
\[
\int \frac{2x^3 + x^2 - 6x + 7}{x^2 + x - 6} \, dx = \int \left( 2x - 1 + \frac{7x + 1}{(x + 3)(x - 2)} \right) \, dx
\]
\[
= \int \left( 2x - 1 + \frac{4}{x + 3} + \frac{3}{x - 2} \right) \, dx
\]
\[
= x^2 - x + 4 \ln |x + 3| + 3 \ln |x - 2| + C.
\]

**7.3.49** \(\int \frac{1}{2 + e^{-t}} \, dt = \int \frac{e^t}{2e^t + 1} \, dt\). Let $u = 2e^t + 1$, so that $du = 2e^t \, dt$. Then we have
\[
\int \frac{1}{2 + e^{-t}} \, dt = \int \frac{e^t}{2e^t + 1} \, dt = \frac{1}{2} \int \frac{1}{u} \, du = \frac{1}{2} \ln |u| + C = \frac{1}{2} \ln(2e^t + 1) + C.
\]

**7.3.50** Start with
\[
\int \frac{1}{1 - e^{2x}} \, dx = \int \frac{1}{1 - e^{2x}} \cdot \frac{e^x}{e^x} \, dx = \int \frac{e^x}{e^x(1 - e^{2x})} \, dx.
\]
\[\]
Let $u = e^x$, so that $du = e^x \, dx$, so the integral becomes \(\int \frac{1}{u(1 - u^2)} \, du\). Now write
\[
\frac{1}{u(1 - u^2)} = \frac{A}{u} + \frac{B}{1 - u} + \frac{C}{1 + u},
\]
so that $1 = A(1 - u^2) + Bu(1 + u) + Cu(1 - u)$.
\[\]
Letting $u = 0$ gives $A = 1$; letting $u = 1$ gives $B = \frac{1}{2}$; letting $u = -1$ gives $C = -\frac{1}{2}$. Then the integral is
\[
\int \frac{1}{1 - e^{2x}} \, dx = \int \frac{1}{u(1 - u^2)} \, du
\]
\[
= \int \left( \frac{1}{u} + \frac{1/2}{1 - u} - \frac{1/2}{1 + u} \right) \, du
\]
\[
= \ln |u| - \frac{1}{2} \ln |1 - u| - \frac{1}{2} \ln |1 + u| + C
\]
\[
= \ln |e^x| - \frac{1}{2} \ln |(1 - e^x)(1 + e^x)| + C
\]
\[
= x - \frac{1}{2} \ln |1 - e^{2x}| + C.
\]

**7.3.51** Let $u = \sin \theta$ so that $du = \cos \theta \, d\theta$. Then we get
\[
\int \frac{8 \cos \theta}{4 - \sin^2 \theta} \, d\theta = 8 \int \frac{1}{4 - u^2} \, du = 8 \int \frac{1}{(2 - u)(2 + u)} \, du.
\]
\[\]
Now write
\[
\frac{1}{(2 - u)(2 + u)} = \frac{A}{2 - u} + \frac{B}{2 + u},
\]
so that $1 = A(2 + u) + B(2 - u)$.
\[\]
Setting $u = 2$ gives $A = \frac{1}{4}$, while setting $u = -2$ gives $B = \frac{1}{4}$. So the integral becomes
\[
\int \frac{8 \cos \theta}{4 - \sin^2 \theta} \, d\theta = 8 \int \frac{1}{4 - u^2} \, du = 8 \int \frac{1}{(2 - u)(2 + u)} \, du
\]
\[
= 8 \int \left( \frac{1/4}{2 - u} + \frac{1/4}{2 + u} \right) \, du
\]
\[
= 8 \cdot \frac{1}{4} \left( -\ln |2 - u| + \ln |2 + u| \right) + C
\]
\[
= 2 \ln \frac{2 + \sin \theta}{2 - \sin \theta} + C,
\]
where we are justified in removing the absolute value signs in the final result since both $2 + \sin \theta$ and $2 - \sin \theta$ are always positive.
7.3.52 Let \( u = \sqrt{e^x + 1} \), so that \( u^2 = e^x + 1 \) and \( 2u \, du = e^x \, dx = (u^2 - 1) \, dx \). Then the original integral is equal to \( \int \frac{2u^2}{u^2 - 1} \, du = \int \left( 2 + \frac{2}{u^2 - 1} \right) \, du \). Now write

\[
\frac{2}{u^2 - 1} = \frac{A}{u + 1} + \frac{B}{u - 1}, \quad \text{so that} \quad 2 = A(u - 1) + B(u + 1).
\]

Letting \( u = 1 \) yields \( B = 1 \) and letting \( u = -1 \) yields \( A = -1 \). Thus

\[
\int \sqrt{e^x + 1} \, dx = \int \left( 2 + \frac{2}{u^2 - 1} \right) \, du = \int \left( 2 - \frac{1}{u + 1} + \frac{1}{u - 1} \right) \, du = 2u + \ln |u - 1| - \ln |u + 1| + C = 2\sqrt{e^x + 1} + \ln \left( \frac{\sqrt{e^x + 1} - 1}{\sqrt{e^x + 1} + 1} \right) + C,
\]

where we may remove the absolute value signs since \( \sqrt{e^x + 1} > 1 \) everywhere.

7.3.53 Let \( u = e^x \) so that \( du = e^x \, dx \). Then the original integral is equal to \( \int \frac{1}{(u - 1)(u + 2)} \, du \). Now write

\[
\frac{1}{(u - 1)(u + 2)} = \frac{A}{u - 1} + \frac{B}{u + 2}, \quad \text{so that} \quad 1 = A(u + 2) + B(u - 1).
\]

Letting \( u = -2 \) yields \( B = -\frac{1}{3} \) and letting \( u = 1 \) yields \( A = \frac{1}{3} \). Thus we have

\[
\int \frac{e^x}{(e^x - 1)(e^x + 2)} \, dx = \int \frac{1}{(u - 1)(u + 2)} \, du = \int \left( \frac{1/3}{u - 1} - \frac{1/3}{u + 2} \right) \, du = \frac{1}{3} (\ln |u - 1| - \ln |u + 2|) + C = \frac{1}{3} \ln \left| \frac{e^x - 1}{e^x + 2} \right| + C.
\]

7.3.54 Let \( u = \sin x \) so that \( du = \cos x \, dx \). Then we have \( \int \frac{1}{u(u - 2)(u + 2)} \, du \). Now write

\[
\frac{1}{u(u - 2)(u + 2)} = \frac{A}{u} + \frac{B}{u - 2} + \frac{C}{u + 2}, \quad \text{so that} \quad 1 = A(u - 2)(u + 2) + Bu(u + 2) + Cu(u - 2).
\]

Letting \( u = 2 \) yields \( B = \frac{1}{8} \) and letting \( u = -2 \) yields \( C = \frac{1}{8} \). Letting \( u = 0 \) yields \( A = -\frac{1}{4} \). Thus we have

\[
\int \frac{\cos x}{\sin^4 x - 4 \sin x} \, dx = \int \frac{1}{u(u - 2)(u + 2)} \, du = \int \left( -\frac{1}{4u} + \frac{1/8}{u - 2} + \frac{1/8}{u + 2} \right) \, du = -\frac{1}{4} \ln |u| + \frac{1}{8} (\ln |u - 2| + \ln |u + 2|) + C = -\frac{1}{4} \ln |\sin x| + \frac{1}{8} \ln |(\sin x - 2)(\sin x + 2)| + C = -\frac{1}{4} \ln |\sin x| + \frac{1}{8} \cdot \ln(4 - \sin^2 x) + C.
\]
7.3.55 Start with \( \int \frac{1}{e^x + e^{-x}} \, dx = \int \frac{1}{e^x + e^{-x}} \cdot e^x \, dx = \int \frac{e^x}{e^{2x} + 1} \, dx \). Let \( u = e^x \) so that \( du = e^x \, dx \); then the integral becomes \( \int \frac{1}{u^2 + 1} \, du \). This gives
\[ \int \frac{1}{u^2 + 1} \, du = \tan^{-1} u + C = \tan^{-1} e^x + C. \]

7.3.56 Let \( u = \sqrt{a} \), so that \( du = \frac{1}{2\sqrt{a}} \, dy \) and thus \( dy = 2u \, du \). Substituting gives
\[ \int \frac{2u}{u^2(\sqrt{a} - u)} \, du = \int \frac{2}{u(\sqrt{a} - u)} \, du. \]
Write
\[ \frac{2}{u(\sqrt{a} - u)} = \frac{A}{u} + \frac{B}{\sqrt{a} - u}, \]
so that \( 2 = A(\sqrt{a} - u) + Bu \).
Letting \( u = 0 \) gives \( A = \frac{2}{\sqrt{a}} \), and letting \( u = \sqrt{a} \) gives \( B = \frac{2}{\sqrt{a}} \). The integral is therefore
\[ \int \frac{dy}{y(\sqrt{a} - \sqrt{a})} = \int \frac{2}{u(\sqrt{a} - u)} \, du = \int \left( \frac{2/\sqrt{a}}{u} - \frac{2/\sqrt{a}}{u - \sqrt{a}} \right) \, du = \frac{2}{\sqrt{a}} \ln \left| \frac{u}{u - \sqrt{a}} \right| + C = \frac{2}{\sqrt{a}} \ln \left| \frac{\sqrt{y}}{\sqrt{y} - \sqrt{a}} \right| + C. \]

7.3.57
a. \( \sec x = \frac{1}{\cos x}, \quad \cos x = \cos x = \frac{\cos x}{1 - \sin^2 x} \).

b. Note that \( \int \sec x \, dx = \int \frac{\cos x}{1 - \sin^2 x} \, dx \). Make the substitution \( u = \sin x \), so that \( du = \cos x \, dx \), to get \( \int \frac{du}{1 - u^2} \). Now use partial fractions:

\[ \frac{1}{1 - u^2} = \frac{A}{1 - u} + \frac{B}{1 + u}, \quad \text{so that} \quad 1 = A(1 + u) + B(1 - u). \]

Setting \( u = 1 \) gives \( A = \frac{1}{2} \); setting \( u = -1 \) gives \( B = \frac{1}{2} \). Thus we get
\[ \int \frac{du}{1 - u^2} = \frac{1}{2} \int \left( \frac{1}{1 - u} + \frac{1}{1 + u} \right) \, du = \frac{1}{2} \ln |1 + u| - \ln |1 - u| + C = \frac{1}{2} \ln \left| 1 + \sin x \right| \]
\[ + C. \]

7.3.58 If we let \( u^3 = x \), then \( 3u^2 \, du = dx \). Substituting yields \( \int \frac{3u^2}{u^3 - u} \, du = 3 \int \frac{u}{(u - 1)(u + 1)} \, du \). Now write
\[ \frac{u}{(u - 1)(u + 1)} = \frac{A}{u - 1} + \frac{B}{u + 1}, \quad \text{so that} \quad u = A(u + 1) + B(u - 1). \]

Letting \( u = 1 \) yields \( A = \frac{1}{2} \) and letting \( u = -1 \) yields \( B = \frac{1}{2} \). Thus we have
\[ \int \frac{dx}{x - \sqrt{x}} = 3 \int \frac{u}{(u - 1)(u + 1)} \, du = \frac{3}{2} \int \left( \frac{1}{u - 1} + \frac{1}{u + 1} \right) \, du = \frac{3}{2} \ln |x^{2/3} - 1| + C. \]
7.3.59 If we let \( u^4 = x + 2 \), then \( 4u^3 \, du = dx \). Substituting yields

\[
\int \frac{dx}{\sqrt{x^2 + 2}} = \int \frac{4u^3}{u + 1} \, du = \int \left( 4u^2 - 4u + 4 - \frac{4}{u + 1} \right) \, du \\
= \frac{4}{3}u^3 - 2u^2 + 4u - 4 \ln |u + 1| + C \\
= \frac{4}{3}(x + 2)^{3/4} - 2(x + 2)^{1/2} + 4(x + 2)^{1/4} - 4 \ln((x + 2)^{1/4} + 1) + C.
\]

7.3.60 If we let \( u^2 = 2x + 1 \), then \( 2u \, du = 2 \, dx \). Substituting yields

\[
\int \frac{dx}{x \sqrt{1 + 2x}} = \int \frac{2u}{u(u - 1)(u + 1)} \, du = 2 \int \frac{1}{(u - 1)(u + 1)} \, du \\
= 2 \int \left( \frac{1}{u - 1} - \frac{1}{u + 1} \right) \, du \\
= \ln |u - 1| - \ln |u + 1| + C \\
= \ln \left| \frac{\sqrt{1 + 2x} - 1}{\sqrt{1 + 2x} + 1} \right| + C.
\]

7.3.61 If we let \( u^3 = x \), then \( 3u^2 \, du = dx \). Substituting yields

\[
\int \frac{dx}{1 - \sqrt{x}} = 3 \int \frac{3u^2}{1 - u} \, du = 3 \int \left( -u - 1 + \frac{1}{1 - u} \right) \, du \\
= 3 \left( -\frac{1}{2}u^2 - u - \ln |1 - u| \right) + C = -3 \left( \frac{1}{2}x^{2/3} + x^{1/3} + \ln \left| 1 - x^{1/3} \right| \right) + C.
\]

7.3.62 If we let \( u^4 = x \), then \( 4u^3 \, du = dx \). Substituting yields

\[
\int \frac{4u^3}{u^2 - u} \, du = 4 \int \frac{u^2}{u - 1} \, du = 4 \int \left( u + 1 + \frac{1}{u - 1} \right) \, du \\
= 4 \left( \frac{1}{2}u^2 + u + \ln |u - 1| \right) + C = 2x^{1/2} + 4x^{1/4} + 4 \ln |x^{1/4} - 1| + C.
\]

7.3.63 If we let \((u^2 - 1)^2 = x\), then \( 2(u^2 - 1) \cdot 2u \, du = dx \). Substituting yields

\[
\int \frac{dx}{\sqrt{1 + \sqrt{x}}} = \int \frac{4u(u^2 - 1)}{\sqrt{1 + (u^2 - 1)}} \, du \\
= \int \frac{4u(u^2 - 1)}{u} \, du \\
= 4 \int (u^2 - 1) \, du \\
= \frac{4u^3}{3} - 4u + C = \frac{4}{3}u(u^2 - 3) + C = \frac{4}{3} \sqrt{1 + u} (\sqrt{u^2 - 2} + C.
\]

7.3.64

a. If \( y = \ln x \) then \( \frac{dy}{dx} = \frac{1}{x} \), so \( \sqrt{1 + \left( \frac{dy}{dx} \right)^2} = \sqrt{x^2 + 1} \). Thus the arc length is \( L(a) = \int_1^a \sqrt{x^2 + 1} \, dx \).

If we let \( u^2 = x^2 + 1 \), then \( 2u \, du = 2x \, dx \), so that \( dx = \frac{u}{\sqrt{u^2 - 1}} \, du \). Then \( x = 1 \) corresponds to
7.3. PARTIAL FRACTIONS

\[ u = \sqrt{2} \text{ while } x = a \text{ corresponds to } u = \sqrt{a^2 + 1}. \] Substituting gives

\[ L(a) = \int_1^a \frac{\sqrt{x^2 + 1}}{x} \, dx = \int_\sqrt{2}^\sqrt{a^2 + 1} \frac{u}{\sqrt{u^2 - 1}} \cdot \frac{u}{u^2 - 1} \, du \]
\[ = \int_\sqrt{2}^\sqrt{a^2 + 1} \frac{u^2}{u^2 - 1} \, du \]
\[ = \int_\sqrt{2}^\sqrt{a^2 + 1} \left( 1 + \frac{1}{u^2 - 1} \right) \, du \]
\[ = \int_\sqrt{2}^\sqrt{a^2 + 1} \left( 1 + \frac{1}{2} \left( \frac{1}{u - 1} - \frac{1}{u + 1} \right) \right) \, du \]
\[ = u + \frac{1}{2} \ln \left| \frac{u - 1}{u + 1} \right|_\sqrt{2}^{\sqrt{a^2 + 1}} \]
\[ = \sqrt{a^2 + 1} - \sqrt{2} + \frac{1}{2} \ln \left( \frac{\sqrt{a^2 + 1} - 1}{\sqrt{a^2 + 1} + 1} \right) + \frac{1}{2} \ln \left( \frac{\sqrt{2} + 1}{\sqrt{2} - 1} \right). \]

b. 

\[ L(a) \text{ increases like } a. \] Note that the third term is the log of a fraction that approaches 1 as \( a \to \infty \), so that the third term approaches zero. Hence

\[ \lim_{a \to \infty} \frac{L(a)}{a} = \lim_{a \to \infty} \frac{\sqrt{a^2 + 1}}{\sqrt{2} + 1} = 1. \]

7.3.65 Using the substitution \( x = 2 \tan^{-1} u \) gives \( dx = \frac{1}{1+u^2} \, du \), so we get

\[ \int \frac{1}{1 - \cos x} \, dx = \int \frac{1}{1 - \frac{1-u^2}{1+u^2}} \cdot \frac{2}{1+u^2} \, du = \int \frac{2}{(1+u^2) - (1-u^2)} \, du = \int \frac{1}{u^2} \, du = -\frac{1}{u} + C = -\cot \frac{x}{2} + C. \]

Note that using half-angle formulas, this is the same as \( -\cot x - \csc x + C \).

7.3.66 Using the substitution \( x = 2 \tan^{-1} u \) gives \( dx = \frac{2}{1+u^2} \, du \), so we get

\[ \int \frac{dx}{1 + \sin x + \cos x} = \int \frac{1}{1 + \frac{2u}{1+u^2} + \frac{1-u^2}{1+u^2}} \cdot \frac{2}{1+u^2} \, du \]
\[ = \int \frac{2}{(1+u^2) + 2u + (1-u^2)} \, du \]
\[ = \int \frac{1}{1+u} \, du \]
\[ = \ln |1+u| + C = \ln \left| 1 + \tan \frac{x}{2} \right| + C. \]

7.3.67 Using the substitution \( \theta = 2 \tan^{-1} u \) gives \( d\theta = \frac{1}{1+u^2} \, du \), so we get

\[ \int \frac{d\theta}{\cos \theta - \sin \theta} = \int \frac{1}{1-u^2} \cdot \frac{2}{1+u^2} \, du = -2 \int \frac{1}{u^2 + 2u - 1} \, du = -2 \int \frac{1}{(u+1)^2 - 2} \, du. \]

Now write

\[ \frac{1}{(u+1)^2 - 2} = \frac{A}{u+1-\sqrt{2}} + \frac{B}{u+1+\sqrt{2}}, \]
so that \( 1 = A(u+1+\sqrt{2}) + B(u+1-\sqrt{2}) \).

Copyright © 2014 Pearson Education, Inc.
Letting \( u = -1 - \sqrt{2} \) gives \( B = \frac{1}{-2\sqrt{2}} = -\frac{\sqrt{2}}{4} \), letting \( u = \sqrt{2} - 1 \) gives \( A = \frac{1}{2\sqrt{2}} = \frac{\sqrt{2}}{4} \). So we get

\[
\int \frac{d\theta}{\cos \theta - \sin \theta} d\theta = -2 \int \frac{1}{(u+1)^2 - 2} \, du \\
= -2 \cdot \frac{\sqrt{2}}{4} \int \left( \frac{1}{u+1 - \sqrt{2}} - \frac{1}{u+1 + \sqrt{2}} \right) \, du \\
= -\frac{\sqrt{2}}{2} \ln \left| \frac{u+1 - \sqrt{2}}{u+1 + \sqrt{2}} \right| + C \\
= \frac{\sqrt{2}}{2} \ln \left| \frac{\tan \frac{\theta}{2} + 1 + \sqrt{2}}{\tan \frac{\theta}{2} + 1 - \sqrt{2}} \right| + C.
\]

7.3.68 Using the substitution \( t = 2\tan^{-1} u \) gives \( dx = \frac{1}{1+u^2} \, du \), so we get

\[
\int \frac{2}{1+u^2} \cdot \frac{1+u^2}{1-u^2} \, du = 2 \int \frac{1}{1-u^2} \, du \\
= \int \left( \frac{1}{u+1} - \frac{1}{u-1} \right) \, du \\
= \ln \left| \frac{u+1}{u-1} \right| + C \\
= \ln \left| \frac{\tan \frac{\theta}{2} + 1}{\tan \frac{\theta}{2} - 1} \right| + C.
\]

7.3.69 We have

\[
s_A(t) = \int v_A(t) \, dt = 88 \int \frac{t}{t+1} \, dt = 88 \int \left( 1 - \frac{1}{1+t} \right) \, dt = 88t - 88 \ln(t+1) + C_A.
\]

Since \( s_A(0) = 0 \), we have \( 0 = 88 \cdot 0 - 88 \ln 1 + C_A \), so that \( C_A = 0 \) and \( s_A(t) = 88t - 88 \ln (t+1) \). Next, we have

\[
s_B(t) = \int v_B(t) \, dt = 88 \int (1 - e^{-t/2}) \, dt = 88 \left( t + 2e^{-t/2} \right) + C_B.
\]

Since \( s_B(0) = 0 \), we have \( 0 = 88 (0 + 2e^0) + C_B \), so that \( C_B = -88 \cdot 2 \) and thus \( s_B(t) = 88 \left( t + 2e^{-t/2} - 2 \right) \). Finally,

\[
s_C(t) = \int v_C(t) \, dt = 88 \int \frac{t^2}{t^2+3t+2} \, dt = 88 \int \left( 1 - \frac{3t+2}{t^2+3t+2} \right) \, dt.
\]

Write

\[
\frac{3t+2}{t^2+3t+2} = \frac{3t+2}{(t+1)(t+2)} = \frac{A}{t+1} + \frac{B}{t+2}, \quad \text{so that} \quad 3t+2 = A(t+2) + B(t+1).
\]

Setting \( t = -1 \) gives \( A = -1 \); setting \( t = -2 \) gives \( B = 4 \). Thus

\[
s_C(t) = 88 \int \left( 1 + \frac{1}{t+1} - \frac{4}{t+2} \right) \, dt = 88 \left( t + \ln |t+1| - 4 \ln |t+2| \right) + C_C.
\]

Since \( s_C(0) = 0 \), we see that \( 0 = 88 (0 + \ln 1 - 4 \ln 2) + C_C \), so that \( C_C = 88 \cdot 4 \ln 2 \) and

\[
s_C(t) = 88 \left( t + \ln |t+1| - 4 \ln |t+2| + 4 \ln 2 \right).
\]

a. Since

\[
s_A(5) = 88(5 - \ln 6) \approx 282, \quad s_B(5) = 88(5 + 2e^{-5/2} - 2) \approx 278, \quad s_C(5) = 88(5 + \ln 6 - 4 \ln 7 + 4 \ln 2) \approx 157,
\]

car A has traveled furthest on \([0, 5]\).

Copyright © 2014 Pearson Education, Inc.
b. 

\[ s_A(10) = 88(10 - \ln 11) \approx 669, \quad s_B(10) = 88(10 + 2e^{-11/2} - 2) \approx 705, \]

\[ s_C(10) = 88(10 + \ln 11 - 4\ln 12 + 4\ln 2) \approx 460, \]

car B has traveled furthest on \([0, 10]\).

c. From the material above,

\[ s_A(t) = 88(t - \ln(t+1)), \quad s_B(t) = 88(t + 2e^{-t/2} - 2), \quad s_C(t) = 88(t + \ln|t+1| - 4\ln|t+2| + 4\ln 2). \]

d. Consider first

\[ s_A(t) - s_C(t) = 88(4\ln(t+2) - 4\ln 2 - 2\ln(t+1)) = 88\ln\left(\frac{(t+2)^4}{16(t+1)^2}\right) = 176\ln\left(\frac{t+2}{2}\right)^2. \]

For any \(t > 0\), we have \((t + 2)^2 - 4(t + 1) = t^2 + 4t + 4 - 4t - 4 = t^2 > 0\), so that \(\frac{(t+2)^2}{4(t+1)} > 0\) and thus \(s_A(t) - s_C(t) > 0\). So at any time, car A has traveled further than car C. Next compare cars A and B.

\[ s_B(t) - s_A(t) = 88(2e^{-t/2} - 2 + \ln(t+1)). \]

For large \(t\), we see that \(2e^{-t/2} \approx 0\), so that the expression is \(\approx 88(-2 + \ln(t+1))\), which is positive for large \(t\). Thus eventually \(s_B(t) > s_A(t)\), so that in the long run, car B goes ahead and stays ahead. (The crossover point after which \(s_B(t) > s_A(t)\) is approximately \(t = 5.504\)). So even though all three velocities approach 88 in the long run, the cars do not go the same distances after a given time; the way in which their velocities approach 88 matters.

7.3.70

a. Clearly \(v(0) = V_T \cdot \frac{1 - \frac{1}{1+1}}{1+1} = 0\). Further,

\[ \lim_{t \to \infty} \frac{1 - e^{-2gt/V_T}}{1 + e^{-2gt/V_T}} = \lim_{t \to \infty} \frac{e^{2gt/V_T} - 1}{e^{2gt/V_T} + 1}. \]

Since \(g\) and \(V_T\) are both in the downward direction, their quotient is positive (we can give them both plus signs, or both minus signs, it doesn’t matter). Thus the exponents are both positive, so the limit form is \(\infty/\infty\). Applying L’Hôpital’s rule then gives

\[ \lim_{t \to \infty} \frac{e^{2gt/V_T} - 1}{e^{2gt/V_T} + 1} = \lim_{t \to \infty} \frac{(2g/V_T)e^{2gt/V_T}}{(2g/V_T)e^{2gt/V_T}} = 1. \]

Thus \(\lim_{t \to \infty} v(t) = V_T \cdot 1 = V_T\).

This makes sense — in the limit the velocity approaches the terminal velocity.

b.
c. Write \( v(t) \) as \( V_T \left( \frac{e^{kt} + 1}{e^{kt} - 1} \right) \) by multiplying numerator and denominator of the given formula by \( e^{2gt/V_T} \) and letting \( k = \frac{2g}{V_T} \). We know that
\[
s(t) = \int v(t) \, dt = V_T \int \frac{e^{kt} - 1}{e^{kt} + 1} \, dt = V_T \int \left( \frac{e^{kt}}{e^{kt} + 1} - \frac{1}{e^{kt} + 1} \right) \, dt
\]
\[= V_T \int \left( \frac{e^{kt}}{e^{kt} + 1} - \frac{e^{kt}}{e^{kt}(e^{kt} + 1)} \right) \, dt.\]

Let \( u = e^{kt} + 1 \) in the first integral and \( w = e^{kt} \) in the second, so that \( du = dw = ke^{kt} \, dt \). Then the integral becomes
\[
s(t) = V_T \int \left( \frac{e^{kt}}{e^{kt} + 1} - \frac{e^{kt}}{e^{kt}(e^{kt} + 1)} \right) \, dt
\]
\[= \frac{V_T}{k} \ln |e^{kt} + 1| - \frac{V_T}{k} \int \left( \frac{1}{w} - \frac{1}{w + 1} \right) \, dw
\]
\[= \frac{V_T}{k} \ln(e^{kt} + 1) - \frac{V_T}{k} \ln \left( \frac{e^{kt}}{e^{kt} + 1} \right) + C
\]
\[= \frac{V_T}{k} (2 \ln(e^{kt} + 1) - kt) + C.\]

Now since \( s(0) = 0 \), we must have \( C = -\frac{V_T}{k} \ln 4 \). Thus
\[
s(t) = \frac{V_T}{k} (2 \ln(e^{kt} + 1) - kt - \ln 4)
\]
\[= \frac{V_T}{k} \left( 2 \ln \left( \frac{e^{kt} + 1}{2} \right) \right) - V_T t
\]
\[= \frac{V_T^2}{g} \cdot \ln \frac{e^{kt} + 1}{2} - V_T t
\]
\[= \frac{V_T^2}{g} \cdot \ln \left( e^{kt} \cdot \frac{1 + e^{-kt}}{2} \right) - V_T t
\]
\[= \frac{V_T^2}{g} \cdot \left( \ln e^{kt} + \ln \frac{1 + e^{-kt}}{2} \right) - V_T t
\]
\[= \frac{V_T^2}{g} \left( 2g t + \ln \frac{1 + e^{-kt}}{2} \right) - V_T t
\]
\[= V_T t + \frac{V_T^2}{g} \ln \frac{1 + e^{-2gt/V_T}}{2}.
\]

\[d.\]
7.3.71 First note that the numerator of the given integrand can be written as \(x^8 - 4x^7 + 6x^6 - 4x^5 + x^4\). Dividing by \(x^2 + 1\) gives \(x^6 - 4x^5 + 5x^4 - 4x^2 + 4 - \frac{4}{1+x^2}\). Thus the integral is

\[
\int_0^1 \frac{x^4(1-x)^4}{1+x^2} \, dx = \int_0^1 \left( x^6 - 4x^5 + 5x^4 - 4x^2 + 4 - \frac{4}{1+x^2} \right) \, dx
\]

\[
= \left( \frac{1}{7}x^7 - \frac{2}{3}x^6 + x^5 - \frac{4}{3}x^3 + 4x - 4 \tan^{-1} x \right) \bigg|_0^1
\]

\[
= \frac{1}{7} - \frac{2}{3} + 1 - \frac{4}{3} + 4 - 4 \tan^{-1} 1
\]

\[
= \frac{22}{7} - \pi,
\]

since \(\tan^{-1} 1 = \frac{\pi}{4}\). Since the given integrand is positive on the interval \((0, 1)\), we know that this integral is positive. Thus,

\[
0 < \int_0^1 \frac{x^4(1-x)^4}{1+x^2} \, dx = \frac{22}{7} - \pi.
\]

Adding \(\pi\) to both sides of this inequality yields \(\pi < \frac{22}{7}\).

7.4 Improper Integrals

7.4.1 The interval of integration is infinite or the integrand is unbounded on the interval of integration.

7.4.2 Compute \(\int_a^\infty f(x) \, dx = \lim_{b \to \infty} \int_a^b f(x) \, dx\).

7.4.3 Compute \(\int_0^1 \frac{1}{\sqrt{x}} \, dx = \lim_{b \to 0^+} \int_0^b \frac{1}{\sqrt{x}} \, dx\).

7.4.4 As shown in Example 2, this integral converges if and only if \(p > 1\).

7.4.5 \(\int_1^\infty x^{-2} \, dx = \lim_{b \to \infty} \int_1^b x^{-2} \, dx = \lim_{b \to \infty} \left( -\frac{1}{x} \right) \bigg|_1^b = \lim_{b \to \infty} \left( 1 - \frac{1}{b} \right) = 1\).

7.4.6 \(\int_0^\infty \frac{dx}{(x+1)^p} = \lim_{b \to \infty} \int_0^b \frac{dx}{(x+1)^p} = \lim_{b \to \infty} \left( -\frac{1}{2(1+b)^2} \right) \bigg|_0^b = \lim_{b \to \infty} \left( 2 - \frac{1}{2(b+1)^2} \right) = \frac{1}{2}\).

7.4.7 \(\int_{-\infty}^0 e^x \, dx = \lim_{b \to -\infty} \int_b^0 e^x \, dx = \lim_{b \to -\infty} e^x \bigg|_0^b = \lim_{b \to -\infty} (1 - e^b) = 1\).

7.4.8 \(\int_1^\infty 2^{-x} \, dx = \lim_{b \to \infty} \int_1^b 2^{-x} \, dx = \lim_{b \to \infty} \left( \frac{-1}{\ln 2(2^x)} \right) \bigg|_1^b = \lim_{b \to \infty} \left( \frac{-1}{\ln 2(2^b)} + \frac{1}{2 \ln 2} \right) = \frac{1}{2 \ln 2}\).

7.4.9 \(\int_2^\infty \frac{dx}{\sqrt{x}} = \lim_{b \to \infty} \int_2^b \frac{dx}{\sqrt{x}} = \lim_{b \to \infty} 2\sqrt{x} \bigg|_2^b = \lim_{b \to \infty} 2(\sqrt{b} - 2\sqrt{2}) = \infty\), so the integral diverges.

7.4.10

\[
\int_{-\infty}^0 \frac{dx}{\sqrt{2-x}} = \lim_{b \to -\infty} \int_b^0 (2-x)^{-1/3} \, dx = \lim_{b \to -\infty} \left( \frac{3}{2}(2-x)^{2/3} \right) \bigg|_b^0
\]

\[
= \lim_{b \to -\infty} \left( \frac{3}{2} \left( -2^{2/3} + (2-b)^{2/3} \right) \right) = \infty,
\]

so the integral diverges.

Copyright © 2014 Pearson Education, Inc.
7.4.11 \[ \int_{0}^{\infty} e^{-2x} \, dx = \lim_{b \to \infty} \int_{0}^{b} e^{-2x} \, dx = \lim_{b \to \infty} \left( \frac{-1}{2} e^{-2x} \right) \bigg|_{0}^{b} = \frac{1}{2} \left( 1 - e^{-2b} \right) = \frac{1}{2}. \]

7.4.12 \[ \int_{0}^{\infty} \frac{\sec^2(1/x)}{x^2} \, dx = \lim_{b \to \infty} \int_{1/b}^{b} \frac{\sec^2(1/x)}{x^2} \, dx. \] Let \( u = \frac{1}{x} \) so that \( du = -\frac{1}{x^2} \, dx \). Then \( x = \frac{1}{u} \) corresponds to \( u = \frac{1}{b} \) and \( x = b \) to \( u = \frac{1}{b} \), and we get
\[
\lim_{b \to \infty} \int_{1/b}^{b} (-\sec^2 u) \, du = \lim_{b \to \infty} \tan u \bigg|_{1/b}^{\pi/4} = \lim_{b \to \infty} \left( 1 - \tan \frac{1}{b} \right) = 1.
\]

7.4.13 \[ \int_{0}^{\infty} e^{-ax} \, dx = \lim_{b \to \infty} \int_{0}^{b} e^{-ax} \, dx = \lim_{b \to \infty} \left( -\frac{e^{-ax}}{a} \right) \bigg|_{0}^{b} = \lim_{b \to \infty} \left( -\frac{1 - e^{-ab}}{a} \right) = \frac{1}{a}.
\]

7.4.14 \[ \int_{2}^{\infty} \frac{dx}{x \ln x} = \lim_{b \to \infty} \int_{2}^{b} \frac{dx}{x \ln x} = \lim_{b \to \infty} \left( \ln(\ln x) \right) \bigg|_{2}^{b} = \lim_{b \to \infty} (\ln(\ln b) - \ln(\ln 2)) = \infty, \text{ so the integral diverges.}
\]

7.4.15 \[ \int_{e^2}^{\infty} \frac{dx}{x \ln^p x} = \lim_{b \to \infty} \int_{e^2}^{b} \frac{dx}{x \ln^p x} = \lim_{b \to \infty} \left( \frac{1}{p} \ln^{1-p} x \right) \bigg|_{e^2}^{b} = \lim_{b \to \infty} \frac{1}{p-1} \left( 2^{1-p} - \ln^1 b \right) = \frac{1}{(p-1)2^{p-1}}.
\]

7.4.16 \[ \int_{0}^{\infty} \frac{x}{\sqrt{x^2+1}} \, dx = \lim_{b \to \infty} \int_{0}^{b} \frac{x}{\sqrt{x^2+1}} \, dx = \lim_{b \to \infty} \left( \frac{5}{8} (x^2 + 1)^{1/5} \right) \bigg|_{0}^{b} = \lim_{b \to \infty} \frac{5}{8} \left( (b^2 + 1)^{1/5} - 1 \right) = \infty,
\text{ so the integral diverges.}
\]

7.4.17
\[
\int_{-\infty}^{\infty} xe^{-x^2} \, dx = \lim_{b \to \infty} \int_{-b}^{0} xe^{-x^2} \, dx + \lim_{b \to \infty} \int_{0}^{b} xe^{-x^2} \, dx
\]
\[
= \lim_{b \to \infty} \left( -\frac{1}{2} e^{-x^2} \right) \bigg|_{-b}^{0} + \lim_{b \to \infty} \left( -\frac{1}{2} e^{-x^2} \right) \bigg|_{0}^{b}
\]
\[
= \lim_{b \to \infty} \left( -\frac{1}{2} + \frac{1}{2} e^{-b^2} \right) + \lim_{b \to \infty} \left( -\frac{1}{2} e^{-b^2} + \frac{1}{2} \right)
\]
\[
= \frac{1}{2} + \frac{1}{2} = 0.
\]

7.4.18 \[ \int_{0}^{\infty} \cos x \, dx = \lim_{b \to \infty} \int_{0}^{b} \cos x \, dx = \lim_{b \to \infty} (\sin x) \bigg|_{0}^{b} = \lim_{b \to \infty} \sin b, \text{ which does not exist so the integral diverges.}
\]

7.4.19 \[ \int_{2}^{\infty} \frac{\cos(x/2)}{x^2} \, dx = \lim_{b \to \infty} \int_{2}^{b} \frac{\cos(x/2)}{x^2} \, dx = \lim_{b \to \infty} \left( -\frac{1}{\pi} \sin \frac{\pi}{x} \right) \bigg|_{2}^{b} = \lim_{b \to \infty} \frac{1}{\pi} \left( 1 - \sin \frac{\pi}{b} \right) = \frac{1}{\pi}.
\]

7.4.20
\[
\int_{-\infty}^{\infty} \frac{dx}{1 + x^2} = \lim_{b \to \infty} \int_{-b}^{0} \frac{dx}{1 + x^2} + \lim_{b \to \infty} \int_{0}^{b} \frac{dx}{1 + x^2}
\]
\[
= \lim_{b \to \infty} \left( \tan^{-1} x \right) \bigg|_{-b}^{0} + \lim_{b \to \infty} \left( \tan^{-1} x \right) \bigg|_{0}^{b}
\]
\[
= \lim_{b \to \infty} (-\tan^{-1} b) + \lim_{b \to \infty} \tan^{-1} b
\]
\[
= \frac{\pi}{2} + \frac{\pi}{2} = \pi.
\]
7.4.1 Using the result from Example 2, we see that the volume is given by 7.4.29. Let us compute it using partial fractions, 7.4.21.

Let \( v \). After substitution we have

\[
\lim_{b \to \infty} \int_1^b \frac{1}{u^2 + 1} \, du = \lim_{b \to \infty} (\tan^{-1} u) \bigg|_1^b = \lim_{b \to \infty} (\tan^{-1} e^b - \tan^{-1} 1) = \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4}.
\]

7.4.22 Using the substitution 7.4.30, we have

\[
\int_2^b \frac{1}{u} \, du = \lim_{b \to \infty} \int_2^b \frac{1}{u} \, du = \lim_{b \to \infty} (\ln u) \bigg|_2^b = \lim_{b \to \infty} (\ln b - \ln 2) = \infty.
\]

The given integral diverges.

7.4.23 Using partial fractions,

\[
\int_1^\infty \frac{dx}{x^2 + 3x + 2} = \lim_{b \to \infty} \int_1^b \frac{dx}{(x + 1)(x + 2)}
\]

\[
= \lim_{b \to \infty} \int_1^b \left( \frac{1}{x + 1} - \frac{1}{x + 2} \right) \, dx
\]

\[
= \lim_{b \to \infty} \left[ \ln |x + 1| - \ln |x + 2| \right]_1^b
\]

\[
= \lim_{b \to \infty} \left( \ln \frac{b + 1}{b + 2} - \ln \frac{2}{3} \right) = \ln 1 - \ln \frac{2}{3} = \ln \frac{3}{2}
\]

7.4.24 Let us compute it using the substitution 7.4.52, we get

\[
\int_2^b \frac{1}{u} \, du = \lim_{b \to \infty} \int_2^b \frac{1}{u} \, du = \lim_{b \to \infty} (\ln u) \bigg|_2^b = \lim_{b \to \infty} (\ln b - \ln 2) = \infty.
\]

The given integral diverges.

7.4.26 Using the substitution 7.4.53, we get

\[
\int_1^\infty \frac{1}{x^2} \sin \frac{x}{x} \, dx = -\frac{1}{\pi} \lim_{b \to \infty} \int_\pi^b \sin u \, du = -\frac{1}{\pi} \lim_{b \to \infty} (-\cos u) \bigg|_\pi^b = -\frac{1}{\pi} \lim_{b \to \infty} (-\cos \frac{\pi}{b} + \cos \pi) = \frac{2}{\pi}.
\]

7.4.27 Using the result from Example 2, we see that the volume is given by 7.4.30, we have

\[
\int_1^\infty \frac{\tan^{-1} x}{x^2 + 1} \, dx = \lim_{b \to \infty} \int_1^b \frac{\tan^{-1} x}{x^2 + 1} \, dx = \lim_{b \to \infty} \left( \frac{1}{2} (\tan^{-1} x)^2 \right) \bigg|_1^b
\]

\[
= \lim_{b \to \infty} \frac{1}{2} \left( (\tan^{-1} b)^2 - \left( \frac{\pi}{4} \right)^2 \right) = \frac{1}{2} \left( \left( \frac{\pi}{2} \right)^2 - \left( \frac{\pi}{4} \right)^2 \right) = \frac{3\pi^2}{32}.
\]

7.4.29 Using the result from Example 2, we see that the volume is given by

\[
V = \pi \int_1^\infty x^{-4} \, dx = \frac{\pi}{4 - 1} = \frac{\pi}{3}.
\]

7.4.30 Let us compute it using the substitution 7.4.54, we get

\[
V = \pi \int_2^b \frac{dx}{x^2 + 1} = \pi \lim_{b \to \infty} \int_2^b \frac{dx}{x^2 + 1} = \pi \lim_{b \to \infty} (\tan^{-1} x) \bigg|_2^b = \pi \left( \frac{\pi}{2} - \tan^{-2} x \right) \approx 1.457.
\]

Copyright © 2014 Pearson Education, Inc.
7.4.31 Using the result from Example 2, we see that the volume is given by

\[ V = \pi \int_1^\infty \left( \frac{1}{x^2} + \frac{1}{x^3} \right) \, dx = \frac{\pi}{2 - 1} + \frac{\pi}{3 - 1} = \frac{3\pi}{2}. \]

7.4.32 Using the shell method gives \( V = 2\pi \int_0^\infty \frac{x}{(x+1)^3} \, dx \), which we do not know how to integrate. So solve for \( x \) and try using the disk method: \( x = y^{-1/3} - 1 \), and the integral is

\[ \pi \int_0^1 \left( y^{-1/3} - 1 \right)^2 \, dy = \pi \lim_{b \to 0} \int_b^1 \left( y^{-2/3} - 2y^{-1/3} + 1 \right) \, dy \]

\[ = \pi \lim_{b \to 0} \left( 3y^{1/3} - 3y^{2/3} + y \right|_b^1 \right) \]

\[ = \pi \left( 3 - 3 + 1 - 3b^{1/3} + 3b^{2/3} - b \right) = \pi. \]

7.4.33 \( V = \pi \int_2^\infty \frac{dx}{x(\ln x)^2} = \pi \lim_{b \to \infty} \int_2^b \frac{dx}{x(\ln x)^2} = \pi \lim_{b \to \infty} \left( -\frac{1}{\ln x} \right|_2^b = \pi \lim_{b \to \infty} \left( \frac{1}{\ln 2} - \frac{1}{\ln b} \right) = \pi \frac{1}{\ln 2}. \]

7.4.34 The volume is given by

\[ V = \pi \int_0^\infty \frac{x}{(x^2 + 1)^{2/3}} \, dx \]

\[ = \pi \lim_{b \to \infty} \int_0^b \frac{x}{(x^2 + 1)^{2/3}} \, dx \]

\[ = \pi \lim_{b \to \infty} \left( \frac{3}{2} (x^2 + 1)^{1/3} \right|_0^b \]

\[ = \pi \lim_{b \to \infty} \frac{3}{2} \left( (b^2 + 1)^{1/3} - 1 \right) = \infty, \]

so the volume is infinite.

7.4.35 \( \int_0^8 \frac{dx}{\sqrt{x}} = \lim_{c \to 0^+} \int_c^8 \frac{x^{-1/3}}{\sqrt{x}} \, dx = \lim_{c \to 0^+} \left( \frac{3}{2} x^{2/3} \right|_c^8 = \frac{3}{2} \lim_{c \to 0^+} (4 - c^{2/3}) = 6. \)

7.4.36 \( \int_0^{\pi/2} \tan \theta \, d\theta = \lim_{c \to \pi/2^-} \int_0^c \tan \theta \, d\theta = \lim_{c \to \pi/2^-} (\ln \sec \theta)|_0^c = \lim_{c \to \pi/2^-} \ln \sec c = \infty \), so the integral diverges.

7.4.37 \( \lim_{c \to 1^+} \int_c^2 \frac{dx}{\sqrt{x - 1}} = \lim_{c \to 1^+} \left( 2\sqrt{x - 1} \right|_c^2 = \lim_{c \to 1^+} (2 - 2\sqrt{c - 1}) = 2. \)

7.4.38 \( \int_{-3}^1 \frac{dx}{(2x + 6)^{2/3}} = \lim_{c \to -3^+} \int_c^1 \frac{x + 6}{(2x + 6)^{2/3}} \, dx = \lim_{c \to -3^+} \left( \frac{3}{2} \sqrt[3]{2x + 6} \right|_c^1 \]

\[ = \lim_{c \to -3^+} \frac{3}{2} \left( 2 - \sqrt[3]{2c + 6} \right) = 3. \]

7.4.39 \( \lim_{b \to (\pi/2)^-} \int_0^b \sec x \, \tan x \, dx = \lim_{b \to (\pi/2)^-} (\sec x)|_0^b = \lim_{b \to (\pi/2)^-} (\sec b - 1) = \infty. \) The given integral diverges.

7.4.40 \( \int_3^4 \frac{dx}{(x - 3)^{3/2}} = \lim_{c \to 3^+} \int_c^4 \frac{1}{(x - 3)^{3/2}} \, dx = \lim_{c \to 3^+} \left( -2(x - 3)^{-1/2} \right|_c^4 = \lim_{c \to 3^+} \left( -2 - (-2(c - 3)^{-1/2}) \right) = \infty. \)

The given integral diverges.
7.4.41 Use the substitution \( u = \sqrt{x} \), so that \( du = \frac{1}{2\sqrt{x}} \, dx \). \( x = c \) corresponds to \( u = \sqrt{c} \) and \( x = 1 \) to \( u = 1 \), so substituting gives

\[
\int_0^1 \frac{e^{\sqrt{x}}}{\sqrt{x}} \, dx = \lim_{c \to 0^+} \int_0^1 e^u \, du = \lim_{c \to \infty} (2e^u)|_1^1 = 2 \lim_{c \to \infty} (e - e^{\sqrt{c}}) = 2(e - 1).
\]

7.4.42 Use the substitution \( u = e^x - 1 \), so that \( du = e^x \, dx \). Then \( x = 0 \) corresponds to \( u = 0 \) and \( x = \ln 3 \) to \( u = 2 \), so we get

\[
\int_0^{\ln 3} \frac{e^x}{(e^x - 1)^{2/3}} \, dx = \int_0^2 u^{-2/3} \, du = \lim_{b \to 0^+} \int_b^2 u^{-2/3} \, du = \lim_{b \to 0^+} 3u^{1/3} |_b^2 = \lim_{b \to 0^+} (3 \cdot 2^{1/3} - 3b^{1/3}) = 3 \cdot 2^{1/3}.
\]

7.4.43 \( \int_0^1 \frac{x^3}{x^4 - 1} \, dx = \lim_{c \to 1^-} \int_0^c \frac{x^3}{x^4 - 1} \, dx = \lim_{c \to 1^-} \left( \frac{1}{4} \ln |x^4 - 1| \right) |_0^c = \frac{1}{4} \lim_{c \to 1^-} \ln |c^4 - 1| = -\infty \), so the integral diverges.

7.4.44 This integral is improper at both limits, so we split it as

\[
\int_1^\infty \frac{dx}{\sqrt{x} - 1} = \int_1^2 \frac{dx}{\sqrt{x} - 1} + \int_2^\infty \frac{dx}{\sqrt{x} - 1}.
\]

If we let \( u = x - 1 \) in the second integral on the right we obtain after the substitution \( u = x - 1 \) and \( du = dx \)

\[
\int_2^\infty \frac{du}{u^{1/3}},
\]

which diverges using the result in Example 2. Therefore the original integral diverges.

7.4.45

\[
\int_0^{10} \frac{dx}{\sqrt{10 - x}} = \lim_{c \to 10^-} \int_0^c \frac{(10 - x)^{-1/4}}{dx} = \lim_{c \to 10^-} \left( -\frac{4}{3} (10 - x)^{3/4} \right)_0^c = \frac{4}{3} \lim_{c \to 10^-} \left( 10^{3/4} - (10 - c)^{3/4} \right) = \frac{4}{3} 10^{3/4}.
\]

7.4.46 This integral is improper at the point \( x = 3 \), so we split it as

\[
\int_1^{11} \frac{dx}{(x - 3)^{2/3}} = \int_1^3 \frac{dx}{(x - 3)^{2/3}} + \int_3^{11} \frac{dx}{(x - 3)^{2/3}}
\]

and evaluate each integral separately:

\[
\int_1^3 \frac{dx}{(x - 3)^{2/3}} = \lim_{c \to 3^-} \int_1^c (x - 3)^{-2/3} \, dx = \lim_{c \to 3^-} \left( 3(x - 3)^{1/3} \right)_1^c = 3 \lim_{c \to 3^-} \left( 2^{1/3} - (3 - c)^{1/3} \right) = 3 \cdot 2^{1/3}
\]

\[
\int_3^{11} \frac{dx}{(x - 3)^{2/3}} = \lim_{c \to 3^+} \int_c^{11} (x - 3)^{-2/3} \, dx = \lim_{c \to 3^+} \left( 3(x - 3)^{1/3} \right)_c^{11} = 3 \lim_{c \to 3^+} \left( 8^{1/3} - (c - 3)^{1/3} \right) = 6,
\]

so

\[
\int_1^{11} \frac{dx}{(x - 3)^{2/3}} = 6 + 3 \cdot 2^{1/3}.
\]

7.4.47 \( \int_0^1 \ln x^2 \, dx = 2 \lim_{c \to 0^+} \int_c^1 \ln x \, dx = 2 \lim_{c \to 0^+} (\ln x - x)|_c^1 = 2 \lim_{c \to 0^+} (-1 - c \ln c + c) \). The last term clearly has limit zero as \( c \to 0 \). For the middle term, we have by L'Hôpital's rule

\[
\lim_{c \to 0^+} c \ln c = \lim_{c \to 0^+} \frac{\ln c}{c^{-1}} = \lim_{c \to 0^+} \frac{c^{-1}}{-c^{-2}} = \lim_{c \to 0^+} (-c) = 0.
\]

Since the last two terms go to zero, the result of the limit, and the integral, is \( 2 \cdot (-1) = -2 \).
7.4.48 The integrand has a discontinuity at $x = 2$. Splitting the integral gives

\[
\int_{-2}^{6} \frac{dx}{\sqrt{|x - 2|}} = \lim_{c \to 2^-} \int_{-2}^{c} \frac{dx}{\sqrt{|x - 2|}} + \lim_{c \to 2^+} \int_{c}^{6} \frac{dx}{\sqrt{|x - 2|}} = \lim_{c \to 2^-} \int_{-2}^{c} \frac{dx}{\sqrt{x - 2}} + \lim_{c \to 2^+} \int_{c}^{6} \frac{dx}{\sqrt{x - 2}}.
\]

Evaluating these integrals we get

\[
\lim_{c \to 2^-} \int_{-2}^{c} \frac{dx}{\sqrt{|x - 2|}} = \lim_{c \to 2^-} \left(-2(2-x)^{1/2}\right) \bigg|_{-2}^{c} = 4 - \lim_{c \to 2^-} \left(-2(2-c)^{1/2}\right) = 4
\]

\[
\lim_{c \to 2^+} \int_{c}^{6} \frac{dx}{\sqrt{x - 2}} = \lim_{c \to 2^+} \left(2(x-2)^{1/2}\right) \bigg|_{c}^{6} = 4 - \lim_{c \to 2^+} 2(c-2)^{1/2} = 4.
\]

Thus the value of the integral is $4 + 4 = 8$.

7.4.49 Since the integrand is discontinuous at both ends, split it into two integrals to get

\[
\int_{-2}^{2} \frac{x \, dx}{\sqrt{4-x^2}} = \lim_{c \to 0^-} \int_{-2}^{c} \frac{x \, dx}{\sqrt{4-x^2}} + \lim_{c \to 0^+} \int_{c}^{2} \frac{x \, dx}{\sqrt{4-x^2}}
\]

\[
= \lim_{c \to 0^-} \left(-(4-x^2)^{1/2}\right) \bigg|_{-2}^{c} + \lim_{c \to 0^+} \left(-(4-x^2)^{1/2}\right) \bigg|_{c}^{2}
\]

\[
= \lim_{c \to 0^-} \left(-(4-c^2)^{1/2}\right) + \lim_{c \to 0^+} \left((4-c^2)^{1/2}\right)
\]

\[
= -2 + 2 = 0.
\]

7.4.50 Since the integrand is discontinuous at $x = 1$, split it into two integrals to get

\[
\int_{0}^{9} \frac{dx}{(x-1)^{1/3}} = \lim_{c \to 1^-} \int_{0}^{c} \frac{dx}{(x-1)^{1/3}} + \lim_{c \to 1^+} \int_{c}^{9} \frac{dx}{(x-1)^{1/3}}
\]

\[
= \lim_{c \to 1^-} \left( \frac{3}{2} (x-1)^{2/3} \right) \bigg|_{0}^{c} + \lim_{c \to 1^+} \left( \frac{3}{2} (x-1)^{2/3} \right) \bigg|_{c}^{9}
\]

\[
= \lim_{c \to 1^-} \left( \frac{3}{2} (c-1)^{2/3} - (-1)^{2/3} \right) + \lim_{c \to 1^+} \left( \frac{3}{2} (8^{2/3} - (c-1)^{2/3}) \right)
\]

\[
= -\frac{3}{2} + \frac{3}{2} - 4 = 9 - 4 = 5/2.
\]

7.4.51

\[
V = \pi \int_{1}^{2} (x-1)^{-1/2} \, dx = \pi \lim_{c \to 1^+} \int_{c}^{2} (x-1)^{-1/2} \, dx = \pi \lim_{c \to 1^+} \left(2(x-1)^{1/2}\right) \bigg|_{c}^{2}
\]

\[
= 2\pi \lim_{c \to 1^+} (1 - \sqrt{c - 1}) = 2\pi.
\]

7.4.52

\[
V = 2\pi \int_{1}^{2} x(x^2 - 1)^{-1/4} \, dx = 2\pi \lim_{c \to 1^+} \int_{c}^{2} x(x^2 - 1)^{-1/4} \, dx = \pi \lim_{c \to 1^+} \left(\frac{4}{3} (x^2 - 1)^{3/4}\right) \bigg|_{c}^{2}
\]

\[
= \frac{4}{3} \pi \lim_{c \to 1^+} \left(3^{3/4} - (c^2 - 1)^{3/4}\right) = \frac{4\pi}{3^{1/4}}.
\]

7.4.53 Use the shell method, so that

\[
V = 2\pi \int_{0}^{4} x(4-x)^{-1/3} \, dx.
\]
Now use the substitution \( u = 4 - x \), so that \( x = 4 - u \) and \( du = -dx \). Then \( x = 0 \) corresponds to \( u = 4 \) while \( x = c \) corresponds to \( u = 4 - c \). Then

\[
V = 2\pi \int_0^4 x(4 - x)^{-1/3} \, dx
\]

\[
= 2\pi \lim_{c \to 4^-} \int_0^c x(4 - x)^{-1/3} \, dx
\]

\[
= -2\pi \lim_{c \to 4^-} \int_4^{4-c} (4 - u)u^{-1/3} \, du
\]

\[
= -2\pi \lim_{c \to 4^-} \int_4^{4-c} (4u^{-1/3} - u^{2/3}) \, du
\]

\[
= -2\pi \lim_{c \to 4^-} \left[ \frac{6u^{2/3}}{2} - \frac{3}{5} u^{5/3} \right]_4^{4-c}
\]

\[
= -2\pi \lim_{c \to 4^-} \left( 6(4 - c)^{2/3} - \frac{3}{5} (4 - c)^{5/3} - 6 \cdot 4^{2/3} + \frac{3}{5} \cdot 4^{5/3} \right)
\]

\[
= -2\pi \left( -6 \cdot 4^{2/3} + \frac{3}{5} \cdot 4 \cdot 4^{2/3} \right) = 2\pi \left( \frac{18}{5} \cdot 2^{4/3} \right) = \frac{72\pi}{5} \cdot 2^{1/3}.
\]

**7.4.54** Using the disk method, the radius of each disk is \((x + 1)^{-3/2} -(−1) = 1 + (x + 1)^{-3/2}, so the volume is

\[
V = \pi \int_{-1}^{1} \left( 1 + (x + 1)^{-3/2} \right)^2 \, dx
\]

\[
= \pi \int_{-1}^{1} \left( 1 + 2(x + 1)^{-3/2} + \frac{1}{(x + 1)^3} \right) \, dx
\]

\[
= \pi \lim_{c \to -1^+} \int_c^{1} \left( 1 + 2(x + 1)^{-3/2} + \frac{1}{(x + 1)^3} \right) \, dx
\]

\[
= \pi \lim_{c \to -1^+} \left( x - \frac{4}{(x + 1)^{1/2}} - \frac{1}{2(x + 1)^2} \right)_{c}^{1}
\]

\[
= \pi \lim_{c \to -1^+} \left( 1 - \frac{4}{\sqrt{2}} - \frac{1}{8} - c + \frac{4}{(c + 1)^{1/2}} + \frac{1}{2(c + 1)^2} \right).
\]

Each of the last two terms of this limit diverges to \( \infty \) as \( c \to -1^+ \), so the integral diverges and the volume is infinite.

**7.4.55** Notice that this curve is symmetric in both the \( x \) and \( y \)-axes, so it suffices to find the length of the part of the curve in the first quadrant, which joins the points \((8,0)\) and \((0,8)\). Solving for \( y \) gives \( y = (4 - x^{2/3})^{3/2} \), so \( y' = (4 - x^{2/3})^{1/2}x^{-1/3} \) and \( \sqrt{1 + (y')^2} = \sqrt{\frac{4 - x^{2/3}}{x^{2/3}}} + 1 = \sqrt{\frac{4}{x^{2/3}}} = 2x^{-1/3} \), so the length of the part of the curve in the first quadrant is

\[
L = 2 \int_0^8 x^{-1/3} \, dx = 2 \lim_{c \to 0^+} \int_c^8 x^{-1/3} \, dx = 2 \lim_{c \to 0^+} \left( \frac{3}{2}x^{2/3} \right)_{c}^{8} = 12.
\]

Therefore the entire curve has length 48.

**7.4.56** It suffices to find the length of the quarter-circle given by \( y = \sqrt{a^2 - x^2} \) where \( 0 \leq x \leq a \) and then multiply by 4. We have \( y' = -x/\sqrt{a^2 - x^2} \), so \( \sqrt{1 + (y')^2} = \sqrt{1 + \frac{x^2}{a^2 - x^2}} = \sqrt{\frac{a^2}{a^2 - x^2}} = \frac{a}{\sqrt{a^2 - x^2}} \), and the quarter-circle has length

\[
L = a \int_0^a \frac{dx}{\sqrt{a^2 - x^2}} = a \lim_{c \to a^-} \int_0^c \frac{dx}{\sqrt{a^2 - x^2}} = a \lim_{c \to a^-} \left( \sin^{-1} \frac{x}{a} \right)_{0}^{c} = \frac{a\pi}{2},
\]

so a circle of radius \( a \) has circumference \( 2\pi a \).
As in Example 7, we have
\[
\text{AUC}_i = \int_0^\infty C_i(t) \, dt = 250 \int_0^\infty e^{-0.08t} \, dt = \frac{250}{0.08} = 3125
\]
\[
\text{AUC}_o = \int_0^\infty C_o(t) \, dt = 200 \int_0^\infty (e^{-0.08t} - e^{-1.8t}) \, dt = 200 \left( \frac{1}{0.08} - \frac{1}{1.8} \right) = \frac{21500}{9} \approx 2389
\]
(here we use the fact that \(\int_0^\infty e^{-ax} \, dx = \frac{1}{a}\) for \(a > 0\)). Therefore the bioavailability of the drug is
\[
F = \frac{\text{AUC}_o}{\text{AUC}_i} = \frac{21500}{9 \cdot 3125} \approx 0.764.
\]

The total amount of water drained is \(W = 100 \int_0^\infty e^{-0.05t} \, dt = \frac{100}{0.05} = 2000\) gal (here we use the fact that \(\int_0^\infty e^{-ax} \, dx = \frac{1}{a}\) for \(a > 0\)).

The maximum distance is
\[
D = 10 \int_0^\infty (t+1)^{-2} \, dt = 10 \lim_{b \to \infty} \int_0^b (t+1)^{-2} \, dt = 10 \lim_{b \to \infty} \left( -(t+1)^{-1} \right) \bigg|_0^b = 10 \text{ mi}.
\]

If the extraction continues indefinitely, the total amount of oil extracted is
\[
A = r_0 \int_0^\infty e^{-kt} \, dt = \frac{r_0}{k} = \frac{10^7}{0.005} = 2 \times 10^9 \text{ barrels},
\]
which is the amount in the reserve; therefore the reserve is never exhausted, but the remaining amount of oil in the reserve approaches 0 as \(t \to \infty\). (Note that here we used the fact that \(\int_0^\infty e^{-ax} \, dx = \frac{1}{a}\) for \(a > 0\)).

a. True. The area under the curve \(y = f(x)\) from 0 to \(\infty\) is less than the area under \(y = g(x)\) on this interval, which by assumption is finite.

b. False. For example, take \(f(x) = 1\); then \(\int_0^\infty f(x) \, dx = \infty\).

c. False. For example, take \(p = \frac{1}{2}\) and \(q = 1\).

d. True. The area under the curve \(y = x^{-q}\) from 1 to \(\infty\) is less than the area under \(y = x^{-p}\) on this interval, which by assumption is finite.

e. True. Using the result in Example 2, we see that this integral exists if and only if \(3p + 2 > 1\), which is equivalent to \(p > -\frac{1}{3}\).

a. The function \(e^{-|x|}\) is even, so \(\int_{-\infty}^{\infty} e^{-|x|} \, dx = 2 \int_0^{\infty} e^{-x} \, dx = 2\). (Note that here we used the fact that \(\int_0^\infty e^{-ax} \, dx = \frac{1}{a}\) for \(a > 0\)).

b. The function \(\frac{x^3}{1 + x^8}\) is odd, so
\[
\int_{-\infty}^{\infty} \frac{x^3}{1 + x^8} \, dx = \int_0^{\infty} \frac{x^3}{1 + x^8} \, dx + \int_{-\infty}^{0} \frac{x^3}{1 + x^8} \, dx = \int_0^{\infty} \frac{x^3}{1 + x^8} \, dx - \int_0^{\infty} \frac{x^3}{1 + x^8} \, dx = 0
\]
assuming \(\int_0^{\infty} \frac{x^3}{1 + x^8} \, dx\) exists, which it does because \(0 < \frac{x^3}{1 + x^8} < \frac{1}{x^5}\) on \([1, \infty)\) and \(\int_1^{\infty} x^{-5} \, dx\) exists.

### 7.4. IMPROPER INTEGRALS

7.4.64 Let \( u = \ln x \), so that \( du = \frac{1}{x} \, dx \). Then we have \( \int_{\ln 2}^{\infty} \frac{du}{x^p} \), which exists if and only if \( p > 1 \), from the result in Example 2.

7.4.65 Let \( T_n(n) \) be the result of using the Trapezoid Rule to approximate \( \int_0^R e^{-x^2} \, dx \) with \( n \) trapezoids. Then we get

<table>
<thead>
<tr>
<th>( n )</th>
<th>( T_2(n) )</th>
<th>( T_4(n) )</th>
<th>( T_8(n) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>0.881</td>
<td>0.886</td>
<td>1.037</td>
</tr>
<tr>
<td>8</td>
<td>0.882</td>
<td>0.886</td>
<td>0.886</td>
</tr>
<tr>
<td>16</td>
<td>0.882</td>
<td>0.886</td>
<td>0.886</td>
</tr>
<tr>
<td>32</td>
<td>0.882</td>
<td>0.886</td>
<td>0.886</td>
</tr>
</tbody>
</table>

Based on these results, we conclude that \( \int_0^\infty e^{-x^2} \, dx \approx 0.886 \).

7.4.66 Integration by parts with \( u = x \) and \( dv = e^{-x} \, dx \) gives

\[
\int x e^{-x} \, dx = -xe^{-x} - \int (-e^{-x}) \, dx = -(x + 1)e^{-x} + C,
\]

so

\[
\int_0^\infty x e^{-x} \, dx = \lim_{b \to \infty} \int_0^b x e^{-x} \, dx = \lim_{b \to \infty} (-x + 1)e^{-x} \bigg|_0^b = \lim_{b \to \infty} (1 - (b + 1)e^{-b}) = 1.
\]

7.4.67 Integration by parts with \( u = \ln x \) and \( dv = x, \, dx \) gives

\[
\int x \ln x \, dx = \frac{1}{2} x^2 \ln x - \int \left( \frac{1}{2} x^2 \cdot \frac{1}{x} \right) \, dx = \frac{1}{2} x^2 \ln x - \frac{1}{2} \int x \, dx = \frac{x^2}{4} (2 \ln x - 1) + C,
\]

so

\[
\int_0^1 x \ln x \, dx = \lim_{c \to 0^+} \int_c^1 x \ln x \, dx = \lim_{c \to 0^+} \left( \frac{x^2}{4} (2 \ln x - 1) \right) \bigg|_c^1 = \frac{1}{4} \lim_{c \to 0^+} (c^2 (-2 \ln c + 1) - 1) = -\frac{1}{4}.
\]

Note that \( \lim_{c \to 0^+} c^2 \ln c = 0 \) follows from L’Hôpital’s rule:

\[
\lim_{c \to 0^+} c^2 \ln c = \lim_{c \to 0^+} \frac{\ln c}{c^{-2}} = \lim_{c \to 0^+} \frac{c^{-1}}{-2c^{-3}} = \lim_{c \to 0^+} \left( -\frac{c^2}{2} \right) = 0.
\]

7.4.68 Integration by parts with \( u = \ln x \) and \( dv = \frac{1}{x^2} \, dx \) gives

\[
\int \frac{\ln x}{x^2} \, dx = -\frac{\ln x}{x} - \int \left( -\frac{1}{x} \cdot \frac{1}{x} \right) \, dx = -\frac{\ln x + 1}{x} + C,
\]

so

\[
\int_1^\infty \frac{\ln x}{x^2} \, dx = \lim_{b \to \infty} \int_1^b \frac{\ln x}{x^2} \, dx = \lim_{b \to \infty} \left( -\frac{\ln x + 1}{x} \right) \bigg|_1^b = \lim_{b \to \infty} \left( 1 - \frac{\ln b + 1}{b} \right) = 1,
\]

since \( \lim_{b \to \infty} \frac{\ln b}{b} = 0 \) because powers grow faster than logs.

7.4.69

Let \( u = x^2 \) so that \( 2x \, dx = du \). The first integral is then equal to \( \frac{1}{2} \int_0^\infty e^{-u} \, du = \frac{1}{2} \), using the fact that \( \int_0^\infty e^{-ax} \, dx = \frac{1}{a} \) for \( a > 0 \). The second integral cannot be evaluated by finding an antiderivative for \( x^2 e^{-x^2} \); however using more advanced methods it can be shown that \( \int_0^\infty x^2 e^{-x^2} \, dx = \frac{\sqrt{\pi}}{4} \approx 0.443 \).
7.4.70 The region $R$ has area $A = \int_1^\infty x^{-p} \, dx - \int_1^\infty x^{-q} \, dx = \frac{1}{p-1} - \frac{1}{q-1}$, using the result in Example 2.

7.4.71 The region $R$ has area $A = \int_0^\infty e^{-bx} \, dx - \int_0^\infty e^{-ax} \, dx = \frac{1}{b} - \frac{1}{a}$.

7.4.72 We have $A(a) = \int_0^\infty e^{-ax} \, dx = \frac{1}{a}$, which is a decreasing function on $a > 0$.

7.4.73

a. We have

$$A(a, b) = \int_b^\infty e^{-ax} \, dx = \lim_{c \to \infty} \int_b^c e^{-ax} \, dx = \lim_{c \to \infty} \left( -\frac{1}{a} e^{-ax} \right) \bigg|_b^c = \frac{1}{a} \lim_{c \to \infty} (e^{-ab} - e^{-ac}) = \frac{e^{-ab}}{a}.$$ 

b. Solving $e^{-ab} = 2a$ for $b$ gives $b = g(a) = -\frac{1}{a} \ln 2a$.

c. The function $g$ has $g'(x) = \frac{1}{a^2} \ln 2x - \frac{1}{a^2} = \frac{\ln 2x - 1}{a^2}$, so $g$ has a critical point at $x = \frac{e}{2}$, and the first derivative test shows that $g$ takes a minimum at this point. Hence $b^* = g\left(\frac{e}{2}\right) = -\frac{2}{e}.$

7.4.74 First, assume $p \neq 1$. Then

$$\int_0^1 x^{-p} \, dx = \lim_{c \to 0^+} \int_c^1 x^{-p} \, dx = \lim_{c \to 0^+} \left( \frac{x^{1-p}}{1-p} \right) \bigg|_c^1 = \frac{1}{1-p} \lim_{c \to 0^+} (1 - c^{1-p}).$$

This is $\frac{1}{1-p}$ when $p < 1$ and is infinite otherwise. In the case $p = 1$ we have

$$\int_0^1 x^{-1} \, dx = \lim_{c \to 0^+} \int_c^1 x^{-1} \, dx = \lim_{c \to 0^+} (\ln x) \bigg|_c^1 = \lim_{c \to 0^+} (-\ln c) = \infty,$$

so the integral exists if and only if $p < 1$.

7.4.75

a. The solid has volume $V = \pi \int_0^1 x^{-2p} \, dx$, which by the result in problem 74 is finite if and only if $2p < 1$, or $p < \frac{1}{2}$.

b. The solid has volume $V = 2\pi \int_0^1 x^{1-p} \, dx$, which by the result in problem 74 is finite if and only if $p - 1 < 1$, or $p < 2$.

7.4.76

a. The solid has volume $V = \pi \int_1^\infty x^{-2p} \, dx$, which by the result in Example 2 is finite if and only if $2p > 1$, or $p > \frac{1}{2}$.

b. The solid has volume $V = 2\pi \int_1^\infty x^{1-p} \, dx$, which by the result in Example 2 is finite if and only if $p - 1 > 1$, or $p > 2$.  

Copyright © 2014 Pearson Education, Inc.
7.4.77 These integrals cannot be evaluated by finding an antiderivative of their integrands. They can be evaluated numerically, or the following method can be used: note first that using the substitution \( u = \frac{\pi}{2} - x \) gives
\[
\int_0^{\pi/2} \ln \sin x \, dx = -\int_0^{\pi/2} \ln \cos u \, du = \int_0^{\pi/2} \ln \cos x \, dx.
\]
We also have
\[
\int_{\pi/2}^{\pi} \ln \sin x \, dx = \int_0^{\pi/2} \ln \left( x + \frac{\pi}{2} \right) \, dx = \int_0^{\pi/2} \ln \cos x \, dx,
\]
and therefore
\[
\int_0^{\pi/2} \ln \sin x \, dx = \frac{1}{2} \int_0^{\pi} \ln \sin x \, dx
\]
\[
= \int_0^{\pi/2} \ln \sin 2u \, du \quad \text{(use } u = 2x)\]
\[
= \int_0^{\pi/2} (\ln \sin u + \ln \cos u + \ln 2) \, du \quad \text{(since } \sin 2u = 2 \sin u \cos u)\]
\[
= \int_0^{\pi/2} \ln \sin u \, du + \int_0^{\pi/2} \ln \cos u \, du + \int_0^{\pi/2} \ln 2 \, du.
\]
This implies
\[
\int_0^{\pi/2} \ln \cos x \, dx = -\int_0^{\pi/2} \ln 2 \, dx = -\frac{\pi \ln 2}{2},
\]
and thus that \( \int_0^{\pi/2} \ln \sin x \, dx = -\frac{\pi \ln 2}{2} \) as well.

7.4.78 This integral cannot be evaluated by finding an antiderivative of the integrand; however the result may be verified by numerical approximation.

7.4.79 This integral cannot be evaluated by finding an antiderivative of the integrand; however the result may be verified by numerical approximation.

7.4.80 This integral cannot be evaluated by finding an antiderivative of the integrand; however the result may be verified by numerical approximation.

7.4.81 We have the relation
\[
B = I \int_0^\infty e^{-rt} \, dt = \frac{1}{r},
\]
using the result that \( \int_0^\infty e^{-ax} \, dx = \frac{1}{a} \) for \( a > 0 \). Therefore \( B = \frac{0.009}{0.12} \approx 41.667 \).

7.4.82 The rate at which water is draining from the tank is given by \( r(t) = 100(0.95)^t = 100e^{\ln(0.95)t} \), so the total amount of water drained from the tank is \( W = 100 \int_0^\infty e^{\ln(0.95)t} \, dt = \frac{100}{\ln(0.95)} \approx 1950 \) gal, using the result that \( \int_0^\infty e^{-ax} \, dx = \frac{1}{a} \) for \( a > 0 \). Therefore the full 3,000 gallon tank cannot be emptied at this rate.

7.4.83
a. We have
\[
\int_0^\infty e^{-ax} \cos bx \, dx = \lim_{c \to \infty} \int_0^c e^{-ax} \cos bx \, dx = \lim_{c \to \infty} \left. \left( \frac{e^{-ax}(b \sin bx - a \cos bx)}{a^2 + b^2} \right) \right|_0^c
\]
\[
= \lim_{c \to \infty} \left( a + e^{-ac}(b \sin bc - a \cos bc) \right) = a + \frac{a}{a^2 + b^2}.
\]

b. We have
\[
\int_0^\infty e^{-ax} \sin bx \, dx = \lim_{c \to \infty} \int_0^c e^{-ax} \sin bx \, dx = \lim_{c \to \infty} \left. \left( \frac{e^{-ax}(a \sin bx + b \cos bx)}{a^2 + b^2} \right) \right|_0^c
\]
\[
= \lim_{c \to \infty} \left( b - e^{-ac}(a \sin bc + b \cos bc) \right) = b + \frac{b}{a^2 + b^2}.
\]
7.4.84
a. We will make use of the result \[ \int_b^\infty e^{-at} \, dt = \frac{e^{-ab}}{a} \] for \( a > 0 \) (this is derived in problem 73). The probability that a chip fails after 15,000 hours of operation (or equivalently, lasts at least 15,000 hours) is
\[
p = 0.00005 \int_{15,000}^\infty e^{-0.00005t} \, dt = e^{-0.00005 \cdot 15,000} \approx 0.472.
\]
b. The probability that a chip fails after 30,000 hours of operation is
\[
p = 0.00005 \int_{30,000}^\infty e^{-0.00005t} \, dt = e^{-0.00005 \cdot 30,000} \approx 0.223.
\]
Of the chips that are still operating at 15,000 hours, the fraction that operate for at least another 15,000 hours is \( \approx 0.223 \cdot 0.472 \approx 0.472 \).
c. From part a, we see that \( 0.00005 \int_0^\infty e^{-0.00005t} \, dt = 1 \), which can be interpreted as meaning that all the chips are working initially.

7.4.85 Evaluate the improper integral:
\[
\int_0^\infty te^{at} \, dt = \lim_{b \to \infty} \int_0^b te^{at} \, dt = \lim_{b \to \infty} \left( -\frac{e^{at}(at+1)}{a^2} \right) \bigg|_0^b = \frac{1}{a^2} \lim_{b \to \infty} (1 - e^{-ab}(ab+1)) = \frac{1}{a^2},
\]
provided \( a > 0 \). Therefore \( 0.00005 \int_0^\infty e^{-0.00005t} \, dt = \frac{0.00005}{0.00005} = 20,000 \text{ hrs.} \)

7.4.86
a. Evaluate the improper integral:
\[
\int_0^\infty xe^{-cx} \, dx = \lim_{b \to \infty} \int_0^b xe^{-cx} \, dx = \lim_{b \to \infty} \left( -\frac{e^{-cx}(cx+1)}{c^2} \right) \bigg|_0^b = \frac{1}{c^2} \lim_{b \to \infty} (1 - e^{-cb}(cb+1)) = \frac{1}{c^2},
\]
provided \( c > 0 \). We also have \( \int_0^\infty e^{-cx} \, dx = \frac{1}{c} \) for \( c > 0 \). Hence \( \overline{x} = \frac{1}{c} = \frac{1}{2} \) for the case \( c = 2 \). A sketch of the region is

b. The curve \( y = e^{-2x} \) has slope \(-2\) at \( x = 0 \), so the equation of the tangent line at \((0,1)\) is \( y = 1 - 2x \). Similarly, the equation of the tangent line to \( y = -e^{-2x} \) at \((0,-1)\) is \( y = -1 + 2x \).
c. Both tangent lines intersect the \( x \)-axis at \( x = \frac{1}{2} \).
d. More generally, in the case \( a = 0 \) the center of mass is \( \overline{x} = \frac{1}{c} \) and the tangent lines at \((0 \pm 1)\) have equations \( y = \pm(1 - cx) \), so both tangent lines meet the \( x \)-axis at the center of mass. The case for arbitrary \( a \) can be reduced to the case \( a = 0 \) by a horizontal shift.

7.4.87
a. We have \( W = Gm \int_R^\infty x^{-2} \, dx = Gm \lim_{b \to \infty} \left( -\frac{1}{x} \right) \bigg|_R^b = \frac{GMm}{R} \approx 6.279 \times 10^7 \text{ m J.} \)
b. Solve \( \frac{1}{2}v_e^2 = 6.279 \times 10^7 \) to obtain \( v_e \approx 11.207 \) km/s.

b. \( \frac{GM}{r} \geq \frac{1}{2}v_e^2 \iff R \leq \frac{2GM}{v_e^2} \approx 9 \) mm.

7.4.88 Let \( r_0 \) be the radius of the nucleus. The work required to bring a free proton to the edge of the nucleus is given by

\[
W = kQq \int_{r_0}^{\infty} r^{-2} \, dr = kQq \lim_{b \to \infty} \left( -\frac{1}{r} \right) \bigg|_b^{\infty} = \frac{kQq}{r_0} = 50kq^2 r_0 = 1.92 \times 10^{-16} \text{ N m.}
\]

7.4.89

\( a. \)

\[
\int_0^1 \frac{dy}{\sqrt{1 - y^2}} = \int_0^1 \sqrt{1 - y^2} \, dy = \frac{\sin^{-1} x}{\sqrt{1 - x^2}} = \frac{\pi}{2}
\]

b. The areas are \( \sqrt{2\pi}, \sqrt{\pi}, \sqrt{\frac{\pi}{2}} \) respectively.

\( c. \) Completing the square gives

\[
a x^2 + bx + c = a \left( x + \frac{b}{2a} \right)^2 + \frac{4ac - b^2}{4a},
\]

and therefore

\[
\int_{-\infty}^{\infty} e^{-(ax^2+bx+c)} \, dx = e^{(b^2-4ac)/(4a)} \int_{-\infty}^{\infty} e^{-a(x+(b/2a))^2} \, dx.
\]

Make the substitution \( y = x + \frac{b}{2a} \) to obtain

\[
\int_{-\infty}^{\infty} e^{-(ax^2+bx+c)} \, dx = e^{(b^2-4ac)/(4a)} \int_{-\infty}^{\infty} e^{-ay^2} \, dy = e^{(b^2-4ac)/(4a)} \sqrt{\frac{\pi}{a}}.
\]

7.4.90 The Laplace transform of \( f(t) = 1 \) is given by \( F(s) = \int_0^\infty e^{-st} \, dt = \frac{1}{s} \).

7.4.91 The Laplace transform of \( f(t) = e^{at} \) is given by \( F(s) = \int_0^\infty e^{-st} e^{at} \, dt = \int_0^\infty e^{-(s-a)t} \, dt = \frac{1}{s-a} \), using the formula \( \int_0^\infty e^{-cx} \, dx = \frac{1}{c} \) for \( c > 0 \).

7.4.92 The Laplace transform of \( f(t) = t \) is given by \( F(s) = \int_0^\infty te^{-st} \, dt = \frac{1}{s^2} \) (this formula is derived in the solution to problem 86).

7.4.93 The Laplace transform of \( f(t) = \sin at \) is given by \( F(s) = \int_0^\infty e^{-st} \sin at \, dt = \frac{a}{s^2 + a^2} \) (this formula is derived in the solution to problem 83 b).

7.4.94 The Laplace transform of \( f(t) = \cos at \) is given by \( F(s) = \int_0^\infty e^{-st} \cos at \, dt = \frac{s}{s^2 + a^2} \) (this formula is derived in the solution to problem 83 a).

7.4.95

a. Make the substitution \( x = y + 2 \); then

\[
\int_{1}^{3} \frac{dx}{\sqrt{(x-1)(3-x)}} = \int_{-1}^{1} \frac{dy}{\sqrt{1 - y^2}} = 2 \int_{0}^{1} \frac{dy}{\sqrt{1 - y^2}} = 2 \lim_{c \to 1^-} \left( \sin^{-1} x \right) = \pi.
\]
b. The substitution \( y = e^x \) gives
\[
\int_1^\infty \frac{dx}{e^{x+1} + e^{3-x}} = \frac{1}{e} \int_1^\infty \frac{e^x dx}{e^{2x} + e^2} = \frac{1}{e} \int_1^\infty \frac{dy}{y^2 + e^2} = \frac{1}{e} \lim_{b \to \infty} \left( \frac{1}{e} \tan^{-1}\left(\frac{y}{e}\right)\right) \bigg|_1^b = \frac{\pi}{4e^2}.
\]

7.4.96 Using integration by parts, we have
\[
\int_0^1 \ln x \, dx = \lim_{c \to 0^+} (x \ln x - x)^1_c = \lim_{c \to 0^+} (-1 - c \ln c + c) = -1.
\]
The integral is the (signed) area of the region in the fourth quadrant between the \( y \)-axis and the curve \( y = \ln x \); this region is identical to the region under the curve \( y = e^{-x} \) in the first quadrant. Hence \( \int_0^1 \ln x \, dx = - \int_0^\infty e^{-x} \, dx = -1 \).

7.4.97 Since \( p > 0 \), the functions \( 1/(x^p + x^{-p}) \) and \( 1/x^p \) have the same growth rate as \( x \to \infty \); therefore by the result in Example 2, we have \( \int_0^\infty \frac{dx}{x^p + x^{-p}} < \infty \iff p > 1 \).

7.4.98
a. Repeatedly applying this reduction formula gives \( \Gamma(p+1) = p(p-1) \cdots 2 \cdot 1 \cdot \int_0^\infty e^{-x} \, dx = p! \cdot 1 = p! \).

b. We have \( \Gamma\left(\frac{1}{2}\right) = \int_0^\infty x^{-1/2}e^{-x} \, dx = 2 \int_0^\infty e^{-u^2} \, du = \sqrt{\pi} \).

7.4.99
a. Integrate by parts with \( u = \sqrt{x} \ln x \) and \( v = -1/(1+x) \):
\[
\int_0^\infty \frac{\sqrt{x} \ln x}{(1+x)^2} \, dx = \frac{1}{2} \int_0^\infty \frac{\ln x + 2}{\sqrt{x}(x+1)} \, dx = \frac{1}{2} \int_0^\infty \frac{\ln x}{\sqrt{x}(x+1)} \, dx + \int_0^\infty \frac{dx}{\sqrt{x}(x+1)}
\]
(the integration by parts is legitimate for this improper integral because the product \( uv \) has limit 0 as \( x \to \infty \) and as \( x \to 0^+ \)).

b. Let \( y = \frac{1}{x} \). Then \( dy = -\frac{1}{x^2} \, dx \).

c. We have
\[
\int_0^1 \frac{\ln x}{\sqrt{x}(x+1)} \, dx = \int_0^1 \frac{\ln y}{\sqrt{y}(1+y)} \cdot \left( -\frac{dy}{y^2} \right) = -\int_0^\infty \frac{\ln y}{\sqrt{y}(1+y)} \, dy.
\]
Placing both integrals on the left-hand side of the equals sign and then combining them gives
\[
\int_0^\infty \frac{\ln x}{\sqrt{x}(x+1)} \, dx = 0.
\]
d. The change of variables \( z = \sqrt{x} \) gives
\[
\int_0^\infty \frac{dx}{\sqrt{x}(x+1)} = 2 \int_0^\infty \frac{dz}{z^2 + 1} = \pi.
\]

7.4.100
a. We have \( \frac{1}{n} \ln n! - \ln n = (\frac{1}{n} \sum_{k=1}^n \ln k) - \ln n = \frac{1}{n} \sum_{k=1}^n (\ln k - \ln n) = \frac{1}{n} \sum_{k=1}^n \ln \left( \frac{k}{n} \right) \).

b. This is the right-hand Riemann sum for the integral \( \int_0^1 \ln x \, dx = -1 \) (see the solution to problem 96). Therefore \( L = \lim_{n \to \infty} \left( \frac{1}{n} \ln n! - \ln n \right) = -1 \).

7.5 Trigonometric Substitutions

7.5.1 This would suggest \( x = 3 \sec \theta \), because then \( \sqrt{x^2 - 9} = 3 \sec^2 \theta - 1 = 3 \tan^2 \theta = 3 \tan \theta \), for \( \theta \in [0, \pi/2) \).

7.5.2 This would suggest \( x = 6 \tan \theta \), because then \( \sqrt{x^2 + 36} = 6 \tan^2 \theta + 1 = 6 \sec^2 \theta = 6 \sec \theta \), for \( |\theta| < \pi/2 \).

7.5.3 This would suggest \( x = 10 \sin \theta \), because then \( \sqrt{100 - x^2} = 10 \sqrt{1 - \sin^2 \theta} = 10 \cos \theta = 10 \cos \theta \), for \( |\theta| \leq \pi/2 \).

7.5.4 A picture of this situation is

\[ \begin{array}{c}
\sqrt{x^2 + 16} \\
\theta \\
4 \\
x
\end{array} \]

If \( \tan \theta = \frac{5}{4} \), then \( 16 \tan^2 \theta = x^2 \), so \( 16 (\sec^2 \theta - 1) = x^2 \). Thus \( \sec^2 \theta = \frac{x^2 + 16}{16} \) and \( \cos^2 \theta = 1 - \sin^2 \theta = \frac{16}{x^2 + 16} \). Thus \( \sin^2 \theta = \frac{x^2}{16 + x^2} \) and we have \( \sin \theta = \frac{x}{\sqrt{16 + x^2}} \), for \( |\theta| < \pi/2 \).

7.5.5 A picture of this situation is

\[ \begin{array}{c}
\sqrt{4 - x^2} \\
\theta \\
x
\end{array} \]

If \( x = 2 \sin \theta \) then \( \frac{x^2}{4} = \sin^2 \theta = \frac{1}{\csc^2 \theta} \). Then \( \cot^2 \theta = \csc^2 \theta - 1 = \frac{4}{x^2} - 1 = \frac{4 - x^2}{x^2} \). So \( \cot \theta = \sqrt{\frac{4 - x^2}{x}} \) for \( 0 < |\theta| \leq \pi/2 \).

7.5.6 A picture of this situation is

\[ \begin{array}{c}
\sqrt{x^2 - 64} \\
\theta \\
8 \\
x
\end{array} \]

If \( x = 8 \sec \theta \), then \( \tan^2 \theta = \sec^2 \theta - 1 = \frac{x^2}{64} - 1 = \frac{x^2 - 64}{64} \). Since we are assuming \( x \geq 8 \), we have \( \sec \theta \geq 0 \) so that \( \theta \) is in the first quadrant, where \( \tan \theta \) is also positive. So we get \( \tan \theta = \frac{\sqrt{x^2 - 64}}{8} \).
7.5.7 Let $x = 5\sin \theta$, so that $dx = 5\cos \theta \, d\theta$. Note that $\sqrt{25 - x^2} = 5\cos \theta$. Then $x = 0$ corresponds to $\theta = 0$ while $x = \frac{5}{2}$ corresponds to $\theta = \frac{\pi}{6}$, and
\[
\int_0^{5/2} \frac{1}{\sqrt{25 - x^2}} \, dx = \int_0^{\pi/6} \frac{5\cos \theta}{5\cos \theta} \, d\theta = \frac{\pi}{6}.
\]

7.5.8 Let $x = 3\sin \theta$ so that $dx = 3\cos \theta \, d\theta$. Note that $\sqrt{9 - x^2} = 3\cos \theta$. Then $x = 0$ corresponds to $\theta = 0$ and $x = \frac{3}{2}$ to $\theta = \frac{\pi}{6}$, so
\[
\int_0^{3/2} \frac{1}{(9 - x^2)^{3/2}} \, dx = \int_0^{\pi/6} \frac{3\cos \theta}{27\cos^3 \theta} \, d\theta = \frac{1}{9} \int_0^{\pi/6} \sec^2 \theta \, d\theta = \frac{1}{9} \tan \theta \bigg|_0^{\pi/6} = \frac{1}{9} \left( \frac{1}{\sqrt{3}} - 0 \right) = \frac{\sqrt{3}}{27}.
\]

7.5.9 Let $x = 10\sin \theta$ so that $dx = 10\cos \theta \, d\theta$. Note that $\sqrt{100 - x^2} = 10\cos \theta$. Then $x = 5$ corresponds to $\theta = \frac{\pi}{6}$ and $x = 10$ to $\theta = \frac{\pi}{2}$, so
\[
\int_5^{10} \sqrt{100 - x^2} \, dx = 100 \int_{\pi/6}^{\pi/2} \cos^2 \theta \, d\theta
\]
\[
= 50 \int_{\pi/6}^{\pi/2} (1 + \cos 2\theta) \, d\theta
\]
\[
= 50 \left( \theta + \frac{\sin 2\theta}{2} \right) \bigg|_{\pi/6}^{\pi/2}
\]
\[
= 50 \left( \frac{\pi}{2} + 0 - \left( \frac{\pi}{6} + \frac{\sqrt{3}}{4} \right) \right)
\]
\[
= \frac{50\pi}{3} - \frac{25\sqrt{3}}{2}.
\]

7.5.10 Let $x = 2\sin \theta$, so that $dx = 2\cos \theta \, d\theta$. Note that $\sqrt{4 - x^2} = 2\cos \theta$. Then $x = 0$ corresponds to $\theta = 0$ and $x = \sqrt{2}$ to $\theta = \frac{\pi}{4}$, so
\[
\int_0^{\sqrt{2}} \frac{x^2}{\sqrt{4 - x^2}} \, dx = \int_0^{\pi/4} \frac{4\sin^2 \theta \cdot 2\cos \theta}{2\cos \theta} \, d\theta
\]
\[
= 4 \int_0^{\pi/4} \sin^2 \theta \, d\theta
\]
\[
= 2 \left( \frac{\pi}{4} - \int_0^{\pi/4} \cos 2\theta \, d\theta \right)
\]
\[
= \frac{\pi}{2} - 2 \left( \frac{\sin 2\theta}{2} \right) \bigg|_0^{\pi/4}
\]
\[
= \frac{\pi}{2} - 1.
\]

7.5.11 Let $x = \sin \theta$ so that $dx = \cos \theta \, d\theta$. Note that $\sqrt{1 - x^2} = \sqrt{1 - \sin^2 \theta} = \cos \theta$. Then $x = 0$ corresponds to $\theta = 0$ and $x = \frac{1}{2}$ to $\theta = \frac{\pi}{6}$, so
\[
\int_0^{1/2} \frac{x^2}{\sqrt{1 - x^2}} \, dx = \int_0^{\pi/6} \sin^2 \theta \, d\theta = \int_0^{\pi/6} \frac{1 - \cos 2\theta}{2} \, d\theta = \left( \frac{\theta}{2} \right) \bigg|_0^{\pi/6} - \left( \frac{\sin 2\theta}{4} \right) \bigg|_0^{\pi/6} = \frac{\pi}{12} - \frac{\sqrt{3}}{8}.
\]

7.5.12 Let $x = \sin \theta$ so that $dx = \cos \theta \, d\theta$. Note that $(1 - x^2)^{3/2} = (1 - \sin^2 \theta)^{3/2} = (\cos^2 \theta)^{3/2} = \cos^3 \theta$. Then $x = 0$ corresponds to $\theta = 0$ and $x = \frac{1}{2}$ to $\theta = \frac{\pi}{6}$, so we get
\[
\int_0^{1/2} \frac{dx}{(1 - x^2)^{3/2}} = \int_0^{\pi/6} \frac{\cos \theta}{\cos^3 \theta} \, d\theta = \int_0^{\pi/6} \sec^2 \theta \, d\theta = \tan \theta \bigg|_0^{\pi/6} = \frac{\sqrt{3}}{3}.
\]
7.5.13 Let \( x = 4 \sin \theta \) so that \( dx = 4 \cos \theta \, d\theta \). Note that \( \sqrt{16 - x^2} = 4 \cos \theta \). Thus
\[
\int \frac{1}{\sqrt{16 - x^2}} \, dx = \int \frac{4 \cos \theta}{4 \cos \theta} \, d\theta = \theta + C = \sin^{-1} \frac{x}{4} + C.
\]

7.5.14 Let \( x = 6 \sin \theta \) so that \( dx = 6 \cos \theta \, d\theta \) and \( \sqrt{36 - x^2} = 6 \cos \theta \). Then
\[
\int \sqrt{36 - x^2} \, dx = \int 36 \cos^2 \theta \, d\theta
\]
\[
= 18 \int (1 + \cos 2\theta) \, d\theta
\]
\[
= 18 \left( \theta + \frac{\sin 2\theta}{2} \right) + C
\]
\[
= 18 (\theta + \sin \theta \cos \theta)
\]
\[
= 18 \left( \sin^{-1} \frac{x}{6} + \frac{x}{6} \cdot \frac{\sqrt{36 - x^2}}{6} \right) + C
\]
\[
= 18 \sin^{-1} \frac{x}{6} + \frac{x \sqrt{36 - x^2}}{2} + C.
\]

7.5.15 Let \( x = 3 \sin \theta \) so that \( dx = 3 \cos \theta \, d\theta \) and \( \sqrt{9 - x^2} = 3 \cos \theta \). Then
\[
\int \sqrt{9 - x^2} \, dx = \int 3 \cos \theta \cdot 3 \cos \theta \, d\theta
\]
\[
= 9 \int \cos^2 \theta \, d\theta
\]
\[
= 9 \int \left( \frac{1}{2} + \frac{1}{2} \cos 2\theta \right) \, d\theta
\]
\[
= \frac{9}{2} \theta + \frac{9}{4} \sin 2\theta + C
\]
\[
= \frac{9}{2} \sin^{-1} \frac{x}{3} + \frac{9}{4} \cdot 2 \sin \theta \cos \theta + C
\]
\[
= \frac{9}{2} \sin^{-1} \frac{x}{3} + \frac{9}{2} \cdot \frac{x}{3} \cdot \frac{\sqrt{9 - x^2}}{3} + C
\]
\[
= \frac{9}{2} \sin^{-1} \frac{x}{3} + \frac{x \sqrt{9 - x^2}}{2} + C.
\]

7.5.16 Let \( x = 6 \sin \theta \) so that \( dx = 6 \cos \theta \, d\theta \) and \( 36 - x^2 = 36 \cos^2 \theta \). Then
\[
\int (36 - x^2)^{-3/2} \, dx = \int (36 \cos^2 \theta)^{-3/2} \cdot 6 \cos \theta \, d\theta = \frac{6}{63} \int \sec^2 \theta \, d\theta = \frac{1}{36} \tan \theta + C = \frac{x}{36 \sqrt{36 - x^2}} + C.
\]

7.5.17 Let \( x = 8 \sin \theta \) so that \( dx = 8 \cos \theta \, d\theta \) and \( \sqrt{64 - x^2} = 8 \cos \theta \). Then,
\[
\int \sqrt{64 - x^2} \, dx = \int 64 \cos^2 \theta \, d\theta = 32 \int (1 + \cos 2\theta) \, d\theta = 32 \theta + 16 \sin 2\theta + C
\]
\[
= 32 \theta + 32 \sin \theta \cos \theta + C = 32 \sin^{-1} \frac{x}{8} + \frac{x \sqrt{64 - x^2}}{2} + C.
\]

7.5.18 Let \( x = 7 \sec \theta \) where \( \theta \in \left(0, \frac{\pi}{2}\right) \) since \( x > 7 \). Then \( dx = 7 \sec \theta \tan \theta \, d\theta \) and \( \sqrt{x^2 - 49} = 7 \tan \theta \), so that
\[
\int \frac{1}{\sqrt{x^2 - 49}} \, dx = \int \frac{7 \sec \theta \tan \theta}{7 \tan \theta} \, d\theta = \int \sec \theta \, d\theta = \ln |\sec \theta + \tan \theta| + C = \ln \left( \frac{x}{7} + \frac{\sqrt{x^2 - 49}}{7} \right) + C.
\]
Note that the absolute value signs can be omitted because \(x > 7\). If desired, we can also simplify further as follows:

\[
\ln \left( \frac{x}{7} + \frac{\sqrt{x^2 - 49}}{7} \right) + C = \ln \frac{1}{7} + \ln(x + \sqrt{x^2 - 49}) + C = \ln(x + \sqrt{x^2 - 49}) + D,
\]

where \(D = C - \ln 7\) is also an arbitrary constant.

7.5.19 Let \(x = \sin \theta\) so that \(dx = \cos \theta d\theta\). Note that \(1 - x^2 = 1 - \sin^2 \theta = \cos^2 \theta\). Substituting gives

\[
\int \frac{1}{(1 - x^2)^{3/2}} \, dx = \int \sec^2 \theta \, d\theta = \tan \theta + C = \tan(\sin^{-1} x) + C = \frac{x}{\sqrt{1 - x^2}} + C.
\]

7.5.20 Let \(x = \tan \theta\) so that \(dx = \sec^2 \theta \, d\theta\). Note that \(1 + x^2 = 1 + \tan^2 \theta = \sec^2 \theta\). Substituting gives

\[
\int \frac{1}{(1 + x^2)^{3/2}} \, dx = \int \frac{1}{\sec \theta} \, d\theta = \int \cos \theta \, d\theta = \sin \theta + C = \sin(\tan^{-1} x) + C = \frac{x}{\sqrt{x^2 + 1}} + C.
\]

7.5.21 Let \(x = 3 \tan \theta\) so that \(dx = 3 \sec^2 \theta \, d\theta\). Note that \(\sqrt{x^2 + 9} = \sqrt{9(\tan^2 \theta + 1)} = 3 \sec \theta\). Substituting gives

\[
\int \frac{1}{x^2\sqrt{x^2 + 9}} \, dx = \int \frac{3 \sec^2 \theta}{9 \tan^2 \theta \cdot 3 \sec \theta} \, d\theta = \frac{1}{9} \int \frac{\sec \theta}{\tan^2 \theta} \, d\theta
\]

\[
= \frac{1}{9} \int \cot \theta \csc \theta \, d\theta = -\frac{1}{9} \csc \theta + C = -\frac{1}{9} \cot \left( \tan^{-1} \frac{x}{3} \right) + C = -\frac{\sqrt{x^2 + 9}}{9x} + C.
\]

7.5.22 Let \(x = 3 \sin \theta\), so that \(dx = 3 \cos \theta \, d\theta\) and \(\sqrt{9 - x^2} = \sqrt{9 \cos^2 \theta} = 3 \cos \theta\). Substituting gives

\[
\int \frac{1}{x^2\sqrt{9 - x^2}} \, dx = \int \frac{3 \cos \theta}{9 \sin^2 \theta \cdot 3 \cos \theta} \, d\theta = \frac{1}{9} \int \frac{\csc^2 \theta}{\csc \theta} \, d\theta
\]

\[
= -\frac{1}{9} \cot \theta + C = -\frac{1}{9} \cot \left( \sin^{-1} \frac{x}{3} \right) + C = -\frac{\sqrt{9 - x^2}}{9x} + C.
\]

7.5.23 Let \(x = 6 \sin \theta\) so that \(dx = 6 \cos \theta \, d\theta\) and \(\sqrt{36 - x^2} = \sqrt{36 - \sin^2 \theta} = 6 \cos \theta\). Then

\[
\int \frac{1}{\sqrt{36 - x^2}} \, dx = \int \frac{6 \cos \theta}{6 \cos \theta} \, d\theta = \theta = \sin^{-1} \frac{x}{6} + C.
\]

7.5.24 Let \(x = 2 \tan \theta\), \(dx = 2 \sec^2 \theta \, d\theta\) and \(\sqrt{16 + 4x^2} = 4 \sec \theta\). Then

\[
\int \frac{1}{\sqrt{16 + 4x^2}} \, dx = \int \frac{2 \sec^2 \theta}{4 \sec \theta} \, d\theta = \frac{1}{2} \int \sec \theta \, d\theta = \frac{1}{2} \ln |\sec \theta + \tan \theta| + C = \frac{1}{2} \ln \left( \frac{\sqrt{4 + x^2} + x}{2} \right) + C.
\]

Next, note that \(\sqrt{4 + x^2} > |x|\), so we may remove the absolute value signs. Finally, we can simplify further as follows:

\[
\frac{1}{2} \ln \left( \frac{\sqrt{4 + x^2} + x}{2} \right) + C = \frac{1}{2} \left( \ln \frac{1}{2} + \ln \left( x + \sqrt{4 + x^2} \right) \right) + C = \frac{1}{2} \ln \left( x + \sqrt{4 + x^2} \right) + D,
\]

where \(D = C + \frac{1}{2} \ln \frac{1}{2}\) is also an arbitrary constant.

7.5.25 Let \(x = 9 \sec \theta\) with \(\theta \in (0, \frac{\pi}{2})\). Then \(dx = 9 \sec \theta \tan \theta \, d\theta\) and \(\sqrt{x^2 - 81} = 9 \tan \theta\). Then

\[
\int \frac{1}{\sqrt{x^2 - 81}} \, dx = \int \frac{9 \sec \theta \tan \theta}{9 \tan \theta} \, d\theta = \int \sec \theta \, d\theta = \ln |\sec \theta + \tan \theta| + C = \ln \left| \frac{x}{9} + \frac{\sqrt{x^2 - 81}}{9} \right| + C.
\]
Note that because \( x > 9 \), the absolute value signs are unnecessary. Also, the final result can be further simplified if desired as follows:

\[
\ln \left( \frac{x}{9} + \frac{\sqrt{x^2 - 81}}{9} \right) + C = \ln \frac{1}{9} + \ln(x + \sqrt{x^2 - 81}) + C = \ln(x + \sqrt{x^2 - 81}) + D,
\]

where \( D = C - \ln 9 \) is again an arbitrary constant.

7.5.26 Let \( x = \frac{1}{\sqrt{2}} \sin \theta \) so that \( dx = \frac{1}{\sqrt{2}} \cos \theta \, d\theta \) and \( \sqrt{1 - 2x^2} = \cos \theta \). Then

\[
\int \frac{1}{\sqrt{1 - 2x^2}} \, dx = \frac{1}{\sqrt{2}} \int \cos \theta \, d\theta = \frac{1}{\sqrt{2}} \cdot \theta + C = \frac{1}{\sqrt{2}} \sin^{-1}(\sqrt{2}x) + C.
\]

7.5.27 Let \( x = \tan \theta / 2 \) so that \( dx = \frac{\sec^2 \theta}{2} \, d\theta \) and \( 1 + 4x^2 = \sec^2 \theta \). Then

\[
\int \frac{1}{(1 + 4x^2)^{3/2}} \, dx = \frac{1}{2} \int \frac{\sec^2 \theta}{\sec^3 \theta} \, d\theta = \frac{1}{2} \int \cos \theta \, d\theta = \frac{\sin \theta}{2} + C = \frac{x}{\sqrt{1 + 4x^2}} + C.
\]

7.5.28 Let \( x = 6 \sec \theta \) with \( \theta \in (0, \frac{\pi}{2}) \). Then \( dx = 6 \sec \theta \tan \theta \, d\theta \), and \( x^2 - 36 = 36 \tan^2 \theta \). Then

\[
\int \frac{1}{(x^2 - 36)^{3/2}} \, dx = \frac{1}{36} \int \frac{6 \sec \theta \tan \theta}{\tan^3 \theta} \, d\theta = \frac{1}{36} \int \frac{\sec \theta}{\tan^2 \theta} \, d\theta = \frac{1}{36} \int \frac{\cos \theta}{\sin^2 \theta} \, d\theta.
\]

Let \( u = \sin \theta \) so that \( du = \cos \theta \, d\theta \). Then we have

\[
\frac{1}{36} \int u^{-2} \, du = -\frac{1}{36u} + C = -\frac{1}{36 \sin \theta} + C = -\frac{x}{36\sqrt{x^2 - 36}} + C.
\]

7.5.29 Let \( x = 4 \sin \theta \) so that \( dx = 4 \cos \theta \, d\theta \) and \( \sqrt{16 - x^2} = 4 \cos \theta \). Then

\[
\int \frac{x^2}{\sqrt{16 - x^2}} \, dx = \int \frac{16 \sin^2 \theta \cdot 4 \cos \theta}{4 \cos \theta} \, d\theta = 16 \int \sin^2 \theta \, d\theta
\]

\[
= 8 \int (1 - \cos 2\theta) \, d\theta
\]

\[
= 8 \left( \theta - \frac{\sin 2\theta}{2} \right) + C
\]

\[
= 8\theta - 8 \sin \theta \cos \theta + C
\]

\[
= 8 \sin^{-1} \frac{x}{4} - \frac{x\sqrt{16 - x^2}}{2} + C.
\]

7.5.30 Let \( x = 9 \tan \theta \). Then \( dx = 9 \sec^2 \theta \, d\theta \) and \( 81 + x^2 = 81 \sec^2 \theta \). Then

\[
\int \frac{dx}{(81 + x^2)^2} = \int \frac{9 \sec^2 \theta}{9^4 \sec^4 \theta} \, d\theta
\]

\[
= \frac{1}{729} \int \cos^2 \theta \, d\theta
\]

\[
= \frac{1}{1458} \int 1 + \cos 2\theta \, d\theta
\]

\[
= \frac{1}{1458} \left( \theta + \frac{\sin 2\theta}{2} \right) + C
\]

\[
= \frac{1}{1458} (\theta + \sin \theta \cos \theta) + C
\]

\[
= \frac{1}{1458} \left( \tan^{-1} \frac{x}{9} + \frac{9x}{81 + x^2} \right) + C.
\]

7.5.31 Let \( x = \sec \theta \). Since \( x > 1 \) we know that \( \theta \in \left( 0, \frac{\pi}{2} \right) \). Then \( dx = \sec \theta \tan \theta \, d\theta \) and \( \sqrt{x^2 - 1} = \tan \theta \), so that
\[
\int \frac{dx}{x^2 \sqrt{x^2 - 1}} = \int \frac{\sec \theta \tan \theta}{\sec^2 \theta \tan \theta} \, d\theta = \int \cos \theta \, d\theta = \sin \theta + C = \frac{\sqrt{x^2 - 1}}{x} + C.
\]

7.5.32 Let \( x = \frac{3}{2} \sin \theta \), so that \( dx = \frac{3}{2} \cos \theta \, d\theta \) and \( \sqrt{9 - 4x^2} = 3 \cos \theta \). Then
\[
\int \sqrt{9 - 4x^2} \, dx = \frac{3}{2} \int \cos \theta \cdot 3 \cos \theta \, d\theta = \frac{9}{2} \int \cos^2 \theta \, d\theta = \frac{9}{4} \int 1 + \cos 2\theta \, d\theta = \frac{9}{4} \left( \theta + \sin 2\theta \right) + C = \frac{9}{4} \theta + \frac{9}{4} \sin \theta \cos \theta + C = \frac{9}{4} \sin^{-1} \frac{2x}{3} + \frac{x \sqrt{9 - 4x^2}}{2} + C.
\]

7.5.33 Let \( x = 5 \sec \theta \), so that \( dx = 5 \sec \theta \tan \theta \, d\theta \) and \( \sqrt{x^2 - 25} = 5 \tan \theta \) (note that we can take the positive square root since \( x > 5 \) implies that \( \theta \) is in the first quadrant, so that \( \tan \theta \) is positive). Then
\[
\int \frac{dx}{x \sqrt{x^2 - 25}} = \int \frac{5 \sec \theta \tan \theta}{5 \sec \theta \cdot 5 \tan \theta} \, d\theta = \int \frac{1}{5} \, d\theta = \frac{1}{5} \theta + C = \frac{1}{5} \sec^{-1} \frac{x}{5} + C.
\]

7.5.34 Let \( x = \frac{1}{3} \sec \theta \), where \( \theta \in \left( 0, \frac{\pi}{2} \right) \) since \( x > \frac{1}{3} \). Then \( dx = \frac{1}{3} \sec \theta \tan \theta \, d\theta \) and \( \sqrt{9x^2 - 1} = \tan \theta \). Then
\[
\int \frac{1}{x^2 \sqrt{9x^2 - 1}} \, dx = \int \frac{\frac{1}{3} \sec \theta \tan \theta}{\frac{1}{3} \sec \theta \tan \theta} \, d\theta = 3 \int \cos \theta \, d\theta = 3 \sin \theta + C = \frac{\sqrt{9x^2 - 1}}{x} + C.
\]

7.5.35 Let \( x = 10 \sin \theta \) so that \( dx = 10 \cos \theta \, d\theta \) and \( \sqrt{100 - x^2} = 10 \cos \theta \). Thus
\[
\int \frac{x^2}{(100 - x^2)^{1/2}} \, dx = \int \frac{100 \sin^2 \theta \cdot 10 \cos \theta}{10 \cos \theta} \, d\theta = 100 \int \sin^2 \theta \, d\theta = 50 \int (1 - \cos 2\theta) \, d\theta = 50 \left( \theta - \frac{1}{2} \sin 2\theta \right) + C = 50 \left( \theta - \sin \theta \cos \theta \right) + C = 50 \left( \sin^{-1} \frac{x}{10} - \frac{x \sqrt{100 - x^2}}{100} \right) + C.
\]
7.5.36 Let \( x = 10 \sec \theta \) where \( \theta \in \left(0, \frac{\pi}{2}\right) \) since \( x > 10 \). Then \( dx = 10 \sec \theta \tan \theta \, d\theta \) and \( \sqrt{x^2 - 100} = 10 \tan \theta \), so

\[
\int \frac{1}{x^3\sqrt{x^2 - 100}} \, dx = \int \frac{10 \sec \theta \tan \theta}{10^3 \sec^3 \theta \cdot 10 \tan \theta} \, d\theta
\]

\[
= \frac{1}{1000} \int \cos^2 \theta \, d\theta
\]

\[
= \frac{1}{2000} \int 1 + \cos 2\theta \, d\theta
\]

\[
= \frac{\theta}{2000} + \frac{\sin 2\theta}{4000} + C
\]

\[
= \frac{\theta}{2000} + \frac{\sin \theta \cos \theta}{2000} + C
\]

\[
= \frac{1}{2000} \sec^{-1} \frac{x}{10} + \frac{\sqrt{x^2 - 100}}{200x^2} + C.
\]

7.5.37 Let \( x = \tan \theta \), so that \( dx = \sec^2 \theta \, d\theta \) and \( 1 + x^2 = \sec^2 \theta \). Then

\[
\int \frac{x^3}{(1 + x^2)^3} \, dx = \int \frac{\tan^3 \theta \sec^2 \theta}{\sec^6 \theta} \, d\theta = \int \frac{\tan^3 \theta}{\sec^4 \theta} \, d\theta = \int \sin^3 \theta \cos \theta \, d\theta
\]

\[
= \frac{\sin^4 \theta}{4} + C = \frac{1}{4} \left( \frac{x}{\sqrt{1 + x^2}} \right)^4 + C = \frac{x^4}{4(1 + x^2)^2} + C.
\]

7.5.38 Let \( x = \sec \theta \) where \( \theta \in \left(0, \frac{\pi}{2}\right) \) since \( x > 1 \). Then \( dx = \sec \theta \tan \theta \, d\theta \) and \( \sqrt{x^2 - 1} = \tan \theta \). Thus

\[
\int \frac{1}{x^3\sqrt{x^2 - 1}} \, dx = \int \frac{\sec \theta \tan \theta}{\sec^3 \theta \tan \theta} \, d\theta
\]

\[
= \int \sec^2 \theta \, d\theta
\]

\[
= \frac{1}{2} \int (1 + \cos 2\theta) \, d\theta
\]

\[
= \frac{1}{2} \left( \theta + \frac{\sin 2\theta}{2} \right) + C
\]

\[
= \frac{1}{2} \left( \theta + \sin \theta \cos \theta \right) + C
\]

\[
= \frac{1}{2} \left( \sec^{-1} x + \frac{\sqrt{x^2 - 1}}{x^2} \right) + C.
\]

7.5.39 Let \( x = 4 \tan \theta \) so that \( dx = 4 \sec^2 \theta \, d\theta \) and \( \sqrt{x^2 + 16} = 4 \sec \theta \). Then \( x = 0 \) corresponds to \( \theta = 0 \) and \( x = 1 \) to \( \theta = \tan^{-1} \frac{1}{4} \). Thus

\[
\int_0^1 \frac{1}{\sqrt{x^2 + 16}} \, dx = \int_0^{\tan^{-1}(1/4)} \frac{4 \sec^2 \theta}{4 \sec \theta} \, d\theta
\]

\[
= \int_0^{\tan^{-1}(1/4)} \sec \theta \, d\theta
\]

\[
= \ln |\sec \theta + \tan \theta|_0^{\tan^{-1}(1/4)}
\]

\[
= \ln \left( \frac{\sqrt{17} + 1}{4} \right).
\]
7.5.40 Let \( x = 8 \sec \theta \) so that \( dx = 8 \sec \theta \tan \theta \, d\theta \) and \( \sqrt{x^2 - 64} = 8 \tan \theta \). Then \( x = 8\sqrt{2} \) corresponds to \( \theta = \frac{\pi}{4} \) and \( x = 16 \) to \( \theta = \frac{3\pi}{4} \), so

\[
\int_{8\sqrt{2}}^{16} \frac{dx}{\sqrt{x^2 - 64}} = \int_{\pi/4}^{\pi/3} \frac{8 \sec \theta \tan \theta}{8 \tan \theta} \, d\theta = \int_{\pi/4}^{\pi/3} \sec \theta \, d\theta = \ln |\sec \theta + \tan \theta|_{\pi/4}^{\pi/3} = \ln(2 + \sqrt{3}) - \ln(\sqrt{2} + 1) = \ln \left( \frac{2 + \sqrt{3}}{1 + \sqrt{2}} \right).
\]

7.5.41 Let \( x = \tan \theta \) so that \( dx = \sec^2 \theta \, d\theta \) and \( \sqrt{1 + x^2} = \sec \theta \). Then \( x = \frac{1}{\sqrt{3}} \) corresponds to \( \theta = \frac{\pi}{6} \) and \( x = 1 \) to \( \theta = \frac{\pi}{4} \). Substituting gives

\[
\int_{\sqrt{1/3}}^{1} \frac{1}{x^2\sqrt{1 + x^2}} \, dx = \int_{\pi/6}^{\pi/4} \frac{\sec^2 \theta}{\tan^2 \theta \sec \theta} \, d\theta = \int_{\pi/6}^{\pi/4} \cot \theta \csc \theta \, d\theta = -\csc \theta \big|_{\pi/6}^{\pi/4} = 2 - \sqrt{2}.
\]

7.5.42 Let \( x = 2 \sin \theta \), so that \( dx = 2 \cos \theta \, d\theta \) and \( \sqrt{4 - x^2} = 2 \cos \theta \). Then \( x = 1 \) corresponds to \( \theta = \frac{\pi}{6} \) and \( x = 2 \) to \( \theta = \frac{\pi}{3} \), so substituting gives

\[
\int_{1}^{2} \frac{1}{x^2\sqrt{4 - x^2}} \, dx = \int_{\pi/6}^{\pi/2} \frac{2 \cos \theta}{4 \sin^2 \theta \cdot 2 \cos \theta} \, d\theta = \frac{1}{4} \int_{\pi/6}^{\pi/2} \csc^2 \theta \, d\theta = \frac{1}{4} (-\cot \theta) \big|_{\pi/6}^{\pi/2} = \frac{\sqrt{3}}{4}.
\]

7.5.43 Let \( x = \tan \theta \) so that \( dx = \sec^2 \theta \, d\theta \). Note that \( x^2 + 1 = \sec^2 \theta \), that \( x = 0 \) corresponds to \( \theta = 0 \), and that \( x = \frac{1}{\sqrt{3}} \) corresponds to \( \theta = \frac{\pi}{6} \). Substituting gives

\[
\int_{1/\sqrt{3}}^{1} \frac{dx}{(x^2 + 1)^{3/2}} = \int_{\pi/6}^{\pi/2} \frac{\sec^2 \theta}{\sec^3 \theta} \, d\theta = \int_{0}^{\pi/6} \cos \theta \, d\theta = \sin \theta \big|_{0}^{\pi/6} = \frac{1}{2}.
\]

7.5.44 Let \( x = 3 \sec \theta \) so that \( dx = 3 \sec \theta \tan \theta \, d\theta \) and \( \sqrt{x^2 - 9} = 3 \tan \theta \). Then \( x = 4 \) corresponds to \( \theta = \sec^{-1} \frac{4}{3} = \cos^{-1} \frac{3}{4} \) and \( x = 5 \) corresponds to \( \theta = \sec^{-1} \frac{5}{3} = \cos^{-1} \frac{3}{5} \), and we have

\[
\int_{4}^{5} \frac{dx}{x^2\sqrt{x^2 - 9}} = \int_{\cos^{-1}(3/4)}^{\cos^{-1}(3/5)} 3 \sec \theta \tan \theta \cdot 3 \tan \theta \, d\theta = \frac{3}{9} \int_{\cos^{-1}(3/4)}^{\cos^{-1}(3/5)} \cos \theta \, d\theta = \frac{3}{9} \sin \theta \big|_{\cos^{-1}(3/4)}^{\cos^{-1}(3/5)} = \frac{3}{9} \left( \frac{4}{5} - \frac{\sqrt{7}}{4} \right).
\]

7.5.45 Let \( x = \frac{1}{3} \tan \theta \) so that \( dx = \frac{1}{3} \sec^2 \theta \, d\theta \) and \( 9x^2 + 1 = \sec^2 \theta \). Then \( x = 0 \) corresponds to \( \theta = 0 \) and \( x = \frac{1}{3} \) to \( \theta = \frac{\pi}{4} \), and we have

\[
\int_{0}^{1/3} 1 \frac{dx}{(9x^2 + 1)^{3/2}} = \int_{0}^{\pi/4} \frac{\sec^2 \theta}{\sec^3 \theta} \, d\theta = \int_{0}^{\pi/4} \cos \theta \, d\theta = \frac{1}{3} \sin \theta \big|_{0}^{\pi/4} = \frac{\sqrt{2}}{6}.
\]

7.5.46 Let \( x = 5 \sec \theta \) so that \( dx = 5 \sec \theta \tan \theta \, d\theta \) and \( \sqrt{x^2 - 25} = 5 \tan \theta \). Then \( x = \frac{10}{\sqrt{3}} \) corresponds to \( \theta = \frac{\pi}{6} \) and \( x = 10 \) to \( \theta = \frac{\pi}{3} \), so we have

\[
\int_{10/\sqrt{3}}^{10} \frac{1}{\sqrt{x^2 - 25}} \, dx = \int_{\pi/3}^{\pi/6} \frac{5 \sec \theta \tan \theta}{5 \tan \theta} \, d\theta = \int_{\pi/3}^{\pi/6} \sec \theta \, d\theta = \ln |\sec \theta + \tan \theta|_{\pi/6}^{\pi/3} = \ln(2 + \sqrt{3}) - \ln(\sqrt{3}) = \ln \left( \frac{2 + \sqrt{3}}{\sqrt{3}} \right).
\]
7.5.47  

a. False. In fact, we would have \( \csc \theta = \frac{\sqrt{x^2 + 16}}{x} \).

b. True. Almost every number in the interval [1, 2] is not in the domain of \( \sqrt{1-x^2} \), so this integral isn’t defined.

c. False. It does represent a finite real number, because \( \sqrt{x^2-1} \) is continuous on the interval [1, 2].

7.5.48  Let \( A \) be the area of the ellipse. Using symmetry, we have \( \frac{A}{4} = \frac{b}{a} \int_0^\pi \sqrt{a^2 - x^2} \, dx \). Let \( x = a \sin \theta \), so that \( dx = a \cos \theta \, d\theta \), and \( \sqrt{a^2 - x^2} = \cos \theta \). Further, \( x = 0 \) corresponds to \( \theta = 0 \) while \( x = a \) corresponds to \( \theta = \frac{\pi}{2} \). Substituting yields

\[
\frac{A}{4} = \frac{b}{a} \int_0^{\pi/2} a \cos \theta \cdot a \cos \theta \, d\theta = ab \int_0^{\pi/2} \cos^2 \theta \, d\theta = \frac{ab}{2} \int_0^{\pi/2} (1 + \cos 2\theta) \, d\theta = \frac{ab}{2} \left( \theta + \frac{\sin 2\theta}{2} \right) \Bigg|_0^{\pi/2} = \frac{\pi ab}{4}.
\]

So the total area of the ellipse is \( A = \pi ab \).

7.5.49  

a. Recall that the area of a circular sector subtended by an angle \( \theta \) is given by \( \frac{\theta r^2}{2} \). So the area of the cap is this area minus the area of the isosceles triangle with two sides of length \( r \) and angle between them \( \theta \). So \( A_{\text{seg}} = A_{\text{sector}} - A_{\text{triangle}} = \frac{\theta r^2}{2} - \frac{r^2 \sin \theta}{2} = \frac{r^2}{2} (\theta - \sin \theta) \).

b. Note that the secant connecting the two points on the circle has equation

\[
y = \frac{\sin \theta}{\cos \theta - 1} (x - r),
\]

so the area of the cap is found by integrating the height of the area, which is \( \sqrt{r^2 - x^2} - \frac{\sin \theta}{\cos \theta - 1} (x - r) \) over \([r \cos \theta, r]\). Use the substitution \( x = r \sin \alpha \) so that \( dx = r \cos \alpha \, d\alpha \) and \( \sqrt{r^2 - x^2} = r \cos \alpha \). Then we have

\[
A_{\text{seg}} = \int_{r \cos \theta}^{r} \sqrt{r^2 - x^2} \, dx - \frac{\sin \theta}{\cos \theta - 1} \int_{r \cos \theta}^{r} (x - r) \, dx
\]

\[
= \frac{1}{2} r^2 \left( \frac{\sin \theta}{\cos \theta - 1} \right) \left[ x - r \cos \theta \right]_{x=r \cos \theta}^{x=r} - \int_{r \cos \theta}^{r} \frac{\sin \theta}{\cos \theta - 1} \left[ -\frac{1}{2} r^2 - \frac{1}{2} r^2 \cos^2 \theta + r^2 \cos \theta \right] \, d\alpha
\]

\[
= \frac{1}{2} r^2 \left( \frac{\sin \theta}{\cos \theta - 1} \right) \left[ \frac{\theta}{2} + \sin \alpha \right]_{\alpha=r \cos \theta}^{\alpha=r} - \frac{\sin \theta}{\cos \theta - 1} \left( -\frac{1}{2} r^2 + 2 \cos \theta - 1 \right)
\]

\[
= \frac{1}{2} r^2 \left( \frac{\sin \theta}{\cos \theta - 1} \right) \left[ \frac{\pi}{2} + \sin \theta \cos \theta - \sin \theta (1 - \cos \theta) \right]
\]

\[
= \frac{1}{2} r^2 \left( \theta - \sin \theta \right).
\]

7.5.50  The circles intersect when \( 16 - x^2 = 9 - (x - 2)^2 \), or \( 16 - x^2 = 9 - x^2 + 4x - 4 \), which is when \( 11 = 4x \), or \( x = \frac{11}{4} \). The corresponding \( y \) coordinates are \( y = \pm \sqrt{16 - \frac{121}{16}} = \pm \frac{3}{4} \sqrt{15} \). Let \( A_L \) be the area of the large circle from \( x = -4 \) to \( x = \frac{11}{4} \) and \( A_S \) be the area of the small circle from \( x = -1 \) to \( x = \frac{11}{4} \). Then \( A_L \)
Thus the area of the lune is

\[ A_L = 4 \cdot 2^2 - C_L = 16\pi - \frac{1}{2} \cdot 2^2 \left( 2 \cos^{-1} \frac{11}{16} - \sin \left( 2 \cos^{-1} \frac{11}{16} \right) \right) \]

\[ = 16\pi - 16 \cos^{-1} \frac{11}{16} + 16 \sin \left( \cos^{-1} \frac{11}{16} \right) \cos \left( \cos^{-1} \frac{11}{16} \right) \]

\[ = 16\pi - 16 \cos^{-1} \frac{11}{16} + 16 \cdot \frac{3\sqrt{15}}{16} \cdot \frac{11}{16} \]

\[ = 16\pi - 16 \cos^{-1} \frac{11}{16} + \frac{33\sqrt{15}}{16}, \]

and

\[ A_S = \pi \cdot 3^2 - C_S = 9\pi - \frac{1}{2} \cdot 3^2 \left( 2 \cos^{-1} \frac{1}{4} - \sin \left( 2 \cos^{-1} \frac{1}{4} \right) \right) \]

\[ = 9\pi - 9 \cos^{-1} \frac{1}{4} + 9 \sin \left( \cos^{-1} \frac{1}{4} \right) \cos \left( \cos^{-1} \frac{1}{4} \right) \]

\[ = 9\pi - 9 \cos^{-1} \frac{1}{4} + 9 \cdot \frac{\sqrt{15}}{4} \cdot \frac{1}{4} \]

\[ = 9\pi - 9 \cos^{-1} \frac{1}{4} + \frac{9\sqrt{15}}{16}. \]

Thus the area of the lune is

\[ A = A_L - A_S = 16\pi - 16 \cos^{-1} \frac{11}{16} + \frac{33\sqrt{15}}{16} - \left( 9\pi - 9 \cos^{-1} \frac{1}{4} + \frac{9\sqrt{15}}{16} \right) \]

\[ = 7\pi - 16 \cos^{-1} \frac{11}{16} + 9 \cos^{-1} \frac{1}{4} + \frac{33\sqrt{15}}{16} - \frac{9\sqrt{15}}{16} \]

\[ = 7\pi - 16 \cos^{-1} \frac{11}{16} + 9 \cos^{-1} \frac{1}{4} + \frac{3\sqrt{15}}{2} \approx 26.660. \]

7.5.51

a. The area is given by

\[ \int_0^4 \frac{1}{\sqrt{9 + x^2}} \, dx. \]

Let \( x = 3 \tan \theta \), so that \( dx = 3 \sec^2 \theta \, d\theta \) and \( \sqrt{9 + x^2} = 3 \sec \theta \). Then \( x = 0 \) corresponds to \( \theta = 0 \) while \( x = 4 \) corresponds to \( \theta = \tan^{-1} \frac{4}{3} \). Substituting yields

\[ \int_0^{\tan^{-1} \frac{4}{3}} 3 \sec^2 \theta \, d\theta = \frac{3}{3} \int_0^{\tan^{-1} \frac{4}{3}} \sec \theta \, d\theta = \ln \left| \sec \theta + \tan \theta \right|_0^{\tan^{-1} \frac{4}{3}} = \ln \left( \frac{5}{3} + \frac{4}{3} \right) = \ln 3. \]

b. Using disks, we have

\[ V = \pi \int_0^4 \frac{1}{9 + x^2} \, dx. \]

Let \( x = 3 \tan \theta \), so that \( dx = 3 \sec^2 \theta \, d\theta \) and \( \sqrt{9 + x^2} = 3 \sec \theta \). Then \( x = 0 \) corresponds to \( \theta = 0 \) while \( x = 4 \) corresponds to \( \theta = \tan^{-1} \frac{4}{3} \). Substituting yields

\[ V = \pi \int_0^{\tan^{-1} \frac{4}{3}} \frac{3 \sec^2 \theta}{9 \sec^2 \theta} \, d\theta = \frac{\pi}{3} \int_0^{\tan^{-1} \frac{4}{3}} \frac{1}{\sec \theta} \, d\theta = \frac{\pi}{3} \theta \bigg|_0^{\tan^{-1} \frac{4}{3}} = \frac{\pi}{3} \tan^{-1} \frac{4}{3}. \]
c. Using shells, we have \( V = 2\pi \int_{0}^{4} \frac{x}{(9 + x^2)^{1/2}} \, dx \). Let \( u = 9 + x^2 \), so that \( du = 2x \, dx \). Then \( x = 0 \)
 corresponds to \( u = 9 \) while \( x = 4 \) corresponds to \( u = 25 \). Then we have

\[
2\pi \int_{9}^{25} \frac{1}{2} u^{-1/2} \, du = 2\pi \sqrt{u} \bigg|_{9}^{25} = 2\pi (5 - 3) = 4\pi.
\]

7.5.52

Note that \( f'(x) = -\frac{3}{\pi} \cdot 2x(16 + x^2)^{-5/2} = \frac{-3x}{\sqrt{16 + x^2}} \).
So \( f \) is increasing on \((-\infty, 0)\) and decreasing on \((0, \infty)\) and thus has a maximum at \( x = 0 \) of \( \frac{1}{8} \).
Also, \( f''(x) = \frac{12(x^2 - 4)}{(16 + x^2)^{3/2}} \), so \( f \) is concave up on \((-\infty, -2)\) and on \((2, \infty)\) and is concave down on \((-2, 2)\).

The area bounded by the curve and the axis on \([0, 3]\) is given by

\[
\int_{0}^{3} \frac{1}{(16 + x^2)^{3/2}} \, dx.
\]

Let \( x = 4\tan \theta \) so that \( dx = 4\sec^2 \theta \, d\theta \) and \( 16 + x^2 = 16\sec^2 \theta \). Then \( x = 0 \) corresponds to \( \theta = 0 \) while \( x = 3 \) corresponds to \( \theta = \tan^{-1} \frac{3}{4} \). Substituting yields

\[
\int_{0}^{3} \frac{1}{(16 + x^2)^{3/2}} \, dx = \int_{0}^{\tan^{-1}(3/4)} \frac{4\sec^2 \theta}{4^3 \sec^3 \theta} \, d\theta = \frac{1}{16} \int_{0}^{\tan^{-1}(3/4)} \cos \theta \, d\theta = \frac{\sin \theta}{16} \bigg|_{0}^{\tan^{-1}(3/4)} = \frac{3}{80}.
\]

7.5.53 A graph of this function and region is

To compute the area, let \( x = 3\sin \theta \) so that \( dx = 3\cos \theta \, d\theta \) and \( 9 - x^2 = 9\cos^2 \theta \). Then \( x = 0 \) corresponds to \( \theta = 0 \) while \( x = \frac{3}{2} \) corresponds to \( \theta = \frac{\pi}{6} \), and we have

\[
\int_{0}^{3/2} \frac{dx}{(9 - x^2)^{1/2}} \, dx = \int_{0}^{\pi/6} \frac{3\cos \theta}{9^2 \cos^4 \theta} \, d\theta = \frac{1}{27} \int_{0}^{\pi/6} \sec^3 \theta \, d\theta = \frac{1}{54} \left( \sec \theta \tan \theta + \ln |\sec \theta + \tan \theta| \right) \bigg|_{0}^{\pi/6}
\]

\[
= \frac{1}{54} \left( \frac{2}{\sqrt{3}} \cdot \frac{1}{\sqrt{3}} + \ln \left( \frac{2}{\sqrt{3}} + \frac{1}{\sqrt{3}} \right) \right) = \frac{1}{81} + \frac{\ln \sqrt{3}}{54} = \frac{1}{81} + \frac{\ln 3}{108}.

7.5.54 A graph of this function and region is

To compute the area, let \( x = 2 \tan \theta \) so that \( dx = 2 \sec^2 \theta \, d\theta \) and \( \sqrt{4 + x^2} = 2 \sec \theta \). Then \( x = 0 \) corresponds to \( \theta = 0 \) and \( x = 2 \) to \( \theta = \frac{\pi}{4} \), and we have

\[
\int_0^2 \sqrt{4 + x^2} \, dx = \int_0^{\pi/4} 2 \sec^2 \theta \cdot 2 \sec \theta \, d\theta = 4 \int_0^{\pi/4} \sec^3 \theta \, d\theta = 2 (\sec \theta \tan \theta + \ln |\sec \theta + \tan \theta|) \bigg|_0^{\pi/4} = 2 \left( \sqrt{2} + \ln(\sqrt{2} + 1) \right).
\]

7.5.55 A graph of this function and region is

To compute the area, let \( x = 5 \sec \theta \) so that \( dx = 5 \sec \theta \tan \theta \, d\theta \) and \( \sqrt{x^2 - 25} = 5 \tan \theta \). Then \( x = 5 \) corresponds to \( \theta = 0 \) and \( x = 10 \) to \( \theta = \frac{\pi}{3} \), and we have

\[
\int_5^{10} \sqrt{x^2 - 25} \, dx = \int_0^{\pi/3} 5 \sec \theta \tan \theta \cdot 5 \tan \theta \, d\theta = 25 \int_0^{\pi/3} \sec \theta \tan^2 \theta \, d\theta = 25 \int_0^{\pi/3} \sec \theta (\sec^2 \theta - 1) \, d\theta = 25 \int_0^{\pi/3} (\sec^3 \theta - \sec \theta) \, d\theta = \frac{25}{2} (\sec \theta \tan \theta - \ln |\sec \theta + \tan \theta|) \bigg|_0^{\pi/3} = \frac{25}{2} \left( 2\sqrt{3} - \ln(2 + \sqrt{3}) \right) = 25\sqrt{3} - \frac{25}{2} \ln(2 + \sqrt{3}).
\]
7.5.56 Let \( x = 2 \tan^{-1} u \) so that \( u = \tan \frac{x}{2} \) and \( \sec^2 \frac{x}{2} = 1 + \tan^2 \frac{x}{2} = 1 + u^2 \). Thus \( \cos^2 \frac{x}{2} = \frac{1}{1 + u^2} \). Next, by the double angle identities,

\[
\begin{align*}
\cos x &= \cos^2 \frac{x}{2} - \sin^2 \frac{x}{2} = \cos^2 \frac{x}{2} - u^2 \cos^2 \frac{x}{2} = (1 - u^2) \cos^2 \frac{x}{2} = \frac{1 - u^2}{1 + u^2} \\
\sin x &= 2 \sin \frac{x}{2} \cos \frac{x}{2} = 2 \tan \frac{x}{2} \cos^2 \frac{x}{2} = \frac{2u}{1 + u^2}.
\end{align*}
\]

Finally, \( dx = \frac{2}{1 + u^2} \, du \). Then

\[
\int \frac{1}{1 + \sin x + \cos x} \, dx = \int \frac{2}{1 + u^2} \cdot \frac{1}{1 + \frac{2u}{1 + u^2} + \frac{1 - u^2}{1 + u^2}} \, du
\]

\[
= \int \frac{2}{1 + u^2 + 2u + 1 - u^2} \, du
\]

\[
= \int \frac{1}{u + 1} \, du
\]

\[
= \ln |u + 1| + C
\]

\[
= \ln \left| 1 + \tan \frac{x}{2} \right| + C.
\]

7.5.57 Use the washer method. The range of integration is for \(-4 \leq x \leq 4\); for each \( x \), the outer radius is \( 6 + \sqrt{16 - x^2} \) and the inner radius is \( 6 - \sqrt{16 - x^2} \), so the volume is

\[
V = \pi \int_{-4}^{4} \left( (6 + \sqrt{16 - x^2})^2 - (6 - \sqrt{16 - x^2})^2 \right) \, dx = \pi \int_{-4}^{4} 24 \sqrt{16 - x^2} \, dx = 24 \pi \int_{-4}^{4} \sqrt{16 - x^2} \, dx.
\]

But the remaining integral is just the area of a semicircle of radius 4, which is \( \frac{1}{2} \pi \cdot 4^2 = 8 \pi \), so we get \( V = 24 \pi \cdot 8 \pi = 192 \pi^2 \).

7.5.58 Let \( R \) denote the outer radius and \( r \) the inner radius, and consider a circle whose equation is \( x^2 + (y - \frac{R+r}{2})^2 = \left( \frac{R+r}{2} \right)^2 \); the center is at \( \left( 0, \frac{R+r}{2} \right) \) and the radius is \( \frac{R-r}{2} \). We will imagine rotating this circle about the \( x \)-axis to generate the bagel. Using the washer method, the outer radius for a given value of \( x \) is \( \frac{R+r}{2} + \sqrt{\left( \frac{R-r}{2} \right)^2 - x^2} \) and the inner radius is \( \frac{R+r}{2} - \sqrt{\left( \frac{R-r}{2} \right)^2 - x^2} \). Then the volume is

\[
V = \pi \int_{-(R-r)/2}^{(R-r)/2} \left( \frac{R+r}{2} + \sqrt{\left( \frac{R-r}{2} \right)^2 - x^2} \right)^2 - \left( \frac{R+r}{2} - \sqrt{\left( \frac{R-r}{2} \right)^2 - x^2} \right)^2 \, dx
\]

\[
= 2(R + r) \pi \int_{-(R-r)/2}^{(R-r)/2} \sqrt{\left( \frac{R-r}{2} \right)^2 - x^2} \, dx.
\]

The remaining integral is simply the area of a semicircle of radius \( \frac{R-r}{2} \), which is \( \frac{1}{2} \pi \left( \frac{R-r}{2} \right)^2 = \frac{\pi}{8} (R - r)^2 \), so that we get

\[
V = 2(R + r) \pi \cdot \frac{\pi}{8} (R - r)^2 = \frac{\pi^2}{4} (R + r)(R - r)^2.
\]

Now suppose the inner radius \( r \) decreases to become \( \frac{4}{5} r \). The resulting volume is

\[
V_1 = \frac{\pi^2}{4} \left( \frac{4}{5} R + \frac{4}{5} r \right) \left( \frac{R}{5} - \frac{4}{5} r \right)^2 = \frac{\pi^2}{4 \cdot 5^3} (5R + 4r)(5R - 4r)^2.
\]

Likewise, an increase in \( R \) by 20 percent yields a new value for \( R \) of \( \frac{6}{5} R \), so the resulting volume is

\[
V_2 = \frac{\pi^2}{4} \left( \frac{6}{5} R + r \right) \left( \frac{6}{5} R - r \right)^2 = \frac{\pi^2}{4 \cdot 5^3} (6R + 5r)(6R - 5r)^2.
\]
Since $R, r > 0$ we have $6R + 5r > 5R + 4r$; since $R > r$ we also have $6R - 5r = (R - r) + 5R - 4r > 5R - 4r$. Thus for any values of $r$ and $R$, we have $V_2 > V_1$, so that the bagel resulting from the 20% increase in the outer radius is bigger, independent of the size of the original bagels.

7.5.59

a. Since the integrand is an even function, we have

$$E_x(a) = \frac{kQa}{2L} \int_{-L}^{L} \frac{dy}{(a^2 + y^2)^{3/2}} = \frac{kQa}{L} \int_{0}^{L} \frac{dy}{(a^2 + y^2)^{3/2}}.$$

Let $y = a \tan \theta$ so that $dy = a \sec^2 \theta \, d\theta$ and $a^2 + y^2 = a^2 \sec^2 \theta$. Then $y = 0$ corresponds to $\theta = 0$ while $y = L$ corresponds to $\theta = \tan^{-1} \frac{L}{a}$. Substituting gives

$$\frac{kQa}{L} \int_{0}^{\tan^{-1}(L/a)} \frac{a \sec^2 \theta}{a^3 \sec^3 \theta} \, d\theta = \frac{kQ}{L} \int_{0}^{\tan^{-1}(L/a)} \cos \theta \, d\theta = \frac{kQ}{La} \sin \theta \bigg|_{0}^{\tan^{-1}(L/a)} = \frac{kQ}{La} \cdot \frac{L}{\sqrt{a^2 + L^2}} = \frac{kQ}{a \sqrt{a^2 + L^2}}.$$

b. Set $\rho = \frac{Q}{2L}$. Then because $\lim_{L \to \infty} \frac{2L}{a^2 \sqrt{a^2 + L^2}} = \frac{2}{a^2}$, we have as $L \to \infty$

$$E_x(a) \approx \lim_{L \to \infty} \frac{kQa}{2L} \int_{-L}^{L} \frac{dy}{(a^2 + y^2)^{3/2}} = \lim_{L \to \infty} \frac{kQ}{a \sqrt{a^2 + L^2}} \int_{-L}^{L} \frac{dy}{(a^2 + y^2)^{3/2}} = \lim_{L \to \infty} \frac{2kL\rho}{a \sqrt{a^2 + L^2}} = \lim_{L \to \infty} \left( \frac{2k\rho}{a} \cdot \frac{L}{a \sqrt{a^2 + L^2}} \right) = \frac{2k\rho}{a}.$$

7.5.60

a. Referring to the diagram in the exercise statement, let $\beta = \pi - \theta$, and let $\alpha$ be the angle with vertex at $(a, 0)$. Note that $\theta + \beta = \pi$ and $\alpha + \beta = \frac{\pi}{2}$, so $\theta = \pi - \beta = \frac{\pi}{2} + \alpha$. Thus, $\sin \theta = \sin \left( \frac{\pi}{2} + \alpha \right) = \cos \alpha$.

Now, because $r^2 = a^2 + y^2$ and $\cos \alpha = \frac{r}{a}$, we have that $\frac{\sin \theta}{r^2} = \frac{a}{r^3} = \frac{a}{(a^2 + y^2)^{3/2}}$. Hence

$$\int_{-L}^{L} \frac{\sin \theta}{r^2} \, dy = \int_{-L}^{L} \frac{a}{(a^2 + y^2)^{3/2}} \, dy = 2 \int_{0}^{L} \frac{a}{(a^2 + y^2)^{3/2}} \, dy.$$

Let $y = a \tan u$ so that $dy = a \sec^2 u \, du$. Then $y = 0$ corresponds to $u = 0$ and $y = L$ to $u = \tan^{-1} \frac{L}{a}$. Substituting, we get

$$2 \int_{0}^{\tan^{-1}(L/a)} \frac{a^2 \sec^2 u}{a^3 \sec^3 u} \, du = 2 \int_{0}^{\tan^{-1}(L/a)} \cos u \, du = \frac{2}{a} \sin \left( \tan^{-1} \frac{L}{a} \right) = \frac{2L}{a \sqrt{a^2 + L^2}}.$$

Thus

$$B(a) = \frac{\mu_0 I}{4\pi} \cdot \frac{2L}{a \sqrt{a^2 + L^2}} = \frac{\mu_0 IL}{2\pi a \sqrt{a^2 + L^2}}.$$

b. Taking limits from part (a) gives

$$B(a) = \lim_{L \to \infty} \frac{\mu_0 IL}{2\pi a \sqrt{a^2 + L^2}} = \lim_{L \to \infty} \left( \frac{\mu_0 I}{2\pi a} \cdot \frac{L}{\sqrt{a^2 + L^2}} \right) = \frac{\mu_0 I}{2\pi a}.$$
7.5. TRIGONOMETRIC SUBSTITUTIONS 733

7.5.61

a. Since \( t \in [0, \pi] \) so that \( \sin t \geq 0 \), we have

\[
\int_a^b \sqrt{\frac{1 - \cos t}{g(\cos a - \cos t)}} \, dt = \int_a^b \sqrt{\frac{(1 - \cos t)(1 + \cos t)}{g(1 + \cos t)(\cos a - \cos t)}} \, dt
\]

\[
= \int_a^b \sqrt{\frac{1 - \cos^2 t}{g(1 + \cos t)(\cos a - \cos t)}} \, dt
\]

\[
= \int_a^b \sin t \sqrt{\frac{1}{g(1 + \cos t)(\cos a - \cos t)}} \, dt.
\]

Let \( u = \cos t \) so that \( du = -\sin t \, dt \). Then the descent time is

\[
\frac{1}{\sqrt{g}} \int_{\cos a}^{\cos b} \frac{1}{\sqrt{(1 + u)(\cos a - u)}} \, du.
\]

Now we complete the square in the denominator:

\[
(1 + u)(\cos a - u) = \cos a + (\cos a - 1)u - u^2
\]

\[
= -\left( u^2 - (\cos a - 1)u + \left( \frac{\cos a - 1}{2} \right)^2 - \left( \frac{\cos a - 1}{2} \right)^2 \right) + \cos a
\]

\[
= \cos a + \left( \frac{\cos a - 1}{2} \right)^2 - \left( u - \frac{\cos a - 1}{2} \right)^2
\]

\[
= \left( \frac{\cos a + 1}{2} \right)^2 - \left( u - \frac{\cos a - 1}{2} \right)^2.
\]

Thus, setting \( v = u - \frac{\cos a - 1}{2} \) we have that the descent time is

\[
\frac{1}{\sqrt{g}} \int_{(\cos a + 1)/2}^{\cos b - \cos a/2} \frac{1}{\sqrt{k^2 - v^2}} \, dv, \quad \text{where} \quad k = \frac{\cos a + 1}{2}.
\]

Now, \( \int \frac{1}{\sqrt{k^2 - v^2}} \, dv = \int \frac{k \cos \theta}{k \cos \theta} \, d\theta = \theta + C = \sin^{-1} \frac{v}{k} + C \) where \( v = k \sin \theta \). Therefore, the descent time is

\[
-\frac{1}{\sqrt{g}} \sin^{-1} \left( \frac{2v}{\cos a + 1} \right) \bigg|_{(\cos a + 1)/2}^{\cos b - (\cos a - 1)/2}
\]

\[
= \frac{1}{\sqrt{g}} \left( \sin^{-1} \left( \frac{\cos a + 1}{\cos a + 1} \right) - \sin^{-1} \left( \frac{2 \cos b - \cos a + 1}{\cos a + 1} \right) \right)
\]

\[
= \frac{1}{\sqrt{g}} \left( \frac{\pi}{2} - \sin^{-1} \left( \frac{2 \cos b - \cos a + 1}{\cos a + 1} \right) \right).
\]

b. Letting \( b = \pi \), we get for the descent time

\[
\frac{1}{\sqrt{g}} \left( \frac{\pi}{2} - \sin^{-1} \left( \frac{-2 - \cos a + 1}{\cos a + 1} \right) \right) = \frac{1}{\sqrt{g}} \left( \frac{\pi}{2} - \sin^{-1}(-1) \right)
\]

\[
= \frac{1}{\sqrt{g}} \left( \frac{\pi}{2} - \left( -\frac{\pi}{2} \right) \right)
\]

\[
= \frac{\pi}{\sqrt{g}}.
\]

which is independent of \( a \).
Chapter Review

1.  
   a. True. Two applications of integration by parts are needed to reduce to \( \int e^{2x} \, dx \).
   
   b. False. This integral can be done using a trigonometric substitution.
   
   c. True. Recall that \( 2 \sin x \cos x = \sin 2x \).
   
   d. False. Use long division to write the integrand as the sum of a polynomial and a proper rational function.

2. Let \( u = \frac{x}{2} + \frac{3}{2} \). Then \( du = \frac{1}{2} \, dx \). Substituting gives \( 2 \int \cos u \, du = 2 \sin u + C = 2 \sin \left( \frac{x}{2} + \frac{3}{2} \right) + C \).

3. Let \( u = x + 4 \) so that \( du = dx \) and \( x = u - 4 \). Substituting gives
   \[
   \int \frac{3x}{\sqrt{x + 4}} \, dx = \int \frac{3(u - 4)}{\sqrt{u}} \, du = 3 \int (u^{1/2} - 4u^{-1/2}) \, du = 3 \left( \frac{2}{3} u^{3/2} - 8u^{1/2} \right) + C
   \]
   \[
   = 2(x + 4)^{3/2} - 24\sqrt{x + 4} + C = 2(x + 4 - 12)\sqrt{x + 4} + C = 2(x - 8)\sqrt{x + 4} + C.
   \]

4. \( \int (2 \sec^2 \theta - \tan 2 \theta \sec 2 \theta) \, d\theta = \tan 2\theta - \frac{1}{2} \sec 2\theta + C \).

5. \( \int_{-2}^{1} \frac{3}{(x + 2)^2 + 9} \, dx = \left( \frac{1}{3} \tan^{-1} \frac{x + 2}{3} \right) \bigg|_{-2}^{1} = \frac{\pi}{4} - 0 = \frac{\pi}{4} \).

6. By long division, \( \frac{x^3 + 3x^2 + 1}{x^3 + 1} = 1 + \frac{3x^2}{x^3 + 1} \). Thus
   \[
   \int \frac{x^3 + 3x^2 + 1}{x^3 + 1} \, dx = \int \left( 1 + \frac{3x^2}{x^3 + 1} \right) \, dx = x + \ln |x^3 + 1| + C.
   \]

7. Let \( u = \sqrt{t} - 1 \). Then \( u^2 + 1 = t \), and \( 2u \, du = dt \). Substituting gives
   \[
   \int \frac{u^2}{u^2 + 1} \, du = \int \left( 1 - \frac{1}{u^2 + 1} \right) \, du = u - \tan^{-1} u + C = \sqrt{t - 1} - \tan^{-1} \sqrt{t - 1} + C.
   \]

8. Let \( u = 3t \) and \( dv = e^{-t} \, dt \), so that \( du = 3 \, dt \) and \( v = -e^{-t} \). Then
   \[
   \int_{-1}^{\ln 2} 3te^{-t} \, dt = -3te^{-t} \bigg|_{-1}^{\ln 2} - \int_{-1}^{\ln 2} (-3e^{-t}) \, dt = -3te^{-t} \bigg|_{-1}^{\ln 2} - 3e^{-t} \bigg|_{-1}^{\ln 2}
   \]
   \[
   = -\frac{3\ln 2}{2} - 3e - \left( \frac{3}{2} - 3e \right) = -\frac{3}{2} (\ln 2 + 1).
   \]

9. Let \( u = x \) and \( dv = \frac{1}{2} (x + 2)^{-1/2} \, dx \). Then \( du = dx \) and \( v = (x + 2)^{1/2} \). We have
   \[
   \int \frac{x}{2\sqrt{x + 2}} \, dx = x\sqrt{x + 2} - \int \sqrt{x + 2} \, dx = x\sqrt{x + 2} - \frac{2}{3} (x + 2)^{3/2} + C
   \]
   \[
   = \frac{1}{3} (3x - 2x - 4)\sqrt{x + 2} + C = \frac{1}{3} (x - 4)\sqrt{x + 2} + C.
   \]

10. Let \( u = \tan^{-1} x \) and \( dv = x \, dx \). Then \( du = \frac{dx}{x^2 + 1} \) and \( v = \frac{x^2}{2} \), so that
   \[
   \int x \tan^{-1} x \, dx = \frac{1}{2} x^2 \tan^{-1} x - \int \frac{x^2}{2x^2 + 2} \, dx = \frac{1}{2} x^2 \tan^{-1} x - \frac{1}{2} \int \left( 1 - \frac{1}{x^2 + 1} \right) \, dx
   \]
   \[
   = \frac{1}{2} x^2 \tan^{-1} x - \frac{1}{2} (x - \tan^{-1} x) + C = \frac{1}{2} x^2 \tan^{-1} x - \frac{x}{2} + \frac{\tan^{-1} x}{2} + C.
   \]
11. Let \( u = x \) and \( dv = \sin 2x \, dx \). Then \( du = dx \) and \( v = -\frac{1}{2} \cos 2x \), so that
\[
\int x \sin 2x \, dx = -\frac{1}{2} x \cos 2x + \frac{1}{2} \int \cos 2x \, dx = -\frac{1}{2} x \cos 2x + \frac{1}{4} \sin 2x + C.
\]

12. Write \( \frac{8x + 5}{2x^2 + 3x + 1} = \frac{A}{2x + 1} + \frac{B}{x + 1} \). Then \( 8x + 5 = A(x + 1) + B(2x + 1) \). Letting \( x = -1 \) gives \( B = 3 \) and letting \( x = -\frac{1}{2} \) gives \( A = 2 \). Thus
\[
\int \frac{8x + 5}{2x^2 + 3x + 1} \, dx = \int \left( \frac{2}{2x + 1} + \frac{3}{x + 1} \right) \, dx = \ln |(2x + 1)(x + 1)^3| + C.
\]

13. Write
\[
\frac{2x^2 + 7x + 4}{x^3 + 3x^2 + 2x} = \frac{2x^2 + 7x + 4}{x(x + 1)(x + 2)} = \frac{A}{x} + \frac{B}{x + 1} + \frac{C}{x + 2},
\]
so that \( 2x^2 + 7x + 4 = A(x + 1)(x + 2) + Bx(x + 2) + Cx(x + 1) \).

Letting \( x = 0 \) gives \( A = 2 \); letting \( x = -1 \) gives \( B = 1 \); letting \( x = -2 \) gives \( C = -1 \). Thus
\[
\int \frac{2x^2 + 7x + 4}{x^3 + 3x^2 + 2x} \, dx = \int \left( \frac{2}{x} + \frac{1}{x + 1} - \frac{1}{x + 2} \right) \, dx = 2 \ln |x| + \ln |x + 1| - \ln |x + 2| + C = \ln \left| \frac{x^2(x + 1)}{x + 2} \right| + C.
\]

14. Note that \( \frac{x^2 + 1}{x^2 - 1} = 1 + \frac{2}{x^2 - 1} = 1 + \frac{1}{x - 1} - \frac{1}{x + 1} \). Then we get
\[
\int_{-1/2}^{1/2} \frac{x^2 + 1}{x^2 - 1} \, dx = \int_{-1/2}^{1/2} \left( 1 + \frac{1}{x - 1} - \frac{1}{x + 1} \right) \, dx = \left[ x + \ln \left| \frac{x - 1}{x + 1} \right| \right]_{-1/2}^{1/2}
= \frac{1}{2} + \ln \frac{1}{3} - \left( -\frac{1}{2} + \ln 3 \right) = 1 - 2 \ln 3.
\]

15. Note that \( \frac{2x^3 + x^2 + x}{1 - x^2} = -2x + \frac{3x + 1}{(1 - x)(1 + x)} \). Now use partial fractions:
\[
\frac{3x + 1}{(1 - x)(1 + x)} = \frac{A}{1 - x} + \frac{B}{1 + x}, \quad \text{so} \quad 3x + 1 = A(1 + x) + B(1 - x).
\]

Setting \( x = 1 \) gives \( 2A = 4 \) or \( A = 2 \); setting \( x = -1 \) gives \( 2B = -2 \) so that \( B = -1 \). Then the integral is
\[
\int \frac{2x^3 + x^2 + x}{1 - x^2} \, dx = \int \left( -2x + 2 \cdot \frac{1}{1 - x} - \frac{1}{1 + x} \right) \, dx = -x - x^2 - 2 \ln |1 - x| - \ln |1 + x| + C
= -x^2 - x - \ln \left| (1 - x)^2(1 + x) \right| + C.
\]

16. Let \( x = \sin \theta \) so that \( dx = \cos \theta \, d\theta \) and \( \sqrt{1 - x^2} = \cos \theta \). Substituting gives gives
\[
\int \frac{\sqrt{1 - x^2}}{x} \, dx = \int \frac{\cos^2 \theta}{\sin \theta} \, d\theta = \int \frac{1 - \sin^2 \theta}{\sin \theta} \, d\theta = \int (\csc \theta - \sin \theta) \, d\theta
= - \ln |\csc \theta + \cot \theta| + \cos \theta + C
= - \ln |\csc \sin^{-1} x + \cot \sin^{-1} x| + \cos \sin^{-1} (x) + C
= - \ln \left| \frac{1}{x} + \sqrt{1 - x^2} \right| + \sqrt{1 - x^2} + C
= \ln \left| \frac{x}{1 + \sqrt{1 - x^2}} \right| + \sqrt{1 - x^2} + C.
\]
17. Let \( x = \sec \theta \) so that \( dx = \sec \theta \tan \theta \, d\theta \) and \( \sqrt{x^2 - 1} = \tan \theta \). Now, \( x = \sqrt{2} \) corresponds to \( u = \frac{\pi}{3} \) while \( x = 2 \) corresponds to \( u = \frac{\pi}{3} \), so substituting gives

\[
\int_{\sqrt{2}}^{2} \frac{\sqrt{x^2 - 1}}{x} \, dx = \int_{\pi/4}^{\pi/3} \tan^2 \theta \, d\theta = \int_{\pi/4}^{\pi/3} (\sec^2 \theta - 1) \, d\theta = (\tan \theta - \theta)\bigg|_{\pi/4}^{\pi/3} = \sqrt{3} - \frac{\pi}{3} - \left(1 - \frac{\pi}{4}\right) = \sqrt{3} - 1 - \frac{\pi}{12}.
\]

18. Let \( x = 2 \sin \theta \) so that \( dx = 2 \cos \theta \, d\theta \) and \( \sqrt{4-x^2} = 2 \cos \theta \). Substituting gives

\[
\int \frac{x^3}{\sqrt{4-x^2}} \, dx = \int \frac{8 \sin^3 \theta}{2 \cos \theta} \, 2 \cos \theta \, d\theta = \int 8 \sin \theta(1 - \cos^2 \theta) \, d\theta.
\]

Let \( u = \cos \theta \) so that \( du = -\sin \theta \, d\theta \). Substituting again gives

\[
8 \int (u^2 - 1) \, du = \frac{8}{3} u^3 - 8u + C
\]

\[
= \frac{8}{3} \cos^3 \theta - 8 \cos \theta + C
\]

\[
= \frac{8}{3} \left(\cos \left(\sin^{-1} \frac{x}{2}\right)\right)^3 - 8 \cos \left(\sin^{-1} \frac{x}{2}\right) + C
\]

\[
= \frac{1}{3} \left(\sqrt{4-x^2}\right)^3 - 4 \sqrt{4-x^2} + C
\]

\[
= \frac{1}{3} (4-x^2-12) \sqrt{4-x^2} = -\frac{1}{3} (x^2+8) \sqrt{4-x^2} + C.
\]

Note that while the instructions require the use of a trigonometric substitution, this exercise can be done more easily using the simple substitution \( u = 4 - x^2 \) so that \( du = -2x \, dx \); the integral then becomes

\[
\frac{1}{2} \int \frac{4-u}{\sqrt{u}} \, du = -\frac{1}{2} \int \left(4u^{-1/2} - u^{1/2}\right) \, du,
\]

which can easily be integrated.

19. Let \( x = 2 \tan \theta \) so that \( dx = 2 \sec^2 \theta \, d\theta \) and \( \sqrt{x^2 + 4} = 2 \sec \theta \). Substituting gives

\[
\int \frac{x^3}{\sqrt{x^2 + 4}} \, dx = \int \frac{8 \tan^3 \theta}{2 \sec \theta} \, 2 \sec^2 \theta \, d\theta = 8 \int \tan \theta \sec \theta (\sec^2 \theta - 1) \, d\theta.
\]

Let \( u = \sec \theta \) so that \( du = \sec \theta \tan \theta \, d\theta \). Substituting again gives

\[
8 \int (u^2 - 1) \, du = \frac{8}{3} u^3 - 8u + C
\]

\[
= \frac{8}{3} \sec^3 \theta - 8 \sec \theta + C
\]

\[
= \frac{8}{3} \left(\sec \left(\tan^{-1} \frac{x}{2}\right)\right)^3 - 8 \sec \tan^{-1} \frac{x}{2} + C
\]

\[
= \frac{1}{3} (x^2 + 4) \sqrt{x^2 + 4} - 4 \sqrt{x^2 + 4} + C
\]

\[
= \frac{1}{3} (x^2 + 4 - 12) \sqrt{x^2 + 4} + C = \frac{1}{3} (x^2 - 8) \sqrt{x^2 + 4} + C.
\]

Note that while the instructions require the use of a trigonometric substitution, this exercise can be done more easily using the simple substitution \( u = x^2 + 4 \) so that \( du = 2x \, dx \); the integral then becomes

\[
\frac{1}{2} \int \frac{u-4}{\sqrt{u}} \, du = \frac{1}{2} \int \left(u^{1/2} - 4u^{-1/2}\right) \, du,
\]

which can easily be integrated.

Copyright © 2014 Pearson Education, Inc.
20. We have
\[ \int_{-\infty}^{1} \frac{dx}{(x-1)^4} = \lim_{b \to \infty} \int_{b}^{-1} \frac{dx}{(x-1)^4} = \lim_{b \to \infty} \left( -\frac{1}{3(x-1)^3} \right) \bigg|_{b}^{-1} = \frac{1}{24} + \frac{1}{3} \lim_{b \to \infty} \frac{1}{(b-1)^3} = \frac{1}{24}. \]

21. We have, using integration by parts with \( u = x \) and \( dv = e^{-x} \, dx \),
\[ \int_{0}^{\infty} x e^{-x} \, dx = \lim_{b \to \infty} \int_{0}^{b} x e^{-x} \, dx = \lim_{b \to \infty} \left( -xe^{-x}\bigg|_{0}^{b} + \int_{0}^{b} e^{-x} \, dx \right) = \lim_{b \to \infty} \left( -be^{-b} - e^{-b}\bigg|_{0}^{b} \right) \]
\[ = \lim_{b \to \infty} \left( -be^{-b} - e^{-b} + 1 \right) = 1. \]
Note that \( \lim_{b \to \infty} (-be^{-b} - e^{-b}) = - \lim_{b \to \infty} \frac{b+1}{e^b} = 0 \) since exponentials grow faster than power functions.

22. We have
\[ \int_{0}^{8} \frac{dx}{\sqrt{2x}} = \lim_{c \to 0+} \int_{c}^{8} \frac{dx}{\sqrt{2x}} = \lim_{c \to 0+} \sqrt{2x}\bigg|_{c}^{8} = \lim_{c \to 0+} (4 - \sqrt{2c}) = 4. \]

23. We have (using Table 7.1)
\[ \int_{0}^{3} \frac{dx}{\sqrt{9-x^2}} = \lim_{c \to 3^{-}} \int_{0}^{c} \frac{dx}{\sqrt{9-x^2}} = \lim_{c \to 3^{-}} \left( \sin^{-1} \frac{x}{3}\bigg|_{0}^{c} \right) = \lim_{c \to 3^{-}} \sin^{-1} \frac{c}{3} = \frac{\pi}{2}. \]

24. Note that by long division \( \frac{x^2 - 4}{x + 4} = x - 4 + \frac{12}{x + 4}. \) The integral is therefore
\[ \int \frac{x^2 - 4}{x + 4} \, dx = \int \left( x - 4 + \frac{12}{x + 4} \right) \, dx = \frac{x^2}{2} - 4x + 12 \ln |x + 4| + C. \]

25. Multiply by 1:
\[ \int \frac{d\theta}{1 - \cos \theta} = \int \frac{1 + \cos \theta}{1 - \cos \theta} \cdot \frac{1 + \cos \theta}{\sin^2 \theta} \, d\theta = \int \frac{1 + \cos \theta}{\sin^2 \theta} \, d\theta = \int (\csc^2 \theta + \csc \theta \cot \theta) \, d\theta = -\cot \theta - \csc \theta + C. \]

26. We will need to integrate twice using integration by parts. First use \( u = x^2 \) and \( dv = \cos x \, dx \) to get
\[ \int x^2 \cos x \, dx = x^2 \sin x - 2 \int x \sin x \, dx. \]
Now integrate by parts again with \( u = x \) and \( dv = \sin x \, dx \) to get
\[ x^2 \sin x - 2 \int x \sin x \, dx = x^2 \sin x - 2 \left( -x \cos x + \int \cos x \, dx \right) \]
\[ = x^2 \sin x + 2x \cos x - 2 \sin x + C = (x^2 - 2) \sin x + 2x \cos x + C. \]

27. We will need to integrate twice using integration by parts. First use \( u = \sin x \) and \( dv = e^x \, dx \) to get
\[ \int e^x \sin x \, dx = e^x \sin x - \int e^x \cos x \, dx. \]
Now use integration by parts again, with \( u = \cos x \) and \( dv = e^x \, dx \) to get
\[ \int e^x \sin x \, dx = e^x \sin x - \int e^x \cos x \, dx = e^x \sin x - e^x \cos x + C - \int e^x \sin x \, dx. \]
Collect terms and divide through by 2 to give
\[ \int e^x \sin x \, dx = \frac{1}{2} e^x (\sin x - \cos x) + C. \]
28. Integrate by parts with \( u = \ln x \) and \( dv = x^2 \) to get

\[
\int_1^e x^2 \ln x \, dx = \frac{x^3}{3} \ln x \bigg|_1^e - \int_1^e \frac{x^3}{3} \cdot \frac{1}{x} \, dx
\]
\[
= \frac{e^3}{3} - \frac{1}{3} \int_1^e x^2 \, dx
\]
\[
= \frac{e^3}{3} - \frac{1}{3} \left( \frac{1}{3} x^3 \right) \bigg|_1^e
\]
\[
= \frac{1}{9} (2e^3 + 1).
\]

29. Use the double-angle formula to get

\[
\int \cos^2 4\theta \, d\theta = \int \left( \frac{1}{2} + \frac{1}{2} \cos 8\theta \right) \, d\theta = \frac{1}{2} \theta + \frac{1}{16} \sin 8\theta + C.
\]

30. Let \( x = \frac{5}{3} \sec \theta \) so that \( dx = \frac{5}{3} \sec \theta \tan \theta \, d\theta \). Then

\[
\int \frac{dx}{\sqrt{9x^2 - 25}} = \frac{5}{3} \int \frac{\sec \theta \tan \theta \, d\theta}{5 \tan \theta} = \frac{1}{3} \int \sec \theta \, d\theta
\]
\[
= \frac{1}{3} \ln |\sec \theta + \tan \theta| + C
\]
\[
= \frac{1}{3} \ln \left( 3x + \sqrt{9x^2 - 25} \right) + C
\]
\[
= \frac{1}{3} \ln \left( 3x + \sqrt{9x^2 - 25} \right) + C.
\]

Note that we absorb the constant \(-\ln 5\) into \( C \), and we don’t need absolute values since we were given \( x > \frac{5}{3} \).

31. Let \( y = 3 \sin \theta \) so that \( dy = 3 \cos \theta \, d\theta \). Then

\[
\int \frac{dy}{y^2 \sqrt{9 - y^2}} = \int \frac{3 \cos \theta \, d\theta}{9 \sin^2 \theta \cdot 3 \cos \theta} = \frac{1}{9} \int \csc^2 \theta \, d\theta
\]
\[
= -\frac{1}{9} \cot \theta + C
\]
\[
= -\frac{\sqrt{9 - y^2}}{9y} + C.
\]

32. Let \( x = \sin \theta \) so that \( dx = \cos \theta \, d\theta \). Then \( x = 0 \) corresponds to \( \theta = 0 \) and \( x = \frac{\sqrt{3}}{2} \) to \( \theta = \frac{\pi}{3} \), and \( 1 - x^2 = \cos^2 \theta \). Thus

\[
\int_0^{\sqrt{3}/2} \frac{x^2}{(1-x^2)^{3/2}} \, dx = \int_0^{\pi/3} \frac{\sin^2 \theta}{\cos^3 \theta} \cos \theta \, d\theta
\]
\[
= \int_0^{\pi/3} \frac{1}{3} \tan^2 \theta \, d\theta
\]
\[
= \int_0^{\pi/3} \left( \sec^2 \theta - 1 \right) \, d\theta
\]
\[
= \left( \tan \theta - \theta \right) \bigg|_0^{\pi/3} = \sqrt{3} - \frac{\pi}{3}.
\]

Copyright © 2014 Pearson Education, Inc.
33. Let \( x = \frac{3}{2} \tan \theta \) so that \( dx = \frac{3}{2} \sec^2 \theta \, d\theta \) and \( 9 + 4x^2 = 9 \sec^2 \theta \). Since \( \frac{3}{2} \tan \frac{\pi}{6} = \frac{\sqrt{3}}{2} \), we see that \( x = \frac{\sqrt{3}}{2} \) corresponds to \( \theta = \frac{\pi}{6} \); also \( x = 0 \) corresponds to \( \theta = 0 \). Then

\[
\int_0^{\sqrt{3}/2} \frac{4}{9 + 4x^2} \, dx = \int_0^{\pi/6} \frac{4}{9 \sec^2 \theta} \cdot \frac{3}{2} \sec^2 \theta \, d\theta = \frac{2}{3} \int_0^{\pi/6} \, d\theta = \frac{\pi}{9}.
\]

34. Use integration by parts with \( u = \sin^{-1} x \) and \( dv = dx \), so that \( du = \frac{1}{\sqrt{1-x^2}} \) and \( v = x \). Then

\[
\int_0^1 \sin^{-1} x \, dx = x \sin^{-1} x \bigg|_0^1 - \int_0^1 \frac{x}{\sqrt{1-x^2}} \, dx = \frac{\pi}{2} + \sqrt{1-x^2} \bigg|_0^1 = \frac{\pi}{2} - 1.
\]

35. Using the method of partial fractions, write

\[
\frac{1}{x^2 - 2x - 15} = \frac{1}{(x - 5)(x + 3)} = \frac{A}{x - 5} + \frac{B}{x + 3},
\]

so that \( 1 = A(x + 3) + B(x - 5) \).

Setting \( x = 5 \) gives \( A = \frac{1}{8} \); setting \( x = -3 \) gives \( B = -\frac{1}{8} \). Thus

\[
\int \frac{dx}{x^2 - 2x - 15} = \frac{1}{8} \int \left( \frac{1}{x - 5} - \frac{1}{x + 3} \right) \, dx = \frac{1}{8} \ln \left| \frac{x - 5}{x + 3} \right| + C.
\]

36. Using the method of partial fractions, write

\[
\frac{2}{x^2 - 2x} = \frac{2}{x(x - 2)} = \frac{A}{x} + \frac{B}{x - 2},
\]

so that \( 2 = A(x - 2) + Bx \).

Setting \( x = 0 \) gives \( A = -1 \); setting \( x = 2 \) gives \( B = 1 \). Thus

\[
\int \frac{dx}{x^2 - 2x} = \int \left( \frac{-1}{x} + \frac{1}{x - 2} \right) \, dx = \ln \left| \frac{x - 2}{x} \right| + C.
\]

37. Using the method of partial fractions, write

\[
\frac{1}{(y + 1)(y + 2)} = \frac{A}{y + 1} + \frac{B}{y + 2},
\]

so that \( 1 = A(y + 2) + B(y + 1) \).

Setting \( y = -1 \) gives \( A = 1 \); setting \( y = -2 \) gives \( B = -1 \). Thus

\[
\int_0^1 \frac{dy}{(y + 1)(y + 2)} = \int_0^1 \left( \frac{1}{y + 1} - \frac{1}{y + 2} \right) \, dy
\]

\[
= \left( \ln |y + 1| - \ln |y + 2| \right) \bigg|_0^1
\]

\[
= \left( \ln \frac{y + 1}{y + 2} \right) \bigg|_0^1
\]

\[
= \ln \frac{2}{3} - \ln \frac{1}{2} = \ln \frac{4}{3}.
\]

38. Let \( u = x + 1 \). Then \( x = -1 \) corresponds to \( u = 0 \), and \( x = 1 \) to \( u = 2 \), so we have

\[
\int_{-1}^1 \frac{dx}{x^2 + 2x + 5} = \int_0^2 \frac{du}{u^2 + 2^2} = \frac{1}{2} \tan^{-1} \frac{u}{2} \bigg|_0^2 = \frac{\pi}{8}.
\]

39. Factor \( x^2 - x - 2 = (x - 2)(x + 1) \) and use the method of partial fractions:

\[
\frac{1}{(x - 2)(x + 1)} = \frac{A}{x - 2} + \frac{B}{x + 1},
\]

so that \( 1 = A(x + 1) + B(x - 2) \).

Setting \( x = -1 \) gives \( B = -\frac{1}{3} \); setting \( x = 2 \) gives \( A = \frac{1}{3} \). Thus

\[
\int \frac{dx}{x^2 - x - 2} = \frac{1}{3} \int \left( \frac{1}{x - 2} - \frac{1}{x + 1} \right) \, dx = \frac{1}{3} \ln \left| \frac{x - 2}{x + 1} \right| + C.
\]
40. Using polynomial long division we get \( \frac{3x^2 + x - 3}{x^2 - 1} = 3 + \frac{x}{x^2 - 1} \), so that
\[
\int \frac{3x^2 + x - 3}{x^2 - 1} \, dx = 3x + \int \frac{x}{x^2 - 1} \, dx = 3x + \frac{1}{2} \ln |x^2 - 1| + C,
\]
where we make the substitution \( u = x^2 - 1 \) for the final integral above.

41. Observe that
\[
\frac{2x^2 - 4x}{x^2 - 4} = \frac{2x(x - 2)}{(x - 2)(x + 2)} = \frac{2x}{x + 2} = 2 - \frac{4}{x + 2}.
\]
Hence
\[
\int \frac{2x^2 - 4x}{x^2 - 4} \, dx = 2x - 4 \ln |x + 2| + C = 2(x - 2 \ln |x + 2|) + C.
\]

42. Let \( u = 1 + 8\sqrt{x} \) so that \( du = \frac{4}{\sqrt{x}} \, dx \). Then \( x = \frac{1}{8} \) corresponds to \( u = \frac{11}{3} \) while \( x = \frac{1}{4} \) corresponds to \( u = 5 \). Then we get
\[
\int_{1/9}^{1/4} \frac{dx}{\sqrt{2}(1 + 8\sqrt{x})} = \int_{11/3}^{5} \frac{du}{4u} = \frac{1}{4} \ln |u| \bigg|_{11/3}^{5} = \frac{1}{4} \left( \ln 5 - \ln \frac{11}{3} \right) = \frac{1}{4} \ln \frac{15}{11}.
\]

43. Make the substitution \( u = e^{2t} \), so that \( du = 2e^{2t} \, dt \). Then we get
\[
\int \frac{e^{2t}}{1 + e^{2t}} \, dt = \frac{1}{2} \int \frac{1}{1 + u} \, du = \frac{1}{2} \tan^{-1} u + C = \frac{1}{2} \tan^{-1} e^{2t} + C.
\]

44. Use the substitution \( u = x^{1/4} \); then \( du = \frac{1}{4} x^{-3/4} \, dx = \frac{1}{4u^3} \, dx \) so that \( dx = 4u^3 \, du \). Further, \( x = 1 \) corresponds to \( u = 1 \) and \( x = 16 \) to \( u = 2 \). Then
\[
\int_{1}^{16} \frac{dx}{x^{1/2} + x^{1/4}} = \int_{1}^{2} \frac{4u^3}{u^2 + u} \, du = 4 \int_{1}^{2} \frac{u^2}{u + 1} \, du.
\]

Now use polynomial long division to simplify the fraction:
\[
4 \int_{1}^{2} \frac{u^2}{u + 1} \, du = 4 \int_{1}^{2} \left( u - 1 + \frac{1}{u + 1} \right) \, du = 4 \left( \frac{u^2}{2} - u + \ln |u + 1| \right) \bigg|_{1}^{2} = 4 \left( \ln 3 - \frac{1}{2} + 1 - \ln 2 \right) = 2 + 4 \ln \frac{3}{2}.
\]

45. Using the disk method, the volume is
\[
V = \pi \int_{1}^{e} (\ln x)^2 \, dx.
\]
Integrate by parts with \( u = (\ln x)^2 \) and \( dv = dx \), so that \( du = 2 \frac{\ln x}{x} \, dx \) and \( v = x \). Then
\[
\pi \int_{1}^{e} (\ln x)^2 \, dx = \pi x(\ln x)^2 \bigg|_{1}^{e} - 2\pi \int_{1}^{e} \ln x \, dx = \pi e - 2\pi \int_{1}^{e} \ln x \, dx.
\]
Integrate by parts again with \( u = \ln x \) and \( dv = dx \) to get
\[
\pi e - 2\pi \int_{1}^{e} \ln x \, dx = \pi e - 2\pi x \ln x \bigg|_{1}^{e} + 2\pi \int_{1}^{e} dx = \pi(e - 2).
\]

46. Use the shell method, and integration by parts with \( u = \ln x \) and \( dv = x \, dx \) to get
\[
V = 2\pi \int_{1}^{e} x \ln x \, dx = 2\pi \left( \frac{1}{2} x^2 \ln x \right) \bigg|_{1}^{e} - 2\pi \int_{1}^{e} \frac{1}{2} x \, dx = \pi e^2 - \pi \left( \frac{1}{2} e^2 \right) \bigg|_{1}^{e} = \frac{1}{2} \pi \left( e^2 + 1 \right).
\]
47. Use the shell method. The radius of each shell is \( x - 1 \). Then use integration by parts and/or the intermediate results from the previous two exercises:

\[
V = 2\pi \int_1^e (x - 1) \ln x \, dx = 2\pi \int_1^e x \ln x \, dx - 2\pi \int_1^e \ln x \, dx = \frac{1}{2} \pi (e^2 + 1) - 2\pi (x \ln x - x) \bigg|_1^e = \frac{1}{2} \pi (e^2 - 3).
\]

48. Use the washer method. Around \( y = 1 \), the outer radius is 1 while the inner radius is \( 1 - \ln x \), so the volume is (using results from previous exercises)

\[
V = \pi \int_1^e \left( \frac{1}{2} - (1 - \ln x)^2 \right) \, dx \\
= \pi \int_1^e (2 \ln x - \ln^2 x) \, dx \\
= 2\pi \int_1^e \ln x \, dx - \pi \int_1^e \ln^2 x \, dx \\
= 2\pi (x \ln x - x) \bigg|_1^e - \pi (e - 2) \\
= \pi (4 - e).
\]

49. Use disks for the \( x \) axis rotation and shells for the \( y \) axis rotation; then (using integration by parts with \( u = x \) and \( dv = \sin x \, dx \) for the \( y \) axis integration)

\[
V_x = \pi \int_0^\pi \sin^2 x \, dx = \frac{1}{2} \pi \int_0^\pi (1 - \cos 2x) \, dx = \frac{1}{2} \pi \left( x - \frac{\sin 2x}{2} \right) \bigg|_0^\pi = \frac{\pi^2}{2}
\]

\[
V_y = 2\pi \int_0^\pi x \sin x \, dx = 2\pi (\sin x - x \cos x) \bigg|_0^\pi = 2\pi^2.
\]

Thus the greater volume is obtained by revolving around the \( y \)-axis.

50. The area is given by the improper integral

\[
\int_0^\infty ae^{-ax} \, dx = \lim_{b \to \infty} \int_0^b ae^{-ax} \, dx = \lim_{b \to \infty} \left( -e^{-ax} \bigg|_0^b \right) = \lim_{b \to \infty} (1 - e^{-ab}) = 1
\]

as long as \( a > 0 \).

51.

a. Observe that

\[
\int_{1/2}^b \ln x \, dx = (x \ln x - x) \bigg|_{1/2}^b \approx b \ln b - b + 0.847;
\]

solve \( b \ln b - b + 0.847 = 0 \) numerically to obtain \( b \approx 1.603 \).

b. Similarly, we have

\[
\int_{1/3}^b \ln x \, dx = (x \ln x - x) \bigg|_{1/3}^b \approx b \ln b - b + 0.700;
\]

solve \( b \ln b - b + 0.700 = 0 \) numerically to obtain \( b \approx 1.870 \).

c. In general, the pair \((a, b)\) must satisfy the equation

\[
\int_a^b \ln x \, dx = (b \ln b - b) - (a \ln a - a) = 0,
\]

which gives \( b \ln b - b = a \ln a - a \).

d. As \( a \) increases there is less negative area to the left of \( x = 1 \), so less positive area is required to balance it out, so that \( b = g(a) \) is a decreasing function of \( a \).
52. The arc length is given by the integral

\[ \int_1^e \sqrt{1 + \frac{1}{x^2}} \, dx = \int_1^e \frac{\sqrt{1 + x^2}}{x} \, dx. \]

This can be evaluated numerically to get \( \approx 6.789 \).

53. The average velocity is

\[ \bar{v} = \frac{1}{\pi} \int_0^\pi 10 \sin 3t \, dt = -\frac{10}{3\pi} \cos 3t \bigg|_0^\pi = \frac{20}{3\pi}. \]

54. a. The distance traveled by car A after 2 hrs is

\[ \int_0^2 40(t + 1) \, dt = 40 \ln(t + 1) \bigg|_0^2 = 40 \ln 3 \approx 43.944 \text{ mi} \]

and the distance traveled by car B after 2 hrs is

\[ \int_0^2 40e^{-t/2} \, dt = -80e^{-t/2} \bigg|_0^2 = 80(1 - e^{-1}) \approx 50.570 \text{ mi}, \]

so car B traveled farther.

b. The distance traveled by car A after 3 hrs is

\[ \int_0^3 40(t + 1) \, dt = 40 \ln(t + 1) \bigg|_0^3 = 40 \ln 4 \approx 55.452 \text{ mi} \]

and the distance traveled by car B after 2 hrs is

\[ \int_0^3 40e^{-t/2} \, dt = -80e^{-t/2} \bigg|_0^3 = 80(1 - e^{-3/2}) \approx 62.150 \text{ mi}, \]

so car B traveled farther.

c. The distance traveled by car A after t hrs is

\[ \int_0^t 40(t + 1) \, dt = 40 \ln(t + 1) \bigg|_0^t = 40 \ln(t + 1) \text{ and the distance} \]

traveled by car B after t hrs is

\[ \int_0^t 40e^{-t/2} \, dt = -80e^{-t/2} \bigg|_0^t = 80(1 - e^{-t/2}). \]

The distance traveled by car A increases without bound, whereas the distance traveled by car B approaches 80 mi as \( t \to \infty \).

55. The number of cars is given by the integral

\[ \int_0^4 800te^{-t/2} \, dt = -1600(t + 2)e^{-t/2} \bigg|_0^4 = 3200(1 - 3e^{-2}) \approx 1901. \]

56. Observe that both \( g(x) \) and \( h(x) \) lie between the functions \( \pm \frac{1}{x^2} \), which have finite area from 1 to \( \infty \) since

\[ \int_1^\infty \frac{1}{x^2} \, dx = \lim_{b \to \infty} \int_1^b \frac{1}{x^2} \, dx = \lim_{b \to \infty} \left( -\frac{1}{x} \right)_1^b = 1. \]

Therefore the improper integrals of both \( g(x) \) and \( h(x) \) from 1 to \( \infty \) are finite.

57. a. Using integration by parts, we find that

\[ I(p) = \int_1^e \frac{\ln x}{x^p} \, dx = -\frac{x^{1-p}}{(p-1)^2} ((p-1) \ln x + 1) \bigg|_1^e = \frac{1}{(p-1)^2} (1 - pe^{1-p}) \]

for \( p \neq 1 \), and using the substitution \( u = \ln x \) gives

\[ I(1) = \int_1^e \frac{\ln x}{x} \, dx = \frac{(\ln x)^2}{2} \bigg|_1^e = \frac{1}{2}. \]

b. We have

\[ \lim_{p \to \infty} I(p) = \lim_{p \to \infty} \frac{1}{(p-1)^2} (1 - pe^{1-p}) = \lim_{p \to \infty} \left( \frac{1}{(p-1)^2} - \frac{pe^{1-p}}{(p-1)^2} \right) = 0, \]

Copyright © 2014 Pearson Education, Inc.
and
\[
\lim_{p \to -\infty} I(p) = \lim_{p \to -\infty} \left( \frac{1}{(p-1)^2} - \frac{pe}{(p-1)^2} e^{-p} \right) = \infty,
\]
since \( e^{-p} \) grows much faster than \( \frac{(p-1)^2}{p} \) as \( p \to -\infty \).

c. By inspection we see that \( I(0) = 1 \).

58. Note that
\[
y' = \frac{1}{2} \sqrt{3 - x^2} + \frac{x}{2} \frac{-2x}{2\sqrt{3 - x^2}} + \frac{3}{2} \frac{1}{2\sqrt{3}} \frac{1}{\sqrt{1 - x^2/3}} = \frac{6 - 2x^2}{4\sqrt{3 - x^2}} - 2x^2/6 = \frac{3 - x^2}{\sqrt{3 - x^2}} = \sqrt{3 - x^2}.
\]
Then
\[
L = \int_0^1 \sqrt{1 + 3 - x^2} \, dx = \int_0^1 \sqrt{4 - x^2} \, dx.
\]
Using the table of integrals entry 51, we have
\[
L = \left( \frac{x}{2} \sqrt{4 - x^2} + 2 \sin^{-1} \frac{x}{2} \right)_0^1 = \frac{\sqrt{3}}{2} + \frac{\pi}{3}.
\]

59. Let \( f(x) = \frac{x^2 - x}{\ln x} \) for \( x \neq 0, 1 \), and defined \( f(0) = 0 \) and \( f(1) = 1 \), since these are the limits as \( x \to 0, 1 \). Then use a CAS with, say, the Trapezoid rule with \( n = 100 \). The value of the integral is
\[
\int_0^1 \frac{x^2 - x}{\ln x} \, dx \approx 0.405.
\]

60.

a. We have \( V_1 = \pi \int_1^\infty x^{-2p} \, dx = \frac{\pi}{2p-1} \) for \( p > \frac{1}{2} \), and \( V_1 = \infty \) for \( p \leq \frac{1}{2} \) (see Example 2 in Section 7.4 for the evaluation of this improper integral). Similarly \( V_2 = 2\pi \int_1^\infty x^{1-p} \, dx = \frac{2\pi}{p-2} \) for \( p > 2 \), and \( V_2 = \infty \) for \( p \leq 2 \). Observe that \( V_1 = \frac{2\pi}{4p-2} = \frac{2\pi}{p-2} = V_2 \) for all \( p > 2 \). Therefore \( V_1 = V_2 \) only when both are infinite.

b. We will use the fact that \( \int_0^1 x^a \, dx = \frac{1}{a+1} \) for \( a > -1 \) and is infinite otherwise. We have \( V_1 = \pi \int_0^1 x^{-2p} \, dx = \frac{\pi}{1-2p} \) for \( p < \frac{1}{2} \), and \( V_1 = \infty \) for \( p \geq \frac{1}{2} \). Similarly \( V_2 = 2\pi \int_0^1 x^{1-p} \, dx = \frac{2\pi}{2-2p} \) for \( p < 2 \), and \( V_2 = \infty \) for \( p \geq 2 \). As above, \( V_1 = V_2 \) only when both are infinite.

61. We have
\[
V_1 = \pi \int_0^b e^{-2ax} \, dx = -\frac{\pi}{2a} e^{-2ab} \Big|_0^b = \frac{\pi}{2a} (1 - e^{-2ab}) ,
\]
and
\[
V_2 = \pi \int_b^\infty e^{-2ax} \, dx = \lim_{c \to \infty} \left( -\frac{\pi}{2a} e^{-2ax} \Big|_b^c \right) = \frac{\pi}{2a} e^{-2ab}.
\]
Equating these results and solving gives \( e^{-2ab} = \frac{1}{2} \), or \( ab = \frac{1}{2} \ln 2 \). A plot of the function is
Any point on this graph gives a pair \((a, b)\) for which the two integrals are equal.

**AP Practice Questions**

**Multiple Choice**

1. C is correct. Use the substitution \(u = \sqrt{x}\), so that \(du = \frac{1}{2\sqrt{x}} \, dx\). Then
   \[
   \int \frac{\cos \sqrt{x}}{\sqrt{x}} \, dx = 2 \int \cos u \, du = 2 \sin u + C = 2 \sin \sqrt{x} + C.
   \]

2. E is correct. Use integration by parts with \(u = \ln x\) and \(dv = x \, dx\), so that \(du = \frac{1}{x} \, dx\) and \(v = \frac{1}{2} x^2\). Then
   \[
   \int_1^e x \ln x \, dx = \frac{1}{2} x^2 \ln x \bigg|_1^e - \frac{1}{2} \int_1^e x \, dx = \frac{1}{2} e^2 - \frac{1}{4} e^2 \bigg|_1^e = \frac{1}{4} (e^2 + 1).
   \]

3. D is correct. Using partial fractions, write
   \[
   \frac{6}{x(x-6)} = \frac{A}{x} + \frac{B}{x-6},
   \]
   so that \(6 = A(x-6) + Bx\).
   Setting \(x = 0\) gives \(A = -1\); setting \(x = 6\) gives \(B = 1\), so that
   \[
   \int_1^4 \frac{6}{x(x-6)} \, dx = \int_1^4 \left( -\frac{1}{x} + \frac{1}{x-6} \right) \, dx = \ln \left| \frac{x-6}{x} \right| \bigg|_1^4 = \ln \frac{1}{2} - \ln 5 = - \ln 2 - \ln 5 = - \ln 10.
   \]

4. C is correct. Using integration by parts with \(u = x\) and \(dv = f'(x) \, dx\) gives \(du = dx\) and \(v = f(x)\), so we have
   \[
   \int_0^2 x f'(x) \, dx = (xf(x)) \bigg|_0^2 - \int_0^2 f(x) \, dx = 2f(2) - 0f(0) - 4 = 8.
   \]

5. A is correct. Since \(4 - x^2 = (2-x)(2+x)\) we get
   \[
   \frac{3}{x(4-x^2)} = \frac{3}{x(2-x)(2+x)} = \frac{A}{x} + \frac{B}{2-x} + \frac{C}{2+x}.
   \]
   Note that B, C, and D are all incorrect because they use incorrect factorizations of the denominator. E is incorrect since solving the above partial fraction gives \(A = \frac{3}{4}\), not \(A = 3\).
6. C is correct. Since \( x \sin x \geq 0 \) for \( x \in [0, \pi] \), the area is \( \int_0^\pi x \sin x \, dx \). Use integration by parts with \( u = x \) and \( dv = \sin x \, dx \), so that \( du = dx \) and \( v = -\cos x \). Then

\[
\int_0^\pi x \sin x \, dx = -x \cos x |_0^\pi + \int_0^\pi \cos x \, dx = \pi + \sin x |_0^\pi = \pi.
\]

7. D is correct. Since \( \frac{1}{\sqrt{2x-6}} \) is discontinuous at \( x = 3 \), we get

\[
\int_3^4 \frac{dx}{\sqrt{2x-6}} = \lim_{c \to 3^+} \int_c^4 (2x-6)^{-1/2} \, dx = \lim_{c \to 3^+} \left( \frac{(2x-6)^{1/2}}{1} \right)_{c} = \lim_{c \to 3^+} \left( 2^{1/2} - (2c-6)^{1/2} \right) = \sqrt{2}.
\]

8. A is correct. Use the disk method. The radius is \( \sqrt{x} \), so the volume is

\[
V = \pi \int_0^1 (\sqrt{x})^2 \, dx = \pi \int_0^1 x \, dx.
\]

Now integrate by parts with \( u = x \) and \( dv = e^x \, dx \), so that \( du = dx \) and \( v = e^x \). This gives

\[
V = \pi x e^x |_0^1 - \pi \int_0^1 e^x \, dx = \pi e - \pi e^x |_0^1 = \pi.
\]

9. B is correct. We have

\[
\int_1^\infty \frac{dx}{x^{3/2}} = \lim_{c \to \infty} \int_1^c \frac{dx}{x^{3/2}} = \lim_{c \to \infty} \left( -\frac{2}{x^{1/2}} \right)_{c} = \lim_{c \to \infty} \left( -\frac{2}{c^{1/2}} + 2 \right) = 2.
\]

10. D is correct. We have

\[
\int_0^1 \frac{dx}{x^{1/3}} = \lim_{c \to 0^+} \int_c^1 \frac{dx}{x^{1/3}} = \lim_{c \to 0^+} \left( \frac{3}{2} x^{2/3} \right)^1_{c} = \lim_{c \to 0^+} \left( \frac{3}{2} - \frac{3}{2} e^{2/3} \right) = \frac{3}{2}.
\]

11. E is correct. Use partial fractions. Write

\[
\frac{6}{x^2 + 2x - 8} = \frac{6}{(x+4)(x-2)} = \frac{A}{x+4} + \frac{B}{x-2}, \quad \text{so that} \quad 6 = A(x-2) + B(x+4).
\]

Setting \( x = 2 \) gives \( B = 1 \) while setting \( x = -4 \) gives \( A = -1 \), so that

\[
\int \frac{6}{x^2 + 2x - 8} \, dx = \int \left( -\frac{1}{x+4} + \frac{1}{x-2} \right) \, dx = \ln |x-2| - \ln |x+4| + C.
\]

12. E is correct. Since the degree of the numerator exceeds the degree of the denominator, using long division will reduce this to a polynomial plus a simpler fraction; in this case, we get

\[
\frac{x^2 + x + 3}{2x+1} = \frac{x}{2} + \frac{1}{4} + \frac{11}{4(2x+1)}.
\]

13. B is correct. This curve intersects the \( x \) axis at \( x = \pm 1 \), so we want to compute

\[
\int_{-1}^1 \left( 1 - \frac{\sqrt{3}}{\sqrt{4-x^2}} \right) \, dx = 2 \int_0^1 \left( 1 - \frac{\sqrt{3}}{\sqrt{4-x^2}} \right) \, dx.
\]

By Table 7.1, item 11, we get

\[
2 \int_0^1 \left( 1 - \frac{\sqrt{3}}{\sqrt{4-x^2}} \right) \, dx = 2 \left( x - \sqrt{3} \sin^{-1} \frac{x}{2} \right) \bigg|_0^1 = 2 \left( 1 - \sqrt{3} \cdot \frac{\pi}{6} \right) \approx 0.186.
\]
14. B is correct. Integrating \( f(x) = \ln x \) by parts with \( u = \ln x \) and \( dv = dx \) and using a constant term of \( C = 0 \) gives

\[
F(x) = \int f(x) \, dx = x \ln x - \int 1 \, dx = x \ln x - x + C.
\]

Since \( F(1) = -1 \) we get \( C = 0 \), so that \( F(x) = x \ln x - x \). Integrate the first term of \( F(x) \) using parts again, with \( u = \ln x \) and \( dv = x \, dx \) to get

\[
\int e^{\int_{1}^{e} F(x) \, dx} = \int e^{\int_{1}^{e} x \ln x - x \, dx} = \int e^{x \ln x - x} \, dx = x \ln x - x + C.
\]

Since \( F(1) = \frac{1}{2} \) we get \( C = 0 \), so that \( F(x) = x \ln x - x \).

Free Response
1. a. We have \( f(x) = \cos(x^2) \cdot 2x = 2x \cos x^2 \), so that \( f'(x) = 0 \) for \( x = 0 \) and for \( x^2 = \frac{2k \pi}{1} \) for \( k \) an odd integer (of course, in fact \( k \) must be a positive integer for it to be equal to \( x^2 \)). The smallest positive value of \( x \) where \( f'(x) = 0 \) is therefore \( x = \sqrt{\frac{2k \pi}{1}} \). Now, \( f''(x) = 2 \cos x^2 - 2x \sin x^2 \cdot 2x = 2 \cos x^2 - 4x^2 \sin x^2 \), so that

\[
f'' \left( \sqrt{\frac{2k \pi}{1}} \right) = 2 \cos \frac{2k \pi}{1} - 4 \cdot \sin \frac{2k \pi}{1} = -2\pi.
\]

Thus \( x = \sqrt{\frac{2k \pi}{1}} \approx 1.253 \) is a local maximum and this is the point we are seeking.

b. The smallest positive zero of \( f(x) \) is for \( x = \sqrt{\pi} \), so the area is

\[
\int_{0}^{\sqrt{\pi}} \sin x^2 \, dx \approx 0.895.
\]

Note that \( f(x) \) cannot be integrated in terms of elementary functions.

c. The total moment is

\[
M = \int_{0}^{1} x \rho(x) \, dx = \int_{0}^{1} x \sin x^2 \, dx = -\frac{1}{2} \cos x^2 \bigg|_{0}^{1} = \frac{1}{2} (1 - \cos 1) \approx 0.230.
\]

Since the units of \( \rho \) are kg per meter and \( x \) is measured in meters, the result of the integral is meters times kg per meter times meters, or kg-meters, so the answer is \( \approx 0.230 \) kg-m.

d. Since \( f'(x) = 2x \cos x^2 \), the arc length on \( [0, \pi] \) is

\[
\int_{0}^{\pi} \sqrt{1 + f'(x)^2} \, dx = \int_{0}^{\pi} \sqrt{1 + 4x^2 \cos^2 x^2} \, dx.
\]

2. a. \( f(x) = \frac{1}{\sqrt{2}} \) when \( 1 + x^2 = 2 \), so when \( x = \pm 1 \). Thus the region is above the given line and below \( f(x) \), between \( x = -1 \) and \( x = 1 \). Use the washer method; then the outer radius is \( f(x) \) and the inner radius
4.

a. We have \( f'(x) = e^{x^2-9} \cdot \frac{d}{dx} (x^2 - 9) = 2xe^{x^2-9}. \)

b. At \( x = 3 \), the slope of \( f(x) \) is \( f'(3) = 6e^0 = 6 \), so the tangent line at \((3, f(3)) = (3, 1)\) is \( y = y = 6(x-3) \), or \( y = 6x - 17 \).

c. \( g \) is continuous at \( x = 3 \) if and only if \( \lim \frac{g(x)}{x} = g(3) \). Since \( f \) is continuous, we know that \( \lim_{x \to 3} \frac{f(x)}{x} = f'(3) = e^0 = 1 = g(3) \). Also, \( \lim_{x \to 3^+} \frac{g(x)}{x} = \lim_{x \to 3^+} (2x - 5) = 1 \). Thus the limit exists and is equal to \( g(3) \), so that \( g \) is continuous at \( x = 3 \).

d. Use the substitution \( u = x^2 - 9 \), so that \( du = 2x \, dx \). Then \( x = 0 \) corresponds to \( u = -9 \) while \( x = 3 \) corresponds to \( u = 0 \), and we get

\[
\int_{-9}^{0} x e^{x^2-9} \, dx = \frac{1}{2} \int_{-9}^{0} e^u \, du = \frac{1}{2} e^u \bigg|_{-9}^{0} = \frac{1}{2} (1 - e^{-9}).
\]

4.

a. We have \( f'(x) = -xe^{-x} + 2xe^{-x} = (2x - x^2)e^{-x} \). Then \( f'(x) = 0 \) for \( x = 0 \) and \( x = 2 \). Since

\[
f'(-1) = (-2 - 1)e^{-1} < 0, \quad f'(1) = (2 - 1)e^{-1} > 0, \quad f'(3) = (6 - 9)e^{-3} < 0,
\]

we see that \( x = 0 \) is a local minimum while \( x = 2 \) is a local maximum. Thus \( f(x) \) has a local minimum only at \( x = 0 \).

b. \( f \) is increasing when \( f'(x) > 0 \), which, from the computations in part (a), is for \( x \in (0, 2) \).

c. Use integration by parts with \( u = x^2 \) and \( dv = e^{-x} \, dx \) to get

\[
\int_{0}^{\infty} f(x) \, dx = \lim_{c \to \infty} \int_{0}^{c} f(x) \, dx
\]

\[
= \lim_{c \to \infty} \left( -x^2 e^{-x}|_{0}^{c} \right) + 2 \lim_{c \to \infty} \int_{0}^{c} xe^{-x} \, dx
\]

\[
= \lim_{c \to \infty} \left( -c^2 e^{-c} + 0 \right) + 2 \lim_{c \to \infty} \int_{0}^{c} xe^{-x} \, dx
\]

\[
= 2 \lim_{c \to \infty} \int_{0}^{c} xe^{-x} \, dx.
\]
Use integration by parts again, with \( u = x \) and \( dv = e^{-x} \, dx \) to get

\[
2 \lim_{c \to \infty} \int_0^c x e^{-x} \, dx = 2 \lim_{c \to \infty} \left( -xe^{-x}\bigg|_0^c \right) + 2 \lim_{c \to \infty} \int_0^c e^{-x} \, dx
= 2 \lim_{c \to \infty} \left( -ce^{-c} + 0 \right) + 2 \lim_{c \to \infty} \left( -e^{-c}\bigg|_0^c \right)
= 2 \lim_{c \to \infty} \left( -e^{-c} + 1 \right) = 2.
\]

d. Since \( f(x) \) is continuous for all \( x \), we see that
\[
\lim_{x \to 1^-} g(x) = \lim_{x \to 1^-} f(x) = f(1) = e^{-1},
\]
so we need \( \lim_{x \to 1^-} e^{kx} = e^k = e^{-1} \). Thus \( k = -1 \).

5.

a. The slope of \( f \) at \( x = 0 \) is \( f'(0) = (0 - 6)e^0 = -6 \), so the equation of the tangent line at \((0,1)\) is
\[
y - 1 = -6(x - 0), \quad \text{or} \quad y = 1 - 6x.
\]

b. \( f \) is increasing where \( f'(x) > 0 \). Since \( e^x \) is always positive, we know that \( f \) is increasing when \( x - 6 > 0 \) or \( x > 6 \). So \( f \) is increasing on \((6, \infty)\). \( f \) is concave up where \( f''(x) > 0 \). But \( f''(x) = (x - 6)e^x + e^x = (x - 5)e^x \), so that \( f \) is concave up for \( x > 5 \). Thus \( f \) is both increasing and concave up for \( x \in (6, \infty) \).

c. \( f'(x) = 0 \) only at \( x = 6 \), and \( x = 6 \) is a local minimum since \( f' \) changes from negative to positive there. Since \( x = 6 \) is the only local extremum, it must be a global extremum, so that \( x = 6 \) is a global minimum (see Theorem 4.5). To determine the value of \( f \) at that point, we integrate using integration by parts with \( u = x - 6 \) and \( dv = e^x \, dx \) to get

\[
f(x) = \int (x - 6)e^x \, dx = (x - 6)e^x - \int e^x \, dx = (x - 7)e^x + C.
\]

Since \( f(0) = 1 \) we get \(-7 + C = 1 \) so that \( C = 8 \) and \( f(x) = (x - 7)e^x + 8 \). Thus \( f(6) = 8 - e^6 \).
Chapter 8

Differential Equations

8.1 Basic Ideas

8.1.1 Second-order, because the highest-order derivative appearing in the equation is second order.

8.1.2 Linear, because the unknown function and its derivatives appear only to the first power.

8.1.3 The equation is second-order, so we expect two arbitrary constants in the general solution.

8.1.4 We have \( y(0) = Ce^{−3t} + 10 \) and \( C + 10 = 5 \), so \( C = −5 \). The solution is \( y(t) = −5e^{−3t} + 10 \).

8.1.5 Yes. Note that \( y''(t) = 0 \) and \( y'(t) = 2 \).

8.1.6 No. \( y'(t) = −18e^{−3t} \), so \( y'(t) − 3y(t) = −18e^{−3t} − 3 \cdot 6e^{−3t} = −36e^{−3t} \neq 0 \).

8.1.7 Yes, it is a solution. Note that \( y'(t) = −5Ce^{−5t} \), so \( y'(t) + 5y(t) = 0 \).

8.1.8 Yes, it is a solution. \( y'(t) = −3Ct^{−4} \), so \( ty'(t) + 3y(t) = −3Ct^{−3} + 3Ct^{−3} = 0 \).

8.1.9 Yes, it is a solution. \( y'(t) = 4C_1 \cos 4t − 4C_2 \sin 4t \), so \( y''(t) = −16C_1 \sin 4t − 16C_2 \cos 4t \), so \( y''(t) + 16y(t) = 0 \).

8.1.10 Yes, it is a solution. \( y'(x) = −C_1 e^{−x} + C_2 e^{x} \), so \( y''(x) = C_1 e^{−x} + C_2 e^{x} \), so \( y''(x) − y(x) = 0 \).

8.1.11 Yes, it is a solution. \( y'(t) = 32e^{2t} \), so \( y'(t) − 2y(t) = 32e^{2t} − (32e^{2t} − 20) = 20 \). Also, \( y(0) = 16 − 10 = 6 \).

8.1.12 Yes, it is a solution. \( y'(t) = 48t^5 \), so \( ty'(t) − 6y(t) = 48t^6 − 48t^6 + 18 = 18 \). Also, \( y(1) = 8 − 3 = 5 \).

8.1.13 Yes, it is a solution. \( y'(t) = 9 \sin 3t \), so \( y''(t) = 27 \cos 3t \). Thus, \( y''(t) + 9y(t) = 27 \cos 3t − 27 \cos 3t = 0 \). Also, \( y'(0) = 0 \) and \( y(0) = −3 \).

8.1.14 Yes, it is a solution. \( y'(x) = \frac{1}{4} (2e^{2x} + 2e^{−2x}) \) and \( y''(x) = \frac{1}{4} (4e^{2x} − 4e^{−2x}) \). So \( y''(x) − 4y(x) = 0 \). Also, \( y(0) = 0 \) and \( y'(0) = 1 \).

8.1.15 \( y(t) = \int (3 + e^{−2t}) dt = 3t − \frac{1}{2} e^{−2t} + C \).

8.1.16 \( y(t) = \int (12t^5 − 20t^4 + 2 − 6t^{−2}) dt = 2t^6 − 4t^5 + 2t + \frac{6}{t} + C \).

8.1.17 \( y(x) = \int (4 \tan 2x − 3 \cos x) \, dx = −2 \ln | \cos 2x| − 3 \sin x + C = 2 \ln | \sec 2x| − 3 \sin x + C \).

8.1.18 \( p(x) = \int \frac{e^x}{1 + e^x} \, dx \). Use the substitution \( u = 1 + e^x \), so that \( du = e^x \, dx \). Then we get

\[
p(x) = \int \frac{e^x}{1 + e^x} \, dx = \int \frac{1}{u} \, du = \ln |u| + C = \ln(e^x + 1) + C.
\]

Note that the absolute value sign is unnecessary since \( e^x + 1 > 0 \).

Copyright © 2014 Pearson Education, Inc.
8.1.19

\[ y'(t) = \int (60t^4 - 4 + 12t^{-3}) \, dt = 12t^5 - 4t - 6t^{-2} + C_1 \]

\[ y(t) = \int (12t^5 - 4t - 6t^{-2} + C_1) \, dt = 2t^6 - 2t^2 + 6t^{-1} + C_1 t + C_2. \]

8.1.20

\[ y'(t) = \int (15e^{3t} + \sin 4t) \, dt = 5e^{3t} - \frac{1}{4} \cos 4t + C_1 \]

\[ y(t) = \int \left( 5e^{3t} - \frac{1}{4} \cos 4t + C_1 \right) \, dt = \frac{5}{3} e^{3t} - \frac{1}{16} \sin 4t + C_1 t + C_2. \]

8.1.21

\[ u'(x) = \int (55x^9 + 36x^7 - 21x^5 + 10x^{-3}) \, dx = \frac{11}{2} x^{10} + \frac{9}{2} x^8 - \frac{7}{2} x^6 - 5x^{-2} + C_1 \]

\[ u(x) = \int \left( \frac{11}{2} x^{10} + \frac{9}{2} x^8 - \frac{7}{2} x^6 - 5x^{-2} + C_1 \right) \, dx = \frac{1}{2} x^{11} + \frac{1}{2} x^9 - \frac{1}{2} x^7 + 5x^{-1} + C_1 x + C_2. \]

8.1.22

\[ v'(x) = \int x e^x \, dx = xe^x - e^x + C_1 \]

\[ v(x) = \int (xe^x - e^x + C_1) \, dx = xe^x - e^x - e^x + C_1 x + C_2 = xe^x - 2e^x + C_1 x + C_2. \]

The integrations are performed using integration by parts for \( xe^x \).

8.1.23 \( y(t) = \int (1 + e^t) \, dt = t + e^t + C. \) Because \( y(0) = 4 = 1 + C \), we have \( C = 3 \). Thus, \( y(t) = t + e^t + 3 \).

8.1.24 \( y(t) = \int (\sin t + \cos 2t) \, dt = -\cos t + \frac{1}{2} \sin 2t + C. \) Because \( y(0) = 4 = -1 + C \), we have \( C = 5 \). Thus, \( y(t) = -\cos t + \frac{1}{2} \sin 2t + 5 \).

8.1.25 \( y(x) = \int (3x^2 - 3x^{-4}) \, dx = x^3 + x^{-3} + C. \) Because \( y(1) = 0 = 1 + 1 + C \), we have \( C = -2 \). So \( y(x) = x^3 + x^{-3} - 2 \).

8.1.26 \( y(x) = \int 4 \sec^2 2x \, dx = 2 \tan 2x + C. \) Because \( y(0) = 8 = 0 + C \), we have \( C = 8 \). Thus, \( y(x) = 2 \tan 2x + 8 \).

8.1.27 \( y(t) = \int (12t - 20t^3) \, dt = 6t^2 - 5t^4 + C_1. \) Because \( y'(0) = 0 = 0 + C_1 \), we have \( C_1 = 0 \). \( y(t) = \int (6t^2 - 5t^4) \, dt = 2t^3 - t^5 + C_2. \) Because \( y(0) = 1 = 0 - 0 + C_2 \), we have \( C_2 = 1 \). Thus \( y(t) = 2t^3 - t^5 + 1 \).

8.1.28 \( u'(x) = \int (4e^{2x} - 8e^{-2x}) \, dx = 2e^{2x} + 4e^{-2x} + C_1. \) Because \( u'(0) = 3 = 2 + 4 + C_1 \), we have \( C_1 = -3 \). Next, \( u(x) = \int (2e^{2x} + 4e^{-2x} - 3) \, dx = e^{2x} - 2e^{-2x} - 3x + C_2. \) Because \( u(0) = 1 = 1 - 2 - 0 + C_2 \), we have \( C_2 = 2 \). Thus, \( u(x) = e^{2x} - 2e^{-2x} - 3x + 2 \).

8.1.29

a. \( v(t) = -9.8t + 29.4. \) \( s(t) = -4.9t^2 + 29.4t + 30. \)

b. The object reaches its high point when \(-9.8t + 29.4 = 0\), or \( t = \frac{29.4}{9.8} = 3 \). At that time its position is \( s(3) = 74.1 \) meters.

8.1.30

a. \( v(t) = -9.8t + 49. \) \( s(t) = -4.9t^2 + 49t + 60. \)
b. The object reaches its high point when \(-9.8t + 49 = 0\), or \(t = \frac{49}{9.8} = 5\). At that time its position is \(s(5) = 182.5\) meters.

8.1.31

The height function is given by \(h(t) = \left(\sqrt{1.96 - \frac{0.3\sqrt{1.96}}{1.5} \cdot \frac{t}{2}}\right)^2\). The tank is empty when \(h(t) = 0\), which occurs after about 3.162 seconds.

8.1.32

The height function is given by \(h(t) = \left(\sqrt{2.25 - \frac{0.5\sqrt{2.25}}{2} \cdot \frac{t}{2}}\right)^2\). The tank is empty when \(h(t) = 0\), which occurs after about 2.711 seconds.

8.1.33

a. False. That is a specific solution. The general solution is \(t + C\).

b. False. It is second order, but is not linear.

c. True. First find the general solution, and then find the specific solution which satisfies the initial condition.

8.1.34 \(y(t) = \int (t \sin t^2 + 1) \, dt\). Note that \(\frac{d}{dt}(t^2) = 2t\), so this integral is \(y(t) = t - \frac{1}{2} \cos t^2 + C\).

8.1.35 \(u(x) = \int \frac{2\sqrt{x}}{x+4} \, dx - \int \frac{2\sqrt{x}}{x+4} \, dx = \ln(x^2 + 4) - \tan^{-1} \frac{x}{2} + C\).

8.1.36 Note that \(\frac{4}{x^2} = \frac{1}{x^2 - 1} - \frac{1}{x+2}\). Thus, \(v(t) = \int \frac{1}{x+2} \, dt = \int \left(\frac{1}{x^2 - 1} - \frac{1}{x+2}\right) \, dt = \ln \left|\frac{x}{x+2}\right| + C\).

8.1.37 \(y'(x) = \int \frac{x}{(1-x^2)^{3/2}} \, dx\). Let \(u = 1 - x^2\), so that \(du = -2x \, dx\). Substituting gives

\[ y'(x) = -\frac{1}{2} \int u^{-3/2} \, du = u^{-1/2} + C_1 = \frac{1}{\sqrt{1-x^2}} + C_1. \]

Integrating again to get

\[ y(x) = \int \left(\frac{1}{\sqrt{1-x^2}} + C_1\right) \, dx = \sin^{-1} x + C_1 x + C_2. \]

8.1.38 Let \(u = t\) and \(dv = e^t \, dt\). Then \(du = dt\) and \(v = e^t\). Thus, \(y(t) = \int te^t \, dt = te^t - \int e^t \, dt = te^t - e^t + C\). Because \(y(0) = -1 = 0 - 1 + C\), we have \(C = 0\). Thus \(y(t) = te^t - e^t\).

8.1.39 \(u(x) = \int \left(\frac{1}{(x^2+1)} - 4\right) \, dx = \frac{1}{4} \tan^{-1} \frac{x}{4} - 4x + C\). Because \(u(0) = 2 = 0 - 0 + C\), we have \(C = 2\). Thus, \(u(x) = \frac{1}{4} \tan^{-1} \frac{x}{4} - 4x + 2\).
8.1.40 \( p(x) = \int \frac{2}{x(x+1)} \, dx = \int \left( \frac{2}{x} - \frac{2}{x+1} \right) \, dx = 2 \ln \left| \frac{x}{x+1} \right| + C. \) Because \( p(1) = 0 = 2 \ln(1/2) + C, \) we have \( C = -2 \ln(1/2) = 2 \ln 2. \) Thus, \( p(x) = 2 \ln \left| \frac{x}{x+1} \right| + 2 \ln 2. \)

8.1.41 Integrating gives \( y'(t) = -\frac{1}{2} \cos 2t + C_1. \) Since \( y'(0) = -\frac{1}{2} + C_1 = 1 \) we have \( C_1 = \frac{3}{2} \) so that \( y'(t) = -\frac{1}{2} \cos 2t + \frac{3}{2}. \) Integrate again to get \( y(t) = -\frac{1}{4} \sin 2t + \frac{3}{4} t + C_2. \) Since \( y(0) = C_2 = 0, \) we have \( C_2 = 0, \) and \( y(t) = -\frac{1}{4} \sin 2t + \frac{3}{4} t. \)

8.1.42 \( u'(t) = Ce^{1/(4t^4)} \left( \frac{1}{4} \right) t^{-5} = -\frac{u(t)}{t^5}. \) Thus \( u'(t) + \frac{u(t)}{t^5} = -\frac{u(t)}{t^5} + \frac{u(t)}{t^5} = 0. \)

8.1.43 \( u'(t) = C_1 e^t + C_2 e^{2t} + C_2 t e^t, \) and \( u''(t) = C_1 e^t + C_2 e^{2t} + C_2 e^t + C_2 t e^t = C_1 e^t + 2C_2 e^t + C_2 t e^t. \) Thus
\[
\begin{align*}
\frac{u''(t) - 2u'(t) + u(t)}{(C_1 e^t + 2C_2 e^t + C_2 t e^t)} &= 0 \quad \text{or} \quad (C_1 e^t + 2C_2 e^t + C_2 t e^t) - 2(C_1 e^t + C_2 e^t + C_2 t e^t) + C_1 e^t + C_2 t e^t = 0.
\end{align*}
\]

8.1.44 \( g(x) = -2C_1 e^{-2x} + C_2 e^{-2x} - 2C_2 e^{-2x}, \) so
\[
\frac{1}{x} (g(x)) = 4C_1 e^{-2x} - 2C_2 e^{-2x} + 2C_2 e^{-2x} + 4C_2 e^{-2x} = 4C_1 e^{-2x} - 4C_2 e^{-2x} + 4C_2 e^{-2x}.
\]
Thus
\[
g''(x) + 4g'(x) + 4g(x) = 4C_1 e^{-2x} - 4C_2 e^{-2x} + 4C_2 e^{-2x} + 4(-2C_1 e^{-2x} + C_2 e^{-2x} - 2C_2 e^{-2x}) + 4(4C_1 e^{-2x} + C_2 e^{-2x} + 2) = 8.
\]

8.1.45 \( u'(t) = 2C_1 t + 3C_2 t^2, \) so \( u''(t) = 2C_1 + 6C_2 t. \) Thus
\[
t^2 u''(t) - 4t u'(t) + 6u(t) = 2C_1 t^2 + 6C_2 t^3 - 4(2C_1 t^2 + 3C_2 t^3) + 6C_1 t^2 + 6C_2 t^3 = 0.
\]

8.1.46 \( u'(t) = 5C_1 t^4 - 4C_2 t^5 - 3t^2, \) so \( u''(t) = 20C_1 t^3 + 20C_2 t^4 - 6t. \) Thus
\[
t^2 u''(t) - 20u(t) = 20C_1 t^5 + 20C_2 t^4 - 6t - 20 \left( C_1 t^5 + C_2 t^4 - t^3 \right) = 14t^3.
\]

8.1.47 \( z'(t) = -C_1 e^{-t} + 2C_2 e^{2t} - 3C_3 e^{-3t} - e^t. \) So
\[
\begin{align*}
z''(t) &= C_1 e^{-t} + 4C_2 e^{2t} + 9C_3 e^{-3t} - e^t, \\
z'''(t) &= -C_1 e^{-t} + 8C_2 e^{2t} - 27C_3 e^{-3t} - e^t.
\end{align*}
\]
Thus
\[
\begin{align*}
z''''(t) + 2z'''(t) - 5z''(t) - 6z'(t) - 6z(t) &= -C_1 e^{-t} + 8C_2 e^{2t} - 27C_3 e^{-3t} - e^t + 2C_1 e^{-t} + 8C_2 e^{2t} + 18C_3 e^{-3t} - 2e^t + 5C_1 e^{-t} - 10C_2 e^{2t} + 15C_3 e^{-3t} + 5e^t - 6C_1 e^{-t} - 6C_2 e^{2t} - 6C_3 e^{-3t} + 6e^t \\
&= 8e^t.
\end{align*}
\]

8.1.48 a. \( y'(t) = C_1 e^t - C_2 e^{-t}, \) so \( y''(t) = C_1 e^t + C_2 e^{-t}. \) Thus, \( y''(t) - y(t) = 0. \)

b. \( y'(t) = 2C_1 e^{2t} - 2C_2 e^{-2t}, \) so \( y''(t) = 4C_2 e^{2t} + 4C_2 e^{-2t}. \) Thus, \( y''(t) - 4y(t) = 0. \)

c. It appears that a general solution should be \( C_1 e^{kt} + C_2 e^{-kt}. \) Then \( y'(t) = kC_1 e^{kt} - kC_2 e^{-kt}, \) and \( y''(t) = k^2 C_1 e^{kt} + k^2 C_2 e^{-kt}. \) Thus, \( y''(t) - k^2 y(t) = 0. \)

8.1.49 a. \( y'(t) = C_1 \cos t - C_2 \sin t, \) so \( y''(t) = -C_1 \sin t - C_2 \cos t. \) Thus, \( y''(t) + y(t) = 0. \)

b. \( y'(t) = 2C_1 \cos 2t - 2C_1 \sin 2t, \) so \( y''(t) = -4C_1 \sin 2t - 4C_2 \cos 2t. \) Thus, \( y''(t) + 4y(t) = 0. \)
c. A general solution appears to be \( y(t) = C_1 \sin kt + C_2 \cos kt \). Then \( y'(t) = kC_1 \cos kt - kC_2 \sin kt \), so \( y''(t) = -k^2C_1 \sin kt - k^2C_2 \cos kt \). And then \( y''(t) + k^2y(t) = 0 \).

8.1.50

a. Let \( m(t) = \frac{I}{k}(1 - e^{-kt}) \). Note that \( m(0) = 0 \). Then \( m'(t) = \frac{I}{k}(ke^{-kt}) \). Therefore,

\[
m'(t) + km(t) = \frac{I}{k}(ke^{-kt}) + \frac{kI}{k}(1 - e^{-kt}) = Ie^{-kt} + I - Ie^{-kt} = I.
\]

b. We have \( m(t) = 200(1 - e^{-0.05t}) \).

c. It appears that \( \lim_{t \to \infty} m(t) = 200 \).

8.1.51

a. Let \( p(t) = \frac{K}{1+Ce^{-rt}} \). Note that \( 1 - \frac{p}{K} = 1 - \frac{1}{1+Ce^{-rt}} = \frac{Ce^{-rt}}{1+Ce^{-rt}} \). We have

\[
p'(t) = \frac{KCe^{-rt}}{(1 + Ce^{-rt})^2} = \frac{K}{1 + Ce^{-rt}} \cdot \frac{Ce^{-rt}}{1 + Ce^{-rt}} = rp\left(1 - \frac{p}{K}\right).
\]

b. If \( p(0) = 50 = \frac{K}{1+C} \), then \( 50 + 50C = K \), so \( C = \frac{K-50}{50} \).

c. We have \( p(t) = \frac{300}{1 + 5e^{-rt}} \).

d. \( \lim_{t \to \infty} \frac{300}{1 + 5e^{-rt}} = \frac{300}{1+0} = 300 \), which is consistent with the graph from part c.

8.1.52

a. Let \( v(t) = \frac{g}{b}(1 - e^{-bt}) \). Then \( v(0) = 0 \), and

\[
v'(t) = \frac{g}{b} \cdot be^{-bt} = ge^{-bt} = g - b \cdot \frac{g}{b}(1 - e^{-bt}) = g - bv.
\]

b. With \( b = 0.1 \), we have \( v(t) = 98(1 - e^{-1t}) \).
8.1.53

a. If \( y(t) = y_0 e^{-kt} \), then \( y(0) = y_0 \), and \( y'(t) = -ky_0 e^{-kt} \), so \( y'(t) = -ky \).

b. Let \( y(t) = \frac{y_0}{y_0 + kt} \). Then \( y(0) = y_0 \), and \( y'(t) = \frac{-y_0^2 k}{(y_0 + kt)^2} = -ky(t)^2 \).

c. The first order reaction decays more quickly.

8.1.54

a. Let \( M(t) = K \left( \frac{M_0}{K} \right)^{e^{-rt}} \). Note that \( \ln \left( \frac{M_0}{K} \right) = e^{-rt} \ln \frac{M_0}{K} \). Then

\[
M'(t) = K \left( \frac{M_0}{K} \right)^{e^{-rt}} \ln \left( \frac{M_0}{K} \right) (-re^{-rt}) = -rM(t) \ln \frac{M(t)}{K}.
\]

Also, \( M(0) = K \cdot \frac{M_0}{K} = M_0 \).

b. Using \( K = 200 \), \( M_0 = 100 \), and \( r = .05 \), we have \( M(t) = K \left( \frac{M_0}{K} \right)^{e^{-rt}} = 200 \left( \frac{1}{2} \right)^{0.05t} \).

c. \( \lim_{t \to \infty} M(t) = 200 = K \).

8.1.55

a. If \( A > 0 \), then \( y(0) > 0 \). Then the slope of \( y(t) \) at \( t = 0 \) is \( \frac{A}{2} > 0 \), so that \( y(t) \) is increasing at \( t = 0 \). Thus \( y(t) > 0 \) for \( t \) just to the right of \( 0 \). Applying this argument again shows that the slope of \( y(t) \) is positive everywhere, so that \( y(t) \) is increasing. Similarly, if \( A < 0 \), then \( y(0) < 0 \). Then the slope of \( y(t) \) at \( t = 0 \) is \( \frac{A}{2} < 0 \), so that \( y(t) \) is decreasing at \( t = 0 \). Thus \( y(t) < 0 \) for \( t \) just to the right of \( 0 \). Applying this argument again shows that the slope of \( y(t) \) is negative everywhere, so that \( y(t) \) is decreasing.

b. The concavity is determined by the sign of \( y''(t) \). But \( y''(t) = (y'(t))^2 = \frac{y(t)}{2} = \frac{y(t)}{4} \). If \( A > 0 \), then \( y(t) \) is increasing, so is positive everywhere and thus \( y''(t) > 0 \) everywhere and \( y(t) \) is concave up. If \( A < 0 \), then \( y(t) \) is decreasing, so is negative everywhere and thus \( y''(t) < 0 \) everywhere and \( y(t) \) is concave down.

c. At \( t = 0 \), the slope of \( y(t) \) is 1, and the slope increases as \( t \) increases. Also, \( y(0) = 2 \). A graph of \( y(t) \) is
8.1. BASIC IDEAS

8.1.56

a. Since \( y(0) = 3 \), we have \( y'(0) = 4 \cdot 3 - 8 = 4 > 0 \), so that the solution is increasing at \( t = 0 \). Thus for larger values of \( t \), we must have \( y(t) > 3 \), so that \( y'(t) = 4y(t) - 8 > 0 \) for larger values of \( t \) as well. Thus \( y(t) \) is increasing for \( t > 0 \).

b. We have \( y''(t) = (y'(t))' = 4y'(t) = 4(4y - 8) \). Since \( 4y - 8 > 0 \) for all \( t > 0 \), the graph of the solution is concave up for all \( t > 0 \).

c. At \( t = 0 \), the slope of \( y(t) \) is 4, and the slope increases as \( t \) increases. Also, \( y(0) = 3 \). A graph of \( y(t) \) is

d. If \( y(0) = 1 \), then \( y'(0) = 4 \cdot 1 - 8 = -4 < 0 \), so that the solution is decreasing at \( t = 0 \). Thus for larger values of \( t \), we must have \( y(t) < 1 \), so that \( y'(t) < 0 \) for larger values of \( t \) as well. Thus \( y(t) \) is decreasing for \( t > 0 \). Also, \( y''(t) = (y'(t))' = 4y'(t) = 4(4y - 8) \) as in part (b). Since \( 4y - 8 < 0 \) for all \( t > 0 \), the graph of the solution is concave down for all \( t > 0 \).

e. At \( t = 0 \), the slope of \( y(t) \) is \(-4\), and the slope becomes increasingly negative since the graph is concave down. Also, \( y(0) = 1 \). A graph of \( y(t) \) is
f. For \(y(0) = A\), we have \(y'(0) = 4A - 8\). Then the solution is increasing when \(4A - 8 > 0\), since it is then increasing at \(t = 0\) so that for larger values of \(t\), we have \(y'(0) > 0\) as well. But \(4A - 8 > 0\) means \(A > 2\). So for \(A > 2\) the solution is increasing and for \(A < 2\) it is decreasing. For \(A = 2\), we have \(y'(0) = 0\), so that the solution is constant (and is \(y(t) = 2\)).

### 8.2 Direction Fields and Euler’s Method

**8.2.1** Choose a regular grid of points in the \(ty\)-plane, and for each point \(P\), make a small line segment with slope \(f(t, y)\).

**8.2.2** It will have slope \(3^2 - 3 \cdot 1^2 = 6\).

**8.2.3** \(u_0 = y(3) = 1\). \(u_1 = u_0 + f(3, 1) \cdot 0.1 = 1 + 0.6 = 1.6\).

**8.2.4** Because the differential equation is giving the slope at a given point, we can approximate the solution to the differential equation by starting at the initial point, and using the slope to guide where the next iteration should be. In essence, we are numerically “following the direction field” to estimate the solution to the differential equation.

**8.2.5** With \(y'(t) = -2y\) we get

<table>
<thead>
<tr>

b, c. A sketch of these points in the slope field, with the solution curve through $(0, -1)$, and a sketch including more points, is
8.2.12 a. With \( y'(t) = ty \) we get

\[
\begin{array}{c|c|c|c|c|c}
  & t = 0 & t = 0.5 & t = 1 & t = 1.5 & t = 2 \\
\hline
y = 0 & 0 & 0 & 0 & 0 & 0 \\
y = 1 & 0 & 0.5 & 1 & 1.5 & 2 \\
y = 2 & 0 & 1 & 2 & 3 & 4 \\
\end{array}
\]

b, c. A sketch of these points in the slope field, with the solution curve through \((0, \frac{1}{2})\), and a sketch including more points, is
8.2.15

a. For a given value of \( t \), the slopes do not depend on \( y \). The only field that has this property is D.

b. For a given value of \( y \), the slopes do not depend on \( t \). The only field that has this property is B.

c. The slope at \((t, y)\) depends on the distance of \((t, y)\) from the origin, since it involves \( t^2 + y^2 \). This matches A.

d. Along the \( y \) axis, where \( t = 0 \), the slopes should be vertical. This matches C.

8.2.16 Note that the slopes are zero when \( y = -1 \) and when \( t = 1 \). Also, they are positive when both \( y > -1 \) and \( t > 1 \). The only differential equation with this property is choice a.

8.2.17

a.

b. An initial condition of \( y(0) = -1 \) appears to lead to a constant solution.

c. For any initial condition other than \( y(0) = -1 \), the solutions are increasing over time.
8.2.18

a.

b. An initial condition of \( y(0) = 1 \) appears to lead to a constant solution.

c. For any other initial condition, the solutions oscillate between increasing and decreasing over time intervals of length one.

8.2.19

a.

b. An initial condition of \( y(0) = 1 \) appears to lead to a constant solution.

c. Initial conditions \( y(0) = A \) lead to solutions that are increasing over time if \( A > 1 \) and solutions that are decreasing over time if \( A < 1 \).
8.2. DIRECTION FIELDS AND EULER’S METHOD

8.2.20

8.2.21

8.2.22

8.2.23

8.2.24

8.2.25

a. The solutions \( y = 1 \) and \( y = -1 \) are constant since \( y'(t) = 0 \) everywhere under those conditions.

b. From the equation, solutions are increasing when both \( y > 1 \) and \( y > -1 \) (so for \( y > 1 \)), or when both \( y < 1 \) and \( y < -1 \) (so for \( y < -1 \)). In other words, solutions are increasing for \( |y| > 1 \) and decreasing for \( |y| < 1 \).

c. Initial conditions \( y(0) = A \) lead to solutions that are increasing over time if \( |A| > 1 \) and decreasing over time if \( |A| < 1 \).

d.

8.2.26

a. The solutions \( y = 2 \) and \( y = -1 \) are constant since \( y'(t) = 0 \) everywhere under those conditions.

b. Solutions are increasing when both \( y > 2 \) and \( y > -1 \) (so for \( y > 2 \)), or when both \( y < 2 \) and \( y < -1 \) (so for \( y < -1 \)). Solutions are decreasing for \(-1 < y < 2 \).
c. Initial conditions \( y(0) = A \) lead to solutions that are increasing over time if \( A > 2 \) or \( A < -1 \), and decreasing over time if \( -1 < A < 2 \).

8.2.27

a. The solutions \( y = \frac{\pi}{2} \) and \( y = -\frac{\pi}{2} \) are constant since \( y'(t) = 0 \) everywhere under those conditions.

b. Solutions are increasing when \( |y| < \frac{\pi}{2} \) and decreasing when \( \frac{\pi}{2} < |y| < \pi \).

c. Initial conditions \( y(0) = A \) lead to solutions that are increasing over time if \( |A| < \frac{\pi}{2} \) and decreasing over time if \( \frac{\pi}{2} < |A| < \pi \).

8.2.28

a. The solutions \( y = 0, y = -3, \) and \( y = 4 \) are constant since \( y'(t) = 0 \) everywhere under those conditions.

b. Solutions are increasing when \( y < -3 \) and when \( 0 < y < 4 \). Solutions are decreasing when \( -3 < y < 0 \) and when \( y > 4 \).

c. Initial conditions \( y(0) = A \) lead to solutions that are increasing over time if \( A < -3 \) or \( 0 < A < 4 \), and decreasing over time if \( -3 < A < 0 \) or \( A > 4 \).
8.2.29 The slope field at the specified values of $P$, with the solution curves sketched for the given initial values, is:

The equilibrium solutions are $P = 0$ and $P = 500$, since $P'(t)$ is zero for those values.

8.2.30 The slope field at the specified values of $P$, with the solution curves sketched for the given initial values, is:

The equilibrium solutions are $P = 0$ and $P = 1200$, since $P'(t)$ is zero for those values.

8.2.31 The slope field at the specified values of $P$, with the solution curves sketched for the given initial values, is:

The equilibrium solutions are $P = 0$ and $P = 3200$, since $P'(t)$ is zero for those values.
8.2.32 The slope field at the specified values of $P$, with the solution curves sketched for the given initial values, is:

Since $P'(t) = 0.05P - 0.001P^2 = 0.05P \left(1 - \frac{P}{50}\right)$, the equilibrium solutions are $P = 0$ and $P = 50$, since $P'(t)$ is zero for those values.

8.2.33 Computing gives

<td>1.245</td>
</tr>
<tr>
<td>5</td>
<td>2</td>
<td>3.140</td>
<td>—</td>
</tr>
</tbody>
</table>

8.2.37

$u_0 = 2, \quad u_1 = 2 + f(0,2) \cdot 0.5 = 2 + 4 \cdot 0.5 = 4, \quad u_2 = 4 + f(0.5,4) \cdot 0.5 = 4 + 8 \cdot 0.5 = 8.$

So $y(0.5) \approx 4$ and $y(1) \approx 8.$
8.2.38

\[ u_0 = -1, \quad u_1 = -1 + f(0, -1) \cdot 0.2 = -1 + 1 \cdot 0.2 = -0.8, \]
\[ u_2 = -0.8 + f(0.2, -0.8) \cdot 0.2 = -0.8 + 0.8 \cdot 0.2 = -0.64. \]

So \( y(0.2) \approx -0.8 \) and \( y(0.4) \approx -0.64. \)

8.2.39

\[ u_0 = 1, \quad u_1 = 1 + f(0, 1) \cdot 0.1 = 1 + 0.1 = 1.1, \]
\[ u_2 = 1.1 + f(0.1, 1.1) \cdot 0.1 = 1.1 + 0.9 \cdot 0.1 = 1.19. \]

So \( y(0.1) \approx 1.1 \) and \( y(0.2) \approx 1.19. \)

8.2.40

\[ u_0 = 4, \quad u_1 = 4 + f(0, 4) \cdot 0.5 = 4 + 4 \cdot 0.5 = 6 \]
\[ u_2 = 6 + f(0.5, 6) \cdot 0.5 = 6 + 6.5 \cdot 0.5 = 9.25. \]

So \( y(0.5) \approx 6 \) and \( y(1) \approx 9.25. \)

8.2.41

a. 
\[
\begin{array}{|c|c|c|}
\hline
\Delta t & \text{approximation of } y(0.2) & \text{approximation of } y(0.4) \\
\hline
0.2 & 0.800 & 0.640 \\
0.1 & 0.810 & 0.656 \\
0.05 & 0.815 & 0.663 \\
0.025 & 0.817 & 0.667 \\
\hline
\end{array}
\]

b. \( e^{-0.2} \approx 0.818731 \) and \( e^{-0.4} \approx 0.67032. \)

\[
\begin{array}{|c|c|c|}
\hline
\Delta t & \text{error in approximation of } y(0.2) & \text{error in approximation of } y(0.4) \\
\hline
0.2 & 1.9 \times 10^{-2} & 3.0 \times 10^{-2} \\
0.1 & 8.7 \times 10^{-3} & 1.4 \times 10^{-2} \\
0.05 & 4.2 \times 10^{-3} & 6.9 \times 10^{-3} \\
0.025 & 2.0 \times 10^{-3} & 3.4 \times 10^{-3} \\
\hline
\end{array}
\]

c. The time step \( \Delta t = 0.025 \) has the smallest errors. A smaller time step generally produces more accurate results.

d. Halving the time steps results in approximately halving the error.

</table>
c. The time step $\Delta t = 0.025$ has the smallest errors. A smaller time step generally produces more accurate results.

d. Halving the time steps results in approximately halving the error.

### 8.2.45

a. The computations yield:

<table>
<thead>
<tr>
<th>$t_k$</th>
<th>0</th>
<th>0.2</th>
<th>0.4</th>
<th>0.6</th>
<th>0.8</th>
<th>1</th>
<th>1.2</th>
<th>1.4</th>
<th>1.6</th>
<th>1.8</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>$u_k$</td>
<td>1</td>
<td>0.6</td>
<td>0.36</td>
<td>0.216</td>
<td>0.1296</td>
<td>0.07776</td>
<td>0.046656</td>
<td>0.0279936</td>
<td>0.0167962</td>
<td>0.0100777</td>
<td>0.00604662</td>
</tr>
</tbody>
</table>

So $y(2) \approx 0.00604662$.

b. $y(2) = e^{-1} \approx 0.183156$, so the error is about $0.0183156 - 0.00604662 = 0.012269$.

c. The computations yield:

<table>
<thead>
<tr>
<th>$t_k$</th>
<th>1.1</th>
<th>1.2</th>
<th>1.3</th>
<th>1.4</th>
<th>1.5</th>
<th>1.6</th>
<th>1.7</th>
<th>1.8</th>
<th>1.9</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>$u_k$</td>
<td>0.0859</td>
<td>0.0687</td>
<td>0.0550</td>
<td>0.0440</td>
<td>0.0352</td>
<td>0.02815</td>
<td>0.02252</td>
<td>0.01801</td>
<td>0.01441</td>
<td>0.01153</td>
</tr>
</tbody>
</table>

So $y(2) \approx 0.01153$ The error is about $0.0183156 - 0.01153 = 0.0067856$.

d. The error with twice as many steps is about half the other error.

### 8.2.46

a. The computations yield:

<table>
<thead>
<tr>
<th>$t_k$</th>
<th>0</th>
<th>0.2</th>
<th>0.4</th>
<th>0.6</th>
<th>0.8</th>
<th>1</th>
<th>1.2</th>
<th>1.4</th>
</tr>
</thead>
<tbody>
<tr>
<td>$u_k$</td>
<td>-1</td>
<td>0.6</td>
<td>1.56</td>
<td>2.136</td>
<td>2.4816</td>
<td>2.68896</td>
<td>2.81338</td>
<td>2.88803</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>$t_k$</th>
<th>1.6</th>
<th>1.8</th>
<th>2</th>
<th>2.2</th>
<th>2.4</th>
<th>2.6</th>
<th>2.8</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>$u_k$</td>
<td>2.93282</td>
<td>2.95969</td>
<td>2.97581</td>
<td>2.98549</td>
<td>2.99129</td>
<td>2.99478</td>
<td>2.99687</td>
<td>2.99812</td>
</tr>
</tbody>
</table>

So $y(3) \approx 2.99812$.

b. $y(3) = (3 - 4e^{-6}) \approx 2.99008$, so the error is about $2.99812 - 2.99008 = 0.00804$.

c. The computations yield:

<table>
<thead>
<tr>
<th>$t_k$</th>
<th>0</th>
<th>0.1</th>
<th>0.2</th>
<th>0.3</th>
<th>0.4</th>
<th>0.5</th>
<th>0.6</th>
<th>0.7</th>
<th>0.8</th>
<th>0.9</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>$u_k$</td>
<td>-1</td>
<td>-0.2</td>
<td>0.44</td>
<td>0.952</td>
<td>1.3616</td>
<td>1.68928</td>
<td>1.95142</td>
<td>2.16114</td>
<td>2.32891</td>
<td>2.46313</td>
<td>2.5705</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>$t_k$</th>
<th>1.1</th>
<th>1.2</th>
<th>1.3</th>
<th>1.4</th>
<th>1.5</th>
<th>1.6</th>
<th>1.7</th>
<th>1.8</th>
<th>1.9</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>$u_k$</td>
<td>2.6564</td>
<td>2.72512</td>
<td>2.7801</td>
<td>2.82408</td>
<td>2.85926</td>
<td>2.88741</td>
<td>2.90993</td>
<td>2.92794</td>
<td>2.94235</td>
<td>2.95388</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>$t_k$</th>
<th>2.1</th>
<th>2.2</th>
<th>2.3</th>
<th>2.4</th>
<th>2.5</th>
<th>2.6</th>
<th>2.7</th>
<th>2.8</th>
<th>2.9</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>$u_k$</td>
<td>2.96311</td>
<td>2.97049</td>
<td>2.97639</td>
<td>2.98111</td>
<td>2.98489</td>
<td>2.98791</td>
<td>2.99033</td>
<td>2.99226</td>
<td>2.99381</td>
<td>2.99505</td>
</tr>
</tbody>
</table>

So $y(3) \approx 2.99505$. The error is about $2.99812 - 2.99505 = 0.00307$.

d. The error with twice as many steps is less than half the other error.

Copyright © 2014 Pearson Education, Inc.
8.2.47
a. After many calculations, we arrive at \( y(4) \approx 3.05765 \).
b. \( y(4) = 3 + 5e^{-4} \approx 3.09158 \), so the error is about \( 3.09158 - 3.05765 = 0.03393 \).
c. After many calculations, we arrive at \( y(4) = 3.0739 \). The error is about \( 3.09158 - 3.0739 = 0.01768 \).
d. The error with twice as many steps is about half the other error.

8.2.48
a. After many calculations, we arrive at \( y(2) \approx 4.45125 \).
b. \( y(4) = \sqrt{20} \approx 4.47214 \), so the error is about \( 4.47214 - 4.45125 = 0.02089 \).
c. After many calculations, we arrive at \( y(2) = 4.46173 \). The error is about \( 4.47214 - 4.46173 = 0.01041 \).
d. The error with twice as many steps is about half the other error.

8.2.49
a. True.
b. False. It allows you to compute approximations.

8.2.50

b, c.

a. \( y = -2 \) is an equilibrium solution, because \( 2(-2) + 4 = 0 \).

8.2.51

b, c.

a. \( y = 3 \) is an equilibrium solution, because \( 6 - 2(3) = 0 \).
8.2.52

a. Solve \( y(2-y) = 0 \) to get equilibrium solutions \( y = 0 \) and \( y = 2 \).

b, c.

8.2.53

a. Solve \( y(y-3) = 0 \) to get equilibrium solutions \( y = 0 \) and \( y = 3 \).

b, c.

8.2.54

a. Solve \( \sin y = 0 \) to get equilibrium solutions \( y = k\pi \), where \( k \) is any integer.

b, c.
8.2.55

b, c.

a. The equilibrium solutions are $y = 0$, $y = -2$ and $y = 3$.

8.2.56

a. Solving $y' = 0$ gives the equilibrium solution $y = -\frac{b}{a}$, which is a horizontal line.

b. c.

Note that the general solution $y = (A + \frac{b}{a})e^{at} - \frac{b}{a}$ increases without bound if $a > 0$ and $A > -\frac{b}{a}$, and decreases without bound if $a > 0$ but $A < -\frac{b}{a}$. But if $a < 0$, the general solution has limit $-\frac{b}{a}$ and increases to it if $A < -\frac{b}{a}$, or decreases to it if $A > -\frac{b}{a}$.

8.2.57

a. $\Delta t = \frac{b-a}{N}$.

b. Recall that $u_0 = A$ and $t_0 = a$. So $u_1 = A + f(a, A) \cdot \frac{b-a}{N}$.

c. $u_{k+1} = u_k + f(t_k, u_k) \cdot \frac{b-a}{N}$, where $t_k = a + k \cdot \frac{b-a}{N}$ for $k = 0, 1, 2, \ldots, N - 1$. 

Copyright © 2014 Pearson Education, Inc.
8.2. DIRECTION FIELDS AND EULER’S METHOD

8.2.58

a.

b. The equilibrium solution is \( m(t) = 200 \).

c. The solutions are increasing for \( A < 200 \) and decreasing for \( A > 200 \).

8.2.59

a.

b. The solutions are increasing for \( A < 98 \) and decreasing for \( A > 98 \).

c. The equilibrium solution is \( v(t) = 98 \).

8.2.60

a. In both cases, the equilibrium is 0.

b. The second-order reaction approaches \( y = 5 \) more quickly.

8.2.61

a. We have \( u_0 = y(0) = 1, \) and \( u_{k+1} = u_k + f(t_k, u_k)h = u_k + au_kh = u_k(1 + ah) \) for \( k = 0, 1, 2, \ldots \)
b. Suppose \( u_k = (1 + ah)^k \). Then \( u_{k+1} = u_k(1 + ah) = (1 + ah)^k(1 + ah) = (1 + ah)^{k+1}, k = 0, 1, 2, \ldots \).

c. \( \lim_{h \to 0} u_k = \lim_{h \to 0}(1 + ah)^k = \lim_{h \to 0}(1 + ah)^{k/h} = \lim_{h \to 0}((1 + ah)^{1/h})^t_k = (e^a)^{t_k} = e^{at_k} = y(t_k) \).

8.2.62 Euler’s method uses the slope of the solution curve, which is given by the differential equation, to estimate successive values of the solution curve. So if the tangent line at a point lies above the curve just to the right of that point, Euler’s method will be an overestimate, while if it lies below the curve, Euler’s method will be an underestimate. The tangent line to a curve lies above the curve if the curve is concave down, so we would expect Euler’s method to overestimate exactly when the curve is concave down.

a. Consider the following example, where \( t_0 \) is the marked point and \( y'(t_0) > 0 \) and \( y''(t_0) < 0 \):

![Tangent line above curve example](image)

Clearly moving up the tangent line will overestimate the true value of the solution curve.

b. Consider the following example, where \( t_0 \) is the marked point and \( y'(t_0) < 0 \) and \( y''(t_0) > 0 \):

![Tangent line below curve example](image)

Clearly moving down the tangent line will underestimate the true value of the solution curve.

c. Consider the following example, where \( t_0 \) is the marked point and \( y'(t_0) < 0 \) and \( y''(t_0) < 0 \):

![Tangent line below curve example](image)

Clearly moving down the tangent line will overestimate the true value of the solution curve.
8.2.63

a. With \( y'(t) = 2y - 4 \) and \( y(0) = 3 \), we get \( y'(0) = 2y(0) - 4 = 2 \cdot 3 - 4 = 2 \).

b. The linear approximation to \( y \) at \( t = 0 \) is given by the tangent line to \( y(t) \) at the point \((0, y(0)) = (0, 3)\). The slope of this tangent line is \( y'(0) = 2 \), so the line is \( y = 2(x - 0) + 3 = 2x + 3 \). Then \( y(0.5) \approx 2 \cdot 0.5 + 3 = 4 \).

c. Using Euler’s method, we would choose \( t_0 = 0 \) and \( u_0 = y(0) = 3 \) with \( \Delta t = 0.5 \). Then we get

\[ y(0.5) \approx u_1 = u_0 + f(t_0, u_0)\Delta t = 3 + f(0, 3) \cdot 0.5 = 3 + 2 \cdot 0.5, \]

which is the same as the computation in part (b).

d. Since \( y(0) = A \), we have \( y'(0) = f(0, y(0)) = f(0, A) \), so that the linear approximation to \( y \) at \( (0, A) \) is \( y = f(0, A)x + A \). Using Euler’s method, we would get

\[ y(\Delta t) \approx u_1 = u_0 + f(t_0, u_0)\Delta t = A + f(0, A)\Delta t, \]

so that Euler’s method gives the same result as using the linear approximation to estimate the value of \( y(\Delta t) \).

8.2.64

a. The slope field looks like

![Slope Field](image)

b. The initial condition \( y(0) = 1 \) corresponds to the curve emanating from the point \((0, 1)\). This solution curve clearly increases, but asymptotically approaches \( y = 2 \). The initial condition \( y(0) = -1 \) corresponds to the curve emanating from \((0, 1)\); this solution curve is also increasing, and asymptotically approaches \( y = 0 \).
8.2.65  a. The slope field looks like

b. The initial condition \( y(0) = 2 \) corresponds to the curve emanating from the point \((0, 2)\). This solution curve first decreases, then increases without bound. For the initial condition \( y(0) = -2 \), the solution curve from \((0, -2)\) first increases and then decreases without bound.

8.2.66  a. The slope field looks like

b. The initial condition \( y(0) = 1 \) corresponds to the curve emanating from the point \((0, 1)\). This solution curve decreases asymptotically to \( y = 0 \). The initial condition \( y(0) = -2 \) decreases from \((0, -2)\) asymptotically to \( y = -3 \). Finally, for the initial condition \( y(0) = 2.1 \), the solution curve from \((0, 2.1)\) increases without bound (note that \( y = 2 \) is an equilibrium solution).
8.2.67  a. The slope field looks like

b. Since \( y = \pi \) is a zero of the right-hand side, \( \pi \) is an equilibrium value, so that the solution curve for the initial condition \( y(0) = \pi \) is the constant \( y = \pi \). The initial condition \( y(0) = 1 \) corresponds to the curve emanating from the point \((0, 1)\). This solution curve oscillates, first increasing, then decreasing, then increasing again, with constant amplitude. The initial condition \( y(0) = -2 \) has an oscillating solution curve with constant amplitude as well, which starts out decreasing.

8.2.68  a. The slope field looks like

b. All three of the solution curves corresponding to the initial values \( y(0) = 0 \), \( y(0) = 1 \), and \( y(0) = -2 \) are increasing. It appears that they all increase without bound, but without solving the differential equation or enlarging the graphing window, it is difficult to tell for sure (in fact, they do all increase without bound, but rather slowly).
8.2.69 a. Computing for both values of $\Delta t$ gives

</table>

b. At $t = 1$, the true value is $1 + 3e^{-1} - 1 = 3e^{-1} \approx 1.10364$, which rounds to 1.104. The computed value for $\Delta t = 0.1$ has error $1.104 - 1.046 \approx 0.058$, while the error for $\Delta t = 0.05$ is $1.104 - 1.075 \approx 0.029$.

c. The error for $\Delta t = 0.05$ is about half of the error for $\Delta t = 0.1$.

d. To reduce the error by about another factor of 2, we would need to use $\Delta t = 0.25$; another factor of 2 beyond that would require $\Delta t = 0.125$.

8.3 Separable Differential Equations

8.3.1 A separable first-order differential equation is one that can be written in the form $g(y)y'(t) = h(t)$, where the factor $g(y)$ is a function of $y$ and $h(t)$ is a function of $t$.

8.3.2 Yes, this equation is separable because it can be written in the form $y^2 y' = t^{-2}(t + 4)$.

8.3.3 No, this equation cannot be written in the required form.

8.3.4 Integrate both sides with respect to $t$ and convert the integral on the left side to an integral with respect to $y$.

8.3.5 We have $\frac{dy}{dt} = t^3$, so $\int \frac{dy}{dt} dt = \int t^3 dt$, so $y = \frac{t^4}{4} + C$. 

Copyright © 2014 Pearson Education, Inc.
8.3.6 \( \frac{dy}{dt} = 5e^{-4t} \), so \( \int y'(t) \, dt = \int 5e^{-4t} \, dt \), so \( y = -\frac{5}{4}e^{-4t} + C \).

8.3.7 \( y \frac{du}{dx} = 3t^2 \), so \( \int y \, dy = \int 3t^2 \, dt \). Thus, \( \frac{u^2}{2} = t^3 + C \), and thus \( y = \pm \sqrt{2t^3 + C} \).

8.3.8 We have \( \frac{1}{y} \frac{dy}{dx} = x^2 + 1 \), so \( \int \frac{1}{y} \frac{dy}{dx} \, dx = \int (x^2 + 1) \, dx \). Thus, \( \ln y = \frac{x^3}{3} + x + C \), and \( y = Ae^{(x^3/3) + x} \).

8.3.9 We have \( \int e^{-y^2/2} \, dy = \int \sin t \, dt \), and so \( -2e^{-y^2/2} = -\cos t + C \). Thus, \( y = -2 \ln \left( \frac{1}{2} \cos t + C \right) \).

8.3.10 We have \( \int w^{-1/2} \, dw = \int \frac{3w+1}{2} \, dw = \int \left( \frac{3}{2} + \frac{1}{2w} \right) \, dw \), so \( 2w^{1/2} = 3 \ln |x| - \frac{1}{x} + C \). It follows that \( w = \left( \frac{3}{2} \ln |x| - \frac{1}{x} + C \right)^2 \).

8.3.11 \( \frac{1}{y^2} \frac{dy}{dx} = \frac{1}{x^2} \), so \( \int \frac{1}{y^2} \frac{dy}{dx} \, dx = \int \frac{1}{x^2} \, dx \), so \( -\frac{1}{y} = -\frac{1}{x} + C = \frac{C - x}{x} \). Thus, \( y = \frac{x}{C - x} \). If we replace the arbitrary constant \( C \) by its opposite, this can be written as \( y = \frac{1}{x + C} \).

8.3.12 \( \frac{y}{y^2+1} \frac{y'(t)}{e^{t^2+1}} \). Therefore, \( \int \frac{y}{y^2+1} \, dy = \int e^{-(t^2+1)/2} \, dt \). We have \( \frac{1}{2} \ln (y^2 + 4) = -\frac{1}{4} \ln (t^2 + 1) + C \), so \( \ln (y^2 + 4) = C_1 - \frac{1}{2} \ln (t^2 + 1) \). This can be written as \( y^2 + 4 = Ae^{-(t^2+1)/2} \), so \( y = \pm \sqrt{Ae^{-(t^2+1)/2} - 4} \).

8.3.13 \( -\frac{2}{y^2} \frac{dy}{dt} = \sin t \), so \( \int \left( -\frac{2}{y^2} \frac{dy}{dt} \right) \, dt = \int \sin t \, dt \). Thus, \( \frac{1}{y^2} = -\cos t + C \). Solving for \( y \) gives \( y = \pm \frac{1}{\sqrt{C - \cos t}} \).

8.3.14 \( \frac{1}{y^2+1} \frac{y'(t)}{e^{t/2}} \). So \( \int \frac{1}{y^2+1} \, dy = \int e^{-(t/2)^2} \, dt \), so \( \frac{1}{2} \tan^{-1} \frac{y}{2} = -2e^{-t^2/4} + C \). Thus, \( \tan^{-1} \frac{y}{2} = C_1 - 4e^{-t^2/4} \), and \( y = 2 \tan(C_1 - 4e^{-t^2/4}) \).

8.3.15 \( e^u u'(x) = e^{2x} \), so \( \int e^u \, du = \int e^{2x} \, dx \), and \( e^u = \frac{1}{2} e^{2x} + C \). Thus, \( u = \ln \left( \frac{e^{2x}}{2} \right) + C \).

8.3.16 \( \frac{1}{y^2+1} \frac{u'(x)}{e^{x/2}} \). So \( \int \frac{1}{y^2+1} \, dy = \int \frac{1}{x} \, dx \), and thus \( \frac{1}{4} \ln \left| \frac{u-2}{u+2} \right| = \ln |x| + C \). Thus, \( \ln \left| \frac{u-2}{u+2} \right| = 4 \ln |x| + C_1 \). Exponentiating both sides gives \( \left| \frac{u-2}{u+2} \right| = Ae^{4 \ln |x| + C_1} = A |x|^4 \).

But now we can remove the absolute value signs, subsuming the sign into the constant \( A \), to get \( \frac{u-2}{u+2} = Ax^4 \). Then
\[
\frac{u-2}{u+2} = 1 - \frac{4}{u+2} = Ax^4 \quad \Rightarrow \quad \frac{4}{u+2} = 1 - Ax^4 \quad \Rightarrow \quad u = -2 + \frac{4}{1 - Ax^4} = -2 + \frac{4}{1 + Cx^4}.
\]

8.3.17 This is separable, and can be written as \( \frac{dy}{dt} = \frac{1}{t} \). Thus, \( \int \frac{dy}{dt} \, dt = \int \frac{dt}{t} = \ln t + C \), so \( y(t) = \ln t + C \). Because \( y(1) = 2 = 0 + C \), we have \( C = 2 \). Thus, \( y(t) = \ln t + 2 \).

8.3.18 This is separable, and can be written as \( \frac{dy}{dt} = \cos t \). Integrating with respect to \( t \) gives \( y(t) = \sin t + C \), and because \( y(0) = 1 = 0 + C \), we have \( C = 1 \). Thus, \( y(t) = \sin t + 1 \).

8.3.19 This is separable, and is already written in the desired form. We have \( \int 2y \, dy = \int 3t^2 \, dt \), so \( y^2 = t^3 + C \). Because \( y(0) = 9 \), we have \( 81 = C \), so \( y = \sqrt{t^3 + 81} \).

8.3.20 This equation is not separable.

8.3.21 This equation is not separable.

8.3.22 This equation is separable. We have \( \int \frac{dy}{y} = \int (4t^3 + 1) \, dt \), and thus \( \ln |y| = t^4 + t + C \). Therefore, \( y = \pm e^{(t^4+t+C)} = Ae^{t^4+t} \). Substituting \( y(0) = 4 \) gives \( A = 4 \), so the solution to this initial value problem is \( y = 4e^{t^4+t} \).

Copyright © 2014 Pearson Education, Inc.
8.3.23 This equation is separable. We have \( \int 2y \, dy = \int e^t \, dt \), so \( y^2 = e^t + C \), and thus \( y = \pm \sqrt{e^t + C} \). Substituting \( y(\ln 2) = 1 \) gives \( 1 = 2 + C \) so \( C = -1 \), and the solution to this initial value problem is \( y = \sqrt{e^t - 1} \).

8.3.24 This equation is separable. We have \( \int y^{-3} \, dy = \int \cos x \, dx \), so \( -\frac{y^{-2}}{2} = \sin x + C \). Therefore, \( y = \pm (-2 \sin x + C)^{-1/2} \). Substituting \( y(0) = 3 \) gives \( C = 1/9 \), so the solution to this initial value problem is \( y = \left(-2 \sin x + \frac{1}{9}\right)^{-1/2} \).

8.3.25 This equation is separable. We have \( \int e^{y} \, dy = \int e^x \, dx \), and thus \( e^y = e^x + C \). Therefore, \( y = \ln(e^x + C) \). Substituting \( y(0) = \ln 3 \) gives \( \ln 3 = \ln(1 + C) \), so \( C = 2 \) and the solution to this initial value problem is \( y = \ln(e^x + 2) \).

8.3.26 This equation is separable. We have \( \int \sec^2 y \, dy = \int dt \), so \( \tan y = t + C \). Because \( y(1) = \frac{\pi}{4} \) we have \( 1 = 1 + C \), so \( C = 0 \). Thus, \( y = \tan^{-1} t \).

8.3.27

\[ y' = t, \quad \text{so} \quad \int y \, dy = \int t \, dt, \quad \frac{y^2}{2} = \frac{t^2}{2} + C. \]
Because \( y(1) = 2 \), we have \( 2 = \frac{1}{2} + C \), so \( C = \frac{3}{2} \), and \( y^2 = t^2 + 3 \). The solution corresponds to the upper portion of the curve.

8.3.28

\[ (2 - y)y'(x) = 1 + x, \quad \text{so} \quad \int (2 - y) \, dy = \int (1 + x) \, dx, \]
and \( 2y - \frac{y^2}{2} = x + \frac{x^2}{2} + C. \) Because \( y(1) = 1 \), we have \( 2 - \frac{1}{2} = 1 + \frac{1}{2} + C, \) so \( C = 0 \). Thus, \( 2y - \frac{y^2}{2} = x + \frac{x^2}{2} \) is the solution.
8.3.29

\((\sin u)u'(x) = \cos \frac{x}{2}\), so \(\int \sin u \, du = \int \cos \frac{x}{2} \, dx\).

We have \(-\cos u = 2 \sin \frac{x}{2} + C\). Because \(u(\pi) = \frac{\pi}{2}\), we have \(-\cos \frac{\pi}{2} = 2 \sin \frac{\pi}{2} + C\), so \(0 = 2 \cdot 1 + C\), so \(C = -2\). Thus, \(-\cos u = 2 \sin \frac{x}{2} - 2\) is the solution.

The curve in the middle in the rightmost column of curves is the particular one described by our initial condition, because it is the only one that contains the point \((\pi, \frac{\pi}{2})\).

8.3.30

\((2 + y^2)^2 y' = 2x\), so \(\int (2 + y^2)^2 y' \, dx = \int 2x \, dx\), and thus \(\frac{(2+y^2)^3}{6} = x^2 + C\). Because \(y(1) = -1\), we have \(C = \frac{21}{6}\). Thus, \((2 + y^2)^3 = 6x^2 + 21\), and thus \(y^2 = \sqrt{6x^2 + 21} - 2\).

8.3.31

\(\sqrt{y+4} y' = \sqrt{x+1}\), so \(\int \sqrt{y+4} \, dy = \int \sqrt{x+1} \, dx\), so \(\frac{2}{3}(y+4)^{3/2} = \frac{2}{3}(x+1)^{3/2} + C\).

Because \(y(3) = 5\), we have \(\frac{2}{3}(27) = \frac{16}{3} + C\), so \(C = \frac{38}{3}\). Thus, \(\frac{2}{3}(y+4)^{3/2} = \frac{2}{3}(x+1)^{3/2} + \frac{38}{3}\), so \((y+4)^{3/2} = (x+1)^{3/2} + 19\).
8.3.32

\[
\frac{1}{x^2 + 4} \cdot z'(x) = \frac{1}{x^2 + 16}, \text{ so } \int \frac{dz}{x^2 + 4} = \int \frac{dx}{x^2 + 16}. \text{ Thus, }
\frac{1}{2} \tan^{-1} \frac{x}{2} = \frac{1}{4} \tan^{-1} \frac{x}{4} + C. \text{ Because } z(4) = 2, \text{ we have } \frac{\pi}{8} = \frac{\pi}{16} + C. \text{ Thus, } 2 \tan^{-1} \frac{x}{2} = \tan^{-1} \frac{x}{4} + \frac{\pi}{4} \text{ is the solution.}
\]

8.3.33

a. This equation is separable, so we have \( \int \frac{200}{P(200-P)} \, dP = \int 0.08 \, dt \), so \( \int \left( \frac{1}{P} + \frac{1}{200-P} \right) \, dP = 0.08t + C. \) Therefore, \( \ln \left| \frac{P}{200-P} \right| = 0.08t + C. \) Substituting \( P(0) = 50 \) gives \( -\ln 3 = C \), and solving for \( P \) gives \( P(t) = \frac{200}{1/e^{0.08t}-1}. \)

b. The steady-state population is \( \lim_{t \to \infty} P(t) = 200. \)

c. The population is growing at the greatest rate when the slope of the population curve in part (a) is at a maximum, which is when \( \frac{dP}{dt} \) is maximized. To find this value, take the derivative of \( \frac{dP}{dt} \) with respect to \( t \):
\[
\frac{d^2P}{dt^2} = 0.08 \left( 1 - \frac{P}{200} \right) P' + 0.08P \left( -\frac{1}{200} \right) P' = \left( 0.08 - \frac{2 \cdot 0.08P}{200} \right) \frac{dP}{dt}.
\]
This is zero when \( P = \frac{200 \cdot 0.08}{2 \cdot 0.08} = 100 \), so the population is growing fastest when there are 100 hares on the island.

d. The rate of growth when there are 100 hares on the island is
\[
\frac{dP}{dt} \bigg|_{P=100} = 0.08 \cdot 100 \left( 1 - \frac{100}{200} \right) = 4 \text{ hares per unit of time.}
\]

8.3.34

a. This equation is separable, so we have \( \int \frac{A}{P(A-P)} \, dP = \int k \, dt \), so \( \int \left( \frac{1}{P} + \frac{1}{A-P} \right) \, dP = kt + D. \) Therefore, \( \ln \left| \frac{P}{A-P} \right| = kt + D, \) which is equivalent to \( \frac{P}{A-P} = Ce^{kt}. \) Substituting \( P(0) = P_0 \) gives \( C = P_0/(A-P_0) \), and solving for \( P \) gives \( P(t) = \frac{AP_0}{P_0+(A-P_0)e^{-kt}}. \)
b.

\[ P \]

8.3. SEPARABLE DIFFERENTIAL EQUATIONS 783

Since the ambient temperature is 30

3.36 Use the equation 8.3.35 variables gives

We thus get

T

\( C \)

Exponentiate both sides to get

This is zero when

T

\( C \)

b. A e. When the population size is

c. The denominator in \( P(t) \) above is positive for all \( t \geq 0 \) when \( 0 < P_0 < A \), so \( P(t) \) is defined for all \( t \geq 0 \); we have \( \lim_{t \to \infty} P(t) = A \), which is the steady-state solution.

d. Treating \( k \) and \( A \) as constants, the population is growing at the greatest rate when the slope of the population curve, which is \( \frac{dP}{dt} \), is at a maximum; to find this point, take the derivative of \( \frac{dP}{dt} \) with respect to \( t \):

\[
\frac{d^2P}{dt^2} = k \left( 1 - \frac{P}{A} \right) P' + kP \left( -\frac{1}{A} \right) P' = \left( k - \frac{2kP}{A} \right) P'.
\]

This is zero when \( P = \frac{A}{2k} = \frac{4}{2} \), so that the population size when the population is growing at the greatest rate is \( \frac{4}{2} \).

e. When the population size is \( \frac{4}{2} \), the rate of growth is

\[
\frac{dP}{dt} \bigg|_{P=A/2} = k \cdot \frac{A}{2} \left( 1 - \frac{A/2}{A} \right) = k \cdot \frac{A}{4}.
\]

8.3.35 Use the equation \( \frac{dT}{dt} = -k(T - 25) \) since the ambient temperature is 25°. Separating variables gives

\[
\frac{dT}{T - 25} = -k \, dt,
\]

so that

\[
\int \frac{dT}{T - 25} = \int (-k) \, dt \quad \text{or} \quad \ln |T - 25| = -kt + C.
\]

Exponentiate both sides to get

\[
|T - 25| = e^{-kt+C}, \quad \text{or} \quad T - 25 = C_1 e^{-kt} \quad \text{(letting} \ C_1 = \pm e^C). \quad \text{Thus} \quad T(t) = C_1 e^{-kt} + 25. \quad \text{We are given that} \quad T(0) = 90, \quad \text{so that} \quad 90 = C_1 e^0 + 25 \quad \text{and thus} \quad C_1 = 65. \quad \text{Hence the equation is} \quad T(t) = 65 e^{-kt} + 25. \quad \text{Next, we have} \quad T(1) = 85, \quad \text{so that} \quad T(1) = 85 = 65 e^{-k} + 25, \quad \text{so that} \quad e^{-k} = \frac{12}{13}, \quad \text{and then} \quad k = \ln \frac{13}{12} \approx 0.080.
\]

We thus get \( T(t) = 65 e^{-0.080t} + 25 \). So the temperature is 30° when

\[
30 = 65 e^{-0.080t} + 25, \quad \text{or} \quad e^{-0.080t} = \frac{1}{13}, \quad \text{or} \quad t = \frac{\ln 13}{0.08} \approx 32.062 \text{ minutes}.
\]

8.3.36 Since the ambient temperature is 30° and \( k = 0.02 \), we have \( \frac{dT}{dt} = -0.02(T - 30) \). Separating variables gives

\[
\frac{dT}{T - 30} = -0.02 \, dt, \quad \text{so that} \quad \int \frac{dT}{T - 30} = \int (-0.02) \, dt \quad \text{or} \quad \ln |T - 30| = -0.02t + C.
\]

Exponentiate both sides to get

\[
|T - 30| = e^{-0.02t+C}, \quad \text{or} \quad T - 30 = C_1 e^{-0.02t} \quad \text{(letting} \ C_1 = \pm e^C). \quad \text{Thus} \quad T(t) = C_1 e^{-0.02t} + 30. \quad \text{Since} \quad T(0) = 900, \quad \text{we have} \quad 900 = C_1 e^0 + 30 \quad \text{so that} \quad C_1 = 870 \quad \text{and} \quad T(t) = 870 e^{-0.02t} + 30. \quad \text{So the temperature of the rod is 100° when}
\]

\[
100 = 870 e^{-0.02t} + 30, \quad \text{or} \quad e^{-0.02t} = \frac{7}{87}, \quad \text{or} \quad t = \frac{\ln(87/7)}{0.02} \approx 126 \text{ time units.}
\]
8.3.37 Since the ambient temperature is 20°, we have \( \frac{dT}{dT} = -k(T - 20) \). Separating variables gives

\[
\frac{dT}{T - 20} = -k \, dt,
\]

so that

\[
\int \frac{dT}{T - 20} = \int (-k) \, dt \quad \text{or} \quad \ln |T - 20| = -kt + C.
\]

Exponentiate both sides to get \(|T - 20| = e^{-kt+C} \), or \( T - 20 = C_1 e^{-kt} \) (letting \( C_1 = \pm e^C \)). Thus \( T(t) = C_1 e^{-kt} + 20 \). Since \( T(0) = 5 \), we have \( 5 = C_1 e^0 + 20 \) so that \( C_1 = -15 \), giving \( T(t) = -15e^{-kt} + 20 \). Further, since \( T(1) = 7 \), we get

\[
7 = -15e^{-k} + 20, \quad \text{so that} \quad e^{-k} = \frac{13}{15}, \quad \text{and then} \quad k = \ln \frac{15}{13} \approx 0.143.
\]

We thus get \( T(t) = -15e^{-0.143t} + 20 \). So the temperature of the milk is 18° when

\[
18 = -15e^{-0.143t} + 20, \quad \text{or} \quad e^{-0.143t} = \frac{2}{15}, \quad \text{or} \quad t = \frac{\ln(15/2)}{0.143} \approx 14.090 \text{ minutes}.
\]

8.3.38 Since the ambient temperature is 10°, we have \( \frac{dT}{dT} = -k(T - 10) \). Separating variables gives

\[
\frac{dT}{T - 10} = -k \, dt, \quad \text{so that} \quad \int \frac{dT}{T - 10} = \int (-k) \, dt \quad \text{or} \quad \ln |T - 10| = -kt + C.
\]

Exponentiate both sides to get \(|T - 10| = e^{-kt+C} \), or \( T - 10 = C_1 e^{-kt} \) (letting \( C_1 = \pm e^C \)). Thus \( T(t) = C_1 e^{-kt} + 10 \). Since \( T(0) = 100 \), we have \( 100 = C_1 e^0 + 10 \) so that \( C_1 = 90 \), giving \( T(t) = 90e^{-kt} + 10 \). Further, since \( T(30) = 80 \), we get

\[
80 = 90e^{-k\cdot30} + 10, \quad \text{so that} \quad e^{-30k} = \frac{7}{9}, \quad \text{and then} \quad k = \ln \left(\frac{9}{7}\right) = 0.00838.
\]

We thus get \( T(t) = 90e^{-0.00838t} + 10 \). So the temperature of the soup is 30° when

\[
30 = 90e^{-0.00838t} + 10, \quad \text{or} \quad e^{-0.00838t} = \frac{2}{9}, \quad \text{or} \quad t = \frac{\ln(9/2)}{0.00838} \approx 179 \text{ minutes}.
\]

8.3.39

a. True. It can be written as \( u^2u'(x) = x^{-2} \).

b. False.

c. True. When separated, we have \( y e^y y'(x) = x \), and the left-hand side of the equation can be integrated by parts.

8.3.40 We have \( \int e^y y'(t) \, dt = \int \frac{\ln^2 t}{t} \, dt \), so \( e^y = \frac{\ln^3 t}{3} + C \). Because \( y(1) = \ln 2 \), we have \( 2 = 0 + C \), so \( e^y = \frac{\ln^3 t}{3} + 2 \). Thus, \( y = \ln \left(\frac{\ln^3 t + 6}{3}\right) \).

8.3.41 We have \( \int \frac{1}{y(y+1)} \, dy = \frac{3}{2} \), so \( \int \frac{1}{y(y+1)} \, dy = \frac{3}{2} \, dt \), and thus \( \ln \left| \frac{y}{y+1} \right| = 3 \ln |t| + C \). Because \( y(1) = 1 \), we have \( C = -\ln 2 \). Thus, \( \ln \left| \frac{y}{y+1} \right| = 3 \ln |t| - \ln 2 \) describes the solution. Then \( \frac{y}{y+1} = \frac{t^3}{2} \), so \( 1 - \frac{1}{y+1} = \frac{t^3}{2} \), so \( \frac{1}{y+1} = \frac{2-t^3}{2} \). Thus \( y+1 = \frac{2-t^3}{2-t^3} \), so \( y = \frac{t^3}{2-t^3} \).

8.3.42 \( \int 2y dy = \int \cos^2 t \, dt \), so \( y^2 = \frac{t}{2} + \frac{\sin 2t}{4} + C \). Because \( y(0) = -2 \), we have \( 4 = 0 + 0 + C \), so \( C = 4 \). Thus, \( y = -\sqrt{\frac{t}{2} + \frac{\sin 2t}{4} + 4} \).

8.3.43 Assume \( y > -3 \) and \( t > -6/5 \). \( \int \left(\frac{1}{y+3} \right) y'(t) \, dt = \int \frac{1}{5t+6} \, dt \), so \( \ln(y+3) = \frac{\ln(5t+6)}{5} + C \). We can write this as \( 5 \ln(y+3) = \ln(5t+6) + 5C \), so \( (y+3)^5 = A(5t+6) \). Because \( y(2) = 0 \), we have \( 3^5 = 16A \), so \( A = \frac{3^5}{16} \). We have \( y + 3 = \frac{3\sqrt[5]{5}}{2}(5t+6)^{1/5} \). Thus, \( y = -3 + \frac{3\sqrt[5]{5}}{2}(5t+6)^{1/5} = \frac{3}{2}(-2 + 2^{1/5}(6+5t)^{1/5}) \).
8.3.44

a. \[ \int y^2 \, dy = \int \left( t^2 + \frac{2}{3} t \right) \, dt, \] so \( \frac{y^3}{3} = \frac{t^3}{3} + \frac{t^2}{3} + C. \) This can be written \( y^3 = t^3 + t^2 + C_1, \) where \( C_1 = 3C. \)

b. When \( y(-1) = 1, \) we have \( 1 = -1 + 1 + C_1, \) so \( C_1 = 1. \) When \( y(1) = 0, \) we have \( 0 = 1 + 1 + C_1, \) so \( C_1 = -2. \) When \( y(-1) = -1, \) we have \( -1 = -1 + 1 + C_1, \) so \( C_1 = -1. \)

c.

8.3.45

a. \[ \int e^{-y/2} \, dy = \int \left( 4x \sin x^2 - x \right) \, dx. \] Thus, \( -2e^{-y/2} = -2 \cos x^2 - \frac{x^2}{2} + K. \) Then \( e^{-y/2} = \cos x^2 + \frac{x^2}{4} + C, \) so \( -\frac{y}{2} = \ln \left( \cos x^2 + \frac{x^2}{4} + C \right), \) and \( y = -2 \ln \left( \cos x^2 + \frac{x^2}{4} + C \right). \)

b. When \( y(0) = 0 \) we have \( 0 = -2 \ln(1 + C), \) so \( C = 0. \) When \( y(0) = \ln \frac{1}{4}, \) we have \( \ln \frac{1}{4} = -2 \ln(1 + C), \) so \( \ln 2 = \ln(1 + C), \) so \( C = 1. \) When \( y \left( \sqrt{\frac{3}{2}} \right) = 0, \) we have \( 0 = -2 \ln \left( 0 + \frac{\pi}{8} + C \right), \) so \( C = 1 - \frac{\pi}{8}. \)

c.

8.3.46

a. \( 4x + 2y \frac{dy}{dx} = 0, \) so \( \frac{dx}{dy} = -\frac{4x}{2y} = -\frac{2x}{y}. \)

b. Curves are orthogonal when their slopes are negative reciprocals of each other, and the negative reciprocal of \( -\frac{2x}{y} \) is \( \frac{y}{2x}. \)

c. We have \( \frac{2dy}{y} = \frac{dx}{x}, \) so \( 2 \ln |y| = \ln y^2 = \ln |x| + C. \) Thus, \( y^2 = e^C |x|. \) We can write \( \pm e^C = k, \) so we have \( y^2 = kx. \)

8.3.47 Differentiating implicitly gives \( 2x + 2yy' = 0, \) so \( y' = -\frac{x}{y}. \) We are thus seeking curves so that \( \frac{dy}{dx} = \frac{y}{x}. \) We have \( \frac{dy}{y} = \frac{dx}{x}, \) so \( \ln |y| = \ln |x| + C \) so \( y = e^C |x| = kx. \) So the family of curves we are seeking is the collection of curves \( y = kx. \)

Copyright © 2014 Pearson Education, Inc.
8.3.48

a. This equation is separable, so we have \( \int \frac{1}{y(1-y)} \, dy = \int k \, dt \), so \( \int \left( \frac{1}{y} + \frac{1}{1-y} \right) \, dy = kt + D \). Therefore, \( \ln \left| \frac{y}{1-y} \right| = kt + D \), which is equivalent to \( \frac{y}{1-y} = Ce^{kt} \). Substituting \( y(0) = y_0 \) gives \( C = \frac{y_0}{1-y_0} \), and thus \( y = \frac{y_0}{(1-y_0)e^{-kt} + y_0} \).

b. The denominator in \( y(t) \) above is positive for all \( t \geq 0 \) when \( 0 < y_0 < 1 \), so \( y(t) \) is defined for all \( t \geq 0 \); we have \( \lim_{t \to \infty} y(t) = 1 \), which is the steady-state solution.

c. The denominator in \( y(t) \) above is positive for all \( t \geq 0 \) when \( 0 < y_0 < 1 \), so \( y(t) \) is defined for all \( t \geq 0 \); we have \( \lim_{t \to \infty} y(t) = 1 \), which is the steady-state solution.

8.3.49

a. We have \( mv'(t) = mg - kv^2 \), so \( v'(t) = g - av^2 \) with \( a = \frac{k}{m} \).

b. We solve \( av^2 = g \) to obtain the terminal velocity \( \tilde{v} = \sqrt{\frac{g}{a}} = \sqrt{\frac{mg}{k}} \).

c. This equation is separable, so we have \( \int \frac{1}{g-av^2} \, dv = \int \, dt \), so \( -\frac{1}{a} \int \frac{1}{v^2 - \tilde{v}^2} \, dv = t + D \). Thus

\[
-\frac{1}{2a\tilde{v}} \int \left( \frac{1}{v - \tilde{v}} - \frac{1}{v + \tilde{v}} \right) \, dv = t + D,
\]

so that

\[
\frac{v - \tilde{v}}{v + \tilde{v}} = Ce^{-2a\tilde{v}t}.
\]

The initial condition \( v(0) = 0 \) gives \( C = -1 \), and solving for \( v \) gives

\[
v = \frac{1 - e^{-2a\tilde{v}t}}{1 + e^{-2a\tilde{v}t}} \tilde{v}.
\]

which, after substituting \( \sqrt{\frac{g}{a}} \) for \( \tilde{v} \), becomes

\[
v = \sqrt{\frac{g}{a}} \cdot \frac{e^{2\sqrt{ag}t} - 1}{e^{2\sqrt{ag}t} + 1}.
\]

d. We have \( a = 0.1, \tilde{v} \approx 9.90 \) m/s

8.3.50

a. We have \( mv'(t) = mg - Rv \), so \( v'(t) = g - bv \) with \( b = R/m \).
b. Solve \( bv = g \) to obtain terminal velocity \( \tilde{v} = g/b = mg/R \).

c. The equation \( v' = g - bv \) is first-order linear, with general solution \( v = Ce^{-bv} + \tilde{v} \). The initial condition \( v(0) = 0 \) gives \( C = -\tilde{v} \), which gives \( v = \tilde{v}(1 - e^{-bt}) \).

d. We have \( b = 0.1, \tilde{v} = 98 \text{ m/s} \).

8.3.51

a. The equation \( h' = -2k\sqrt{h} \) is separable, so we have \( \int \frac{dh}{2\sqrt{h}} = -\int k \, dt \), so \( \sqrt{h} = -kt + C \). The initial condition \( h(0) = H \) gives \( C = \sqrt{H} \), so the solution is \( h = (\sqrt{H} - kt)^2 \).

b. The solution for \( k = 0.1 \) and \( H = 0.5 \) is \( h = (\sqrt{0.5} - 0.1t)^2 \).

c. The tank is drained when \( h(t) = 0 \), which gives \( t = \frac{\sqrt{H}}{k} \). With \( k = 0.1 \) and \( H = 0.5 \), we have \( t = \frac{\sqrt{0.5}}{0.1} \approx 7.071 \text{ seconds} \).

d. 

8.3.52

a. The general solution to \( y' = -ky \) is \( y = Ce^{-kt} \).

b. The equation \( y' = -ky^2 \) is separable, so we have \( -\int \frac{dy}{y^2} = \int k \, dt \), so \( \frac{1}{y} = kt + C \). The initial condition \( y(0) = y_0 \) gives \( C = 1/y_0 \), and solving for \( y \) gives \( y = \frac{1}{kt + 1/y_0} = \frac{y_0}{1 + ky_0 t} \).
8.3.53

a. The growth rate is positive when \(0 < M < 4\).

The function \(R(M)\) has derivative \(R'(M) = -r \ln \left( \frac{M}{K} \right) + M \cdot \frac{K}{M} \cdot \frac{1}{K} = -r \ln \left( \frac{M}{K} \right) + 1\) which is 0 when \(\frac{M}{K} = \frac{1}{e}\) or \(M = \frac{K}{e}\). We also observe that \(\lim_{M \to 0^+} R(M) = 0\) and \(R(4) = 0\), so \(R(M)\) takes its maximum at the critical point \(M = \frac{K}{e}\).

b. The equation is separable, so we have

\[
\frac{dM}{M(\ln M - \ln K)} = -rt \, dt, \quad \text{so} \quad \ln |M - \ln K| = -rt + D, \quad \text{and} \quad \ln \left( \frac{M}{K} \right) = Ce^{-rt}.
\]

The conditions \(r = 1\), \(K = 4\) and \(M_0 = 1\) give \(C = -\ln 4\) and \(M = 4e^{-\ln 4}e^{-t} = 4^{1-e^{-t}}\). Observe that \(\lim_{t \to \infty} M(t) = 4e^0 = 4\), so the limiting size of the tumor is 4.

c. In general, the limiting size of the tumor is \(\lim_{t \to \infty} Ke^{Ce^{-rt}} = K\), because \(r > 0\).

8.3.54 Solving with a CAS gives

\[
y = e^{\left(\frac{e^{t}(1740 \sin 4t + 204 \sin 12t + 435 \cos 4t + 17 \cos 12t)}{9860} - \frac{113}{2465}\right)}.
\]

8.3.55

a. \(\frac{1}{y^3} y'(t) = 1\), so \(\int \frac{dy}{y^3} = \int 1 \, dt\). Thus \(-\frac{1}{y^2} = t + C\). Because \(y_0 = 1\) we have \(-1 = C\). Thus, \(y = \frac{1}{\sqrt[3]{1-t}}\).

b. \(\frac{1}{y^2} y'(t) = 1\), so \(\int \frac{dy}{y^2} = \int 1 \, dt\). Thus \(-\frac{1}{2y} = t + C\). Because \(y_0 = \frac{1}{\sqrt{2}}\) we have \(-1 = C\). Thus, \(\frac{1}{2y} = 1 - t\) and \(y = \frac{1}{\sqrt{2\sqrt{1-t}}}\).

c. \(\frac{1}{y^{n+1}} y'(t) = 1\), so \(\int \frac{dy}{y^{n+1}} = \int 1 \, dt\). Thus \(-\frac{1}{y^n} = t + C\). Because \(y_0 = n^{-1/n}\) we have \(-1 = C\). Thus, \(\frac{1}{y^n} = 1 - t\), and \(ny^n = \frac{1}{1-t}\). Thus, \(y = \left(\frac{1}{n(1-t)}\right)^{1/n}\).

We have \(\lim_{t \to -1^-} \left(\frac{1}{n(1-t)}\right)^{1/n} = \infty\).

8.3.56

a. \(\frac{1}{y(y+1)} y'(t) = \frac{1}{t(t+2)}\), so \(\int \frac{dy}{y(y+1)} = \int \frac{dt}{t(t+2)}\). Using partial fraction decomposition gives

\[
\ln \left| \frac{y}{y+1} \right| = \frac{1}{2} \ln \left| \frac{t}{t+2} \right| + K.
\]

Exponentiating both sides gives

\[
\frac{y}{y+1} = e^{(1/2)\ln|t/(t+2)|+K} = D\sqrt[2]{\frac{t}{t+2}}.
\]

Copyright © 2014 Pearson Education, Inc.
We can remove the remaining absolute value signs by subsuming the sign into the constant D, giving

\[
\frac{y}{y + 1} = D\sqrt{\frac{t}{t + 2}} \quad \Rightarrow \quad 1 - \frac{1}{y + 1} = D\sqrt{\frac{t}{t + 2}} \quad \Rightarrow \quad 1 - D\sqrt{\frac{t}{t + 2}} = \frac{1}{y + 1}.
\]

Inverting gives

\[
y + 1 = \frac{1}{1 - D\sqrt{\frac{t}{t + 2}}} \quad \Rightarrow \quad y = \frac{1}{1 - D\sqrt{\frac{t}{t + 2}}} - 1 = \frac{D\sqrt{\frac{t}{t + 2}}}{1 - D\sqrt{\frac{t}{t + 2}}}.
\]

Finally,

\[
\frac{D\sqrt{\frac{t}{t + 2}}}{1 - D\sqrt{\frac{t}{t + 2}}} = \frac{D\sqrt{\frac{t}{t + 2}}}{1 - D\sqrt{\frac{t}{t + 2}}} \cdot \frac{\sqrt{t + 2}}{\sqrt{t + 2}} \cdot \frac{1}{D} = \frac{\sqrt{t}}{C\sqrt{t + 2} - \sqrt{t}} = \frac{\sqrt{t}}{C\sqrt{t + 2} - \sqrt{t}},
\]

where \( C = \frac{1}{D} \).

b. If \( y(1) = A \), then \( A = \frac{1}{\sqrt{3C - 1}} \), so \( C = \frac{1 + A}{\sqrt{3A}} \).

c. If \( A = 1 \), then \( C = \frac{2}{\sqrt{3}} \), so the solution is \( y = \frac{\sqrt{t}}{2\sqrt{3} - \sqrt{t}} \).

d. \( \lim_{t \to \infty} y(t) = \frac{1}{\sqrt{3} - 1} \approx 6.464 \).

e. When \( y(1) = 2 \), we have \( C = \sqrt{3} \), so the solution is \( y = \frac{\sqrt{t}}{\sqrt{3}2 - \sqrt{t}} \).
f. Note that at $t = 6$ the denominator of $y(t)$ from part (e) vanishes, and that

$$\lim_{t \to 6^-} \frac{\sqrt{t}}{\frac{3\sqrt{t+2}}{2} - \sqrt{t}} = \lim_{t \to 6^-} \frac{2\sqrt{t}}{3t + 6 - 2\sqrt{t}} = \lim_{t \to 6^-} \frac{2\sqrt{t}}{\sqrt{3t + 6 - \sqrt{4t}}}.$$ 

Now, as $t \to 6^-$, we have $3t + 6 > 4t$, so that the denominator is always positive and thus approaches zero from above. Hence the limit is $\infty$, so that the solution from part (e) grows positively without bound as $t \to 6^-$. 

$\lim_{t \to \infty} y(t) = \frac{1}{e^{-1} - 1} = \frac{\sqrt{4A}}{1 + A(1 - \sqrt{3})}$.

8.3.57

a. $\int y' y(t) \, dt = \int \left( \frac{e^t}{T} + t \right) \, dt$, so $y^2 = \frac{e^t}{T} + t^2 + C$, so $y^2 = e^t + t^2 + C_1$. So $y = \pm \sqrt{e^t + t^2 + C_1}$.

b. If $y(-1) = 1$, then $1 = \sqrt{e^{-1} + 1 + C_1}$ so $C_1 = -1^{-1}$, so $y = \sqrt{e^t + t^2 - 1}$. 

If $y(-1) = 2$, then $2 = \sqrt{e^{-1} + 1 + C_1}$ so $C_1 = 3 - 1^{-1}$, so $y = \sqrt{e^t + t^2 + 3 - 1}$.

c. For $t > 0$, the solutions increase as $t$ increases.

d. If $y(-1) = -1$, then $-1 = \sqrt{e^{-1} + 1 + C_1}$, so $C_1 = -1^{-1}$ and $y = -\sqrt{e^t + t^2 - 1}$.

If $y(-1) = -2$, then $-2 = \sqrt{e^{-1} + 1 + C_1}$ so $C_1 = 3 - 1^{-1}$, so $y = -\sqrt{e^t + t^2 + 3 - 1}$.

e. For $t > 0$, the solutions decrease as $t$ increases.

8.3.58 Assuming that $T < A$, start by separating variables in $T' = \frac{dT}{dt} = -k(T - A)$ to get

$$\frac{dT}{T - A} = -k \, dt.$$ 

Now integrate both sides, giving

$$\ln |T - A| = -kt + C_1,$$

Copyright © 2014 Pearson Education, Inc.
where $C_1$ is an arbitrary constant. Since $T < A$, the left-hand side is $\ln(A - T)$. Now exponentiate both sides of the above equation to get

$$A - T = e^{-kt+C} = e^{C_1} \cdot e^{-kt} = Ce^{-kt},$$

so that $T(t) = -Ce^{-kt} + A$. Since $C$ is an arbitrary constant, replace $C$ with $-C$, giving $T(t) = Ce^{-kt} + A$ as in the first case.

### 8.4 Exponential Models

#### 8.4.1 Exponential growth occurs for a constant relative growth rate.

#### 8.4.2 The initial value, and the relative growth rate.

#### 8.4.3 It is the time it takes the population to double in size.

#### 8.4.4 It is the time it takes for a quantity to decay to half its current size.

#### 8.4.5 For exponential growth modeled by $y = y_0e^{kt}$, the doubling time $T_2$ is $T_2 = \frac{\ln 2}{k}$, where $k > 0$ is the growth constant.

#### 8.4.6 For exponential decay modeled by $y = y_0e^{-kt}$, the half-life $T_{1/2}$ is $T_{1/2} = \frac{\ln 2}{k}$, where $k > 0$ is the decay constant.

#### 8.4.7 Compound interest and world population growth.

#### 8.4.8 Radioactive decay and depreciation of durable goods.

#### 8.4.9 For $f(t)$, $\frac{df}{dt} = 10.5$, so the absolute growth rate is constant. For $g(t)$, $\frac{dg}{dt} = 100e^{t/10} \cdot \frac{1}{10} = 10e^{t/10}$, so the growth rate is not constant but the relative growth rate $\frac{1}{g(t)}g'(t) = \frac{1}{10}$ is constant.

#### 8.4.10 For $f(t)$, $\frac{df}{dt} = 400$, so the absolute growth rate is constant. For $g(t)$, $\frac{dg}{dt} = 400 \cdot 2^{t/20} \cdot \frac{\ln 2}{20}$, so the growth rate is not constant but the relative growth rate $\frac{1}{g(t)}g'(t) = \frac{\ln 2}{20}$ is constant.

#### 8.4.11 The growth is modeled by $p(t) = 90,000e^{kt}$, with $t = 0$ corresponding to 2010, and time measured in years. Because $1.024 \cdot 90,000 = 90,000e^{k}$, we have $k = \ln 1.024$. The doubling time is $T_2 = \frac{\ln 2}{\ln 1.024} \approx 29.2263$, so it should reach 180,000 around the year 2039.

#### 8.4.12 The growth is modeled by $p(t) = 2e^{kt}$ where $t = 0$ corresponds to 2013, time is measured in years and $k = \ln 1.045$. The year 2020 corresponds to $t = 7$, so the population should be about $p(7) = 2e^{7\ln 1.045} \approx 2.722$ million people.

#### 8.4.13 The growth is modeled by $p(t) = 50000e^{kt}$. When $t = 10$, we have $p(10) = 50000e^{10k} = 55000$, so $k = \frac{\ln(11/10)}{10}$. Thus in 20 years, the population should be about $50000e^{2\ln(11/10)} = 50000 \cdot 1.1^2 = 60,500$.

#### 8.4.14 Our model is given by $y(t) = 1500e^{kt}$, and $y(1) = 1500 \cdot 1.031 = 1500e^{k}$, so $k = \ln 1.031$. Now we seek $t$ so that $2500 = 1500e^{t\ln 1.031}$. Thus $\ln 2 = t\ln 1.031$, so $t = \frac{\ln 2}{\ln 1.031} \approx 16.7$ years.

#### 8.4.15 The price of a cart of groceries is modeled by $p(t) = 100e^{kt}$ where $t = 0$ corresponds to 2005, and $t$ is measured in years and $k = \ln 1.03$. The price of the groceries in 2015 when $t = 10$ should be about $p(10) = 100e^{10\ln 1.03} \approx 3134.39$.

#### 8.4.16 The number of cells is modeled by $y(t) = 8e^{(\ln 2-t)/6}$ where $t$ is measured in weeks. The population will reach 1500 cells when $\ln \frac{1500}{8} = \frac{\ln 2}{6}t$, so when $t = \frac{6\ln(1500/8)}{\ln 2} \approx 45.3$ weeks.
8.4.17
a. The population is modeled by \( P(t) = 309e^{t\ln 1.008} \). The doubling time is \( \frac{\ln 2}{\ln 1.008} \approx 87 \) years. The population in 2050 will be about \( P(40) = 309e^{40\ln 1.008} \approx 425 \) million.

b. If the growth rate is 0.6\%, the doubling time is \( \frac{\ln 2}{\ln 1.006} \approx 115.9 \) years and the population in 2050 will be about \( 309e^{40\ln(1.006)} \approx 392.5 \) million. If the growth rate is 1\%, the doubling time will be \( \frac{\ln 2}{\ln 1.01} \approx 69.7 \) and the population in 2050 will be about \( 309e^{40\ln(1.01)} \approx 460.1 \) million.

c. A growth rate swing of just 0.2\% produces large differences in population growth.

8.4.18
a. \( P(t) \) has the form \( P(t) = 2000e^{kt} \), and because \( P(1) = 1.013 \cdot 2000 \), we have \( k = \ln 1.013 \). Thus \( P(t) = 2000e^{t\ln 1.013} \).

b. This is given by \( \int_0^4 P(t) \, dt = \frac{2000}{\ln 1.013} e^{t\ln 1.013} \bigg|_0^4 \approx 8210.3 \).

c. This is given by \( \int_0^t P(s) \, ds = \frac{2000}{\ln 1.013} e^{s\ln 1.013} \bigg|_0^t = -154844 + 154844e^{t\ln 1.013} \).

8.4.19 The growth is modeled by \( p(t) = 20.9e^{kt} \). When \( t = 10 \), we have \( p(10) = 20.9e^{10k} = 25.1 \), so 
\( k = \frac{\ln(25.1/20.9)}{10} \approx 0.0183 \). Thus \( p(25) = 20.9e^{0.0183(25)} \approx 33 \) million people.

8.4.20
a. Note that \( k = \ln 1.015 \). The amount consumed over the year would be
\[
\int_0^1 1.2e^{t\ln 1.015} \, dt = \frac{1.2}{\ln 1.015} e^{t\ln 1.015} \bigg|_0^1 \approx 1.209 \text{ million barrels of oil.}
\]

b. \( \int_0^t 1.2e^{x\ln 1.015} \, dx = \frac{1.2}{\ln 1.015} e^{x\ln 1.015} \bigg|_0^t = \frac{1.2}{\ln 1.015} (e^{t\ln 1.015} - 1) \text{ million barrels.}
\]

c. This will occur when \( \frac{1.2}{\ln 1.015} (e^{t\ln 1.015} - 1) = 10 \), or \( e^{t\ln 1.015} = \frac{10\ln 1.015 + 1}{1.2} \), or
\[
t = \frac{\ln \left( \frac{10\ln 1.015 + 1}{1.2} \right)}{\ln 1.015} \approx 7.856 \text{ years.}
\]

8.4.21 The homicide rate is modeled by \( H(t) = 800e^{-kt} \), where \( t = 0 \) corresponds to 2010, and time is measured in years, and \( -k = \ln 0.97 \approx -0.03 \). The rate will reach 600 when \( \frac{6}{8} = e^{-0.03t} \), or \( t = \frac{\ln(6/8)}{-0.03} \approx 9.6 \) years. So it should achieve this rate in 2019.

8.4.22 The amount of drug in the body is modeled by \( y(t) = y_0e^{-kt} \), where \( y_0 \) is the initial dose and time is measured in hours and \( k = -\ln 0.85 \). The amount in the body should be 10 percent of the initial dose when \( 0.1 = e^{t\ln 0.85} \), or \( t = \frac{\ln 0.1}{\ln 0.85} \approx 14.168 \) hours.

8.4.23 Let \( y = 1000e^{-kx} \) model the pressure at \( x \) feet above sea level. We know that \( \frac{1}{3} = e^{-30000k} \), so \( k = \frac{\ln(1/3)}{30000} \). We want to know for what \( x \) does \( \frac{1}{2} = e^{-kx} \), so we are seeking \( x = \frac{\ln 2}{k} = \frac{30000\ln 2}{\ln 3} \approx 18,928 \) feet above sea level. The pressure is \( \frac{1}{100} \) of the sea-level pressure when \( x = \frac{\ln(100)}{\ln 3} \approx 125,754 \) feet.

8.4.24 The population is modeled by \( p(t) = 1.2e^{t\ln 0.995} \). After 50 years, the population should be about \( p(50) = 1.2e^{50\ln 0.995} \approx 0.934 \) billion people (or about 934 million people). This rate is not sufficient to meet the goal of 700 million people.

8.4.25 The population is modeled by \( p(t) = 9.94e^{kt} \), and \( p(10) = 9.94e^{10k} = 9.88 \), so \( k = \frac{\ln(9.88/9.94)}{10} \approx -0.0006 \). We have \( p(20) = 9.94e^{(-0.0006)(20)} \approx 9.82 \) million people. The population decline is likely due to economic factors which may change if the economy (especially manufacturing) improves.
8.4.26
a. The value after $t$ years is given by $V(t) = 2.5e^{-kt}$. Because $V(1) = 2.5 \cdot 0.932$, we have $-k = \ln 0.932$. Thus, after 10 years, we have $V(10) = 2.5e^{10\ln 0.932} \approx 1.2$ million dollars.
b. The value is 10 percent of the original when $0.10 = e^{t\ln 0.932}$, which occurs when $t = \frac{\ln 0.10}{\ln 0.932} \approx 32.7$ years.

8.4.27
a. The amount of U-238 in the rock is modeled by $a(t) = 20e^{-kt}$. If the half-life is 36 hours, then $36 = \frac{\ln 2}{k}$, so $k = \frac{\ln 2}{36}$. So $a(12) = 20e^{-12\ln 2/36} = 20e^{-\ln 2/3} \approx 15.87$ mg.
b. The concentration of Valium will reach 2 mg when $0.1 = e^{-(t\ln 2)/36}$, which is when $t = \frac{-36\ln 0.1}{\ln 2} \approx 119.589$ hours.

8.4.28
a. The decay is modeled by $a(t) = a_0e^{-kt}$ with $k = \frac{\ln 2}{5730}$. We seek $t$ so that $0.77a_0 = a_0e^{-kt}$, so $t = \frac{\ln 0.77}{-k} = \frac{-5730\ln 0.77}{\ln 2} \approx 2160.6$. So the cloth was painted about 2161 years ago.
b. In a similar manner to part (a) we have $t = \frac{-5730\ln 0.602}{\ln 2} \approx 22,986$, so the wood was cut about 23,000 years ago.

8.4.29
The amount of U-238 in the rock is modeled by $a(t) = a_0e^{-kt}$ with $k = \frac{\ln 2}{5.5}$, where time is measured in billions of years. We seek $t$ so that $a_0 = a_0e^{-kt}$, so $t = \frac{\ln 0.85}{-k} = \frac{-5.5\ln 0.85}{\ln 2} \approx 1.055$. So the cloth was painted about 1.055 billion years ago.

8.4.30
a. After $t$ days there would be $y = 100e^{(-t\ln 2)/8}$ millicuries after $t$ days.
b. We seek $t$ so that $10 = 100e^{(-t\ln 2)/8}$, so $t = \frac{-8\ln 0.1}{\ln 2} \approx 26.575$ days.
c. We seek $t$ so that $105 = 105e^{(-t\ln 2)/8}$, so $t = \frac{-8\ln(2/21)}{\ln 2} \approx 27.139$ days.

8.4.31
a. False. If that was the correct formula, then $y(1) = y_0e^{0.06} = (1.06184)y_0 \neq (1.06)y_0$.
b. False. If it increases by ten percent per year, then after 3 years it increases by a factor of $(1.1)^3 = 1.331$ which corresponds to 33.1 percent.
c. True. The relative decay rate is constant, so the decay is exponential.
d. True. This follows because the doubling time is related to $k$ by the equation $T_2 = \frac{\ln 2}{k}$.
e. True. This time would be the constant $\frac{\ln 10}{k}$.

8.4.32
The time required to increase $p$-fold occurs when $py_0 = y_0e^{kt}$, or when $t = \frac{\ln p}{k}$. Thus, the tripling time is $\frac{\ln 3}{k}$.

8.4.33
As in the previous problem, the doubling time is $\frac{\ln 2}{k}$ which is constant as a function of $t$.

8.4.34
a. We are seeking $t$ so that $500,000e^{t\ln 1.03} = 300,000e^{t\ln 1.05}$. This occurs when $\frac{5}{3} = e^{(t\ln 1.05 - t\ln 1.03)}$, so $\ln \frac{5}{3} = t(\ln 1.05 - \ln 1.03)$, so $t = \frac{\ln 5/3}{\ln 1.05 - \ln 1.03} \approx 26.562$ years.
b. We are seeking $y_0$ and $p$ so that $500,000e^{10\ln 1.03} = y_0e^{10\ln(1+p)}$. This occurs when

$$y_0 = 500,000e^{10(\ln 1.03 - \ln(1+p))} = 500,000 \left( \frac{1.03}{1+p} \right)^{10}.$$
8.4.35

a. After 5 hours, Abe has run \( \int_0^5 4e^{-t/2} dt = 4 \ln(t+1)|_0^5 = 4 \ln 6 \approx 7.167 \text{ miles}. \) After 5 hours, Bob has run \( \int_0^5 4e^{-t/2} dt = -8e^{-t/2}|_0^5 = 8(1 - e^{-5/2}) \approx 7.343 \text{ miles}. \) So after 5 hours, Bob is ahead.

After 10 hours, Abe has run \( \int_0^{10} 4e^{-t/2} dt = 4 \ln(t+1)|_0^{10} = 4 \ln 11 \approx 9.592 \text{ miles}. \) After 10 hours, Bob has run \( \int_0^{10} 4e^{-t/2} dt = -8e^{-t/2}|_0^{10} = 8(1 - e^{-5}) \approx 7.946 \text{ miles}. \) So after 10 hours, Abe is ahead.

b. Bob’s distance function is given by \( 8(1 - e^{-t/2}) \) and is bounded above by 8. Abe’s distance function is given by \( 4 \ln(t+1) \) and is unbounded.

8.4.36 The doubling time is \( \frac{\ln 2}{k} = \frac{\ln 2}{\ln(1+p)} \approx \frac{0.693}{\ln(1+p)}. \) On the other hand, 70 divided by the interest rate in percent is \( \frac{70}{100p} = 0.7. \) So showing that these two are approximately equal, since 0.693 \( \approx 0.7, \) amounts to showing that for \( p \) fairly small, \( p \approx \ln(1+p). \) The derivative of \( \ln(1+p) \) is \( \frac{1}{1+p}. \) So at \( p_0 = 0, \) the linear approximation to \( \ln(1+p) \) is \( \ln(1+p) - \ln(1+p_0) \approx \frac{1}{1+p_0}(p - p_0), \) or \( \ln(1+p) \approx p, \) and we are done. Since this estimate comes from the linear approximation, it is clear that the Rule of 70 works better the smaller the interest rate is.

8.4.37 \((1 + 0.008)^{12} - 1 \approx 10.034\% , \) which is more than \( 12 \cdot 0.008 \approx 9.6\%. \)

8.4.38

a. If \( \frac{dv}{dt} = -kv, \) then \( \int \frac{dv}{v} dt = \int -k dt, \) so \( \ln v(t) = -kt + C, \) so \( v(t) = v_0e^{-kt} = 10e^{-kt}. \)

b. \( s(t) = \int 10e^{-kt} dt = -\frac{10}{k}e^{-kt} + C = -\frac{10}{k}e^{-kt} + \frac{10}{k}. \) (Because \( s(0) = 0. \))

c. \( \frac{dv}{dt} = \frac{dv}{ds} \cdot v, \) so \( -kv = \frac{dv}{ds} \cdot v, \) so \( \frac{dv}{ds} = -k. \) Thus \( v = -ks + C \) for some constant \( C, \) and because \( v(0) = 10, \) we have \( v = 10 - ks. \)

8.4.39 As in the previous problem, \( s(t) = \frac{v_0}{k}(1 - e^{-kt}). \) Consider the equations \( s(t_2) - s(t_1) = 1200 = \frac{v_0}{k}(e^{-kt_2} - e^{-kt_1}) \) and \( v(t_2) = v(t_1) = -100 = v_0(e^{-kt_2} - e^{-kt_1}). \) Dividing these two equations yields \( k = \frac{1}{12}. \) Now \( v(t_1) = 1000 = v_0e^{-t_1/12} \) and \( v(t_2) = 900 = v_0e^{-t_2/12}, \) so \( \frac{1000}{900} = e^{(-1/12)(t_1-t_2)}, \) so \( t_1 - t_2 = -12 \ln \frac{10}{9} \approx -1.264 \text{ seconds}. \) The deceleration takes about 1.264 seconds to occur.

8.4.40

a. The runner’s velocity approaches but does not attain 12 meters per second.
b. The position function is \( s(t) = \int_0^t 12(1 - e^{-x/2}) \, dx = 12(t + 2e^{-t/2}) \mid _0^t = 12t + 24e^{-t/2} - 24. \)

c. \( s = 100 \) when \( 12t + 24e^{-t/2} - 24 = 100 \), which occurs when \( t \approx 10.322 \) seconds.

**8.4.41** The initial volume is \( V_0 = \frac{4\pi}{3} \left( \frac{5}{10000} \right)^3 = \frac{\pi}{6 \times 10^9} \) cubic cm. \( k = \frac{\ln 2}{35} \). Suppose \( 0.5 = V_0 e^{kt} = \frac{\pi}{6 \times 10^9} e^{\left( t \ln \frac{\ln 2}{35} \right)} \), then \( \frac{t \ln \frac{\ln 2}{35}}{35} = \ln \left( \frac{3 \times 10^9}{\pi} \right) \approx 1044 \) days.

**8.4.42**

a. Since the growth rate in the U.S. is 4%, we have \( k = 0.04 \) for the U.S. Similarly, \( k = 0.09 \) for China.

From the values in 2010, the growth functions are (in billions of tons)

U.S.: \( 5.8 \times 10^9 e^{t \ln 1.04} \), China: \( 8.2 \times 10^9 e^{t \ln 1.09} \).

b. We want to solve \( 2 \cdot 5.8 \times 10^9 e^{t \ln 1.04} = 8.2 \times 10^9 e^{t \ln 1.09} \). Taking logs gives

\[ \ln 2 + \ln 5.8 + t \ln 1.04 = \ln 8.2 + t \ln 1.09, \]  
so that \( t = \frac{\ln 8.2 - \ln 5.8 - \ln 2}{\ln 1.04 - \ln 1.09} \approx 7.387 \) years.

This happens some time in the year 2017.

c. The per capita amounts are

U.S.: \( \frac{5.8 \times 10^9}{309 \times 10^6} \approx 0.0188 \times 10^3 \) tons/person \( \approx 18.8 \) tons/person

China: \( \frac{8.2 \times 10^9}{1.3 \times 10^9} \approx 6.31 \) tons/person

d. The exponential growth functions for the U.S. and Chinese populations are (in billions of people)

U.S.: \( 0.309 e^{t \ln 1.007} \), China: \( 1.3 e^{t \ln 1.005} \).

Thus the per capita growth functions for carbon dioxide emissions are the quotients:

U.S.: \( \frac{5.8 e^{t \ln 1.04}}{0.309 e^{t \ln 1.007}} \approx 18.770 e^{(t \ln 1.04 - \ln 1.007)} \approx 18.770 e^{0.0322t} \)

China: \( \frac{8.2 e^{t \ln 1.09}}{1.3 e^{t \ln 1.005}} \approx 6.308 e^{(t \ln 1.09 - \ln 1.005)} \approx 6.308 e^{0.0812t} \).

e. Per capita emissions will be equal when \( 18.770 e^{0.0322t} = 6.308 e^{0.0812t} \). Taking logs gives

\[ \ln 18.770 + 0.0322t = \ln 6.308 + 0.0812t, \]  
so that \( t = \frac{\ln 18.770 - \ln 6.308}{0.0812 - 0.0322} \approx 22.3 \) years.

This will happen some time in 2032.
8.4.43 Revenue is given by $R(x) = 40xe^{-x/50}$. So

$$R'(x) = 40xe^{-x/50} \cdot \left( \frac{-1}{50} \right) + 40e^{-x/50} = 40e^{-x/50} \left( 1 - \frac{x}{50} \right).$$

The critical number is $x = 50$, and this number yields a maximum, because $R'(x) > 0$ on $(0, 50)$, while $R'(x) < 0$ for $x > 50$. Thus, she should charge $50.00.

8.4.44 If $y(p) = \sqrt[6]{y(m)y(n)}$, then $y_0 e^{kp} = \sqrt[n]{y_0 e^{km} e^{nk}}$, so $e^{kp} = e^{(m+n)k/2}$, so $p = \frac{m+n}{2}$.

8.4.45 If $y_0 e^{kt} = y_0(1 + r)^t$, then $(e^k)^t = (1 + r)^t$, so $e^k = 1 + r$, and $k = \ln(1 + r)$. If $y_0 e^{kt} = y_0 2^{t/T_2}$, then $(e^k)^t = (2^{1/T_2})^t$, so $e^k = 2^{1/T_2}$, and $k = \frac{\ln 2}{T_2}$. Also, we have $T_2 = \frac{\ln 2}{k}$, so $T_2 \ln(1 + r) = \ln 2$. Then $(1 + r)^{T_2} = 2$, so $r = 2^{1/T_2} - 1$.

8.4.46 $R_T = \frac{y(t+T) - y(t)}{y(t)} = \frac{y_0 e^{(t+T)} - y_0 e^{kt}}{y_0 e^{kt}} = \frac{y_0 e^{kt} e^{(kT-1)}}{y_0 e^{kt}} = e^{kT} - 1$. Hence, $R_T$ is constant for all $t$.

**Chapter Review**

1. a. False. It is a first-order, linear differential equation, but it isn’t separable.
   b. False. It is a first-order, separable differential equation, but it isn’t linear.
   c. True. Note that $y' = 1 - t^{-2}$, so $ty' = t - t^{-1}$. Thus, $ty' + y = t - t^{-1} + (t + t^{-1}) = 2t$. Also, $y(1) = 2$.
   d. True.
   e. False. In general, Euler’s method gives approximate solutions.

2. $y'(t) = -3y$, so $\int \frac{y'(t)}{y} dt = \int (-3) dt$. Thus, $\ln|y| = -3t + K$, and exponentiating both sides gives $y = Ce^{-3t}$.

3. $y'(t) = -2y + 6$, so $\int \frac{y'(t)}{2y + 6} dt = \int 1 dt$, and therefore $-\frac{1}{2} \ln |2y + 6| = t + K$. It follows that $|2y + 6| = Ae^{-2t}$. We can write $-2y + 6 = \pm Ae^{-2t}$, so $y(t) = Ce^{-2t} + 3$.

4. $p'(x) = 4p + 8 = 4(p + 2)$, so $\int \frac{p'(x)}{p + 2} dx = \int 4 dx$, and thus $\ln|p + 2| = 4x + K$. Thus $|p + 2| = Ae^{4x}$, so $p + 2 = \pm Ae^{4x}$, and thus $p(x) = Ce^{4x} - 2$.

5. $y'(t) = 2ty$, so $\int \frac{y'(t)}{y} dt = \int 2t dt$, and therefore, $\ln|y| = t^2 + K$. It follows that $y = Ce^{t^2}$.

6. $y'(t) = \sqrt{y}$, so $\int y^{-1/2}y'(t) dt = \int t^{-1/2} dt$. Integrating gives $2\sqrt{y} = 2\sqrt{t} + K$, so $\sqrt{y} = \sqrt{t} + C$, so $y(t) = (\sqrt{t} + C)^2$.

7. $y'(t) = \frac{1}{t^2 + 1}$. Integrating both sides with respect to $t$ gives $\ln|y| = \tan^{-1}t + K$, so $y = Ce^{\tan^{-1}t}$.

8. $2yy'(x) = \sin x$, so $y^2 = -\cos x + C$, and thus $y = \pm \sqrt{C - \cos x}$.

9. $\int \frac{y'(t)}{y^{2/3}} dt = \int (2t + 1) dt$, so $\tan^{-1}y = t^2 + t + C$, and thus $y = \tan(t^2 + t + C)$.

10. $\frac{y'(t)}{x} = \frac{2}{x^2 + 1}$. Integrating both sides with respect to $t$ gives $\ln|x| = \frac{1}{2} \ln|t^2 + 1| + K$. Thus $x = C\sqrt{t^2 + 1}$.

11. $\int y'(t) dt = \int (2t + \cos t) dt$, so $y(t) = t^2 + \sin t + C$. Because $y(0) = 1$, we have $1 = 0 + 0 + C$, so $C = 1$. Thus, $y(t) = t^2 + \sin t + 1$.
12. \( y'(t) = -3(y - 3) \), so \( \int \frac{y'(t)}{y-3} \, dt = \int (-3) \, dt \), so \( \ln |y - 3| = -3t + K \), and thus \( y - 3 = Ce^{-3t} \). Because \( y(0) = 4 \), we have \( C = 1 \). Thus \( y = e^{-3t} + 3 \).

13. \( \int \frac{Q'(t)}{Q-8} \, dt = \int 1 \, dt \), so \( \ln |Q - 8| = t + K \). Thus, \( Q - 8 = Ce^t \). Because \( Q(1) = 0 \), we have \( -8 = Ce \), so \( C = -\frac{8}{e} \). Thus, \( Q = -8e^{t-1} + 8 \).

14. \( yy' = x \), so \( \int yy' \, dx = \int x \, dx \), so \( \frac{y^2}{2} = \frac{x^2}{2} + C \). Because \( y(2) = 4 \), we have \( 8 = 2 + C \), so \( C = 6 \). Thus, \( y^2 = x^2 + 12 \), and \( y = \sqrt{x^2 + 12} \).

15. \( u^{-1/3}u' = t^{-1/3} \). Thus \( \int u^{-1/3}u' \, dt = \int t^{-1/3} \, dt \). We have \( \frac{3}{2}u^{2/3} = \frac{3}{2}t^{2/3} + C \). Because \( u(1) = 8 \), we have \( 6 = \frac{3}{2} + C \), so \( C = \frac{9}{2} \). Thus, \( u^{2/3} = t^{2/3} + 3 \), and \( u = (t^{2/3} + 3)^{3/2} \).

16. \( \int (\sin y)y' \, dx = \int 4x \, dx \), so \( -\cos y = 2x^2 + C \). Because \( y(0) = \frac{\pi}{2} \), we have \( 0 = 0 + C \), so \( C = 0 \). Thus \( \cos y = -2x^2 \), and \( y = \cos^{-1}(-2x^2) \).

17. \( \int 2ss' \, dt = \int \frac{dt}{t+2} \). Thus, \( s^2 = \ln(t+2) + C \). Because \( s(-1) = 4 \), we have \( 16 = 0 + C \), so \( s^2 = \ln(t+2) + 16 \), and \( s = \sqrt{\ln(t+2) + 16} \).

18. \( \int \sec^2 \theta \cdot \theta' \, dx = \int 4x \, dx \). Thus, \( \tan \theta = 2x^2 + C \). Because \( \theta(0) = \frac{\pi}{4} \), we have \( 1 = 0 + C \), so \( C = 1 \). It follows that \( \theta = \tan^{-1}(2x^2 + 1) \).

19.

- c. The solutions are increasing when \( 0 < A < 2 \).
- d. The solutions are decreasing when \( A < 0 \) or when \( A > 2 \).
- e. The equilibrium solutions are \( y = 0 \) and \( y = 2 \).
20.  

a, b. A graph of the slope field with the curves passing through \((0, \pm \frac{1}{2})\) is below:

\[
\begin{array}{c|c|c|c}
 k & t_k & u_k & \text{Slope} = f(t_k, u_k) \\
0 & 0 & 1 & -1 \\
1 & 0.25 & 0.75 & -1.25 \\
2 & 0.5 & 0.438 & -1.563 \\
3 & 0.75 & 0.0469 & -
\end{array}
\]

c. Solutions are increasing where \(y'(t) = t - y > 0\), so when \(t > y\), which is below the line \(t = y\). They are decreasing where \(y'(t) = t - y < 0\), so when \(t < y\).

d. From the slope field, it is apparent that the solution of the differential equation with the initial condition \(y(0) = A\), where \(A\) is a real number, approaches the line \(y = t - 1\).

21. Note that for \(t > 0\) and \(y = 0\) that the slope is negative. The only one of the four given choices that has that property is choice (b), \(y'(t) = y - t\).

22. Equation (A), \(y'(t) = \sin ty\), should be periodic in both the \(t\) and \(y\) directions. The only one of the four slope fields that satisfies this condition is (d). Equation (B), \(y'(t) = \frac{y}{t^2 + 1}\), matches slope field (c), since first, \(y'(t) = 0\) for \(y = 0\), which matches (c), and second, for a given value of \(t\), as \(y\) increases, so does the slope. Equation (C), \(y'(t) = y - 2t\), matches slope field (b), since the slope field is zero for a line through the origin that could well be \(y = 2t\), and also, for a given value of \(t\), the slope is always negative for \(y\) below that line. Finally, equation (D), \(y'(t) = y^2(y - 2)\), matches slope field (a), since that slope field has constant (equilibrium) solutions at \(y = 0\) and \(y = 2\).

23. Computing gives

24. Computing gives
25.

a. \( u_0 = 1 \). \( u_1 = 1 + f(0, 1) \cdot 0.1 = 1 + \frac{1}{20} = 1.05 \). Also, \( u_2 = 1.05 + f(0.1, 1.05) \cdot 0.1 = 1.05 + 0.047619 = 1.09762 \). Thus, \( y(0.1) \approx 1.05 \) and \( y(0.2) \approx 1.09762 \).

b. \( u_0 = 1 \). \( u_1 = 1 + f(0, 1) \cdot 0.05 = 1 + 0.025 = 1.025 \). Also, \( u_2 = 1.025 + f(0.05, 1.025) \cdot 0.05 = 1.04939 \). Next, \( u_3 = 1.04939 + f(0.1, 1.04939) \cdot 0.05 = 1.07321 \) and \( u_4 = 1.07321 + f(0.15, 1.07321) \cdot 0.05 = 1.09651 \). Thus, \( y(0.1) \approx 1.04939 \) and \( y(0.2) \approx 1.09651 \).

c. For part a, we have \( |1.09762 - \sqrt{1.2}| \approx 2.2 \times 10^{-3} \). For part b, we have \( |1.09651 - \sqrt{1.2}| \approx 1.1 \times 10^{-3} \). Part b is more accurate; its absolute error is about half that in part (a).

26. Since the zeros of the right hand side are \( y = 0 \) and \( y = 2 \), the possible values of \( A \) are \( A = 0 \) and \( A = 2 \).

27. Since the zeros of the right hand side are \( y = 0 \), \( y = -3 \) and \( y = 5 \), the possible values of \( A \) are \( A = 0 \), \( A = -3 \) and \( A = 5 \).

28. Since the zeros of the right hand side for \( |y| < \pi \) are only \( y = 0 \) and \( y = \pm \frac{\pi}{2} \), the only possible values of \( A \) in the given range are \( A = 0 \) and \( A = \pm \frac{\pi}{2} \).

29. The right hand side is \( y^3 - y^2 - 2y = y(y^2 - y - 2) = y(y - 2)(y + 1) \), which has zeros \( y = 0 \), \( y = 2 \) and \( y = -1 \). Thus the possible values of \( A \) are \( A = 0 \), \( A = 2 \) and \( A = -1 \).

30.

a. The equilibrium solutions occur where \( P'(t) = 0 \), so they are \( P = 0 \) and \( P = 1200 \).

b. We must solve \( P' = 0.2P - \frac{1200}{P + 1200} \). We have \( \int \frac{P'}{P + 1200} \, dt = \int 0.2 \, dt \), which can be written as \( \int \left( \frac{P'}{P(t)} + \frac{P'}{1200 - P(t)} \right) \, dt = \int 0.2 \, dt \). Thus, \( \ln \left( \frac{P(t)}{1200 - P(t)} \right) = 0.2t + C \). Exponentiating both sides and taking reciprocals gives \( \frac{1200}{P(t)} = Ae^{-0.2t} \), or \( \frac{1200}{P(t)} = Ae^{-0.2t} + 1 \). Because \( P(0) = 50 \), we have \( A = 23 \). Thus \( \frac{1200}{P(t)} = 23e^{-0.2t} + 1 \), so that \( P(t) = \frac{1200}{23e^{-0.2t} + 1} \).

c. The carrying capacity is \( \lim_{t \to \infty} 1200 = 1200 \).

d. We have

\[
P''(t) = (P'(t))^2 - 0.2 \left( 1 - \frac{P}{1200} \right) P' + 0.2P \left( -\frac{1}{1200} \right) P' = 0.2P \left( 1 - \frac{1}{600} \right) \]

Note that \( P(t) \) is an increasing function of \( t \), since as \( t \) increases, \( 1150e^{-0.2t} \) decreases, so the denominator of \( P(t) \) decreases. Thus \( P'(t) > 0 \) for all \( t \), so that \( P'(t) = 0 \) when \( P(t) = 600 \). A glance at the graph shows that this is a maximum.

e. The concavity of the solution curve is determined by the sign of \( P''(t) \). For \( P > 1200 \), both \( P'(t) \) and \( 1 - \frac{1}{600} \) are negative, so that \( P''(t) \) is positive. For \( 0 < P < 1200 \) we have \( P'(t) > 0 \), so that \( P''(t) > 0 \) for \( 0 < P < 600 \) and \( P''(t) < 0 \) for \( 600 < P < 1200 \). So the curve is concave up for \( 0 < P < 600 \) and for \( P > 1200 \) and concave down for \( 600 < P < 1200 \); there is an inflection point at \( P = 600 \).

31.

a. \( T(t) = (80 - 25)e^{-kt} + 25 \). Because \( T(5) = 60 \), we have \( 60 = 55e^{-5k} + 25 \), so \( \frac{35}{55} = e^{-5k} \), and thus \( k = \frac{-\ln(35/55)}{5} \approx 0.0904 \).

b. \( T(t) = 55e^{-0.0904t} + 25 \).

c. The coffee reaches 50 degrees when \( 50 = 55e^{-0.0904t} + 25 \), or when \( e^{-0.0904t} = \frac{25}{55} = \frac{5}{11} \). Thus \( t = \frac{-\ln(5/11)}{0.0904} \approx 8.7 \) minutes.
32. a. Separating variables gives
\[ \frac{dT}{T - 60} = -k dt \]
so that
\[ \int \frac{dT}{T - 60} = \int (-k) dt, \quad \text{or} \quad \ln |T - 60| = -kt + C. \]
Exponentiating both sides gives \( |T - 60| = e^{-kt+C} = C_1 e^{-kt} \). Now replace \( C_1 \) by \( \pm C_1 \) and remove the absolute value signs to get 
\[ T(t) = C_1 e^{-kt} + 60. \]
Since \( T(0) = 300 \), we have 
\[ 300 = C_1 e^0 + 60 \]
so that \( C_1 = 240 \) and thus 
\[ T(t) = 240 e^{-kt} + 60. \]
b. The given condition means that \( T(10) = 240 \), so that
\[ 240 = 240 e^{-10k} + 60, \quad \text{or} \quad e^{-10k} = \frac{3}{4}, \quad \text{so that} \quad k = \frac{\ln(4/3)}{10} \approx 0.0288. \]
c. A plot of \( T(t) = 240 e^{-0.0288t} + 60 \), with \( y = 240 \) and \( t = 10 \) drawn as dotted lines, is

Clearly this solution satisfies the initial condition as well as the condition in part (b).

d. Since \( \lim_{t \to \infty} e^{-0.0288t} = 0 \), we have \( \lim_{t \to \infty} (240 e^{-0.0288t} + 60) = 60 \). This means that as the iron bar cools, its temperature will come arbitrarily close to the ambient temperature of 60°.

33. Because the half-life is 1500 years, we know that \( k = \frac{\ln 2}{1500} \). We are seeking \( t \) so that \( 0.7 y_0 = y_0 e^{-kt} \), so \( \ln 0.7 = -kt \), and thus \( t = -\frac{\ln 0.7}{k} = -\frac{\ln(0.7) \cdot 1500}{\ln 2} \approx 771.86 \) years ago.

34. Growth is modeled by \( p(t) = 150,000 e^{kt} \) where \( k = \ln 1.04 \). The population reaches 1,000,000 when 
\[ 1,000,000 = 150,000 e^{t \ln 1.04}, \quad \text{or when} \quad \ln \frac{20}{3} = t \ln 1.04, \quad \text{so when} \quad t = \frac{\ln(20/3)}{\ln 1.04} \approx 48.37 \text{ years}. \]

35. a. The balance at time \( t \) years is given by \( 1500 \cdot 1.054^t \).

b. The balance doubles when \( 1.054^t = 2 \), which occurs for 
\[ t = \frac{\ln 2}{\ln 1.054} \approx 13.18 \text{ years}. \]

c. The balance reaches $5000 when \( 5000 = 150 \cdot 1.054^t \), which occurs when 
\[ t = \frac{\ln(10/3)}{\ln 1.054} \approx 22.89 \text{ years}. \]

AP Practice Questions

Multiple Choice

1. The correct answer is B. Equation I is not separable. We can write \( y' = 9 - ty \), but there is then no way to separate the \( t \) and the \( y \). Equation II is separable, since \( y' = 4 - 3y \) so that \( \frac{dy}{4-3y} = dt \). Finally, equation III is also separable, since we get \( y' = -y^2 \), so that \( \frac{dy}{y^2} = -dt \).
2. The correct answer is E. Since the slope field appears to be zero on the line \( y = t \) through the origin, this seems to be the right answer. (A) and (B) cannot be right, since the slope fields for those equations are independent of \( t \), which the given slope field is not. (C) cannot be right since the slope field for that equation would be zero when \( y = -t \), so along the line \( y + t = 0 \), which the given slope field is not. Finally, (D) cannot be right since the slope field for that equation would be independent of \( y \), which the given slope field is not.

3. The correct answer is B. A plot of the slope field, with the required solution curve in black, is

![Plot of slope field](https://via.placeholder.com/150)

The curve is increasing asymptotically to 1, and its value at 0 is 0.5, so the interval is \([0.5, 1]\).

4. The correct answer is A. The slope field for the given equation will be positive everywhere except for \( y = 0 \) and \( y \geq 2 \), since the right-hand side of the equation is positive except for those values. The only slope field shown that matches that requirement is (A).

5. The correct answer is B. All five equations shown satisfy the initial condition \( y(1) = -1 \). However, checking the equations we get

- **A**: \( y = -y^3 - \cos \pi t - 1 \), \( y' + 3y^2 = -3y^2 + \pi \sin \pi t + 3t^2 = \pi \sin \pi t \)
- **B**: \( y = -t^3 - \frac{1}{\pi} \cos \pi t - \frac{1}{\pi} \), \( y' + 3t^2 = -3t^2 + \sin \pi t + 3t^2 = \sin \pi t \)
- **C**: \( y = -t^3 + \frac{1}{\pi} \cos \pi t + \frac{1}{\pi} \), \( y' + 3t^2 = -3t^2 - \sin \pi t + 3t^2 = -\sin \pi t \)
- **D**: \( y = t^3 + \frac{1}{\pi} \cos \pi t - 2 + \frac{1}{\pi} \), \( y' + 3t^2 = 3t^2 - \sin \pi t + 3t^2 = 6t^2 - \sin \pi t \)
- **E**: \( y = t^3 - \cos \pi t - 3 \), \( y' + 3t^2 = 3t^2 + \pi \sin \pi t + 3t^2 = 6t^2 + \pi \sin \pi t \)

6. The correct answer is D. Separating variables gives

\[
y^2 \, dy = \left(\frac{2}{3}t + 1\right) \, dt,
\]
so that
\[
\int y^2 \, dy = \int \left(\frac{2}{3}t + 1\right) \, dt,
\]
or
\[
\frac{1}{3}y^3 = \frac{1}{3}t^2 + t + C.
\]

Multiply through by 3 and redefine \( C \) to get \( y^3 = t^2 + 3t + C \), so that \( y = (t^2 + 3t + C)^{1/3} \). Since \( y(0) = 2 \) we have \( 2 = C^{1/3} \), so that \( C = 8 \) and \( y(t) = (t^2 + 3t + 8)^{1/3} \).

7. The correct answer is C. Separate variables to get

\[
\frac{dp}{p - 200} = 0.5 \, dt,
\]
so that
\[
\int \frac{dp}{p - 200} = \int 0.5 \, dt \quad \text{or} \quad \ln |p - 200| = 0.5t + C.
\]

Exponentiate to get \( |p - 200| = e^{0.5t + C_1} = Ce^{0.5t} \). Remove the absolute value sign and replace \( C \) by \( \pm C \) to get \( p(t) = Ce^{0.5t} + 200 \). When the initial condition is given, we get \( 100 = Ce^0 + 200 \), so that \( C = -100 \) and \( p(t) = 200 - 100e^{0.5t} \). As \( t \to \infty \), the second term becomes arbitrarily large negatively, so the population decreases to zero in a finite amount of time — in fact, when \( 200 - 100e^{0.5t} = 0 \), or \( t = 2 \ln 2 \).
8. The correct answer is E. Applying Euler’s method gives

<table>
<thead>
<tr>
<th>$k$</th>
<th>$t_k$</th>
<th>$u_k$</th>
<th>Slope = $f(t_k, u_k)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0.1</td>
<td>1.1</td>
<td>2.1</td>
</tr>
<tr>
<td>2</td>
<td>0.2</td>
<td>1.310</td>
<td>—</td>
</tr>
</tbody>
</table>

9. The correct answer is A. Note that the graphs of B, C, and D all pass through the point (0, 2), but the curve passing through (0, 2) in the slope field is neither exponential (B), periodic (C), nor undefined at $t = -1$ (D). (E) cannot be correct either, since the curve passing through (0, 4) would have to be a downward-opening parabola, which it clearly is not. To see that (A) is plausible, note that this equation may be rewritten $t^2 - y^2 = 4$, which is a hyperbola passing through the points $(\pm 2, 0)$, which matches the curves in the slope field.

10. The correct answer is B. (A) cannot be correct, since we would have $y' < 0$ for $0 < y < 2$, and this is not the case. (C) cannot be correct, since $\cos y < 0$ for $\frac{\pi}{2} < y < \pi$, so for example for $y \approx 1.75$, and again this is not the case. (D) cannot be correct, since we would have $y'(0) = 0$, which is not the case. Finally, (E) cannot be correct, since the slope of the graph would be a constant multiple of $y$, so it would always be increasing, which is not the case. (B) has asymptotes at $y = 0$ and $y = 2$ as you would expect, and has positive slope for $0 < y < 2$. Note that this is a logistic equation.

11. The correct answer is E; all three statements are true. For the first, note that the concavity of $y(t)$ is determined by $y''(t)$, which is

$$y''(t) = \frac{d}{dt} \left( \frac{dy}{dt} \right) = \frac{1}{10}(10 - y)y' + \frac{y}{10}(-1)y' = y' \left( 1 - \frac{y}{5} \right).$$

For $t$ near zero, using the initial condition $y(0) = 2$ we see that $y'$ is positive since $\frac{y}{10}(10 - y) \approx \frac{2}{10} \cdot 8 > 0$. Also the second factor, $1 - \frac{y}{5}$, is positive for $t$ near zero. Thus $y''(t)$ is positive for $t$ near zero and thus $y(t)$ is concave up. For statement III, the slope of the line tangent to the curve at $y = 5$ is

$$\left. \frac{dy}{dt} \right|_{y=5} = \frac{5}{10}(10 - 5) = 2.5.$$

For the second statement, note that we can rewrite the differential equation as $y'(t) = y \left( 1 - \frac{y}{4} \right)$, which is a logistic equation with equilibrium solutions $y = 0$ and $y = 10$. Since $y'(0) > 0$ and $y(0) = 2$, the solution curve in question increases asymptotically to $y = 10$, so that it is increasing everywhere.

12. The correct answer is D. Separating variables gives

$$\frac{dy}{y} = -2 \, dt,$$

so that

$$\int \frac{dy}{y} = \int (-2) \, dt, \quad \text{or} \quad \ln |y| = -2t + C.$$

Exponentiate both sides to get $|y| = e^{-2t+C} = C_1 e^{-2t}$, and remove the absolute value sign by replacing $C_1$ by $\pm C_1$ to get $y = C_1 e^{-2t}$. Since $y(0) = 2$ we get $C_1 = 2$, so that $y(t) = 2e^{-2t}$.

13. The correct answer is C. Rewrite the equation as $y' = 6y(4 - y) = \frac{3}{2}y \left( 1 - \frac{y}{2} \right)$. This is a logistic equation with equilibrium solutions $y = 0$ and $y = 4$, so that with the initial condition $y(0) = 2$, the solution curve asymptotically approaches the upper equilibrium point, so that $y(t) \to 4$.

14. The correct answer is B. A sketch of the slope field is

![Slope Field Image](image-url)

The correct answer is B. The solution curve starting at \( y(0) = \) clearly increases, and is approximately 12 at \( t = 2 \).

15. The correct answer is A. Computing gives

<table>
<thead>
<tr>
<th>( k )</th>
<th>( t_k )</th>
<th>( u_k )</th>
<th>Slope = ( f(t_k, u_k) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>( \frac{1}{3} )</td>
<td>0</td>
<td>( -\frac{1}{3} )</td>
</tr>
<tr>
<td>2</td>
<td>( \frac{2}{3} )</td>
<td>( -\frac{1}{5} )</td>
<td>( -\frac{53}{81} )</td>
</tr>
<tr>
<td>3</td>
<td>1</td>
<td>( -\frac{80}{243} )</td>
<td>—</td>
</tr>
</tbody>
</table>

Thus \( y(1) \approx -\frac{80}{243} \approx -0.329 \).

16. The correct answer is C. At \( t = 3 \) we have \( y(3) = 2 \), so the slope of the solution curve is \( y'(3) = 3 \cdot 2 = 6 \). Thus the linear approximation to \( y(t) \) at \( t = 3 \) is

\[ y(t) \approx 6(t - 3) + y(3) = 6t - 16. \]

Thus \( y(\pi) \approx 6\pi - 16 \approx 2.850 \).

**Free Response**

1.

a. With two subintervals, the intervals are \([0, 0.2] \) and \([0.2, 0.4] \), with midpoints 0.1 and 0.3. Thus the midpoint Riemann sum approximation is

\[
\int_0^{0.4} f'(x) \, dx \approx 0.2 \cdot f'(0.1) + 0.2 \cdot f'(0.3) = 0.2 \cdot 1.2 + 0.2 \cdot 1.6 = 0.56.
\]

b. By the Fundamental Theorem of Calculus,

\[
0.56 \approx \int_0^{0.4} f'(x) \, dx = f(0.4) - f(0) = f(0.4) - 1,
\]

so that \( f(0.4) \approx 1.56 \).
c. Since \( f'(0) = 1.0 \), the tangent to the curve at \((0, 1)\) has equation \( y = 1(x - 0) + 1 = x + 1 \).

d. Using this linear approximation, we get \( f(0.4) \approx 0.4 + 1 = 1.4 \).

e. Calculating using Euler’s method gives

\[
\begin{array}{|c|c|c|c|}
\hline
k & t_k & u_k & \text{Slope} = f'(t_k) \\
\hline
0 & 0 & 1 & 1.0 \\
1 & 0.2 & 1.2 & 1.4 \\
2 & 0.4 & 1.48 & — \\
\hline
\end{array}
\]

The approximation is \( f(0.4) \approx 1.48 \).

2.

a. Calculating using Euler’s method gives

\[
\begin{array}{|c|c|c|c|}
\hline
k & t_k & u_k & \text{Slope} = f(t_k; u_k) \\
\hline
0 & 0 & 4 & 0 \\
1 & 0.2 & 4 & 0.05 \\
2 & 0.4 & 4.01 & — \\
\hline
\end{array}
\]

The approximation is \( f(0.4) \approx 4.01 \).

b. Calculating using Euler’s method gives

\[
\begin{array}{|c|c|c|c|}
\hline
k & t_k & u_k & \text{Slope} = f(t_k; u_k) \\
\hline
0 & 0 & 4 & 0 \\
1 & 0.1 & 4 & 0.025 \\
2 & 0.2 & 4.0025 & 0.04997 \\
3 & 0.3 & 4.0075 & 0.07486 \\
4 & 0.4 & 4.01498 & — \\
\hline
\end{array}
\]

The approximation is \( f(0.4) \approx 4.01498 \).

c. With \( y(t) = \sqrt{t^2 + 16} \), we have \( y(0.4) = \sqrt{16.16} \approx 4.01995 \). The error in the approximation from part (a) is \( 4.01995 - 4.01 \approx 0.00995 \), while the error in the approximation from part (b) is \( 4.01995 - 4.01498 \approx 0.00497 \).

d. The error was reduced by about a factor of 2 as well.

3.

a. A plot of the slope field at the given points is
b. Separate variables to get \(-y^{-2} \, dy = (x+1)^{-2} \, dx\), so that

\[
\int (-y^{-2}) \, dy = \int (x+1)^{-2} \, dx, \quad \text{or} \quad y^{-1} = -(x+1)^{-1} + C = \frac{Cx + C - 1}{x+1}.
\]

Taking reciprocals gives \(y(x) = \frac{x+1}{Cx+C-1} \).

c. With \(y(0) = 2\) we get 2 = \(\frac{1}{C} - 1\) so that \(C = \frac{3}{2}\) and

\[
y(x) = \frac{x + 1}{\frac{3}{2}x^3 + \frac{3}{2}} = \frac{2(x+1)}{3x+1}.
\]

d. We get

\[
\lim_{x \to \infty} y(x) = \lim_{x \to \infty} \frac{2x + 2}{3x + 1} = \lim_{x \to \infty} \frac{2 + 2/x}{3 + 1/x} = \frac{2}{3}.
\]

4.

a. Separating variables gives

\[
\frac{dy}{2 - 4} = dt, \quad \text{or} \quad \frac{dy}{y-8} = \frac{1}{2} \, dt.
\]

Integrating gives \(\ln |y - 8| = \frac{1}{2}t + C\). Exponentiate both sides to get \(|y - 8| = e^{t/2} + C = C_1 e^{t/2}\). Remove the absolute value sign by replacing \(C_1\) by \(\pm C_1\) to get \(y(t) = (A-8) e^{t/2} + 8\). Note that this is a constant solution if \(A = 8\).

b. For \(A = 2\) we get \(y(t) = 8 - 6e^{t/2}\). Since \(\lim_{t \to \infty} e^{t/2} = \infty\), we have \(\lim_{t \to \infty} y(t) = -\infty\).

c. For \(A = 12\) we get \(y(t) = 4e^{t/2} + 8\). Again \(\lim_{t \to \infty} e^{t/2} = \infty\), so that now \(\lim_{t \to \infty} y(t) = \infty\).

d. \(B = 8\) is the desired value. If \(A > 8\), then the solution \(y(t) = (A-8) e^{t/2} + 8\) has a positive coefficient on the exponential term, so it increases as \(t\) increases, while if \(A < 8\), then the solution has a negative coefficient on the exponential term, so it decreases as \(t\) increases.

5.

a. The two rates of growth are

\[
\left. \frac{dP}{dt} \right|_{P=600} = \frac{1}{2} (1000 - 600) = 200, \quad \left. \frac{dP}{dt} \right|_{P=800} = \frac{1}{2} (1000 - 800) = 100.
\]

So the population is growing faster when \(P = 600\).

b. The slope of the tangent line to \(P(t)\) at \(t = 0\) is

\[
\frac{dP}{dt} = \frac{1}{2} (1000 - P(0)) = \frac{1}{2} (1000 - 500) = 250.
\]

Thus the linear approximation to \(P(t)\) at \(t = 0\) is

\[
P(t) \approx 250(t-0) + P(0) = 250 \, t + 500.
\]

So when \(t = 1\) we approximate the number of rabbits to be \(250 + 500 = 750\).

c. We have

\[
\frac{d^2P}{dt^2} = \frac{d}{dt} \left( \frac{1}{2} (1000 - P) \right) = -\frac{1}{2} \frac{dP}{dt} = -\frac{1}{4} (1000 - P) = \frac{1}{4} P - 250.
\]

At \(t = 0\), with \(P(0) = 500\), this is negative, so the curve is concave down and thus the linear approximation is an overestimate of the actual number of rabbits at \(t = 1\).
d. Separating variables gives
\[ \frac{dP}{P - 1000} = -\frac{1}{2} \, dt, \]
so that
\[ \int \frac{dP}{P - 1000} = \int \left( -\frac{1}{2} \right) \, dt, \quad \text{or} \quad \ln |P - 1000| = -\frac{1}{2} t + C. \]
Exponentiate both sides to get
\[ |P - 1000| = e^{-t/2 + C} = C_1 e^{-t/2}. \]
Replace \( C_1 \) by \( \pm C_1 \) to remove the absolute value sign, giving
\[ P = C_1 e^{-t/2} + 1000. \]
With \( P(0) = 500 \) we get 500 = \( C_1 e^0 + 1000 \) so that \( C_1 = -500 \) and \( P(t) = 1000 - 500e^{-t/2} \). Since \( \lim_{t \to \infty} e^{-t/2} = 0 \), we see that \( \lim_{t \to \infty} P(t) = 1000 \). Thus in the long term, the number of rabbits in the county will level off at 1000.

6.

a. A plot of the slope field together with the two solution curves is below. The upper solution curve corresponds to \( y(0) = \frac{1}{2} \).

b. At \((2,1)\) the slope of the solution curve is \( \left. \frac{dy}{dt} \right|_{(t,y)=(2,1)} = \frac{2}{5} \). Thus the tangent line is \( y - 1 = \frac{2}{5}(t - 2) \), or \( y = \frac{2}{5}t + \frac{1}{5} \).

c. Separate variables to get \( y^{-1} \frac{dy}{dt} = \frac{1}{5} \, dt \). Then integrate to get \( \ln |y| = \frac{1}{10} t^2 + C \), so that
\[ |y| = e^{t^2/10 + C} = C_1 e^{t^2/10}, \quad \text{so that} \quad y = C_1 e^{t^2/10}. \]
With \( y(0) = 1 \) we get 1 = \( C_1 e^0 \) so that \( C_1 = 1 \) and the solution is \( y(t) = e^{t^2/10} \).

d. (i) We have
\[ \frac{d^2y}{dt^2} = \frac{d}{dt} \left( \frac{ty}{5} \right) = \frac{y}{5} + \frac{t}{5} \cdot \frac{dy}{dt} = \frac{5y + t^2y}{25} = \frac{y}{25} t^2 + 5. \]
(ii) If \( y(0) > 0 \), then \( \frac{dy}{dt} = \frac{ty}{5} > 0 \) for all \( t > 0 \) so that \( y(t) \) is increasing for \( t > 0 \). Thus in particular \( y(t) > 0 \) for all \( t > 0 \), so that \( \frac{d^2y}{dt^2} > 0 \) and thus \( y(t) \) is concave up.
(iii) If \( y(0) < 0 \), then \( \frac{dy}{dt} = \frac{ty}{5} < 0 \) for all \( t > 0 \) so that \( y(t) \) is decreasing for \( t > 0 \). Thus in particular \( y(t) < 0 \) for all \( t > 0 \), so that \( \frac{d^2y}{dt^2} < 0 \) and thus \( y(t) \) is concave down.
Chapter 9

Sequences and Infinite Series

9.1 An Overview

9.1.1 A sequence is an ordered list of numbers \(a_1, a_2, a_3, \ldots\), often written \(\{a_1, a_2, \ldots\}\) or \(\{a_n\}\). For example, the natural numbers \(\{1, 2, 3, \ldots\}\) are a sequence where \(a_n = n\) for every \(n\).

9.1.2 \(a_1 = 1; a_2 = \frac{1}{2}; a_3 = \frac{1}{3}; a_4 = \frac{1}{4}; a_5 = \frac{1}{5}\).

9.1.3 \(a_1 = 1\) (given); \(a_2 = 1 \cdot a_1 = 1; a_3 = 2 \cdot a_2 = 2; a_4 = 3 \cdot a_3 = 6; a_5 = 4 \cdot a_4 = 24\).

9.1.4 A finite sum is the sum of a finite number of items, for example the sum of a finite number of terms of a sequence.

9.1.5 An infinite series is an infinite sum of numbers. Thus if \(\{a_n\}\) is a sequence, then \(a_1 + a_2 + \cdots = \sum_{k=1}^{\infty} a_k\) is an infinite series. For example, if \(a_k = \frac{1}{k}\), then \(\sum_{k=1}^{\infty} \frac{1}{k}\) is an infinite series.

9.1.6

\[
\begin{align*}
S_1 &= \sum_{k=1}^{1} k = 1; & S_2 &= \sum_{k=1}^{2} k = 1 + 2 = 3; \\
S_3 &= \sum_{k=1}^{3} k = 1 + 2 + 3 = 6 & S_4 &= \sum_{k=1}^{4} k = 1 + 2 + 3 + 4 = 10.
\end{align*}
\]

9.1.7

\[
\begin{align*}
S_1 &= \sum_{k=1}^{1} k^2 = 1; & S_2 &= \sum_{k=1}^{2} k^2 = 1 + 4 = 5; \\
S_3 &= \sum_{k=1}^{3} k^2 = 1 + 4 + 9 = 14 & S_4 &= \sum_{k=1}^{4} k^2 = 1 + 4 + 9 + 16 = 30.
\end{align*}
\]

9.1.8

\[
\begin{align*}
S_1 &= \sum_{k=1}^{1} \frac{1}{k} = \frac{1}{1} = 1; & S_2 &= \sum_{k=1}^{2} \frac{1}{k} = \frac{1}{1} + \frac{1}{2} = \frac{3}{2}; \\
S_3 &= \sum_{k=1}^{3} \frac{1}{k} = \frac{1}{1} + \frac{1}{2} + \frac{1}{3} = \frac{11}{6}; & S_4 &= \sum_{k=1}^{4} \frac{1}{k} = \frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} = \frac{25}{12}.
\end{align*}
\]

9.1.9 \(a_1 = \frac{1}{10}; a_2 = \frac{1}{100}; a_3 = \frac{1}{1000}; a_4 = \frac{1}{10000}\).
9.1.10 \( a_1 = 3(1) + 1 = 4; \ a_2 = 3(2) + 1 = 7; \ a_3 = 3(3) + 1 = 10; \ a_4 = 3(4) + 1 = 13. \)

9.1.11 \( a_1 = -\frac{1}{2}; \ a_2 = \frac{1}{2^2} = \frac{1}{4}; \ a_3 = -\frac{2}{2^2} = -\frac{1}{8}; \ a_4 = \frac{1}{2^4} = \frac{1}{16}. \)

9.1.12 \( a_1 = 2 - 1 = 1; \ a_2 = 2 + 1 = 3; \ a_3 = 2 - 1 = 1; \ a_4 = 2 + 1 = 3. \)

9.1.13 \( a_1 = \frac{2^2}{2 + 1} = \frac{4}{3}; \ a_2 = \frac{2^3}{2^2 + 1} = \frac{8}{5}; \ a_3 = \frac{2^4}{2^3 + 1} = \frac{16}{9}; \ a_4 = \frac{2^5}{2^4 + 1} = \frac{32}{17}. \)

9.1.14 \( a_1 = 1 + \frac{1}{2} = 2; \ a_2 = 2 + \frac{1}{2} = \frac{5}{2}; \ a_3 = 3 + \frac{1}{3} = \frac{10}{3}; \ a_4 = 4 + \frac{1}{4} = \frac{17}{4}. \)

9.1.15 \( a_1 = 1 + \sin \frac{\pi}{2} = 2; \ a_2 = 1 + \sin \frac{2\pi}{2} = 1 + \sin \pi = 1; \ a_3 = 1 + \sin \frac{3\pi}{2} = 0; \ a_4 = 1 + \sin \frac{4\pi}{2} = 1 + \sin 2\pi = 1. \)

9.1.16 \( a_1 = 2 \cdot 1^2 - 3 \cdot 1 + 1 = 0; \ a_2 = 2 \cdot 2^2 - 3 \cdot 2 + 1 = 3; \ a_3 = 2 \cdot 3^2 - 3 \cdot 3 + 1 = 10; \ a_4 = 2 \cdot 4^2 - 3 \cdot 4 + 1 = 21. \)

9.1.17 \( a_1 = 2; \ a_2 = 2 \cdot 2 = 4; \ a_3 = 2 \cdot 4 = 8; \ a_4 = 2 \cdot 8 = 16. \)

9.1.18 \( a_1 = 32; \ a_2 = \frac{32}{2} = 16; \ a_3 = \frac{16}{2} = 8; \ a_4 = \frac{8}{2} = 4. \)

9.1.19 \( a_1 = 10 \) (given); \( a_2 = 3 \cdot a_1 - 12 = 30 - 12 = 18; \ a_3 = 3 \cdot a_2 - 12 = 54 - 12 = 42; \ a_4 = 3 \cdot a_3 - 12 = 126 - 12 = 114. \)

9.1.20 \( a_1 = 1 \) (given); \( a_2 = a_1^2 - 1 = 0; \ a_3 = a_2^2 - 1 = -1; \ a_4 = a_3^2 - 1 = 0. \)

9.1.21 \( a_1 = 0 \) (given); \( a_2 = 3 \cdot a_1^2 + 1 + 1 = 2; \ a_3 = 3 \cdot a_2^2 + 2 + 1 = 15; \ a_4 = 3 \cdot a_3^2 + 3 + 1 = 679. \)

9.1.22 \( a_0 = 1 \) (given); \( a_1 = 1 \) (given); \( a_2 = a_1 + a_0 = 2; \ a_3 = a_2 + a_1 = 3; \ a_4 = a_3 + a_2 = 5. \)

9.1.23

a. \( \frac{1}{32}, \frac{1}{64}. \)

b. \( a_1 = 1; \ a_{n+1} = 2 \cdot a_n \) for \( n \geq 1. \)

c. \( a_n = \frac{2}{3^n} \) for \( n \geq 1. \)

9.1.24

a. \(-6, 7. \)

b. \( a_1 = 1; \ a_{n+1} = (-1)^n(|a_n| + 1) \) for \( n \geq 1. \)

c. \( a_n = (-1)^{n+1} n \) for \( n \geq 1. \)

9.1.25

a. \(-5, 5. \)

b. \( a_1 = -5, \ a_{n+1} = -a_n \) for \( n \geq 1. \)

c. \( a_n = (-1)^n \cdot 5 \) for \( n \geq 1. \)

9.1.27

a. \( 32, 64. \)

b. \( a_1 = 1; \ a_{n+1} = 2a_n \) for \( n \geq 1. \)

c. \( a_n = 2^{n-1} \) for \( n \geq 1. \)

9.1.29

a. \( 243, 729. \)

b. \( a_1 = 1; \ a_{n+1} = 3a_n \) for \( n \geq 1. \)

c. \( a_n = 3^{n-1} \) for \( n \geq 1. \)

9.1.30

a. \( 2, 1. \)

b. \( a_1 = 64; \ a_{n+1} = \frac{a_n}{4} \) for \( n \geq 1. \)

c. \( a_n = \frac{64}{4^{n+1}} \) for \( n \geq 1. \)

9.1.31 \( a_1 = 9, a_2 = 99, a_3 = 999, a_4 = 9999. \) This sequence diverges, because the terms get larger without bound.
9.1.32 $a_1 = 2$, $a_2 = 17$, $a_3 = 82$, $a_4 = 257$. This sequence diverges, because the terms get larger without bound.

9.1.33 $a_1 = \frac{1}{10}$, $a_2 = \frac{1}{100}$, $a_3 = \frac{1}{1000}$, $a_4 = \frac{1}{10000}$. This sequence converges to zero.

9.1.34 $a_1 = \frac{1}{10}$, $a_2 = \frac{1}{100}$, $a_3 = \frac{1}{1000}$, $a_4 = \frac{1}{10000}$. This sequence converges to zero.

9.1.35 $a_1 = -\frac{1}{2}$, $a_2 = \frac{1}{4}$, $a_3 = -\frac{1}{8}$, $a_4 = \frac{1}{16}$. This sequence converges to 0 because each term is smaller in absolute value than the preceding term and they get arbitrarily close to zero.

9.1.36 $a_1 = 0.9$, $a_2 = 0.99$, $a_3 = 0.999$, $a_4 = 0.9999$. This sequence converges to 1.

9.1.37 $a_1 = 1 + 1 = 2$, $a_2 = 1 + 1 = 2$, $a_3 = 2$, $a_4 = 2$. This constant sequence converges to 2.

9.1.38 $a_1 = 9 + \frac{9}{10} = 9.9$, $a_2 = 9 + \frac{9}{10} = 9.99$, $a_3 = 9 + \frac{9}{10} = 9.999$, $a_4 = 9 + \frac{9}{10} = 9.9999$. This sequence converges to 10.

9.1.39 $a_1 = \frac{50}{11} + 50 \approx 54.545$, $a_2 = \frac{54.545}{11} + 50 \approx 54.959$, $a_3 = \frac{54.959}{11} + 50 \approx 54.996$, $a_4 = \frac{54.996}{11} + 50 \approx 55.000$. This sequence converges to 55.

9.1.40 $a_1 = 0 - 1 = -1$, $a_2 = -10 - 1 = -11$, $a_3 = -110 - 1 = -111$, $a_4 = -1110 - 1 = -1111$. This sequence diverges.

This sequence converges to $\frac{1+\sqrt{5}}{2} \approx 1.618$.

### 9.1.55
a. 20, 10, 5, 2.5.

b. $h_n = 20(0.5)^n$ for $n \geq 0$.

### 9.1.56
a. 10, 9, 8.1, 7.29.

b. $h_n = 10(0.9)^n$ for $n \geq 0$.

### 9.1.57
a. 30, 7.5, 1.875, 0.469.

b. $h_n = 30(0.25)^n$ for $n \geq 0$.

### 9.1.58
a. 20, 15, 11.25, 8.438.

b. $h_n = 20(0.75)^n$ for $n \geq 0$. 
9.1.59 $S_1 = 0.3, \ S_2 = 0.33, \ S_3 = 0.333, \ S_4 = 0.333$. It appears that the infinite series has a value of $0.333\ldots = \frac{1}{3}$.

9.1.60 $S_1 = 0.6, \ S_2 = 0.66, \ S_3 = 0.666, \ S_4 = 0.667$. It appears that the infinite series has a value of $0.666\ldots = \frac{2}{3}$.

9.1.61 $S_1 = 4, \ S_2 = 4.9, \ S_3 = 4.99, \ S_4 = 4.999$. The infinite series has a value of $4.999\ldots = 5$.

9.1.62 $S_1 = 1, \ S_2 = \frac{3}{2}, \ S_3 = \frac{7}{4} = 1.75, \ S_4 = \frac{15}{8} = 1.875$. The infinite series has a value of $2$.

9.1.63
a. $S_1 = \frac{2}{7}, \ S_2 = \frac{4}{7}, \ S_3 = \frac{6}{7}, \ S_4 = \frac{8}{7}$.

b. It appears that $S_n = \frac{2n}{2n+1}$.

c. The series has a value of $1$ (the partial sums converge to $1$).

9.1.64
a. $S_1 = \frac{1}{2}, \ S_2 = \frac{3}{4}, \ S_3 = \frac{7}{8}, \ S_4 = \frac{15}{16}$.

b. $S_n = 1 - \frac{1}{2^n}$.

c. The partial sums converge to $1$, so that is the value of the series.

9.1.65
a. $S_1 = \frac{1}{3}, \ S_2 = \frac{2}{5}, \ S_3 = \frac{3}{7}, \ S_4 = \frac{4}{9}$.

b. $S_n = \frac{n}{2n+1}$.

c. The partial sums converge to $\frac{1}{2}$, which is the value of the series.

9.1.66
a. $S_1 = \frac{2}{3}, \ S_2 = \frac{8}{9}, \ S_3 = \frac{26}{27}, \ S_4 = \frac{80}{81}$.

b. $S_n = 1 - \frac{1}{3^n}$.

c. The partial sums converge to $1$, which is the value of the series.

9.1.67
a. True. For example, $S_2 = 1 + 2 = 3$, and $S_4 = a_1 + a_2 + a_3 + a_4 = 1 + 2 + 3 + 4 = 10$.

b. False. For example, $\frac{1}{2}, \frac{3}{4}, \frac{7}{8}, \ldots$ where $a_n = 1 - \frac{1}{2^n}$ converges to $1$, but each term is greater than the previous one.

c. True. In order for the partial sums to converge, they must get closer and closer together. In order for this to happen, the difference between successive partial sums, which is just the value of $a_n$, must approach zero.

9.1.68 The height at the $n^{th}$ bounce is given by the recurrence $h_n = r \cdot h_{n-1}$; an explicit form for this sequence is $h_n = h_0 \cdot r^n$. The distance traveled by the ball between the $n^{th}$ and $(n+1)^{st}$ bounces is thus $2h_n = 2h_0 \cdot r^n$, so that $S_{n+1} = \sum_{i=0}^{n} 2h_0 \cdot r^i$.

a. Here $h_0 = 20, \ r = 0.5$, so $S_1 = 40, \ S_2 = 40 + 40 \cdot 0.5 = 60, \ S_3 = S_2 + 40 \cdot (0.5)^2 = 70, \ S_4 = S_3 + 40 \cdot (0.5)^3 = 75, \ S_5 = S_4 + 40 \cdot (0.5)^4 = 77.5$.  

Copyright © 2014 Pearson Education, Inc.
The sequence converges to 80.

**9.1.69**

Using the work from the previous problem:

a. Here \( h_0 = 20, r = 0.75 \), so \( S_1 = 40, S_2 = 40 + 40 \cdot 0.75 = 70, S_3 = S_2 + 40 \cdot (0.75)^2 = 92.5, S_4 = S_3 + 40 \cdot (0.75)^3 = 109.375, S_5 = S_4 + 40 \cdot (0.75)^4 \approx 122.031 \)

b. The sequence converges to 160.

**9.1.70**

a. \( s_1 = -1, s_2 = 0, s_3 = -1, s_4 = 0 \).

b. The limit does not exist.

**9.1.71**

a. 0.9, 0.99, 0.999, 0.9999.

b. The limit is 1.

**9.1.72**

a. 1.5, 3.75, 7.125, 12.188.

b. The limit does not exist.

**9.1.73**

a. \( \frac{1}{3}, \frac{4}{5}, \frac{13}{27}, \frac{40}{87} \).

b. The limit is \( \frac{1}{2} \).

**9.1.74**

a. 1, 3, 6, 10.

b. The limit does not exist.

**9.1.75**

a. \(-1, 0, -1, 0.\)

b. The limit does not exist.

**9.1.76**

a. \(-1, 1, -2, 2.\)

b. The limit does not exist.

**9.1.77**

a. \( \frac{3}{10} = 0.3, \frac{33}{100} = 0.33, \frac{333}{1000} = 0.333, \frac{3333}{10000} = 0.3333. \)
b. The limit is \( \frac{1}{3} \).

9.1.78
a. \( p_0 = 250, \quad p_1 = 250 \cdot 1.03 = 258, \quad p_2 = 250 \cdot 1.03^2 = 265, \quad p_3 = 250 \cdot 1.03^3 = 273, \quad p_4 = 250 \cdot 1.03^4 = 281. \)

b. The initial population is 250, so that \( p_0 = 250 \). Then \( p_n = 250 \cdot (1.03)^n \), because the population increases by 3 percent each month.

c. \( p_{n+1} = p_n \cdot 1.03 \).

d. The population increases without bound.

9.1.79
a. \( M_0 = 20, \quad M_1 = 20 \cdot 0.5 = 10, \quad M_2 = 20 \cdot 0.5^2 = 5, \quad M_3 = 20 \cdot 0.5^3 = 2.5, \quad M_4 = 20 \cdot 0.5^4 = 1.25 \).

b. \( M_n = 20 \cdot 0.5^n \) for \( n \geq 0 \).

c. The initial mass is \( M_0 = 20 \). We are given that 50% of the mass is gone after each decade, so that \( M_{n+1} = 0.5 \cdot M_n, \quad n \geq 0 \).

d. The amount of material goes to 0.

9.1.80
a. \( c_0 = 100, \quad c_1 = 103, \quad c_2 = 106.09, \quad c_3 = 109.27, \quad c_4 = 112.55 \).

b. \( c_n = 100(1.03)^n \) for \( n \geq 0 \).

c. We are given that \( c_0 = 100 \) (where year 0 is 1984); because it increases by 3% per year, \( c_{n+1} = 1.03 \cdot c_n \).

d. The sequence diverges.

9.1.81
a. \( d_0 = 200, \quad d_1 = 200 \cdot 0.95 = 190, \quad d_2 = 200 \cdot 0.95^2 = 180.5, \quad d_3 = 200 \cdot 0.95^3 = 171.475, \quad d_4 = 200 \cdot 0.95^4 \approx 162.901 \).

b. \( d_n = 200 \cdot 0.95^n, \quad n \geq 0 \).

c. We are given \( d_0 = 200 \); because 5% of the drug is washed out every hour, that means that 95% of the preceding amount is left every hour, so that \( d_{n+1} = 0.95 \cdot d_n \).

d. The sequence converges to 0.

9.1.82
a. Using the recurrence \( a_{n+1} = \frac{1}{2} \left( a_n + \frac{10}{a_n} \right) \), we build a table:

<table>
<thead>
<tr>
<th>( n )</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>( a_n )</td>
<td>10</td>
<td>5.5</td>
<td>3.659090909</td>
<td>3.196005081</td>
<td>3.162455622</td>
<td>3.162277665</td>
</tr>
</tbody>
</table>

The true value is \( \sqrt{10} \approx 3.162277660 \), so the sequence converges with an error of less than 0.01 after only 4 iterations, and is within 0.0001 after only 5 iterations.
b. The recurrence is now \( a_{n+1} = \frac{1}{2} \left( a_n + \frac{c}{a_n} \right) \). A table of \( \sqrt{n} \) together with the approximations, all to two decimal places, is

<table>
<thead>
<tr>
<th>( c )</th>

<td>3.162</td>
<td>3.162</td>
</tr>
</tbody>
</table>

For \( c = 2 \) the sequence converges to within 0.01 after two iterations. For \( c = 3, 4, 5, 6, \) and \( 7 \) the sequence converges to within 0.01 after three iterations. For \( c = 8, 9, \) and \( 10 \) it requires four iterations.

## 9.2 Sequences

### 9.2.1 There are many examples; one is \( a_n = \frac{1}{n} \). This sequence is nonincreasing (in fact, it is decreasing) and has a limit of 0.

### 9.2.2 Again there are many examples; one is \( a_n = \ln n \). It is increasing, and has no limit.

### 9.2.3 There are many examples; one is \( a_n = \frac{1}{n} \). This sequence is nonincreasing (in fact, it is decreasing), is bounded above by 1 and below by 0, and has a limit of 0.

### 9.2.4 For example, \( a_n = (-1)^n \). \( |a_n| \leq 1 \), so it is bounded, but the odd terms are all equal to \(-1\) while the even terms are all equal to 1. Thus the sequence does not have a limit.

### 9.2.5 \( \{r^n\} \) converges for \(-1 < r \leq 1\). It diverges for all other values of \( r \) (see Theorem 9.3).

### 9.2.6 By Theorem 9.1, if we can find a function \( f(x) \) such that \( f(n) = a_n \) for all positive integers \( n \), then if \( \lim_{x \to \infty} f(x) \) exists and is equal to \( L \), we then have \( \lim_{n \to \infty} a_n \) exists and is also equal to \( L \). This means that we can apply function-oriented limit methods such as L'Hôpital's rule to determine limits of sequences.

### 9.2.7 By Theorem 9.6, since \( \{n^p\} \ll \{b^n\} \) for \( p > 0 \) and \( b > 1 \), we see that \( \left( \frac{n}{100} \right)^{100} \ll \{e^{n/100}\} \). This means that

\[
\lim_{n \to \infty} \frac{(n/100)^{100}}{e^{n/100}} = 0.
\]

But \( \left( \frac{n}{100} \right)^{100} = \frac{n^{100}}{100^{100}} \), so that

\[
\lim_{n \to \infty} \frac{(n/100)^{100}}{e^{n/100}} = \lim_{n \to \infty} \left( \frac{1}{100^{100}} \cdot \frac{n^{100}}{e^{n/100}} \right) = \frac{1}{100^{100}} \lim_{n \to \infty} \frac{n^{100}}{e^{n/100}}.
\]

Since the limit on the left is zero, so is the limit on the right, so that \( n^{100} \ll e^{n/100} \).

### 9.2.8 The limit of a sequence involves only the behavior of the \( n^{th} \) term of a sequence as \( n \) gets large (see the Definition of Limit of a Sequence). Thus suppose \( a_n, b_n \) differ in only finitely many terms, so that there is some \( N \) such that \( a_n = b_n \) for \( n > N \). Then as \( n \) gets large, \( a_n \) and \( b_n \) are the same, so the behavior of the two sequences is identical for large \( n \), so that they have the same limit.
9.2.9 Divide numerator and denominator by \( n^4 \) to get \( \lim_{n \to \infty} \frac{1}{1 + \frac{1}{n^8}} = 0 \).

9.2.10 Divide numerator and denominator by \( n^{12} \) to get \( \lim_{n \to \infty} \frac{1}{3 + \frac{1}{n^{12}}} = \frac{1}{3} \).

9.2.11 Divide numerator and denominator by \( n^3 \) to get \( \lim_{n \to \infty} \frac{\frac{3}{2} - n^{-3}}{2 + n^{-3}} = \frac{3}{2} \).

9.2.12 Divide numerator and denominator by \( e^n \) to get \( \lim_{n \to \infty} \frac{2 + (1/e^n)}{1} = 2 \).

9.2.13 Divide numerator and denominator by \( n^3 \) to get \( \lim_{n \to \infty} \frac{3 + (1/3^{n-1})}{1} = 3 \).

9.2.14 Divide numerator by \( k \) and denominator by \( k = \sqrt{k^2} \) to get \( \lim_{k \to \infty} \sqrt{n} \frac{1}{\sqrt{n} + (1/k^2)} = \frac{1}{\sqrt{n}} \).

9.2.15 \( \lim_{n \to \infty} \tan^{-1} n = \frac{\pi}{2} \).

9.2.16 Multiply by \( 1 = \frac{\sqrt{n^2 + 1} + n}{\sqrt{n^2 + 1} + n} \) to get

\[
\lim_{n \to \infty} \left( \sqrt{n^2 + 1} - n \right) = \lim_{n \to \infty} \frac{(\sqrt{n^2 + 1} - n)(\sqrt{n^2 + 1} + n)}{\sqrt{n^2 + 1} + n} = \lim_{n \to \infty} \frac{1}{\sqrt{n^2 + 1} + n} = 0.
\]

9.2.17 Because \( \lim_{n \to \infty} \tan^{-1} n = \frac{\pi}{2} \), \( \lim_{n \to \infty} \frac{\tan^{-1} n}{n} = 0 \).

9.2.18 Let \( y = n^{2/n} \). Then \( \ln y = \frac{2 \ln n}{n} \). By L'Hôpital's rule we have \( \lim_{x \to \infty} \frac{2 \ln x}{x} = \lim_{x \to \infty} \frac{2}{x} = 0 \), so \( \lim_{n \to \infty} n^{2/n} = e^0 = 1 \).

9.2.19 Find the limit of the logarithm of the expression, which is \( n \ln \left( 1 + \frac{2}{n} \right) \). Using L'Hôpital's rule:

\[
\lim_{n \to \infty} n \ln \left( 1 + \frac{2}{n} \right) = \lim_{n \to \infty} \frac{\ln \left( 1 + \frac{2}{n} \right)}{1/n} = \lim_{n \to \infty} \frac{-2/n^2}{-1/n^2} = \lim_{n \to \infty} \frac{2}{1+(2/n)} = 2.
\]

Thus the limit of the original expression is \( e^2 \).

9.2.20 Take the logarithm of the expression and use L'Hôpital's rule:

\[
\lim_{n \to \infty} n \ln \left( \frac{n}{n+5} \right) = \lim_{n \to \infty} \frac{\ln \left( \frac{n}{n+5} \right)}{1/n} = \lim_{n \to \infty} \frac{-5/\left( n+5 \right)}{-1/n^2} = \lim_{n \to \infty} \left( -\frac{5n^2}{n(n+5)^2} \right) = \lim_{n \to \infty} \left( -\frac{5n}{n+5} \right) = -5.
\]

Thus, the original limit is \( e^{-5} \).

9.2.21 Take the logarithm of the expression and use L'Hôpital's rule:

\[
\lim_{n \to \infty} \frac{n}{2} \ln \left( 1 + \frac{1}{2n} \right) = \lim_{n \to \infty} \frac{\ln \left( 1 + \frac{1}{2n} \right)}{1/(n+2)} = \lim_{n \to \infty} \frac{\ln \left( 1 + \frac{1}{2n} \right)}{-2/n^2} = \lim_{n \to \infty} \frac{1}{2/n^2} = \frac{1}{4}.
\]

Thus the original limit is \( e^{1/4} \).

9.2.22 Find the limit of the logarithm of the expression, which is \( 3n \ln \left( 1 + \frac{4}{n} \right) \). Using L'Hôpital's rule:

\[
\lim_{n \to \infty} 3n \ln \left( 1 + \frac{4}{n} \right) = \lim_{n \to \infty} \frac{3n \ln \left( 1 + \frac{4}{n} \right)}{1/n} = \lim_{n \to \infty} \frac{-12/n^2}{-1/n^2} = \lim_{n \to \infty} \frac{12}{1+4/n} = 12.
\]

Thus the limit of the original expression is \( e^{12} \).

9.2.23 Using L'Hôpital's rule:

\[
\lim_{n \to \infty} \frac{n^2}{e^{n} + 3n} = \lim_{n \to \infty} \frac{1}{e^{n} + 3} = 0.
\]

9.2.24 Because \( \ln \frac{1}{n} = -\ln n \), the limit is \( \lim_{n \to \infty} \frac{-\ln n}{n} = -\lim_{n \to \infty} \frac{\ln n}{n} \). But then by L'Hôpital's rule, we have

\[ -\lim_{n \to \infty} \frac{\ln n}{n} = -\lim_{n \to \infty} \frac{1}{n} = 0. \]
9.2.25 Taking logs, we have
\[
\lim_{n \to \infty} \frac{1}{n} \ln \frac{1}{n} = \lim_{n \to \infty} \left( -\frac{\ln n}{n} \right) = \lim_{n \to \infty} \left( -\frac{1}{n} \right) = 0
\]
by L'Hôpital's rule. Thus the original sequence has limit \( e^0 = 1 \).

9.2.26 Find the limit of the logarithm of the expression, which is \( n \ln (1 - \frac{4}{n}) \), using L'Hôpital's rule:
\[
\lim_{n \to \infty} n \ln (1 - \frac{4}{n}) = \lim_{n \to \infty} \frac{n \ln(1 - \frac{4}{n})}{1/n} = \lim_{n \to \infty} \frac{-4}{1-n/4(n^2)} = \lim_{n \to \infty} \frac{-4}{1-\frac{4}{n}} = -4.
\]
Thus the limit of the original expression is \( e^{-4} \).

9.2.27 Except for a finite number of terms, this sequence is just \( a_n = ne^{-n} \), so it has the same limit as this sequence. Note that \( \lim_{n \to \infty} \frac{a_n}{e^n} = \lim_{n \to \infty} \frac{1}{e^n} = 0 \), by L'Hôpital's rule.

9.2.28 \( \ln(n^3 + 1) - \ln(3n^3 + 10n) = \ln \left( \frac{n^3 + 1}{3n^3 + 10n} \right) = \ln \left( \frac{1+n^{-3}}{3+10n^{-2}} \right) \), so the limit is \( \ln \frac{1}{3} = -\ln 3 \).

9.2.29 \( \ln \left( \frac{1}{n} \right) + \ln n = \ln \left( n \sin \frac{1}{n} \right) = \ln \left( \frac{\sin(1/n)}{1/n} \right) \). As \( n \to \infty \), \( \frac{\sin(1/n)}{1/n} \to 1 \), so the limit of the original sequence is \( \ln 1 = 0 \).

9.2.30 Using L'Hôpital's rule:
\[
\lim_{n \to \infty} \left( 1 - \cos \frac{1}{n} \right) = \lim_{n \to \infty} \frac{1 - \cos(1/n)}{1/n} = \lim_{n \to \infty} -\frac{\sin(1/n)(-1/n^2)}{-1/n^2} = -\sin 0 = 0.
\]

9.2.31 \( \lim_{n \to \infty} n \sin \frac{6}{n} = \lim_{n \to \infty} \frac{\sin(6/n)}{1/n} = \lim_{n \to \infty} -\frac{6 \cos(6/n)}{-1/n^2} = \lim_{n \to \infty} 6 \cos \frac{6}{n} = 6 \cos 0 = 6 \).

9.2.32 Because \( -\frac{1}{n} \leq (-1)^n \leq \frac{1}{n} \), and because both \( -\frac{1}{n} \) and \( \frac{1}{n} \) have limit 0 as \( n \to \infty \), the limit of the given sequence is also 0 by the Squeeze Theorem.

9.2.33 The terms with odd-numbered subscripts have the form \( -\frac{n}{n+1} \), so they approach -1, while the terms with even-numbered subscripts have the form \( \frac{n}{n+1} \) so they approach 1. Thus, the sequence has no limit.

9.2.34 Because \( -\frac{n^2}{2n^2+n} \leq (-1)^{n+1} \frac{n^2}{2n^2+n} \leq -\frac{n^2}{2n^2+n} \), and because both \( -\frac{n^2}{2n^2+n} \) and \( \frac{n^2}{2n^2+n} \) have limit 0 as \( n \to \infty \), the limit of the given sequence is also 0 by the Squeeze Theorem. Note that \( \lim_{n \to \infty} \frac{n^2}{2n^2+n} = \lim_{n \to \infty} \frac{1/n}{2+1/n^2} = \frac{1}{2} = 0 \).

9.2.35

When \( n \) is an integer, \( \sin \left( \frac{n\pi}{2} \right) \) oscillates between the values \( \pm 1 \) and 0, so this sequence does not converge.

9.2.36

The even terms form a sequence \( b_{2n} = \frac{2n}{2n+1} \), which converges to 1 (e.g. by L'Hôpital's rule); the odd terms form the sequence \( b_{2n+1} = -\frac{n}{n+1} \), which converges to -1. Thus the sequence as a whole does not converge.

Copyright © 2014 Pearson Education, Inc.
9.2.37

The numerator is bounded in absolute value by 1, while the denominator goes to $\infty$, so the limit of this sequence is 0.

9.2.38

The reciprocal of this sequence is $b_n = \frac{1}{a_n} = 1 + \left(\frac{3}{4}\right)^n$, which increases without bound as $n \to \infty$. Thus $a_n$ converges to zero.

9.2.39

$$\lim_{n \to \infty} \left(1 + \cos \frac{1}{n}\right) = 1 + \cos 0 = 2.$$ 

9.2.40

By L'Hôpital's rule we have: 

$$\lim_{n \to \infty} \frac{e^{-n}}{2 \sin(e^{-n})} = \lim_{n \to \infty} \frac{-e^{-n}}{2 \cos(e^{-n})(-e^{-n})} = \frac{1}{2} \cos 0 = \frac{1}{2}.$$
9.2.41

This is the sequence \( \frac{\cos n}{n^e} \); the numerator is bounded in absolute value by 1 and the denominator increases without bound, so the limit is zero.

9.2.42

Using L'Hôpital's rule, we have \( \lim_{n \to \infty} \frac{\ln n}{n^{1/n}} = \lim_{n \to \infty} \frac{1/n}{1.1n^{-1}} = 0 \).

9.2.43

Ignoring the factor of \((-1)^n\) for the moment, we see, taking logs, that \( \lim_{n \to \infty} \frac{\ln n}{n} = 0 \), so that \( \lim_{n \to \infty} \sqrt[3]{n} = e^0 = 1 \). Taking the sign into account, the odd terms converge to \(-1\) while the even terms converge to 1. Thus the sequence does not converge.

9.2.44

\( \lim_{n \to \infty} \frac{n\pi}{2n+2} = \frac{\pi}{2} \), using L'Hôpital's rule. Thus the sequence converges to \( \cot \frac{\pi}{2} = 0 \).

9.2.45 Because \(0.2 < 1\), this sequence converges to 0. Because \(0.2 > 0\), the convergence is monotone.

9.2.46 Because \(1.2 > 1\), this sequence diverges monotonically to \(\infty\).

9.2.47 Because \(|-0.7| < 1\), the sequence converges to 0; because \(-0.7 < 0\), it does not do so monotonically. The sequence converges by oscillation.

9.2.48 Because \(|-1.01| > 1\), the sequence diverges; because \(-1.01 < 0\), the divergence is not monotone.

9.2.49 Because \(1.00001 > 1\), the sequence diverges; because \(1.00001 > 0\), the divergence is monotone.
9.2.50 This is the sequence
\[ \frac{2^n + 1}{3^n} = 2 \cdot \left( \frac{2}{3} \right)^n; \]
because 0 < \frac{2}{3} < 1, the sequence converges monotonically to zero.

9.2.51 Because |−2.5| > 1, the sequence diverges; because −2.5 < 0, the divergence is not monotone. The sequence diverges by oscillation.

9.2.52 |−0.003| < 1, so the sequence converges to zero; because −0.003 < 0, the convergence is not monotone.

9.2.53 Because −1 ≤ cos n ≤ 1, we have −\frac{1}{n} ≤ \frac{\cos n}{n} ≤ \frac{1}{n}. Because both −\frac{1}{n} and \frac{1}{n} have limit 0 as n → ∞, the given sequence does as well.

9.2.54 Because −1 ≤ sin 6n ≤ 1, we have −\frac{1}{n^3} ≤ \frac{\sin 6n}{n^3} ≤ \frac{1}{n^3}. Because both −\frac{1}{n^3} and \frac{1}{n^3} have limit 0 as n → ∞, the given sequence converges as well.

9.2.55 Because −1 ≤ \sin n ≤ 1 for all n, the given sequence satisfies −\frac{1}{\sqrt{n}} ≤ \frac{\sin n}{\sqrt{n}} ≤ \frac{1}{\sqrt{n}}, and because both ±\frac{1}{\sqrt{n}} → 0 as n → ∞, the given sequence converges to zero as well by the Squeeze Theorem.

9.2.56 Because −1 ≤ \cos(n\pi/2) ≤ 1 for all n, we have −\frac{1}{n} ≤ \frac{\cos(n\pi/2)}{n} ≤ \frac{1}{n} and because both ±\frac{1}{\sqrt{n}} → 0 as n → ∞, the given sequence converges to 0 as well by the Squeeze Theorem.

9.2.57 \tan^{-1} takes values between −\frac{\pi}{2} and \frac{\pi}{2}, so the numerator is always between −\pi and \pi. Thus −\frac{\pi}{n^3 + 4} ≤ \frac{2\tan^{-1} n}{n^3 + 4} ≤ \frac{\pi}{n^3 + 4}, and by the Squeeze Theorem, the given sequence converges to zero.

9.2.58 This sequence diverges. To see this, call the given sequence a_n, and assume it converges to limit L. Then because the sequence b_n = \frac{n}{n + 1} converges to 1, the sequence c_n = \frac{\sin n}{n^{3/2}} would converge to L as well. But for n = 1, 5, 9, 13, . . . , we have c_n = 1, while c_n = −1 for n = 3, 7, 11, 15, . . . . Thus c_n does not converge, so that a_n does not either.

9.2.59
a. After the n^{th} dose is given, the amount of drug in the bloodstream is d_n = 0.5 \cdot d_{n−1} + 80, because the half-life is one day. The initial condition is d_1 = 80.

b. The limit of this sequence is 160 mg.

c. Let L = \lim_{n→∞} d_n. Then from the recurrence relation, we have d_n = 0.5 \cdot d_{n−1} + 80, and thus \lim_{n→∞} d_n = 0.5 \cdot \lim_{n→∞} d_{n−1} + 80, so L = 0.5 \cdot L + 80, and therefore L = 160.

9.2.60
a. 
\begin{align*}
B_0 &= $20,000 \\
B_1 &= 1.005 \cdot B_0 - $200 = $19,900 \\
B_2 &= 1.005 \cdot B_1 - $200 = $19,799.50 \\
B_3 &= 1.005 \cdot B_2 - $200 = $19,698.50 \\
B_4 &= 1.005 \cdot B_3 - $200 = $19,596.99 \\
B_5 &= 1.005 \cdot B_4 - $200 = $19,494.97
\end{align*}

b. B_n = 1.005 \cdot B_{n−1} - $200 for n ≥ 1.

c. Using a calculator or computer program, B_n becomes negative after the 139^{th} payment, so 139 months or almost 11 years.
9.2.61

a. 

\[ B_0 = 0 \]
\[ B_1 = 1.0075 \cdot B_0 + \$100 = \$100 \]
\[ B_2 = 1.0075 \cdot B_1 + \$100 = \$200.75 \]
\[ B_3 = 1.0075 \cdot B_2 + \$100 = \$302.26 \]
\[ B_4 = 1.0075 \cdot B_3 + \$100 = \$404.52 \]
\[ B_5 = 1.0075 \cdot B_4 + \$100 = \$507.56 \]

b. \( B_n = 1.0075 \cdot B_{n-1} + \$100 \) for \( n \geq 1 \).

c. Using a calculator or computer program, \( B_n > \$5,000 \) during the 43rd month.

9.2.62

a. Let \( D_n \) be the total number of liters of alcohol in the mixture after the \( n^{th} \) replacement. At the next step, 2 liters of the 100 liters is removed, thus leaving \( 0.98 \cdot D_n \) liters of alcohol, and then \( 0.1 \cdot 2 = 0.2 \) liters of alcohol are added. Thus \( D_n = 0.98 \cdot D_{n-1} + 0.2 \). Now, \( C_n = D_n / 100 \), so we obtain a recurrence relation for \( C_n \) by dividing this equation by 100: \( C_n = 0.98 \cdot C_{n-1} + 0.002 \).

\[ C_0 = 0.4 \]
\[ C_1 = 0.98 \cdot 0.4 + 0.002 = 0.394 \]
\[ C_2 = 0.98 \cdot C_1 + 0.002 = 0.38812 \]
\[ C_3 = 0.98 \cdot C_2 + 0.002 = 0.38236 \]
\[ C_4 = 0.98 \cdot C_3 + 0.002 = 0.37671 \]
\[ C_5 = 0.98 \cdot C_4 + 0.002 = 0.37118 \]

The rounding is done to five decimal places.

b. Using a calculator or a computer program, \( C_n < 0.15 \) after the 89th replacement.

c. If the limit of \( C_n \) is \( L \), then taking the limit of both sides of the recurrence equation yields \( L = 0.98L + 0.002 \), so \( 0.02L = 0.002 \), and \( L = 0.1 = 10\% \).

9.2.63

Because \( n! \ll n^n \) by Theorem 9.6, we have \( \lim_{n \to \infty} \frac{n!}{n^n} = 0 \).

9.2.64

\( \{3^n\} \ll \{n!\} \) because \( \{b^n\} \ll \{n!\} \) in Theorem 9.6. Thus, \( \lim_{n \to \infty} \frac{3^n}{n!} = 0 \).

9.2.65

Theorem 9.6 indicates that \( \ln^q n \ll n^p \), so \( \ln^{20} n \ll n^{10} \), so \( \lim_{n \to \infty} \frac{n^{10}}{\ln^{20} n} = \infty \).

9.2.66

Theorem 9.6 indicates that \( \ln^q n \ll n^p \), so \( \ln^{1000} n \ll n^{10} \), so \( \lim_{n \to \infty} \frac{n^{10}}{\ln^{1000} n} = \infty \).

9.2.67

By Theorem 9.6, \( n^p \ll b^n \), so \( n^{1000} \ll 2^n \), and thus \( \lim_{n \to \infty} \frac{n^{1000}}{2^n} = 0 \).

9.2.68

Note that \( e^{1/10} = \sqrt[10]{e} \approx 1.1 \). Let \( r = \frac{e^{1/10}}{2} \) and note that \( 0 < r < 1 \). Thus \( \lim_{n \to \infty} \frac{e^{n/10}}{2^n} = \lim_{n \to \infty} r^n = 0 \).

9.2.69

b. False. For example, if \( a_n = \frac{1}{n} \) and \( b_n = e^n \), then \( \lim_{n \to \infty} a_n b_n = \infty \).

Copyright © 2014 Pearson Education, Inc.
c. True. The limit of a sequence involves only the behavior of the \(n\)th term of a sequence as \(n\) gets large (see the Definition of Limit of a Sequence). So if \(a_n, b_n\) differ in only the first 100 terms, then for \(n > 100\), \(a_n\) and \(b_n\) are the same, so the behavior of the two sequences is identical for large \(n\), so that they have the same limit.

d. True. Note that \(a_n\) converges to zero. Intuitively, the nonzero terms of \(b_n\) are those of \(a_n\), which converge to zero. Thus as \(n\) gets large, the terms of \(b_n\) get arbitrarily close to zero (since they are either zero or members of a sequence that converges to zero). Thus \(\lim_{n \to \infty} b_n = \lim_{n \to \infty} a_n = 0\).

e. False. If \(\{a_n\}\) happens to converge to zero, the statement is true. But consider for example \(a_n = 2 + \frac{1}{n}\). Then \(\lim_{n \to \infty} a_n = 2\), but \((-1)^n a_n\) does not converge (it oscillates between positive and negative values increasingly close to \(\pm 2\)).

f. True. Suppose \(\{0.000001a_n\}\) converged to \(L\). Then the terms \(0.000001a_n\) are arbitrarily close to \(L\) for \(n\) large, so that the terms \(a_n\) are arbitrarily close to \(\frac{1}{0.000001}L = 10^6L\). But this means that \(a_n\) converges to \(10^6L\).

9.2.70 \(\{2n - 3\}_{n=3}^{\infty}\).

9.2.71 \(\{(n - 2)^2 + 6(n - 2) - 9\}_{n=3}^{\infty} = \{n^2 + 2n - 17\}_{n=3}^{\infty}\).

9.2.72 If \(f(t) = \int_1^t x^{-2}dx\), then \(\lim_{t \to \infty} f(t) = \lim_{n \to \infty} a_n\). But

\[
\lim_{t \to \infty} f(t) = \int_1^\infty x^{-2}dx = \lim_{b \to \infty} \left(-\frac{1}{x}\right)_{1}^{b} = \lim_{b \to \infty} \left(-\frac{1}{b} + 1\right) = 1.
\]

9.2.73 Evaluate the limit of each term separately: \(\lim_{n \to \infty} \frac{5^n - 1}{9^n} = \frac{1}{99} \lim_{n \to \infty} \left(\frac{5}{9}\right)^{n-1} = 0\), while \(-\frac{5^n}{8^n} \leq \frac{5^n \sin n}{8^n} \leq \frac{5^n}{8^n}\), so by the Squeeze Theorem, this second term converges to 0 as well. Thus the sum of the terms converges to zero.

9.2.74 Because \(\lim_{n \to \infty} \frac{10n}{10n+1} = 1\), and because the inverse tangent function is continuous, the given sequence has limit \(\tan^{-1} 1 = \frac{\pi}{4}\).

9.2.75 Because \(\lim_{n \to \infty} 0.99^n = 0\), and because cosine is continuous, the first term converges to \(\cos 0 = 1\). The limit of the second term is \(\lim_{n \to \infty} \frac{2^n + 9^n}{6^n} = \lim_{n \to \infty} \left(\frac{2}{6}\right)^n + \lim_{n \to \infty} \left(\frac{9}{6}\right)^n = 0\). Thus the sum converges to 1.

9.2.76 Dividing the numerator and denominator by \(n!\) gives \(a_n = \frac{(4^n/n!)+5}{1+2^n/n!}\). By Theorem 9.6, we have \(4^n \ll n!\) and \(2^n \ll n!\). Thus \(\lim_{n \to \infty} a_n = \frac{0+5}{1+0} = 5\).

9.2.77 Dividing the numerator and denominator by \(6^n\) gives \(a_n = \frac{1+(1/2)^n}{1+(2^n/n!)}.\) By Theorem 9.6 \(n^{100} \ll 6^n\). Thus \(\lim_{n \to \infty} a_n = \frac{1+0}{1+0} = 1\).

9.2.78 Dividing the numerator and denominator by \(n^8\) gives \(a_n = \frac{1+(1/n)}{(1/n)^8+\ln n}\). Because \(1 + \frac{1}{n} \to 1\) as \(n \to \infty\) and \(\frac{1}{n} + \ln n \to \infty\) as \(n \to \infty\), we have \(\lim_{n \to \infty} a_n = 0\).

9.2.79 We can write \(a_n = \frac{(7/5)^n}{n^n}\). Theorem 9.6 indicates that \(n^7 \ll b^n\) for \(b > 1\), so \(\lim_{n \to \infty} a_n = \infty\).

9.2.80 Computing the first few terms of the sequence gives

So a reasonable conjecture is that \( a_n = \frac{2^{n+1}}{2^n + 1} \). To see that this is correct, use induction. Clearly the relation holds for \( n = 0 \); assume it holds for \( n = k \). Then

\[
a_{k+1} = \frac{2a_k}{a_k + 1} = \frac{2 \cdot \frac{2^{k+1}}{2^k + 1}}{\frac{2^{k+1}}{2^k + 1} + 1} = \frac{2^{k+2}}{2^{k+1} + 1} \cdot \frac{2^{k+1} + 1}{2^{k+1} + 1 - 1} = \frac{2^{k+2}}{2^{k+2} - 1},
\]

so that it holds for \( n = k + 1 \) as well. Thus this is in fact the explicit formula.

9.2.81 A graph shows that the sequence appears to converge. Let its supposed limit be \( L \), then \( \lim_{n \to \infty} a_{n+1} = \lim_{n \to \infty} (2a_n(1 - a_n)) = 2( \lim_{n \to \infty} a_n)(1 - \lim_{n \to \infty} a_n) \), so \( L = 2L(1 - L) = 2L - 2L^2 \), and thus \( 2L^2 - L = 0 \), so \( L = 0, \frac{1}{2} \). Thus the limit is either 0 or \( \frac{1}{2} \); with the given initial condition, doing a few iterations by hand confirms that the sequence converges to \( \frac{1}{2} \): \( a_0 = 0.3; a_1 = 2 \cdot 0.3 \cdot 0.7 = 0.42; a_2 = 2 \cdot 0.42 \cdot 0.58 = 0.4872 \).

9.2.82 A graph shows that the sequence appears to converge, and to a value other than zero; let its limit be \( L \). Then \( \lim_{n \to \infty} a_{n+1} = \lim_{n \to \infty} \frac{1}{2}(a_n + \frac{2}{a_n}) = \frac{1}{2} \lim_{n \to \infty} a_n + \frac{1}{\lim_{n \to \infty} a_n} \), so \( L = \frac{1}{2}L + \frac{1}{L} \), and therefore \( L^2 = \frac{1}{2}L^2 + 1 \). So \( L^2 = 2 \), and thus \( L = \sqrt{2} \) since the terms are all positive.

9.2.83 Computing three terms gives \( a_0 = 0.5, a_1 = 4 \cdot 0.5 \cdot 0.5 = 1, a_2 = 4 \cdot 1 \cdot (1 - 1) = 0 \). All successive terms are obviously zero, so the sequence converges to 0.

9.2.84 A graph shows that the sequence appears to converge. Let its limit be \( L \). Then \( \lim_{n \to \infty} a_{n+1} = \sqrt{2 + \lim_{n \to \infty} a_n} \), so \( L = \sqrt{2 + L} \). Thus we have \( L^2 = 2 + L \), so \( L^2 - L - 2 = 0 \), and thus \( L = -1, 2 \). A square root can never be negative, so this sequence must converge to 2.

9.2.85 For \( b = 2, 2^b > 3! \) but 16 = 24 < 4! = 24, so the crossover point is \( n = 4 \). For \( e, e^5 \approx 148.41 > 5! = 120 \) while \( e^6 \approx 403.4 < 6! = 720 \), so the crossover point is \( n = 6 \). For 10, 24! \approx 6.2 \times 10^{23} < 10^{24}, \) while 25! \approx 1.55 \times 10^{25} > 10^{25}, so the crossover point is \( n = 25 \).

9.2.86

a. Rounded to the nearest fish, the populations are:

\[
\begin{align*}
F_0 &= 4000 \\
F_1 &= 1.015F_0 - 80 = 3980 \\
F_2 &= 1.015F_1 - 80 \approx 3960 \\
F_3 &= 1.015F_2 - 80 \approx 3939 \\
F_4 &= 1.015F_3 - 80 \approx 3918 \\
F_5 &= 1.015F_4 - 80 \approx 3897
\end{align*}
\]

b. \( F_n = 1.015F_{n-1} - 80 \) for \( n \geq 1 \).

c. The population decreases and eventually reaches zero.

d. With an initial population of 5500 fish, the population increases without bound.

e. If the initial population is less than 5333 fish, the population will decline to zero. This is essentially because for a population of less than 5333, the natural increase of 1.5% does not make up for the loss of 80 fish.

9.2.87

a. The profits for each of the first ten days, in dollars are:

<table>
<thead>

<td>133.15</td>
<td>133.00</td>
</tr>
</tbody>
</table>

Copyright © 2014 Pearson Education, Inc.
b. The profit on an item is revenue minus cost. The total cost of keeping the hippo for \( n \) days is 0.45\( n \), and the revenue for selling the hippo on the \( n \)th day is \((200 + 5n) \cdot (0.65 - 0.01n)\), because the hippo gains 5 pounds per day but is worth a penny less per pound each day. Thus the total profit on the \( n \)th day is \( h_n = (200 + 5n) \cdot (0.65 - 0.01n) - 0.45n = 130 + 0.8n - 0.05n^2 \). The maximum profit occurs when \(-0.1n + 0.8 = 0\), which occurs when \( n = 8 \). The maximum profit is achieved by selling the hippo on the 8th day.

9.2.88

a. \( x_0 = 7, \ x_1 = 6, \ x_2 = 6.5 = \frac{13}{2}, \ x_3 = 6.25 = \frac{25}{4}, \ x_4 = 6.375 = \frac{51}{8}, \ x_5 = 6.3125 = \frac{101}{16}, \ x_6 = 6.34375 = \frac{203}{32} \).

b. For the formula given in the problem, we have \( x_0 = \frac{19}{4} + 2 \cdot \left(-\frac{1}{2}\right)^0 = 7, \ x_1 = \frac{19}{4} + 2 \cdot \left(-\frac{1}{2}\right) = \frac{19}{4} - \frac{1}{2} = 6 \), so that the formula holds for \( n = 0, 1 \). Now assume the formula holds for all integers \( \leq k \); then

\[
x_{k+1} = \frac{1}{2}(x_k + x_{k-1}) = \frac{1}{2} \left( \frac{19}{3} + \frac{2}{3} \left(-\frac{1}{2}\right)^k + \frac{19}{3} + \frac{2}{3} \left(-\frac{1}{2}\right)^{k-1} \right) = \frac{1}{2} \left( \frac{38}{3} + \frac{2}{3} \left(-\frac{1}{2}\right)^k + \frac{19}{3} + \frac{2}{3} \left(-\frac{1}{2}\right)^{k-1} \right) = \frac{1}{2} \left( \frac{38}{3} + \frac{2}{3} \left(-\frac{1}{2}\right)^{k+1} + \frac{19}{3} + \frac{2}{3} \left(-\frac{1}{2}\right)^k \right) = 19 + \frac{2}{3} \left(-\frac{1}{2}\right)^{k+1}.
\]

c. As \( n \to \infty \), \( \left(-\frac{1}{2}\right)^n \to 0 \), so that the limit is \( \frac{19}{4} \).

9.2.89 The approximate first few values of this sequence are:

<table>
<thead>
<tr>
<th>( n )</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>( c_n )</td>
<td>0.707</td>
<td>0.632</td>
<td>0.614</td>
<td>0.609</td>
<td>0.608</td>
<td>0.607</td>
<td>0.607</td>
</tr>
</tbody>
</table>

The value of the constant appears to be around 0.607.

9.2.90 We first prove that \( d_n \) is bounded by 200. If \( d_n \leq 200 \), then \( d_{n+1} = 0.5 \cdot d_n + 100 \leq 0.5 \cdot 200 + 100 \leq 200 \). Because \( d_0 = 100 < 200 \), all \( d_n \) are at most 200. Thus the sequence is bounded. To see that it is monotone, look at

\[ d_n - d_{n-1} = 0.5 \cdot d_{n-1} + 100 - d_{n-1} = 100 - 0.5d_{n-1}. \]

But we know that \( d_{n-1} \leq 200 \), so that \( 100 - 0.5d_{n-1} \geq 0 \). Thus \( d_n \geq d_{n-1} \) and the sequence is nondecreasing.

9.2.91

a. If we “cut off” the expression after \( n \) square roots, we get \( a_n \) from the recurrence given. We can thus define the infinite expression to be the limit of \( a_n \) as \( n \to \infty \).

b. \( a_0 = 1, \ a_1 = \sqrt{2}, \ a_2 = \sqrt{1 + \sqrt{2}} \approx 1.5538, \ a_3 \approx 1.5981, \ a_4 \approx 1.6118, \) and \( a_5 \approx 1.6161 \).

c. \( a_{10} \approx 1.618, \) which differs from \( \frac{1 + \sqrt{5}}{2} \approx 1.61803394 \) by less than 0.001.

d. Assume \( \lim_{n \to \infty} a_n = L \). Then \( \lim_{n \to \infty} a_{n+1} = \lim_{n \to \infty} \sqrt{1 + a_n} = \sqrt{1 + \lim_{n \to \infty} a_n} \), so \( L = \sqrt{1 + L} \), and thus \( L^2 = 1 + L \). Therefore we have \( L^2 - L - 1 = 0 \), so \( L = \frac{1 + \sqrt{5}}{2} \). Because clearly the limit is positive, it must be the positive square root.

Copyright © 2014 Pearson Education, Inc.
e. Letting \( a_{n+1} = \sqrt{p + a_n} \) with \( a_0 = p \) and assuming a limit exists we have \( \lim_{n \to \infty} a_{n+1} = \lim_{n \to \infty} \sqrt{p + a_n} = \sqrt{p + \lim_{n \to \infty} a_n} \), so \( L = \sqrt{p+L} \), and thus \( L^2 = p + L \). Therefore, \( L^2 - L - p = 0 \), so \( L = \frac{1+\sqrt{1+4p}}{2} \), and because we know that \( L \) is positive, we have \( L = \frac{1+\sqrt{4p+1}}{2} \). The limit exists for all positive \( p \).

9.2.92 Note that \( 1 - \frac{1}{t} = \frac{t-1}{t} \), so that the product is \( \frac{1}{2} \cdot \frac{2}{3} \cdot \frac{3}{4} \cdot \ldots \) so that \( a_n = \frac{1}{n} \) for \( n \geq 2 \). The sequence \( \{ \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \ldots \} \) has limit zero.

9.2.93
a. Define \( a_n \) as given in the problem statement. Then we can define the value of the continued fraction to be \( \lim_{n \to \infty} a_n \).

b. \( a_0 = 1, a_1 = 1 + \frac{1}{a_0} = 2, a_2 = 1 + \frac{1}{a_1} = \frac{3}{2} = 1.5, a_3 = 1 + \frac{1}{a_2} = \frac{5}{3} \approx 1.667, a_4 = 1 + \frac{1}{a_3} = \frac{8}{5} = 1.6, a_5 = 1 + \frac{1}{a_4} = \frac{13}{8} = 1.625. \)

c. From the list above, the values of the sequence alternately decrease and increase, so we would expect that the limit is somewhere between 1.6 and 1.625.

d. Assume that the limit is equal to \( L \). Then from \( a_{n+1} = 1 + \frac{1}{a_n} \), we have \( \lim_{n \to \infty} a_{n+1} = 1 + \frac{1}{\lim_{n \to \infty} a_n} \), so \( L = 1 + \frac{1}{L} \), and thus \( L^2 - L - 1 = 0 \). Therefore, \( L = \frac{1+\sqrt{5}}{2} \), and because \( L \) is clearly positive, it must be equal to \( \frac{1+\sqrt{5}}{2} \approx 1.618 \).

e. Here \( a_0 = a \) and \( a_1 = 1 + \frac{1}{a_0} = \frac{a+1}{a} \). Assuming that \( \lim_{n \to \infty} a_n = L \) we have \( L = a + \frac{b}{L} \), so \( L^2 = aL + b \), and thus \( L^2 - aL - b = 0 \). Therefore, \( L = \frac{a+\sqrt{a^2+4b}}{2} \), and because \( L > 0 \) we have \( L = \frac{a+\sqrt{a^2+4b}}{2} \).

9.2.94
a. Experimenting with recurrence (2) one sees that for \( 0 < p \leq 1 \) the sequence appears to converge to 1, while for \( p > 1 \) the sequence appears to diverge to \( \infty \).

b. With \( p = 1.2 \) we get

<table>
<thead>
<tr>
<th>( n )</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
<th>10</th>
</tr>
</thead>
<tbody>
<tr>
<td>( a_n = p^{a_{n-1}} )</td>
<td>1.2</td>
<td>1.2446</td>
<td>1.2547</td>
<td>1.2570</td>
<td>1.2576</td>
<td>1.2577</td>
<td>1.2577</td>
<td>1.2577</td>
<td>1.2577</td>
<td>1.2577</td>
</tr>
</tbody>
</table>

With \( p = 1.2 \) the sequence appears to converge to \( \approx 1.2577 \). Doing the same computation for different values of \( p \) gives the following results:

<table>
<thead>
<tr>
<th>( p )</th>
<th>1.1</th>
<th>1.2</th>
<th>1.3</th>
<th>1.4</th>
<th>1.44</th>
<th>1.444</th>
<th>1.445</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \lim_{n \to \infty} a_n )</td>
<td>1.1118</td>
<td>1.2577</td>
<td>1.471</td>
<td>1.8867</td>
<td>2.3938</td>
<td>2.5875</td>
<td>Diverges</td>
</tr>
</tbody>
</table>

It appears that the upper limit of convergence is \( \approx 1.444 \).

9.2.95
a. \( f_0 = f_1 = 1, f_2 = 2, f_3 = 3, f_4 = 5, f_5 = 8, f_6 = 13, f_7 = 21, f_8 = 34, f_9 = 55, f_{10} = 89. \)

b. The sequence is clearly not bounded.

c. \( \frac{f_0}{f_1} \approx 1.61818 \)

d. We use induction. Note that \( \frac{1}{\sqrt{5}} \left( \varphi + \frac{1}{\varphi} \right) = \frac{1}{\sqrt{5}} \left( \frac{1+\sqrt{5}}{2} + \frac{2}{1+\sqrt{5}} \right) = \frac{1}{\sqrt{5}} \left( \frac{1+\sqrt{5}+5+1}{2(1+\sqrt{5})} \right) = 1 = f_1. \) Also note that \( \frac{1}{\sqrt{5}} \left( \varphi^2 - \frac{1}{\varphi^2} \right) = \frac{1}{\sqrt{5}} \left( \frac{3+\sqrt{5}}{2} - \frac{2}{3+\sqrt{5}} \right) = \frac{1}{\sqrt{5}} \left( \frac{9+6\sqrt{5}+5-4}{2(3+\sqrt{5})} \right) = 1 = f_2. \) Now note that

\[
f_{n+1} + f_{n-2} = \frac{1}{\sqrt{5}} \left( (\varphi^{n+1} - (-1)^{n+1} \varphi^{1-n} + \varphi^{n-2} - (-1)^{n-2} \varphi^{2-n})
\right.
\]

\[
= \frac{1}{\sqrt{5}} \left( ((\varphi^{n+1} + \varphi^{n-2}) - (-1)^{n} (\varphi^{2-n} - \varphi^{1-n})) \right).
\]

Copyright © 2014 Pearson Education, Inc.
Now, note that \( \varphi - 1 = \frac{1}{\varphi} \), so that
\[
\varphi^{n-1} + \varphi^{n-2} = \varphi^{n-1} \left(1 + \frac{1}{\varphi}\right) = \varphi^{n-1} \cdot \varphi = \varphi^n
\]
and
\[
\varphi^{2-n} - \varphi^{1-n} = \varphi^{-n}(\varphi^2 - \varphi) = \varphi^{-n}(\varphi(\varphi - 1)) = \varphi^{-n}.
\]
Making these substitutions, we get
\[
f_n = f_{n-1} + f_{n-2} = \frac{1}{\sqrt{5}}(\varphi^n - (-1)^n\varphi^{-n}).
\]

9.2.96

a. We show that the arithmetic mean of any two distinct positive numbers exceeds their geometric mean.
Let \( a > b > 0 \); then
\[
\frac{a + b}{2} - \sqrt{ab} = \frac{1}{2}(a - 2\sqrt{ab} + b) = \frac{1}{2}((a - \sqrt{b})^2 > 0. \]
Because in addition \( a_0 > b_0 \), we have \( a_n > b_n \) for all \( n \).

b. To see that \( \{a_n\} \) is decreasing, note that
\[
a_{n+1} = \frac{a_n + b_n}{2} < \frac{a_n + a_n}{2} = a_n.
\]
Similarly,
\[
b_{n+1} = \sqrt{a_nb_n} > \sqrt{b_nb_n} = b_n,
\]
so that \( \{b_n\} \) is increasing.

c. \( \{a_n\} \) is monotone and nonincreasing by part (b), and bounded below by part (a) (it is bounded below by any of the \( b_n \), so it converges by the monotone convergence theorem. Similarly, \( \{b_n\} \) is monotone and nondecreasing by part (b) and bounded above by part (a), so it too converges.

d. Since \( a_n > b_n \) for all \( n \), we have
\[
a_{n+1} - b_{n+1} = \frac{a_n + b_n}{2} - \sqrt{a_nb_n} = \frac{1}{2}(a_n - 2\sqrt{a_nb_n} + b_n) < \frac{1}{2}(a_n - 2\sqrt{b_n^2 + b_n}) = \frac{1}{2}(a_n - b_n).
\]
Thus the difference between \( a_{n+1} \) and \( b_{n+1} \) is less than half the difference between \( a_n \) and \( b_n \), so that difference goes to zero and the two limits are the same.

e. The AGM of 12 and 20 is approximately 15.745; Gauss’ constant is \( \frac{1}{\text{AGM}(1,\sqrt{2})} \approx 0.8346. \)

9.2.97

a.

\begin{align*}
2 & : 1 \\
3 & : 10, 5, 16, 8, 4, 2, 1 \\
4 & : 2, 1 \\
5 & : 16, 8, 4, 2, 1 \\
6 & : 3, 10, 5, 16, 8, 4, 2, 1 \\
7 & : 22, 11, 34, 17, 52, 26, 13, 40, 20, 10, 5, 16, 8, 4, 2, 1 \\
8 & : 4, 2, 1 \\
9 & : 28, 14, 7, 22, 11, 34, 17, 52, 26, 13, 40, 20, 10, 5, 16, 8, 4, 2, 1 \\
10 & : 5, 16, 8, 4, 2, 1
\end{align*}

b. From the above, \( H_2 = 1, H_3 = 7, \) and \( H_4 = 2. \)
c.

This plot is for 1 ≤ n ≤ 100. Like hailstones, the numbers in the sequence \( a_n \) rise and fall but eventually crash to the earth. The conjecture appears to be true.

9.2.98 \( \{a_n\} \ll \{b_n\} \) means that \( \lim_{n \to \infty} \frac{a_n}{b_n} = 0 \). But \( \lim_{n \to \infty} \frac{ca_n}{db_n} = \frac{c}{d} \lim_{n \to \infty} \frac{a_n}{b_n} = 0 \), so that \( \{ca_n\} \ll \{db_n\} \).

9.2.99 a. Note that \( a_2 = \sqrt{3a_1} = \sqrt{3\sqrt{3}} > \sqrt{3} = a_1 \). Now assume that \( \sqrt{3} = a_1 < a_2 < \ldots a_{k-1} < a_k \). Then

\[
\sqrt{3a_k} > \sqrt{3a_{k-1}} = a_k.
\]

Thus \( \{a_n\} \) is increasing.

b. Clearly since \( a_1 > 0 \) and \( \{a_n\} \) is increasing, the sequence is bounded below by \( \sqrt{3} > 0 \). Further, \( a_1 = \sqrt{3} < 3 \); assume that \( a_k < 3 \). Then \( a_{k+1} = \sqrt{3a_k} < \sqrt{3\cdot3} = 3 \), so that \( a_{k+1} < 3 \). So by induction, \( \{a_k\} \) is bounded above by 3.

c. Since \( \{a_n\} \) is bounded and monotonically increasing, \( \lim_{n \to \infty} a_n \) exists by Theorem 9.5.

d. Since the limit exists, we have

\[
\lim_{n \to \infty} a_{n+1} = \lim_{n \to \infty} \sqrt{3a_n} = \sqrt{3} \lim_{n \to \infty} \sqrt{a_n} = \sqrt{3} \lim_{n \to \infty} a_n.
\]

Let \( L = \lim_{n \to \infty} a_{n+1} = \lim_{n \to \infty} a_n \); then \( L = \sqrt{3}\sqrt{L} \), so that \( L = 3 \).

9.2.100 By Theorem 9.6,

\[
\lim_{n \to \infty} \frac{2\ln n}{\sqrt{n}} = 2 \lim_{n \to \infty} \frac{\ln n}{n^{1/2}} = 0,
\]

so that \( \sqrt{n} \) has the larger growth rate. Using computational software, we see that \( \sqrt{74} \approx 8.60233 < 2 \ln 74 \approx 8.60813 \), while \( \sqrt{75} \approx 8.66025 > 2 \ln 75 \approx 8.63498 \).

9.2.101 By Theorem 9.6,

\[
\lim_{n \to \infty} \frac{n^5}{e^{n/2}} = 2^5 \lim_{n \to \infty} \frac{(n/2)^5}{e^{n/2}} = 0,
\]

so that \( e^{n/2} \) has the larger growth rate. Using computational software we see that \( e^{35/2} \approx 3.982 \times 10^7 < 35^5 \approx 5.252 \times 10^7 \) while \( e^{36/2} \approx 6.566 \times 10^7 > 36^5 \approx 6.047 \times 10^7 \).

9.2.102 By Theorem 9.6, \( \ln n^{10} \ll n^{1.001} \), so that \( n^{1.001} \) has the larger growth rate. Using computational software we see that \( 35^{1.001} \approx 35.1247 < \ln 35^{10} \approx 35.5535 \) while \( 36^{1.001} \approx 36.1292 > \ln 36^{10} \approx 35.8352 \).

9.2.103 Experiment with a few widely separated values of \( n \):

<table>
<thead>
<tr>
<th>( n )</th>

</tr>
</tbody>
</table>
9.3. Infinite Series

9.3.1 A geometric series is a series in which the ratio of successive terms in the underlying sequence is a constant. Thus a geometric series has the form \( \sum ar^k \) where \( r \) is the constant. One example is \( 3 + 6 + 12 + 24 + 48 + \cdots \) in which \( a = 3 \) and \( r = 2 \).

9.3.2 A geometric sum is the sum of a finite number of terms which have a constant ratio; a geometric series is the sum of an infinite number of such terms.

9.3.3 The ratio is the common ratio between successive terms in the sum.

9.3.4 Yes, because there are only a finite number of terms.

9.3.5 No. For example, the geometric series with \( a_n = 3 \cdot 2^n \) does not have a finite sum.

9.3.6 The series converges if and only if \( |r| < 1 \).

9.3.7 Using the formula in the text gives \( S = 1 \cdot \frac{1 - 3^9}{1 - 3} = \frac{19682}{2} = 9841 \).

9.3.8 \( S = 1 \cdot \frac{1 - (1/4)^{11}}{1 - (1/4)} = \frac{4^{11} - 1}{3 \cdot 4^{10}} = \frac{4194303}{3 \cdot 1048576} = \frac{1398101}{1048576} \approx 1.333 \).

9.3.9 Using the formula in the text gives \( S = 1 \cdot \frac{1 - (4/25)^{21}}{1 - 4/25} = \frac{25^{21} - 4^{21}}{25^{21} - 4} \cdot 25^{20} \approx 1.190 \).
9.3.10 Using the formula in the text gives \( S = 16 \cdot \frac{1 - 2^9}{1 - 2} = 511 \cdot 16 = 8176. \)

9.3.11 Using the formula in the text gives \( S = 1 \cdot \frac{1 - (-3/4)^{10}}{1 + 3/4} = \frac{4^{10} - 3^{10}}{4^{10} + 3 \cdot 4^9} = \frac{141361}{262144} \approx 0.539. \)

9.3.12 Using the formula in the text gives \( S = (-2.5) \cdot \frac{1 - (-2.5)^5}{1 + 2.5} = -70.469. \)

9.3.13 Using the formula in the text gives \( S = 1 \cdot \frac{1 - \pi^7}{1 - \pi} = \frac{\pi^7 - 1}{\pi - 1} \approx 1409.835. \)

9.3.14 Using the formula in the text gives \( S = \frac{4}{7} \cdot \frac{1 - (4/7)^{10}}{3/7} = \frac{375235564}{282475249} \approx 1.328. \)

9.3.15 Using the formula in the text gives \( S = 1 \cdot \frac{1 - (-1)^{21}}{2} = 1. \)

9.3.16 Adding gives \( \frac{65}{27}. \)

9.3.17 This is a geometric series with first term \( \frac{1}{4}, \) ratio \( \frac{1}{3}, \) and 7 terms, so the sum is
\[
\frac{1}{4} \cdot \frac{1 - (\frac{1}{3})^7}{1 - \frac{1}{3}} = \frac{1}{4} \cdot \frac{1 - \frac{1}{2187}}{\frac{2}{3}} = \frac{1}{4} \cdot \frac{2186}{2187} \cdot 3 = \frac{1093}{2916}.
\]

9.3.18 This is a geometric series with first term \( \frac{1}{5}, \) and ratio \( \frac{3}{5}. \) There are 6 terms. Thus the sum is
\[
\frac{1}{5} \cdot \frac{1 - (\frac{3}{5})^6}{1 - \frac{3}{5}} = \frac{1}{5} \cdot \frac{1 - \frac{729}{15625}}{\frac{2}{5}} = \frac{1}{5} \cdot \frac{14896}{15625} \cdot 5 = \frac{7448}{15625}.
\]

9.3.19 Theorem 9.7 gives \( \frac{1}{1 - \frac{1}{4}} = \frac{4}{3}. \)

9.3.20 Theorem 9.7 gives \( \frac{1}{1 - \frac{2}{5}} = \frac{5}{2}. \)

9.3.21 Theorem 9.7 gives \( \frac{1}{1 - 0.9} = 10. \)

9.3.22 This is an infinite geometric series with first term 1 and ratio \( \frac{2}{7}, \) so using Theorem 9.7 we get
\[
\frac{1}{1 - \frac{2}{7}} = \frac{7}{5}.
\]

9.3.23 This is an infinite geometric series with ratio \( r = 1.01 > 1, \) so it is divergent.

9.3.24 This is an infinite geometric series with first term 1 and ratio \( \frac{1}{\pi}, \) so using Theorem 9.7 we get
\[
\frac{1}{1 - \frac{1}{\pi}} = \frac{\pi}{\pi - 1}.
\]

9.3.25 Theorem 9.7 gives \( \frac{e^{-2}}{1 - e^{-2}} = \frac{1}{e^2 - 1}. \)

9.3.26 Theorem 9.7 gives \( \frac{5/4}{1 - 1/2} = \frac{5}{2}. \)

9.3.27 Theorem 9.7 gives \( \frac{2^{-3}}{1 - 2^{-3}} = \frac{1}{7}. \)

9.3.28 Theorem 9.7 gives \( \frac{3 \cdot 4^3/7^3}{1 - 4/7} = \frac{64}{49}. \)

9.3.29 Theorem 9.7 gives \( \frac{1/625}{1 - 1/5} = \frac{1}{500}. \)

9.3.30 Note that this is the same as \( \sum_{i=0}^{\infty} \left(\frac{3}{4}\right)^k. \) Then \( S = \frac{1}{1 - 3/4} = 4. \)
9.3.31 This is an infinite geometric series with first term 1 and ratio \( \frac{e}{\pi} < 1 \) since \( e < \pi \). So its sum is
\[
S = 1 \cdot \frac{1}{1 - \frac{e}{\pi}} = \frac{\pi}{\pi - e}.
\]

9.3.32 This is an infinite geometric series with first term \( \frac{1}{16} \) and ratio \( \frac{3}{4} \), so its sum is
\[
S = \frac{1}{16} \cdot \frac{1}{1 - \frac{3}{4}} = \frac{1}{4}.
\]

9.3.33 By Theorem 9.7 we get
\[
\sum_{k=0}^{\infty} \left( \frac{1}{4} \right)^k 5^6 - k = 5^6 \sum_{k=0}^{\infty} \left( \frac{1}{20} \right)^k = 5^6 \cdot \frac{1}{1 - 1/20} = \frac{5^6 \cdot 20}{19} \approx 312500.
\]

9.3.34 Theorem 9.7 gives \( \frac{3^6/8^6}{1 - (3/8)^3} = \frac{729}{248320} \approx 0.003094 \).

9.3.35 Theorem 9.7 gives \( \frac{1}{1 + 9/10} = \frac{10}{19} \).

9.3.36 Theorem 9.7 gives \( \frac{-2/3}{1 + 2/3} = -\frac{2}{5} \). 

9.3.37 Theorem 9.7 gives \( 3 \cdot \frac{1}{1 + 1/\pi} = \frac{3\pi}{\pi + 1} \).

9.3.38 Theorem 9.7 gives
\[
\sum_{k=1}^{\infty} \left( \frac{-1}{e} \right)^k = -\frac{1/e}{1 + 1/e} = -\frac{1}{e + 1}.
\]

9.3.39 Theorem 9.7 gives \( \frac{0.15^2}{1.15} = \frac{9}{460} \approx 0.0196 \).

9.3.40 Theorem 9.7 gives \( \frac{-3/8^3}{1 + 1/8^3} = -\frac{1}{171} \).

9.3.41 \( 0.3 = 0.333 \ldots = \sum_{k=1}^{\infty} 3(0.1)^k = \frac{0.3}{1 - 0.1} = \frac{1}{3} \).

9.3.42 \( 0.5 = 0.666 \ldots = \sum_{k=1}^{\infty} 6(0.1)^k = \frac{0.6}{1 - 0.1} = \frac{2}{3} \).

9.3.43 \( 0.7 = 0.111 \ldots = \sum_{k=1}^{\infty} (0.1)^k = \frac{0.1}{1 - 0.1} = \frac{1}{9} \).

9.3.44 \( 0.5 = 0.555 \ldots = \sum_{k=1}^{\infty} 5(0.1)^k = \frac{0.5}{1 - 0.9} = \frac{5}{9} \).

9.3.45 \( 0.09 = 0.0909 \ldots = \sum_{k=1}^{\infty} 9(0.01)^k = \frac{0.9}{1 - 0.01} = \frac{1}{11} \).

9.3.46 \( 0.27 = 0.272727 \ldots = \sum_{k=1}^{\infty} 27(0.01)^k = \frac{0.27}{1 - 0.01} = \frac{3}{11} \).

9.3.47 \( 0.037 = 0.037037037 \ldots = \sum_{k=1}^{\infty} 37(0.001)^k = \frac{0.037}{1 - 0.001} = \frac{37}{999} = \frac{1}{27} \).

9.3.48 \( 0.027 = 0.027027027 \ldots = \sum_{k=1}^{\infty} 27(0.001)^k = \frac{0.027}{1 - 0.001} = \frac{27}{999} = \frac{1}{37} \).
9.3.49 0.12 = 0.121212 \ldots = \sum_{k=0}^{\infty} 0.12 \cdot 10^{-2k} = \frac{0.12}{1 - 1/100} = \frac{12}{99} = \frac{4}{33}.

9.3.50 1.25 = 1.252525 \ldots = 1 + \sum_{k=0}^{\infty} 0.25 \cdot 10^{-2k} = 1 + \frac{0.25}{1 - 1/100} = 1 + \frac{25}{99} = \frac{124}{99}.

9.3.51 0.456 = 0.456456456 \ldots = \sum_{k=0}^{\infty} 0.456 \cdot 10^{-3k} = \frac{0.456}{1 - 1/1000} = \frac{456}{999} = \frac{152}{333}.

9.3.52 1.0039 = 1.0039393939 \ldots = 1 + \sum_{k=0}^{\infty} 0.0039 \cdot 10^{-2k} = 1 + \frac{0.0039}{1 - 1/100} = 1 + \frac{39}{9900} = \frac{9939}{9900} = \frac{3313}{3300}.

9.3.53 0.00952 = 0.00952952952952 \ldots = \sum_{k=0}^{\infty} 0.00952 \cdot 10^{-3k} = \frac{0.00952}{1 - 1/1000} = \frac{952}{99900} = \frac{952}{99900} = \frac{238}{24975}.

9.3.54 5.1283 = 5.1283838383 \ldots = 5.12 + \sum_{k=0}^{\infty} 0.0083 \cdot 10^{-2k} = 5.12 + \frac{0.0083}{1 - 1/100} = \frac{512}{100} + \frac{83}{99} = \frac{50771}{9900}.

9.3.55 The second part of each term cancels with the first part of the succeeding term, so \( S_n = \frac{1}{1+1} - \frac{1}{n+2} = \frac{n}{2n+4}, \) and \( \lim_{n \to \infty} \frac{n}{2n+4} = \frac{1}{2}. \)

9.3.56 The second part of each term cancels with the first part of the succeeding term, so \( S_n = \frac{1}{1+2} - \frac{1}{n+3} = \frac{n}{3n+6}, \) and \( \lim_{n \to \infty} \frac{n}{3n+6} = \frac{1}{3}. \)

9.3.57 \( \frac{1}{(k+6)(k+7)} = \frac{1}{k+6} - \frac{1}{k+7}, \) so the series given is the same as \( \sum_{k=1}^{\infty} \left( \frac{1}{k+6} - \frac{1}{k+7} \right). \) In that series, the second part of each term cancels with the first part of the succeeding term, so \( S_n = \frac{1}{1+6} - \frac{1}{n+7}. \) Thus \( \lim_{n \to \infty} S_n = \frac{1}{7}. \)

9.3.58 \( \frac{1}{(3k+1)(3k+4)} = \frac{1}{3} \left( \frac{1}{3k+1} - \frac{1}{3k+4} \right), \) so the series given can be written \( \frac{1}{3} \sum_{k=0}^{\infty} \left( \frac{1}{3k+1} - \frac{1}{3k+4} \right). \) In that series, the second part of each term cancels with the first part of the succeeding term (because \( 3(k+1) + 1 = 3k+4 \)), so we are left with \( S_n = \frac{1}{3} \left( \frac{1}{1} - \frac{1}{3n+4} \right) = \frac{n+1}{3n+4} \) and \( \lim_{n \to \infty} \frac{n+1}{3n+4} = \frac{1}{3}. \)

9.3.59 Note that \( \frac{4}{(4k-3)(4k+1)} = \frac{1}{4k-3} - \frac{1}{4k+1}. \) Thus the given series is the same as \( \sum_{k=3}^{\infty} \left( \frac{1}{4k-3} - \frac{1}{4k+1} \right). \)

In that series, the second part of each term cancels with the first part of the succeeding term (because \( 4(k+1) - 3 = 4k+1 \)), so we have \( S_n = \frac{1}{5} - \frac{1}{4n+1}, \) and thus \( \lim_{n \to \infty} S_n = \frac{1}{5}. \)

9.3.60 Note that \( \frac{2}{(2k-1)(2k+1)} = \frac{1}{2k-1} - \frac{1}{2k+1}. \) Thus the given series is the same as \( \sum_{k=3}^{\infty} \left( \frac{1}{2k-1} - \frac{1}{2k+1} \right). \)

In that series, the second part of each term cancels with the first part of the succeeding term (because \( 2(k+1) - 1 = 2k+1 \)), so we have \( S_n = \frac{1}{5} - \frac{1}{2n+1}, \) and thus \( \lim_{n \to \infty} S_n = \frac{1}{5}. \)

9.3.61 \( \ln \left( \frac{k+1}{k} \right) = \ln(k+1) - \ln k, \) so the series given is the same as \( \sum_{k=1}^{\infty} (\ln(k+1) - \ln k), \) in which the first part of each term cancels with the second part of the next term, so we get \( S_n = \ln(n+1) - \ln 1 = \ln(n+1), \) and thus the series diverges.

Copyright © 2014 Pearson Education, Inc.
9.3.62 Note that $S_n = (\sqrt{2} - \sqrt{1}) + (\sqrt{3} - \sqrt{2}) + \cdots + (\sqrt{n+1} - \sqrt{n})$. The second part of each term cancels with the first part of the previous term. Thus, $S_n = \sqrt{n+1} - 1$. And because $\lim_{n \to \infty} \sqrt{n+1} - 1 = \infty$, the series diverges.

9.3.63 \[ \frac{1}{(k+p)(k+p+1)} = \frac{1}{k+p} - \frac{1}{k+p+1}, \] so that \[ \sum_{k=1}^{\infty} \frac{1}{(k+p)(k+p+1)} = \sum_{k=1}^{\infty} \left( \frac{1}{k+p} - \frac{1}{k+p+1} \right) \] and this series telescopes to give $S_n = \frac{1}{p+1} - \frac{1}{n+1}$ so that $\lim_{n \to \infty} S_n = \frac{1}{p+1}$.

9.3.64 \[ \frac{1}{(ak+1)(ak+a+1)} = \frac{1}{a} \left( \frac{1}{ak+1} - \frac{1}{ak+a+1} \right), \] so that
\[
\sum_{k=1}^{\infty} \frac{1}{(ak+1)(ak+a+1)} = \frac{1}{a} \sum_{k=1}^{\infty} \left( \frac{1}{ak+1} - \frac{1}{ak+a+1} \right).
\] This series telescopes — the second term of each summand cancels with the first term of the succeeding summand — so that $S_n = \frac{1}{a} \left( \frac{1}{a+1} - \frac{1}{an+a+1} \right)$, and thus the limit of the sequence is $\frac{1}{a(a+1)}$.

9.3.65 Let $a_n = \frac{1}{\sqrt{n+1}} - \frac{1}{\sqrt{n+3}}$. Then the second term of $a_n$ cancels with the first term of $a_{n+2}$, so the series telescopes and $S_n = \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} - \frac{1}{\sqrt{n+1}+1} - \frac{1}{\sqrt{n+3}}$ and thus the sum of the series is the limit of $S_n$, which is $\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}}$.

9.3.66 The first term of the $k^{\text{th}}$ summand is $\sin \frac{(k+1)\pi}{2k+1}$; the second term of the $(k+1)^{\text{st}}$ summand is $-\sin \frac{(k+1)\pi}{2(k+1)+1}$; these two are equal except for sign, so they cancel. Thus
\[
S_n = -\sin 0 + \sin \frac{(n+1)\pi}{2n+1} = \sin \frac{(n+1)\pi}{2n+1}.
\] Because $\frac{(n+1)\pi}{2n+1}$ has limit $\frac{\pi}{2}$ as $n \to \infty$, and because the sine function is continuous, it follows that $\lim_{n \to \infty} S_n$ is $\sin \frac{\pi}{2} = 1$.

9.3.67 $16k^2 + 8k - 3 = (4k + 3)(4k - 1)$, so $\frac{1}{(4k+3)(4k-1)} = \frac{1}{4} \left( \frac{1}{4k-1} - \frac{1}{4k+3} \right)$. Thus the series given is equal to $\frac{1}{4} \sum_{k=0}^{\infty} \left( \frac{1}{4k-1} - \frac{1}{4k+3} \right)$. This series telescopes, so $S_n = \frac{1}{4} \left( -1 - \frac{1}{4n+3} \right)$, so the sum of the series is equal to $\lim_{n \to \infty} S_n = -\frac{1}{4}$.

9.3.68 This series clearly telescopes to give $S_n = -\tan^{-1} 1 + \tan^{-1} n = \tan^{-1} n - \frac{\pi}{4}$. Then because $\lim_{n \to \infty} \tan^{-1} n = \frac{\pi}{2}$, the sum of the series is equal to $\lim_{n \to \infty} S_n = \frac{\pi}{4}$.

9.3.69
a. True. $\left( \frac{\pi}{e} \right)^{-k} = \left( \frac{e}{\pi} \right)^{k}$; because $e < \pi$, this is a geometric series with ratio less than 1.

b. True. If $\sum_{k=12}^{\infty} a^k = L$, then $\sum_{k=0}^{\infty} a^k = \left( \sum_{k=0}^{11} a^k \right) + L$.

c. False. For example, let $0 < a < 1$ and $b > 1$.

d. True. Suppose $a > \frac{1}{2}$. Then we want $a = \sum_{k=0}^{\infty} r^k = \frac{1}{1-r}$. Solving for $r$ gives $r = 1 - \frac{1}{a}$. Since $a > 0$ we have $r < 1$; since $a > \frac{1}{2}$ we have $r > 1 - \frac{1}{a} > 0$. Thus $|r| < 1$ so that $\sum_{k=0}^{\infty} r^k$ converges, and it converges to $a$. 

Copyright © 2014 Pearson Education, Inc.
9.3.76 It will take Achilles $\frac{1}{4}$ hour to cover the first mile. At this time, the tortoise has gone $\frac{1}{5}$ mile more, and it will take Achilles $\frac{1}{25}$ hour to reach this new point. At that time, the tortoise has gone another $\frac{1}{25}$ of a mile, and it will take Achilles $\frac{1}{125}$ hour to reach this point. Continuing forever, and adding the times up, we have

$$\frac{1}{5} + \frac{1}{25} + \frac{1}{125} + \cdots = \frac{1/5}{1 - 1/5} = \frac{1}{4},$$

so it will take Achilles $\frac{1}{4}$ of an hour (15 minutes) to catch the tortoise. During that time, he will run $\frac{5}{4}$ miles.
9.3.77 At the \( n \)th stage, there are \( 2^{n-1} \) triangles of area \( A_n = \frac{1}{8} A_{n-1} \), so the total area of the triangles formed at the \( n \)th stage is \( \frac{2^{n-1}}{8n-1} A_1 = \left( \frac{1}{4} \right)^{n-1} A_1 \). Thus the total area under the parabola is

\[
\sum_{n=1}^{\infty} \left( \frac{1}{4} \right)^{n-1} A_1 = A_1 \sum_{n=1}^{\infty} \left( \frac{1}{4} \right)^{n-1} = A_1 \frac{1}{1-1/4} = \frac{4}{3} A_1.
\]

9.3.78

a. Note that \( \frac{3^k}{(3^k+1)(3^k-1)} = \frac{1}{2} \left( \frac{1}{3^k-1} - \frac{1}{3^k+1} \right) \). Then

\[
\sum_{k=1}^{\infty} \frac{3^k}{(3^k-1)(3^k+1)} = \frac{1}{2} \sum_{k=1}^{\infty} \left( \frac{1}{3^k-1} - \frac{1}{3^k+1} \right).
\]

This series telescopes to give \( S_n = \frac{1}{2} \left( \frac{1}{3^1-1} - \frac{1}{3^n+1} \right) \), so that the sum of the series is \( \lim_{n \to \infty} S_n = \frac{1}{4} \).

b. We mimic the above computations. First, \( \frac{a^k}{(a^k-1)(a^k+1)} = \frac{1}{a-1} \cdot \left( \frac{1}{a^k-1} - \frac{1}{a^k+1} \right) \), so we see that we cannot have \( a = 1 \), because the fraction would then be undefined. Continuing, we obtain \( S_n = \frac{1}{a-1} \left( \frac{1}{a-1} - \frac{1}{a^{n+1}-1} \right) \). Now, \( \lim_{n \to \infty} \frac{1}{a^{n+1}-1} \) converges if and only if the denominator grows without bound; this happens if and only if \( |a| > 1 \). Thus, the original series converges for \( |a| > 1 \), when it converges to \( \frac{1}{(a-1)^2} \). Note that this is valid even for \( a \) negative.

9.3.79 From the graph, it appears that the loan is paid off after about 470 months.

Analytically, let \( B_n \) be the loan balance after \( n \) months. Then \( B_0 = 180000 \) and \( B_n = 1.005 \cdot B_{n-1} - 1000 \). Continuing, we get

\[
B_n = 1.005 \cdot B_{n-1} - 1000 \\
= 1.005(1.005 \cdot B_{n-2} - 1000) - 1000 \\
= 1.005^2 \cdot B_{n-2} - 1000(1 + 1.005) \\
= 1.005^2 \cdot (1.005 \cdot B_{n-3} - 1000) - 1000(1 + 1.005) \\
= 1.005^3 \cdot B_{n-3} - 1000(1 + 1.005 + 1.005^2) \\
= \cdots \\
= 1.005^n B_0 - 1000(1 + 1.005 + 1.005^2 + \cdots + 1.005^{n-1}) \\
= 1.005^n \cdot 180000 - 1000 \left( \frac{1.005^n - 1}{1.005 - 1} \right).
\]

Solving this equation for \( B_n = 0 \) gives \( n \approx 461.667 \) months, so the loan is paid off after 462 months.
### 9.3.80

From the graph, it appears that the loan is paid off after about 38 months.

![Graph of loan balance over time](image)

Analytically, let $B_n$ be the loan balance after $n$ months. Then $B_0 = 20000$ and $B_n = 1.0075 \cdot B_{n-1} - 60$. Continuing, we get

$$B_n = 1.0075 \cdot B_{n-1} - 60$$
$$= 1.0075(1.0075 \cdot B_{n-2} - 60) - 60$$
$$= 1.0075^2 \cdot B_{n-2} - 600(1 + 1.0075)$$
$$= 1.0075^2(1.0075 \cdot B_{n-3} - 600) - 600(1 + 1.0075)$$
$$= 1.0075^3 \cdot B_{n-3} - 600(1 + 1.0075 + 1.0075^2)$$
$$= \cdots$$
$$= 1.0075^n B_0 - 600(1 + 1.0075 + 1.0075^2 + \cdots + 1.0075^{n-1})$$
$$= 1.0075^n \cdot 20000 - 600 \left( \frac{1.0075^n - 1}{1.0075 - 1} \right).$$

Solving this equation for $B_n = 0$ gives $n \approx 38.501$ months, so the loan is paid off after 39 months.

### 9.3.81

$$F_n = 1.015 F_{n-1} - 120$$
$$= 1.015(1.015 F_{n-2} - 120) - 120$$
$$= 1.015^2(1.015 F_{n-3} - 120) - 120$$
$$= \cdots$$
$$= 1.015^n \cdot 4000 - 120(1 + 1.015 + 1.015^2 + \cdots + 1.015^{n-1}).$$

This is equal to

$$1.015^n \cdot 4000 - 120 \left( \frac{1.015^n - 1}{1.015 - 1} \right) = 4000 \cdot 1.015^n + 8000.$$

As $n \to \infty$, this approaches $-\infty$. Since the population cannot drop below zero, the long term population of the fish is 0.

### 9.3.82

Let $A_n$ be the amount of antibiotic in your blood after $n$ 6-hour periods. Then $A_0 = 200, A_n = 0.5A_{n-1} + 200$. We have

$$A_n = 0.5A_{n-1} + 200$$
$$= 0.5(0.5A_{n-2} + 200) + 200$$
$$= 0.5(0.5(0.5A_{n-3} + 200) + 200) + 200$$
$$= \cdots$$
$$= 0.5^n \cdot 200 + 200(1 + 0.5 + 0.5^2 + \cdots + 0.5^{n-1}).$$

Copyright © 2014 Pearson Education, Inc.
This is equal to

\[ 0.5^n \cdot 200 + 200 \left( \frac{0.5^n - 1}{0.5 - 1} \right) = 0.5^n (200 - 400) + 400 = -200 \cdot 0.5^n + 400. \]

The limit of this expression as \( n \to \infty \) is 400, so the steady-state amount of antibiotic in your blood is 400 mg.

9.3.83 Under the one-child policy, clearly each of \( N \) couples will have one child, for a total of \( N \) children. Under the one-son policy, after each couple has one child, resulting in \( N \) children, half of those will be girls, resulting in another \( \frac{N}{2} \) children. Half of those will again be girls, so there will be \( \frac{N}{4} \) additional children.

Continuing, it is clear that the total number of children is

\[ N + \frac{N}{2} + \frac{N}{4} + \frac{N}{8} = N \sum_{k=0}^{\infty} \frac{1}{2^k} = 2N. \]

Thus there will be twice as many children under the one-son policy as under the one-child policy.

9.3.84 Let \( L_n \) be the amount of light transmitted through the window the \( n \)th time the beam hits the second pane. Then the amount of light that was available before the beam went through the pane was \( \frac{L_n}{1-p} \), so \( \frac{pL_n}{1-p} \) is reflected back to the first pane, and \( \frac{p^2L_n}{1-p} \) is then reflected back to the second pane. Of that, a fraction equal to \( 1 - p \) is transmitted through the window. Thus

\[ L_{n+1} = (1 - p) \frac{p^2L_n}{1-p} = p^2 L_n. \]

The amount of light transmitted through the window the first time is \( (1 - p)^2 \). Thus the total amount is

\[ \sum_{i=0}^{\infty} p^{2i} (1 - p)^2 = \frac{(1 - p)^2}{1 - p^2} = \frac{1 - p}{1 + p}. \]

9.3.85 Ignoring the initial drop for the moment, the height after the \( n \)th bounce is \( 10p^n \), so the total time spent in that bounce is \( 2 \cdot \sqrt{2} \cdot 10p^n / g \) seconds. The total time before the ball comes to rest (now including the time for the initial drop) is then

\[ \sqrt{\frac{200}{g}} + 2 \sum_{i=1}^{\infty} 2 \cdot \sqrt{2} \cdot 10p^n / g = \sqrt{\frac{200}{g}} + 2 \sqrt{\frac{200}{g}} \sum_{i=1}^{\infty} (1 + \sqrt{p})^n = \sqrt{\frac{20}{9}} + 2 \sqrt{\frac{20}{9}} \frac{1}{1-\sqrt{p}} = \sqrt{\frac{20}{9}} \frac{1+\sqrt{p}}{1-\sqrt{p}} \]

seconds.

9.3.86 a. The fraction of available wealth spent each month is \( 1 - p \), so the amount spent in the \( n \)th month is \( W(1 - p)^n \). The total amount spent is then

\[ \sum_{n=1}^{\infty} W(1 - p)^n = \frac{W(1 - p)}{1 - (1 - p)} = W \left( \frac{1 - p}{p} \right) \] dollars.

b. As \( p \to 1 \), the total amount spent approaches 0. This makes sense, because in the limit, if everyone saves all of the money, none will be spent. As \( p \to 0 \), the total amount spent gets larger and larger. This also makes sense, because almost all of the available money is being respent each month.

9.3.87 a. \( I_{n+1} \) is obtained by \( I_n \) by dividing each edge into three equal parts, removing the middle part, and adding two parts equal to it. Thus 3 equal parts turn into 4, so \( I_{n+1} = \frac{4}{3} I_n \). This is a geometric sequence with a ratio greater than 1, so the \( n \)th term grows without bound.

b. As the result of part (a), \( I_n \) has \( 3 \cdot 4^n \) sides of length \( \frac{1}{3^n} \); each of those sides turns into an added triangle in \( I_{n+1} \) of side length \( 3^{-n-1} \). Thus the added area in \( I_{n+1} \) consists of \( 3 \cdot 4^n \) equilateral triangles with side \( 3^{-n-1} \). The area of an equilateral triangle with side \( x \) is \( \frac{x^2 \sqrt{3}}{4} \). Thus

\[ A_{n+1} = A_n + 3 \cdot 4^n \cdot \frac{3^{-2n-2} \cdot \sqrt{3}}{4} = A_n + \frac{\sqrt{3}}{12} \left( \frac{4}{9} \right)^n, \]

and

\[ A_0 = \frac{\sqrt{3}}{12}. \]

Thus

\[ A_{n+1} = A_0 + \sum_{i=0}^{n} \frac{\sqrt{3}}{12} \left( \frac{4}{9} \right)^i = \sqrt{3} \left( 1 + \frac{3}{5} \right) = \frac{2 \sqrt{3}}{5}. \]

Copyright © 2014 Pearson Education, Inc.
9.3.88

a. \[ 5 \sum_{i=1}^{\infty} 10^{-k} = 5 \sum_{i=1}^{\infty} \left( \frac{1}{10} \right)^k = 5 \left( \frac{1/10}{9/10} \right) = \frac{5}{9}. \]

b. \[ 54 \sum_{i=1}^{\infty} 10^{-2k} = 54 \sum_{i=1}^{\infty} \left( \frac{1}{100} \right)^k = 54 \left( \frac{1/100}{99/100} \right) = \frac{54}{99}. \]

c. Suppose \( x = 0.n_1n_2\ldots n_p n_1 n_2 \ldots \). Then we can write this decimal as \( n_1 n_2 \ldots n_p \sum_{i=1}^{\infty} 10^{-ip} = n_1 n_2 \ldots n_p \sum_{i=1}^{\infty} \left( \frac{1}{10} \right)^i = n_1 n_2 \ldots n_p \frac{1/10^p}{1 - 1/10^p} = \frac{n_1 n_2 \ldots n_p}{999\ldots9} \), where here \( n_1 n_2 \ldots n_p \) does not mean multiplication but rather the digits in a decimal number, and where there are \( p \) 9’s in the denominator.

d. According to part (c), \( 0.12345678912345678912 \ldots = \frac{123456789}{999999999} \).

e. Again using part (c), \( 0.\bar{9} = \frac{9}{9} = 1 \).

9.3.89 \(|S - S_n| = \left| \sum_{i=n}^{\infty} x^k \right| \leq \left| \frac{r^n}{1 - r} \right|\) because the latter sum is simply a geometric series with first term \( r^n \) and ratio \( r \).

9.3.90

a. Solve \( \frac{0.6^n}{0.4} < 10^{-6} \) for \( n \) to get \( n = 29 \).

b. Solve \( \frac{0.15^n}{0.85} < 10^{-6} \) for \( n \) to get \( n = 8 \).

9.3.91

a. Solve \( \left| \frac{(-0.8)^n}{1.8} \right| = \frac{0.8^n}{1.8} < 10^{-6} \) for \( n \) to get \( n = 60 \).

b. Solve \( \frac{0.2^n}{0.8} < 10^{-6} \) for \( n \) to get \( n = 9 \).

9.3.92

a. Solve \( \frac{0.72^n}{0.28} < 10^{-6} \) for \( n \) to get \( n = 46 \).

b. Solve \( \left| \frac{(-0.25)^n}{1.25} \right| = \frac{0.25^n}{1.25} < 10^{-6} \) for \( n \) to get \( n = 10 \).

9.3.93

a. Solve \( \frac{1/\pi^n}{1-1/\pi} < 10^{-6} \) for \( n \) to get \( n = 13 \).

b. Solve \( \frac{1/\pi^n}{1-1/\pi} < 10^{-6} \) for \( n \) to get \( n = 15 \).

9.3.94

a. \( f(x) = \sum_{k=0}^{\infty} x^k = \frac{1}{1-x} \); because \( f \) is represented by a geometric series, \( f(x) \) exists only for \(|x| < 1\). Then \( f(0) = 1, f(0.2) = \frac{1}{0.8} = 1.25, f(0.5) = \frac{1}{0.5} = 2 \). Neither \( f(1) \) nor \( f(1.5) \) exists.

b. The domain of \( f \) is \( \{x : |x| < 1\} \).

9.3.95

a. \( f(x) = \sum_{k=0}^{\infty} (-1)^k x^k = \frac{1}{1+x} \); because \( f \) is a geometric series, \( f(x) \) exists only when the ratio, \(-x\), is such that \(|-x| = |x| < 1\). Then \( f(0) = 1, f(0.2) = \frac{1}{1.2} = \frac{5}{6}, f(0.5) = \frac{1}{1.05} = \frac{2}{3} \). Neither \( f(1) \) nor \( f(1.5) \) exists.

b. The domain of \( f \) is \( \{x : |x| < 1\} \).

9.3.96

a. \( f(x) = \sum_{k=0}^{\infty} x^{2k} = \frac{1}{1-x^2} \). \( f \) is a geometric series, so \( f(x) \) is defined only when the ratio, \( x^2 \), is less than 1, which means \(|x| < 1\). Then \( f(0) = 1, f(0.2) = \frac{1}{1.04} = \frac{25}{24}, f(0.5) = \frac{1}{1-0.25} = \frac{4}{3} \). Neither \( f(1) \) nor \( f(1.5) \) exists.
b. The domain of \( f \) is \( \{ x : |x| < 1 \} \).

9.3.97 \( f(x) \) is a geometric series with ratio \( \frac{1}{1+x} \); thus \( f(x) \) converges when \( \left| \frac{1}{1+x} \right| < 1 \). For \( x > -1 \), \( \left| \frac{1}{1+x} \right| = \frac{1}{1+x} \) and \( \frac{1}{1+x} < 1 \) when \( 1 < 1 + x, x > 0 \). For \( x < -1 \), \( \left| \frac{1}{1+x} \right| = \frac{1}{1-x} \), and this is less than 1 when \( 1 < -1 - x \), i.e. \( x < -2 \). So \( f(x) \) converges for \( x > 0 \) and for \( x < -2 \). When \( f(x) \) converges, its value is \( \frac{1}{1+x} = \frac{1}{1+x} \), so \( f(x) = 3 \) when \( 1 + x = 3x, x = \frac{1}{2} \).

9.3.98

a. Clearly for \( k < n \), \( h_k \) is a leg of a right triangle whose hypotenuse is \( r_k \) and whose other leg is formed where the vertical line (in the picture) meets a diameter of the next smaller sphere; thus the other leg of the triangle is \( r_{k+1} \). The Pythagorean theorem then implies that \( h_k^2 = r_k^2 - r_{k+1}^2 \).

b. The height is \( H_n = \sum_{i=1}^{n} h_i = r_n + \sum_{i=1}^{n-1} \sqrt{r_i^2 - r_{i+1}^2} \) by part (a).

c. From part (b), because \( r_i = a^{i-1} \),
\[
H_n = r_n + \sum_{i=1}^{n-1} \sqrt{r_i^2 - r_{i+1}^2} = a^{n-1} + \sum_{i=1}^{n-1} \sqrt{a^{2i-2} - a^{2i}}
= a^{n-1} + \sum_{i=1}^{n-1} a^{i-1} \sqrt{1 - a^2} = a^{n-1} + \sqrt{1 - a^2} \sum_{i=1}^{n-1} a^{i-1}
= a^{n-1} + \sqrt{1 - a^2} \left( \frac{1 - a^{n-1}}{1 - a} \right)
\]

d. \( \lim_{n \to \infty} H_n = \lim_{n \to \infty} a^{n-1} + \sqrt{1 - a^2} \lim_{n \to \infty} \frac{1 - a^{n-1}}{1 - a} = 0 + \sqrt{1 - a^2} \left( \frac{1}{1-a} \right) = \sqrt{\frac{1-a^2}{(1-a)(1-a)}} = \sqrt{\frac{1}{1-a}} \).

9.3.99

a. Using Theorem 9.7 in each case except for \( r = 0 \) gives

<table>
<thead>
<tr>
<th>( r )</th>
<th>( f(r) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>-0.9</td>
<td>0.526</td>
</tr>
<tr>
<td>-0.7</td>
<td>0.588</td>
</tr>
<tr>

<td>0.7</td>
<td>3.333</td>
</tr>
<tr>
<td>0.9</td>
<td>10</td>
</tr>
</tbody>
</table>

We choose \( f(0) = 1 \) since the most reasonable definition of \( 0^0 \) is \( \lim_{x \to 0^+} x^0 = 1 \).
b. A plot of $f(r)$ is

![Graph of f(r)](image)

c. For $-1 < r < 1$ we have $f(r) = \frac{1}{1-r}$, so that

$$\lim_{r \to -1^+} f(r) = \lim_{r \to -1^+} \frac{1}{1-r} = \frac{1}{2}, \quad \lim_{r \to 1^-} f(r) = \lim_{r \to 1^-} \frac{1}{1-r} = \infty.$$ 

9.3.100

a. In each case (except for $r = 0$, where $N(r)$ is clearly 0), computing $|S - S_n|$ for various values of $n$ gives the following results:

| $r$  | $N(r)$ | $|S - S_{N(r)} - 1|$ | $|S - S_{N(r)}|$ |
|------|--------|---------------------|-----------------|
| -0.9 | 81     | $1.0 \times 10^{-4}$ | $9.3 \times 10^{-5}$ |
| -0.7 | 24     | $1.1 \times 10^{-4}$ | $7.9 \times 10^{-5}$ |
| -0.5 | 12     | $1.6 \times 10^{-4}$ | $8.1 \times 10^{-5}$ |
| -0.2 | 5      | $2.7 \times 10^{-4}$ | $5.3 \times 10^{-5}$ |
| 0    | 0      | —                   | 0               |
| 0.2  | 5      | $4.0 \times 10^{-4}$ | $8.0 \times 10^{-5}$ |
| 0.5  | 14     | $1.2 \times 10^{-4}$ | $6.1 \times 10^{-5}$ |
| 0.7  | 29     | $1.1 \times 10^{-4}$ | $7.5 \times 10^{-5}$ |
| 0.9  | 109    | $1.0 \times 10^{-4}$ | $9.3 \times 10^{-5}$ |

b. A plot of $r$ versus $N(r)$ for these values of $r$ is

![Plot of r versus N(r)](image)

c. The rate of convergence is faster for $r$ closer to zero, since $N(r)$ is smaller. The reason for this is that $r^k$ gets smaller faster as $k$ increases when $|r|$ is closer to zero than when it is closer to 1.

9.4 The Divergence and Integral Tests

9.4.1 If \( \lim_{k \to \infty} a_k = 1 \), then certainly \( a_k \neq 0 \), so that by the Divergence Test, \( \sum_{k=1}^{\infty} a_k \) diverges.

9.4.2 No. For example, the harmonic series \( \sum_{k=1}^{\infty} \frac{1}{k} \) diverges although \( \frac{1}{k} \to 0 \) as \( k \to \infty \).

9.4.3 Yes. Either the series and the integral both converge, or both diverge, if the terms are positive and decreasing.

9.4.4 It converges for \( p > 1 \), and diverges for all other values of \( p \).

9.4.5 For the same values of \( p \) as in the previous problem – it converges for \( p > 1 \), and diverges for all other values of \( p \).

9.4.6 Let \( S_n \) be the partial sums. Then \( S_{n+1} - S_n = a_{n+1} > 0 \) because \( a_{n+1} > 0 \). Thus the sequence of partial sums is increasing.

9.4.7 The remainder of an infinite series is the error in approximating a convergent infinite series by a finite number of terms.

9.4.8 Yes. Suppose \( \sum a_k \) converges to \( S \), and let the sequence of partial sums be \( \{S_n\} \). Then \( \lim_{n \to \infty} R_n = \lim_{n \to \infty} (S - S_n) = 0 \) since \( S_n \to S \).

9.4.9 \( a_k = \frac{k}{2^k+1} \) and \( \lim_{k \to \infty} a_k = \frac{1}{2} \), so the series diverges.

9.4.10 \( a_k = \frac{k}{k^2+1} \) and \( \lim_{k \to \infty} a_k = 0 \), so the divergence test is inconclusive.

9.4.11 \( a_k = \frac{k}{\ln k} \) and \( \lim_{k \to \infty} a_k = \infty \), so the series diverges.

9.4.12 \( a_k = \frac{k^2}{2^k} \) and \( \lim_{k \to \infty} a_k = 0 \), so the divergence test is inconclusive.

9.4.13 \( a_k = \frac{1}{1000+k} \) and \( \lim_{k \to \infty} a_k = 0 \), so the divergence test is inconclusive.

9.4.14 \( a_k = \frac{k^3}{k^3+1} \) and \( \lim_{k \to \infty} a_k = 1 \), so the series diverges.

9.4.15 \( a_k = \frac{\sqrt{k}}{\ln k} \) and \( \lim_{k \to \infty} a_k = \infty \), so the series diverges.

9.4.16 \( a_k = \frac{\sqrt{k+1}}{k} \) and \( \lim_{k \to \infty} a_k = 1 \), so the series diverges.

9.4.17 \( a_k = k^{1/k} \). In order to compute \( \lim_{k \to \infty} a_k \), we let \( y_k = \ln a_k = \frac{\ln k}{k} \). By Theorem 9.6 (or by L’Hôpital’s rule), \( \lim_{k \to \infty} y_k = 0 \), so \( \lim_{k \to \infty} a_k = e^0 = 1 \). The given series thus diverges.

9.4.18 By Theorem 9.6 \( k^3 \ll k! \), so \( \lim_{k \to \infty} \frac{k^3}{k!} = 0 \). The divergence test is inconclusive.

9.4.19 Clearly \( \frac{1}{x} = e^{-x} \) is continuous, positive, and decreasing for \( x \geq 2 \) (in fact, for all \( x \)), so the integral test applies. Since

\[
\int_2^\infty e^{-x} \, dx = \lim_{c \to \infty} \int_2^c e^{-x} \, dx = \lim_{c \to \infty} \left( -e^{-x} \right) \bigg|_2^c = \lim_{c \to \infty} (e^{-2} - e^{-c}) = e^{-2},
\]

the Integral Test tells us that the original series converges as well.

Copyright © 2014 Pearson Education, Inc.
9.4.20 Let \( f(x) = \frac{x}{\sqrt{x^2 + 4}} \). \( f(x) \) is continuous for \( x \geq 1 \). Note that \( f'(x) = \frac{4}{(\sqrt{x^2 + 4})^3} > 0 \). Thus \( f \) is increasing, and the conditions of the Integral Test aren’t satisfied. The given series diverges by the Divergence Test.

9.4.21 Let \( f(x) = x \cdot e^{-2x^2} \). This function is continuous for \( x \geq 1 \). Its derivative is \( e^{-2x^2}(1 - 4x^2) < 0 \) for \( x \geq 1 \), so \( f(x) \) is decreasing. Because \( \int_1^\infty \frac{1}{\sqrt{x+10}} \) dx = \( \infty \), the series diverges.

9.4.22 Let \( f(x) = \frac{1}{\sqrt{x} + 10} \). \( f(x) \) is obviously continuous and decreasing for \( x \geq 1 \). Because \( \int_1^\infty \frac{1}{\sqrt{x} + 10} \) dx = \( \infty \), the series diverges.

9.4.23 Let \( f(x) = \frac{1}{\sqrt{x} + 8} \). \( f(x) \) is obviously continuous and decreasing for \( x \geq 1 \). Because \( \int_1^\infty \frac{1}{\sqrt{x} + 8} \) dx = \( \infty \), the series diverges.

9.4.24 Let \( f(x) = \frac{1}{x \ln x} \). \( f(x) \) is continuous and decreasing for \( x \geq 2 \). Because \( \int_2^\infty f(x) \) dx = \( \frac{1}{\ln 2} \) the series converges.

9.4.25 Let \( f(x) = \frac{e^x}{x} \). \( f(x) \) is clearly continuous for \( x > 1 \), and its derivative, \( f'(x) = \frac{e^x - xe^x}{x^2} = (1 - x) e^x \), is negative for \( x > 1 \) so that \( f(x) \) is decreasing. Because \( \int_1^\infty f(x) \) dx = \( 2e^{-1} \), the series converges.

9.4.26 Let \( f(x) = \frac{1}{x \ln x \ln \ln x} \). \( f(x) \) is continuous and decreasing for \( x > 3 \), and \( \int_3^\infty \frac{1}{x \ln x \ln \ln x} \) dx = \( \infty \). The given series therefore diverges.

9.4.27 The integral test does not apply, because the sequence of terms is not decreasing.

9.4.28 \( f(x) = \frac{x}{(x^2 + 1)^3} \) is decreasing and continuous, and \( \int_1^\infty \frac{x}{(x^2 + 1)^3} \) dx = \( \frac{1}{16} \). Thus, the given series converges.

9.4.29 This is a \( p \)-series with \( p = 10 \), so this series converges.

9.4.30 \( \sum_{k=2}^\infty \frac{k^p}{k^q} = \sum_{k=2}^\infty \frac{1}{k^{q-p}} \). Note that \( \pi - e \approx 3.1416 - 2.71828 < 1 \), so this series diverges.

9.4.31 \( \sum_{k=1}^\infty \frac{1}{k^{(k-2)p}} = \sum_{k=1}^\infty \frac{1}{k^p} \), which is a \( p \)-series with \( p = 4 \), thus convergent.

9.4.32 \( \sum_{k=1}^\infty 2k^{-3/2} = 2 \sum_{k=1}^\infty \frac{1}{k^{3/2}} \) is a \( p \)-series with \( p = \frac{3}{2} \), thus convergent.

9.4.33 \( \sum_{k=1}^\infty \frac{1}{\sqrt{k}} = \sum_{k=1}^\infty \frac{1}{k^{1/2}} \) is a \( p \)-series with \( p = \frac{1}{2} \), thus divergent.

9.4.34 \( \sum_{k=1}^\infty \frac{1}{\sqrt{2k^2}} = \frac{1}{3} \sum_{k=1}^\infty \frac{1}{k^{3/2}} \) is a \( p \)-series with \( p = \frac{3}{2} \), thus divergent.

9.4.35  

a. The remainder \( R_n \) is bounded by \( \int_n^\infty \frac{1}{x^p} \) dx = \( \frac{1}{5n^p} \).

b. We solve \( \frac{1}{5n^p} < 10^{-3} \) to get \( n = 3 \).

c. \( L_n = S_n + \int_{n+1}^\infty \frac{1}{x^p} \) dx = \( S_n + \frac{1}{5(n+1)^p} \), and \( U_n = S_n + \int_n^\infty \frac{1}{x^p} \) dx = \( S_n + \frac{1}{5n^p} \).

d. \( S_{10} \approx 1.017341512 \), so \( L_{10} \approx 1.017341512 + \frac{1}{5\cdot11^3} \approx 1.017342754 \), and \( U_{10} \approx 1.017341512 + \frac{1}{5\cdot10^3} \approx 1.017343512 \).

9.4.36  

a. The remainder \( R_n \) is bounded by \( \int_n^\infty \frac{1}{x^p} \) dx = \( \frac{1}{7n^p} \).

b. We solve \( \frac{1}{7n^p} < 10^{-3} \) to obtain \( n = 3 \).

c. \( L_n = S_n + \int_{n+1}^\infty \frac{1}{x^p} \) dx = \( S_n + \frac{1}{7(n+1)^p} \), and \( U_n = S_n + \int_n^\infty \frac{1}{x^p} \) dx = \( S_n + \frac{1}{7n^p} \).

d. \( S_{10} \approx 1.004077346 \), so \( L_{10} \approx 1.004077346 + \frac{1}{7\cdot11^2} \approx 1.004077353 \), and \( U_{10} \approx 1.004077346 + \frac{1}{7\cdot10^2} \approx 1.004077360 \).

Copyright © 2014 Pearson Education, Inc.
9.4.37
a. The remainder \( R_n \) is bounded by \( \int_n^\infty \frac{1}{x^3} \, dx = \frac{1}{3n^3} \).
b. We solve \( \frac{1}{3n^3} < 10^{-3} \) to obtain \( n = 7 \).
c. \( L_n = S_n + \int_{n+1}^\infty \frac{1}{x^3} \, dx = S_n + \frac{1}{3(n+1)^3} \), and \( U_n = S_n + \int_n^\infty \frac{1}{x^3} \, dx = S_n + \frac{1}{3n^3} \).
d. \( S_{10} \approx 0.4999915325 \), so \( L_{10} \approx 0.4999915325 + \frac{1}{3\times11^3} \approx 0.4999966708 \), and \( U_{10} \approx 0.4999915325 + \frac{1}{3\times10^3} \approx 0.5000069475 \).

9.4.38
a. The remainder \( R_n \) is bounded by \( \int_n^\infty \frac{1}{x \ln^2 x} \, dx = \frac{1}{\ln n} \).
b. We solve \( \frac{1}{\ln n} < 10^{-3} \) to get \( n = e^{1000} \approx 10^{1434} \).
c. \( L_n = S_n + \int_{n+1}^\infty \frac{1}{x \ln^2 x} \, dx = S_n + 2(n+1)^{-1/2} \), and \( U_n = S_n + \int_n^\infty \frac{1}{x \ln^2 x} \, dx = S_n + \frac{1}{\ln n} \).
d. \( S_{11} = \sum_{k=2}^{11} \frac{1}{k \ln^2 k} \approx 1.700396385 \), so \( L_{11} \approx 1.700396385 + \frac{1}{\ln 12} \approx 2.102825989 \), and \( U_{11} \approx 1.700396385 + \frac{1}{\ln 11} \approx 2.117428776 \).

9.4.39
a. The remainder \( R_n \) is bounded by \( \int_n^\infty e^{-x} \, dx = 2n^{-1/2} \).
b. We solve \( 2n^{-1/2} < 10^{-3} \) to get \( n > 4 \times 10^6 \), so let \( n = 4 \times 10^6 + 1 \).
c. \( L_n = S_n + \int_{n+1}^\infty e^{-x} \, dx = S_n + 2(n+1)^{-1/2} \), and \( U_n = S_n + \int_n^\infty e^{-x} \, dx = S_n + 2n^{-1/2} \).
d. \( S_{10} = \sum_{k=1}^{10} \frac{1}{k \ln^2 k} \approx 1.995336493 \), so \( L_{10} \approx 1.995336493 + 2 \cdot 11^{-1/2} \approx 2.598359182 \), and \( U_{10} \approx 1.995336493 + 2 \cdot 10^{-1/2} \approx 2.627792025 \).

9.4.40
a. The remainder \( R_n \) is bounded by \( \int_n^\infty e^{-x} \, dx = e^{-n} \).
b. We solve \( e^{-n} < 10^{-3} \) to get \( n = 7 \).
c. \( L_n = S_n + \int_{n+1}^\infty e^{-x} \, dx = S_n + e^{-(n+1)} \), and \( U_n = S_n + \int_n^\infty e^{-x} \, dx = S_n + e^{-n} \).
d. \( S_{10} = \sum_{k=1}^{10} e^{-k} \approx 0.5819502852 \), so \( L_{10} \approx 0.5819502852 + e^{-11} \approx 0.5819669869 \), and \( U_{10} \approx 0.5819502852 + e^{-10} \approx 0.5819956851 \).

9.4.41
a. The remainder \( R_n \) is bounded by \( \int_n^\infty \frac{1}{x^2} \, dx = \frac{1}{2n^2} \).
b. We solve \( \frac{1}{2n^2} < 10^{-3} \) to get \( n = 23 \).
c. \( L_n = S_n + \int_{n+1}^\infty \frac{1}{x^2} \, dx = S_n + \frac{1}{2(n+1)^2} \), and \( U_n = S_n + \int_n^\infty \frac{1}{x^2} \, dx = S_n + \frac{1}{2n^2} \).
d. \( S_{10} \approx 1.197531986 \), so \( L_{10} \approx 1.197531986 + \frac{1}{2\times11^2} \approx 1.201664217 \), and \( U_{10} \approx 1.197531986 + \frac{1}{2\times10^2} \approx 1.202531986 \).

9.4.42
a. The remainder \( R_n \) is bounded by \( \int_n^\infty xe^{-x^2} \, dx = \frac{1}{2e^{n^2}} \).
b. We solve \( \frac{1}{2e^{n^2}} < 10^{-3} \) to get \( n = 3 \).
c. \( L_n = S_n + \int_{n+1}^\infty xe^{-x^2} \, dx = S_n + \frac{1}{2e(n+1)^2} \), and \( U_n = S_n + \int_n^\infty xe^{-x^2} \, dx = S_n + \frac{1}{2e n^2} \).
d. \( S_{10} \approx 0.4048813986 \), so \( L_{10} \approx 0.4048813986 + \frac{1}{2e\times11^2} \approx 0.4048813986 \), and \( U_{10} \approx 0.4048813986 + \frac{1}{2e\times10^2} \approx 0.4048813986 \).

Copyright © 2014 Pearson Education, Inc.
This is a geometric series with \( a = \frac{1}{3} \) and \( r = \frac{1}{2} \), so \( \sum_{k=1}^{\infty} \frac{4}{12^k} = \frac{1/3}{1-1/12} = \frac{1/3}{11/12} = \frac{4}{11} \).

This is a geometric series with \( a = \frac{3}{2} \) and \( r = \frac{1}{e} \), so \( \sum_{k=2}^{\infty} 3e^{-k} = \frac{3/e^2}{1-(1/e)} = \frac{3/e^2}{e(1-e)} = \frac{3}{e(e-1)} \).

\[
\sum_{k=0}^{\infty} \left( 3 \left( \frac{2}{5} \right)^k - 2 \left( \frac{5}{7} \right)^k \right) = 3 \sum_{k=0}^{\infty} \left( \frac{2}{5} \right)^k - 2 \sum_{k=0}^{\infty} \left( \frac{5}{7} \right)^k = 3 \left( \frac{1/3}{1} \right) - 2 \left( \frac{1}{2/7} \right) = 5 - 7 = -2.
\]

\[
\sum_{k=1}^{\infty} \left( 2 \left( \frac{3}{5} \right)^k + 3 \left( \frac{4}{9} \right)^k \right) = 2 \sum_{k=1}^{\infty} \left( \frac{3}{5} \right)^k + 3 \sum_{k=1}^{\infty} \left( \frac{4}{9} \right)^k = 2 \left( \frac{3/5}{2/5} \right) + 3 \left( \frac{4/9}{5/9} \right) = 3 + \frac{12}{5} = \frac{27}{5}.
\]

\[
\sum_{k=1}^{\infty} \left( \frac{1}{3} \left( \frac{5}{6} \right)^k + \frac{3}{5} \left( \frac{7}{9} \right)^k \right) = \frac{1}{3} \sum_{k=1}^{\infty} \left( \frac{5}{6} \right)^k + \frac{3}{5} \sum_{k=1}^{\infty} \left( \frac{7}{9} \right)^k = \frac{1}{3} \left( \frac{5/6}{1/6} \right) + \frac{3}{5} \left( \frac{7/9}{2/9} \right) = \frac{5}{3} + \frac{21}{10} = \frac{113}{30}.
\]

\[
\sum_{k=0}^{\infty} \left( \frac{1}{2} \left( 0.2 \right)^k + \frac{3}{2} \left( 0.8 \right)^k \right) = \frac{1}{2} \sum_{k=0}^{\infty} \left( 0.2 \right)^k + \frac{3}{2} \sum_{k=0}^{\infty} \left( 0.8 \right)^k = \frac{1}{2} \left( \frac{1}{0.8} \right) + \frac{3}{2} \left( \frac{1}{0.2} \right) = \frac{5}{8} + \frac{15}{2} = \frac{65}{8}.
\]

\[
\sum_{k=1}^{\infty} \left( \frac{1}{6} k + \frac{1}{3} k^{-1} \right) = \sum_{k=1}^{\infty} \left( \frac{1}{6} k \right) + \sum_{k=1}^{\infty} \left( \frac{1}{3} k^{-1} \right) = \frac{1/6}{1/6} + \frac{1}{2/3} = \frac{17}{10}.
\]

\[
\sum_{k=0}^{\infty} \frac{2 - 3^{k}}{6^k} = \sum_{k=0}^{\infty} \left( \frac{2}{6^k} - \frac{3^{k}}{6^k} \right) = 2 \sum_{k=0}^{\infty} \left( \frac{1}{6} \right)^k - \sum_{k=0}^{\infty} \left( \frac{1}{2} \right)^k = 2 \left( \frac{1/5}{6} \right) - \frac{1}{1/2} = \frac{2}{5}.
\]

a. True. The two series differ by a finite amount \( \sum_{k=1}^{n} a_k \), so if one converges, so does the other.

b. True. The same argument applies as in part (a).

c. False. If \( \sum a_k \) converges, then \( a_k \to 0 \) as \( k \to \infty \), so that \( a_k + 0.0001 \to 0.0001 \) as \( k \to \infty \), so that \( \sum (a_k + 0.0001) \) cannot converge.

d. False. Suppose \( p = -1.0001 \). Then \( \sum p^k \) diverges but \( p + 0.001 = -0.9991 \) so that \( \sum (p + 0.001)^k \) converges.

e. False. Let \( p = 1.0005 \); then \( -p + 0.001 = -(p - 0.001) = -0.9959 \), so that \( \sum k^{-p} \) converges \((p\text{-series})\) but \( \sum k^{-p+0.001} \) diverges.

f. False. Let \( a_k = \frac{1}{k} \), the harmonic series.

9.4.52 Diverges by the Divergence Test because \( \lim_{k \to \infty} a_k = \lim_{k \to \infty} \sqrt[k+1]{k} = 1 \neq 0 \).

9.4.53 Because

\[
\frac{1}{(3x+1)(3x+4)} = \frac{1}{3} \left( \frac{1}{3x+1} - \frac{1}{3x+4} \right),
\]

the series telescopes, so that

\[
S_n = \sum_{k=1}^{n} \frac{1}{(3k+1)(3k+4)} = \frac{1}{3} \left( \frac{1}{4} - \frac{1}{3n+4} \right),
\]

and clearly \( \lim_{n \to \infty} S_n = \frac{1}{12} \). Thus the series converges to \( \frac{1}{12} \). (The integral test could also be used, integrating using partial fractions, but it is harder.)
9.4.54 Converges by the Integral Test because
\[ \int_0^\infty \frac{10}{x^2 + 9} \, dx = \frac{10}{3} \lim_{b \to \infty} \tan^{-1} \frac{x}{3} \bigg|_0^b = \frac{10}{3} \cdot \frac{\pi}{2} \approx 5.236 < \infty. \]

9.4.55 Diverges by the Divergence Test because \( \lim_{k \to \infty} a_k = \lim_{k \to \infty} \frac{k}{\sqrt{k^2 + 1}} = 1 \neq 0. \)

9.4.56 Converges because it is the sum of two geometric series. In fact,
\[ \sum_{k=1}^\infty \frac{2^k + 3^k}{4^k} = \sum_{k=1}^\infty \left( \frac{2}{4} \right)^k + \sum_{k=1}^\infty \left( \frac{3}{4} \right)^k = \frac{1}{2} \frac{1}{1 - (1/2)} + \frac{3}{4} \frac{1}{1 - (3/4)} = 1 + 3 = 4. \]

9.4.57 Converges by the Integral Test because \( \int_2^\infty \frac{4}{x \ln^2 x} \, dx = \lim_{b \to \infty} \left( -\frac{4}{\ln x} \right)_{1}^{b} = \frac{4}{\ln 2} < \infty. \)

9.4.58
a. In order for the series to converge, the integral \( \int_2^\infty \frac{1}{x (\ln x)^p} \, dx \) must exist. But
\[ \int \frac{1}{x (\ln x)^p} \, dx = \frac{1}{1 - p} (\ln x)^{1-p}, \]
so in order for this improper integral to exist, we must have that \( 1 - p < 0 \) or \( p > 1. \)

b. The series converges faster for \( p = 3 \) because the terms of the series get smaller faster.

9.4.59
a. Note that \( \int \frac{1}{x \ln x (\ln x)^p} \, dx = \frac{1}{1-p} (\ln \ln x)^{1-p} \), and thus the improper integral with bounds \( n \) and \( \infty \) exists only if \( p > 1 \) because \( \ln \ln x > 0 \) for \( x > e \). So this series converges for \( p > 1. \)

b. For large values of \( z \), clearly \( \sqrt{\pi} > \ln z \), so that \( z > (\ln z)^2 \). Write \( z = \ln x \); then for large \( x \), \( \ln x > (\ln x)^2 \); multiplying both sides by \( x \ln x \) we have that \( x \ln^2 x > x \ln x (\ln x)^2 \), so that the first series converges faster because the terms get smaller faster.

9.4.60
a. \( \sum \frac{1}{k^{3/2}}. \)

b. \( \sum \frac{1}{k \ln k}. \)

c. \( \sum \frac{1}{k \ln^2 k}. \)

9.4.61 Let \( S_n = \sum_{k=1}^n \frac{1}{\sqrt{k}} \). Then this looks like a left Riemann sum for the function \( y = \frac{1}{\sqrt{x}} \) on \( [1, n + 1] \). Because each rectangle lies above the curve itself, we see that \( S_n \) is bounded below by the integral of \( \frac{1}{\sqrt{x}} \) on \( [1, n + 1] \). Now,
\[ \int_1^{n+1} \frac{1}{\sqrt{x}} \, dx = \int_1^{n+1} x^{-1/2} \, dx = 2\sqrt{x} \bigg|_1^{n+1} = 2\sqrt{n+1} - 2. \]

This integral diverges as \( n \to \infty \), so the series does as well by the bound above.

9.4.62 \( \sum_{k=1}^\infty (a_k \pm b_k) = \lim_{n \to \infty} \sum_{k=1}^n (a_k \pm b_k) = \lim_{n \to \infty} \left( \sum_{k=1}^n a_k \pm \sum_{k=1}^n b_k \right) = \lim_{n \to \infty} \sum_{k=1}^n a_k \pm \lim_{n \to \infty} \sum_{k=1}^n b_k = A \pm B. \)

9.4.63 \( \sum_{k=1}^\infty c a_k = \lim_{n \to \infty} \sum_{k=1}^n c a_k = c \lim_{n \to \infty} \sum_{k=1}^n a_k = c \lim_{n \to \infty} \sum_{k=1}^n a_k, \) so that one sum diverges if and only if the other one does.

9.4.64 \( \sum_{k=2}^\infty \frac{1}{k \ln k} \) diverges by the Integral Test, because \( \int_2^\infty \frac{1}{x \ln x} = \lim_{b \to \infty} \left( \ln x \right)_{1}^{b} = \infty. \)
9.4.65 To approximate the sequence for \( \zeta(m) \), note that the remainder \( R_n \) after \( n \) terms is bounded by

\[
\int_n^\infty \frac{1}{x^m} \, dx = \frac{1}{m-1} n^{1-m}.
\]

For \( m = 3 \), if we wish to approximate the value to within \( 10^{-3} \), we must solve \( \frac{1}{2} n^{-2} < 10^{-3} \), so that \( n = 23 \), and \( \sum_{k=1}^{23} \frac{1}{k^3} \approx 1.201151926 \). The true value is \( \approx 1.202056903 \).

For \( m = 5 \), if we wish to approximate the value to within \( 10^{-3} \), we must solve \( \frac{1}{4} n^{-4} < 10^{-3} \), so that \( n = 4 \), and \( \sum_{k=1}^{4} \frac{1}{k^5} \approx 1.036341789 \). The true value is \( \approx 1.036927755 \).

9.4.66

a. Starting with \( \cot^2 x < \frac{1}{x^2} < 1 + \cot^2 x \), substitute \( k\theta \) for \( x \):

\[
\cot^2(k\theta) < \frac{1}{k^2\theta^2} < 1 + \cot^2(k\theta),
\]

\[
\sum_{k=1}^{n} \cot^2(k\theta) < \sum_{k=1}^{n} \frac{1}{k^2\theta^2} < \sum_{k=1}^{n} (1 + \cot^2(k\theta)),
\]

\[
\sum_{k=1}^{n} \cot^2(k\theta) < \frac{1}{\theta^2} \sum_{k=1}^{n} \frac{1}{k^2} < n + \sum_{k=1}^{n} \cot^2(k\theta).
\]

Note that the identity is valid because we are only summing for \( k \) up to \( n \), so that \( k\theta < \frac{\pi}{2} \).

b. Substitute \( \frac{n(2n-1)}{3} \) for the sum, using the identity:

\[
\frac{n(2n-1)}{3} < \frac{1}{\theta^2} \sum_{k=1}^{n} \frac{1}{k^2} < n + \frac{n(2n-1)}{3},
\]

\[
\theta^2 \frac{n(2n-1)}{3} < \sum_{k=1}^{n} \frac{1}{k^2} < \theta^2 \frac{n(2n+2)}{3},
\]

\[
\frac{n(2n-1)\pi^2}{3(2n+1)^2} < \sum_{k=1}^{n} \frac{1}{k^2} < \frac{n(2n+2)\pi^2}{3(2n+1)^2}.
\]

c. By the Squeeze Theorem, if the expressions on either end have equal limits as \( n \to \infty \), the expression in the middle does as well, and its limit is the same. The expression on the left is

\[
\pi^2 \frac{2n^2 - n}{12n^2 + 12n + 3} = \pi^2 \frac{2 - n^{-1}}{12 + 12n^{-1} + 3n^{-2}},
\]

which has a limit of \( \frac{\pi^2}{6} \) as \( n \to \infty \). The expression on the right is

\[
\pi^2 \frac{2n^2 + 2n}{12n^2 + 12n + 3} = \pi^2 \frac{2 + 2n^{-1}}{12 + 12n^{-1} + 3n^{-2}},
\]

which has the same limit. Thus \( \lim_{n \to \infty} \sum_{k=1}^{n} \frac{1}{k^2} = \sum_{k=1}^{\infty} \frac{1}{k^2} = \frac{\pi^2}{6} \).
9.4.67 Splitting the series into even and odd terms gives
\[ \sum_{k=1}^{\infty} \frac{1}{k^2} = \sum_{k=1}^{\infty} \frac{1}{(2k)^2} + \sum_{k=1}^{\infty} \frac{1}{(2k-1)^2}. \]
But
\[ \sum_{k=1}^{\infty} \frac{1}{(2k)^2} = \frac{1}{4} \sum_{k=1}^{\infty} \frac{1}{k^2}. \]
Thus
\[ \frac{\pi^2}{6} = \frac{1}{4} \frac{\pi^2}{6} + \sum_{k=1}^{\infty} \frac{1}{(2k-1)^2}, \]
so that the sum in question is
\[ \frac{3\pi^2}{24} = \frac{\pi^2}{8}. \]

9.4.68

a. \{F_n\} is a decreasing sequence because each term in \( F_n \) is smaller than the corresponding term in \( F_{n-1} \) and thus the sum of terms in \( F_n \) is smaller than the sum of terms in \( F_{n-1} \).

b. It appears that \( \lim_{n \to \infty} F_n = 0. \)

c. The right Riemann sum for \( \int_1^{\infty} \frac{dx}{x} \) using \( n \) subintervals has \( n \) rectangles of width \( \frac{1}{n} \); the right edges of those rectangles are at \( 1 + \frac{i}{n} = \frac{n+i}{n} \) for \( i = 1, 2, \ldots, n \). The height of such a rectangle is \( \frac{1}{x} \) at the right endpoint, which is \( \frac{1}{n+i} \). Thus the area of the rectangle is \( \frac{1}{n} \cdot \frac{1}{n+i} = \frac{1}{n+i} \). Adding up over all the rectangles gives \( x_n \).

d. The limit \( \lim_{n \to \infty} x_n \) is the limit of the right Riemann sum as the width of the rectangles approaches zero.

This is precisely \( \int_1^{\infty} \frac{dx}{x} = \ln x \bigg|_1^2 = \ln 2. \)
The first diagram is a left Riemann sum for $f(x) = \frac{1}{x}$ on the interval $[1, 10]$ (we assume $n = 10$ for purposes of drawing a graph). The area under the curve is $\int_1^{10} \frac{1}{x} \, dx = \ln(10)$, and the sum of the areas of the rectangles is obviously $1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n}$. Thus
\[
\ln(10) < 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n}
\]
The second diagram is a right Riemann sum for the same function on the same interval. Considering only the right endpoint of each subinterval, the area under the curve is
\[
\int_1^{10} \frac{1}{x} \, dx = \ln(n)
\]
and the sum of the areas of the rectangles is
\[
\frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n} < \ln(n)
\]
Adding 1 to both sides gives the desired inequality.

b. According to part (a), $\ln(n + 1) < S_n$ for $n = 1, 2, 3, \ldots$, so that $E_n = S_n - \ln(n + 1) > 0$.

c. Using the second figure above and assuming $n = 9$, the final rectangle corresponds to $\frac{1}{9}$, and the area under the curve between $n + 1$ and $n + 2$ is clearly $\ln(n + 2) - \ln(n + 1)$.

d. $E_{n+1} - E_n = S_{n+1} - \ln(n + 2) - (S_n - \ln(n + 1)) = \frac{1}{n+1} - (\ln(n + 2) - \ln(n + 1))$. But this is positive because of the bound established in part (c).

e. Using part (a), $E_n = S_n - \ln(n + 1) < 1 + \ln n - \ln(n + 1) < 1$.

f. $E_n$ is a monotone (increasing) sequence that is bounded, so it has a limit.

g. The first ten values ($E_1$ through $E_{10}$) are
\[
0.3068528194, \ 0.401387711, \ 0.447038972, \ 0.473895421, \ 0.491573864, \ 0.504089851, \ 0.513415601, \ 0.520632566, \ 0.526383161, \ 0.531072981.
\]
$E_{1000} \approx 0.576716082$.

h. For $S_n > 10$ we need $10 - 0.5772 = 9.4228 > \ln(n + 1)$. Solving for $n$ gives $n \approx 12366.16$, so $n = 12367$.

9.4.71

a. Note that the center of gravity of any stack of dominoes is the average of the locations of their centers. Define the midpoint of the zeroth (top) domino to be $x = 0$, and stack additional dominoes down and to its right (to increasingly positive $x$-coordinates). Let $m(n)$ be the $x$-coordinate of the midpoint of the $n$th domino. Then in order for the stack not to fall over, the left edge of the $n$th domino must be placed directly under the center of gravity of dominoes 0 through $n - 1$, which is $\frac{1}{n} \sum_{i=0}^{n-1} m(i)$, so that $m(n) = 1 + \frac{1}{n} \sum_{i=0}^{n-1} m(i)$. We claim that in fact $m(n) = \sum_{i=1}^{n} \frac{1}{i}$. Use induction. This is certainly true for $n = 1$. Note first that $m(0) = 0$, so we can start the sum at 1 rather than at 0. Now, $m(n) = 1 + \frac{1}{n} \sum_{i=1}^{n-1} m(i) = 1 + \frac{1}{n} \sum_{i=1}^{n-1} \sum_{j=1}^{i} \frac{1}{j}$. Now, 1 appears $n - 1$ times in the double sum, 2 appears $n - 2$ times, and so forth, so we can rewrite this sum as $m(n) = 1 + \frac{1}{n} \sum_{i=1}^{n-1} \frac{n-i}{i} = \ln(n) + \sum_{i=1}^{n-1} \frac{1}{i}$.
1 + \frac{1}{n} \sum_{i=1}^{n-1} \left( \frac{a_i}{a_{i+1}} - 1 \right) = 1 + \frac{1}{n} \left( n \sum_{i=1}^{n-1} \frac{1}{r_i} - (n - 1) \right) = \sum_{i=1}^{n-1} \frac{1}{r_i} + 1 - \frac{n-1}{n} = \sum_{i=1}^{n} \frac{1}{r_i}, \text{ and we are done by induction (noting that the statement is clearly true for } n = 0, n = 1). \text{ Thus the maximum overhang is } \sum_{k=2}^{n} \frac{1}{r_k}.

b. For an infinite number of dominos, because the overhang is the harmonic series, the distance is potentially infinite.

9.4.72
a. The circumference of the } k \text{th layer is } 2\pi \cdot \frac{1}{k}, \text{ so its area is } 2\pi \cdot \frac{1}{k} \text{ and thus the total vertical surface area is } \sum_{k=1}^{n} 2\pi \cdot \frac{1}{k} = 2\pi \sum_{k=1}^{n} \frac{1}{k} = \infty. \text{ The horizontal surface area, however, is } \pi, \text{ since looking at the cake from above, the horizontal surface covers the circle of radius 1, which has area } \pi \cdot 1^2 = \pi.

b. The volume of a cylinder of radius } r \text{ and height } h \text{ is } \pi r^2 h, \text{ so that the volume of the } k \text{th layer is } \pi \cdot \frac{1}{k^2} \cdot 1 = \frac{\pi}{k^2}. \text{ Thus the volume of the cake is }
\sum_{k=1}^{\infty} \frac{\pi}{k^2} = \pi \sum_{k=1}^{\infty} \frac{1}{k^2} = \frac{\pi^3}{6} \approx 5.168.

c. This cake has infinite surface area, yet it has finite volume!

9.5 The Ratio, Root, and Comparison Tests

9.5.1 Given a series } \sum a_k \text{ of positive terms, compute } \lim_{k \to \infty} \frac{a_{k+1}}{a_k} \text{ and call it } r. \text{ If } 0 \leq r < 1, \text{ the given series converges. If } r > 1 \text{ (including } r = \infty), \text{ the given series diverges. If } r = 1, \text{ the test is inconclusive.}

9.5.2 Given a series } \sum a_k \text{ of positive terms, compute } \lim_{k \to \infty} \sqrt[k]{a_k} \text{ and call it } r. \text{ If } 0 \leq r < 1, \text{ the given series converges. If } r > 1 \text{ (including } r = \infty), \text{ the given series diverges. If } r = 1, \text{ the test is inconclusive.}

9.5.3 Given a series of positive terms } \sum a_k \text{ that you suspect converges, find a series } \sum b_k \text{ that you know converges, for which } \lim_{k \to \infty} \frac{a_k}{b_k} = L \text{ where } L \geq 0 \text{ is a finite number. If you are successful, you will have shown that the series } \sum a_k \text{ converges. Given a series of positive terms } \sum a_k \text{ that you suspect diverges, find a series } \sum b_k \text{ that you know diverges, for which } \lim_{k \to \infty} \frac{a_k}{b_k} = L \text{ where } L > 0 \text{ (including the case } L = \infty). \text{ If you are successful, you will have shown that } \sum a_k \text{ diverges.}

9.5.4 The Divergence Test.

9.5.5 The Ratio Test, since one hopes that dividing } a_{k+1} \text{ by } a_k \text{ will convert } \frac{(k+1)!}{k!} \text{ to simply } k+1, \text{ which is much easier to analyze.}

9.5.6 The Comparison Test or the Limit Comparison Test, since we know how to compute limits of rational functions.

9.5.7 The difference between successive partial sums is a term in the sequence. Because the terms are positive, differences between successive partial sums are as well, so the sequence of partial sums is increasing.

9.5.8 No. They all determine convergence or divergence by approximating or bounding the series by some other series known to converge or diverge; thus, the actual value of the series cannot be determined.

9.5.9 The ratio between successive terms is } \frac{a_{k+1}}{a_k} = \frac{1}{(k+1)!} \cdot \frac{k!}{1} = \frac{1}{k+1}, \text{ which goes to zero as } k \to \infty, \text{ so the given series converges by the Ratio Test.

9.5.10 The ratio between successive terms is } \frac{a_{k+1}}{a_k} = \frac{2^{k+1}}{(k+1)!} \cdot \frac{k!}{2^k} = \frac{2}{k+1}; \text{ the limit of this ratio is zero, so the given series converges by the Ratio Test.
9.5.11 The ratio between successive terms is \( \frac{a_{k+1}}{a_k} = \frac{(k+1)^2}{3(k+1)} \cdot \frac{4^k}{k^2} = \frac{1}{4} \left( \frac{k+1}{k} \right)^2 \). The limit is \( \frac{1}{4} < 1 \) as \( k \to \infty \), so the given series converges by the Ratio Test.

9.5.12 The ratio between successive terms is

\[
\frac{a_{k+1}}{a_k} = \frac{2(k+1)}{(k+1)(k+1)} \cdot \frac{k^k}{2k} = \frac{2}{k+1} \left( \frac{k}{k+1} \right)^k .
\]

Note that \( \lim_{k \to \infty} \left( \frac{k}{k+1} \right)^k = \lim_{k \to \infty} \left( 1 - \frac{1}{k+1} \right)^k = \frac{1}{e} \), so the limit of the ratio is \( 0 \cdot \frac{1}{e} = 0 \), so the given series converges by the Ratio Test.

9.5.13 The ratio between successive terms is \( \frac{a_{k+1}}{a_k} = \frac{(k+1)e^{-(k+1)}}{k} = \frac{k+1}{k} \). The limit of this ratio as \( k \to \infty \) is \( \frac{1}{e} < 1 \), so the given series converges by the Ratio Test.

9.5.14 The ratio between successive terms is \( \frac{a_{k+1}}{a_k} = \frac{(k+1)!}{(k+1)^{k+1}} \cdot \frac{k^k}{e^k} = \left( \frac{k}{k+1} \right)^k \). This is the reciprocal of \( \left( \frac{k+1}{k} \right)^k \) which has limit \( e \) as \( k \to \infty \), so the limit of the ratio of successive terms is \( \frac{1}{e} < 1 \), so the given series converges by the Ratio Test.

9.5.15 The ratio between successive terms is \( \frac{a_{k+1}}{a_k} = \frac{(k+1)^2}{2(k+1)^{k+1}} \cdot \frac{99}{2k^9} = 2 \left( \frac{k}{k+1} \right)^{99} \); the limit as \( k \to \infty \) is 0, so the given series diverges by the Ratio Test.

9.5.16 The ratio between successive terms is \( \frac{(k+1)!}{(2k+1)!} \cdot \frac{k^k}{e^k} = \frac{1}{k} \left( \frac{k+1}{k} \right)^k \); the limit as \( k \to \infty \) is zero, so the given series converges by the Ratio Test.

9.5.17 The ratio between successive terms is \( \frac{(k+1)!}{(2k+1)!} \cdot \frac{2k!}{(k+1)!} = \left( \frac{k+1}{2k+1} \right)^2 \); the limit as \( k \to \infty \) is \( \frac{1}{4} < 1 \), so the given series converges by the Ratio Test.

9.5.18 The \( k \)th term of this series is \( \frac{k^4}{2^k} = k^2 2^{-k} \), so the ratio between successive terms is \( \frac{(k+1)^2}{2^{k+2}} = \frac{1}{2} \left( \frac{k+1}{k} \right)^4 \). The limit as \( k \to \infty \) is \( \frac{1}{2} \), so the given series diverges by the Ratio Test.

9.5.19 The \( k \)th root of the \( k \)th term is \( \frac{4k^3+k}{9k^3+k+1} \). The limit of this as \( k \to \infty \) is \( \frac{4}{9} < 1 \), so the given series converges by the Root Test.

9.5.20 The \( k \)th root of the \( k \)th term is \( \frac{k+1}{2k} \). The limit of this as \( k \to \infty \) is \( \frac{1}{2} < 1 \), so the given series converges by the Root Test.

9.5.21 The \( k \)th root of the \( k \)th term is \( \frac{k^{2/k}}{2} \). The limit of this as \( k \to \infty \) is \( \frac{1}{2} < 1 \), so the given series diverges by the Root Test.

9.5.22 The \( k \)th root of the \( k \)th term is \( \left( 1 + \frac{3}{k} \right)^k \). The limit of this as \( k \to \infty \) is \( e^3 > 1 \), so the given series diverges by the Root Test.

9.5.23 The \( k \)th root of the \( k \)th term is \( \left( \frac{k}{k+1} \right)^{2k} \). The limit of this as \( k \to \infty \) is \( e^{-2} < 1 \), so the given series converges by the Root Test.

9.5.24 The \( k \)th root of the \( k \)th term is \( \frac{1}{\ln(k+1)} \). The limit of this as \( k \to \infty \) is 0, so the given series converges by the Root Test.

9.5.25 The \( k \)th root of the \( k \)th term is \( \sqrt[k]{\frac{1}{k^4}} = \frac{1}{k} \). The limit of this as \( k \to \infty \) is 0, so the given series converges by the Root Test.

9.5.26 The \( k \)th root of the \( k \)th term is \( \frac{1/k}{e} \). The limit of this as \( k \to \infty \) is \( \frac{1}{e} < 1 \), so the given series converges by the Root Test.

Copyright © 2014 Pearson Education, Inc.
9.5.32 Use the Limit Comparison Test with \( \frac{1}{k} \). The ratio of the terms of the two series is \( \frac{k^4 + k^3 - k^2}{k^4 + 4k^2 - 3} \) which has limit 1 as \( k \to \infty \). Because the comparison series converges, the given series does as well.

9.5.33 \( \sin \left( \frac{1}{k} \right) > 0 \) for \( k \geq 1 \), so we can apply the Comparison Test with \( \frac{1}{k^2} \). \( \sin \left( \frac{1}{k} \right) < 1 \), so \( \frac{\sin(1/k)}{k^2} < \frac{1}{k^2} \). Because the comparison series converges, the given series converges as well.

9.5.34 Use the Limit Comparison Test with \( \frac{1}{k} \). The ratio of the terms of the two series is \( \frac{k^3}{k^3 - 2k^2} = \frac{1}{1 - \left( \frac{2}{k} \right)} \), which has limit 1 as \( k \to \infty \). Because the comparison series converges, the given series does as well.

9.5.35 Use the Limit Comparison Test with \( \frac{1}{k} \). The ratio of the terms of the two series is \( \frac{1}{2k^3} = \frac{1}{2^{1/3}k} \), which has limit \( \frac{1}{2} \) as \( k \to \infty \). Because the comparison series diverges, the given series does as well.

9.5.36 \( \frac{1}{k^{2/3} + 2^2} < \frac{1}{k^{2/3}} \). Because the series whose terms are \( \frac{1}{k^{2/3}} \) is a \( p \)-series with \( p > 1 \), it converges. Because the comparison series converges, the given series converges as well.

9.5.37 Use the Limit Comparison Test with \( \frac{k^{2/3}}{k^{1/3} + 2} \). The ratio of corresponding terms of the two series is \( \frac{\sqrt[k]{k^{2/3}}}{\sqrt[k]{k^{1/3} + 2}} \), which has limit 1 as \( k \to \infty \). The comparison series is the series whose terms are \( k^{2/3}/k^{1/3} = k^{-1/3} \), which is a \( p \)-series with \( p < 1 \), so it, and the given series, both diverge.

9.5.38 For all \( k \), \( \frac{1}{k^{(\ln k)^2}} < \frac{1}{k^2} \). Because the series whose terms are \( \frac{1}{k^2} \) converges, the given series converges as well.

9.5.39

a. False. For example, let \( \{a_k\} \) be all zeros, and \( \{b_k\} \) be all 1’s.

b. True. This is a result of the Comparison Test.

c. True. Both of these statements follow from the Comparison Test.

d. True. Suppose the rational function is \( a_k = \frac{b_0k^{m+n} + \cdots}{c_0k^m + \cdots} \) where \( b_mk^m \) and \( c_nk^n \) are the highest-degree terms in the numerator and denominator respectively. Then the Ratio Test will produce

\[
\frac{a_{k+1}}{a_k} = \frac{b_m(k+1)^m + \cdots}{c_n(k+1)^n + \cdots} \cdot \frac{c_nk^n + \cdots}{b_mk^m + \cdots}.
\]

But each of these factors has the same highest-degree term in the numerator as in the denominator, so the limit of this ratio is 1 as \( k \to \infty \). Thus the Ratio Test is inconclusive.

9.5.40 Use the Divergence Test: \( \lim_{k \to \infty} a_k = \lim_{k \to \infty} \left( \frac{k-1}{k} \right) = \lim_{k \to \infty} \left( 1 - \frac{1}{k} \right)^k = \frac{e}{\epsilon} \neq 0 \), so the given series diverges.
9.5.41 Use the Divergence Test: \( \lim_{k \to \infty} a_k = \lim_{k \to \infty} (1 + \frac{2}{k})^k = e^2 \neq 0 \), so the given series diverges.

9.5.42 Use the Root Test: The \( k \)th root of the \( k \)th term is \( \frac{k^2}{2k+1} \). The limit of this as \( k \to \infty \) is \( \frac{1}{2} < 1 \), so the given series converges by the Root Test.

9.5.43 Use the Ratio Test: the ratio of successive terms is \( \frac{(k+1)^{100}}{k^{100}} \cdot \frac{k+1}{k+2} \). This has limit \( 1^{100} \cdot 0 = 0 \) as \( k \to \infty \), so the given series converges by the Ratio Test.

9.5.44 Use the Comparison Test. Note that \( \sin^2 k \leq 1 \) for all \( k \), so \( \frac{\sin^2 k}{k^2} \leq \frac{1}{k^2} \) for all \( k \). Because \( \sum_{k=1}^{\infty} \frac{1}{k^2} \) converges, so does the given series.

9.5.45 Use the Root Test. The \( k \)th root of the \( k \)th term is \( (k^{1/k} - 1)^2 \), which has limit 0 as \( k \to \infty \), so the given series converges by the Root Test.

9.5.46 Use the Limit Comparison Test with the series whose \( k \)th term is \( \left(\frac{2}{k}\right)^{k^3} \). Note that \( \lim_{k \to \infty} \frac{2^k}{e^k} = \lim_{k \to \infty} \frac{e^k}{2^k} = 1 \). The given series thus converges because \( \sum_{k=1}^{\infty} \left(\frac{2}{k}\right)^{k^3} \) converges (because it is a geometric series with \( r = \frac{2}{e} < 1 \)). Note that it is also possible to show convergence with the Ratio Test.

9.5.47 Use the Divergence Test: \( \lim_{k \to \infty} \frac{k^2 + 2k + 1}{3k^2 + 1} \neq 0 \), so the given series diverges.

9.5.48 Use the Limit Comparison Test with the series whose \( k \)th term is \( \frac{1}{k^p} \). Note that \( \lim_{k \to \infty} \frac{1}{k^p} = \frac{5^k}{1} = 1 \), and the series \( \sum_{k=1}^{\infty} \frac{1}{k^p} \) converges because it is a geometric series with \( r = \frac{1}{5} \). Thus, the given series also converges.

9.5.49 Use the Limit Comparison Test with the harmonic series. Note that \( \lim_{k \to \infty} \frac{1}{k} = \lim_{k \to \infty} \frac{k}{k^2} = \infty \), and because the harmonic series diverges, the given series does as well.

9.5.50 Use the Limit Comparison Test with the series whose \( k \)th term is \( \frac{1}{k^3} \). Note that \( \lim_{k \to \infty} \frac{1}{k^{3/2}} = \frac{5^k}{k^{3/2}} \), \( \frac{5^k}{k^{3/2}} = \lim_{k \to \infty} \frac{1}{k^{3/2}} \cdot \frac{5^k}{\sqrt[k]{k^{3/2}}} = 1 \), and the series \( \sum_{k=1}^{\infty} \frac{1}{k^{3/2}} \) converges because it is a \( p \)-series with \( p = \frac{3}{2} \). Thus, the given series also converges.

9.5.51 Use the Limit Comparison Test with the series whose \( k \)th term is \( \frac{1}{k^{3/2}} \). Note that \( \lim_{k \to \infty} \frac{1}{\sqrt[k]{k^{3/2}}} = 1 \), and the series \( \sum_{k=1}^{\infty} \frac{1}{k^{3/2}} \) converges because it is a \( p \)-series with \( p = \frac{3}{2} \). Thus, the given series also converges.

9.5.52 Use the Ratio Test: \( \frac{a_{k+1}}{a_k} = \frac{(k+1)^{1/3} (3k+2)(3k+1)^{1/3}}{(3k+1)^{1/3} (3k+2)(3k+1)^{1/3}} \), which has limit \( \frac{1}{2^k} \) as \( k \to \infty \). Thus the given series converges.

9.5.53 Use the Comparison Test. Each term \( \frac{1}{k} + 2^{-k} > \frac{1}{k} \). Because the harmonic series diverges, so does this series.

9.5.54 Use the Comparison Test with \( \{ \frac{2}{k} \} \). Note that \( \frac{2\ln k}{k} > \frac{2}{k} \) for \( k > 1 \). Because the series whose terms are \( \frac{5}{k} \) diverges, the given series diverges as well.

9.5.55 Use the Ratio Test. \( \frac{a_{k+1}}{a_k} = \frac{2^{k+1} (k+1)!}{(k+1)!} \cdot \frac{k^k}{2^k} = 2^{k+1} \left( \frac{k}{k+1} \right)^k \), which has limit \( \frac{2}{e} \) as \( k \to \infty \), so the given series converges.

9.5.56 Use the Root Test. \( \lim_{k \to \infty} \left(1 - \frac{1}{k}\right)^k = e^{-1} < 1 \), so the given series converges.

9.5.57 Use the Limit Comparison Test with \( \{ \frac{1}{k} \} \). The ratio of corresponding terms is \( \frac{k^{1/3}}{(k+1)^{1/3}} \), which has limit 1 as \( k \to \infty \). Because the comparison series converges, so does the given series.
9.5.58 Use the Root Test. \( \lim_{k \to \infty} \sqrt[k]{p} = \frac{1}{\sqrt[p]{p}} < 1 \) because \( p > 0 \), so the given series converges.

9.5.59 This is a \( p \)-series with exponent greater than 1, so it converges.

9.5.60 Use the Comparison Test: \( \frac{1}{k^p} < \frac{1}{k^2} \). Because the series whose terms are \( \frac{1}{k^2} \) is a convergent \( p \)-series, the given series converges as well.

9.5.61 \( \ln \left( \frac{k+2}{k+1} \right) = \ln(k+2) - \ln(k+1) \), so this series telescopes. We get \( \sum_{k=1}^{n} \ln \left( \frac{k+2}{k+1} \right) = \ln(n+2) - \ln 2 \). Because \( \lim_{n \to \infty} \ln(n+2) - \ln 2 = \infty \), the sequence of partial sums diverges, so the given series is divergent.

9.5.62 Use the Divergence Test. Note that \( \lim_{k \to \infty} k^{-1/k} = \lim_{k \to \infty} \frac{1}{k^{1/k}} = 1 \neq 0 \), so the given series diverges.

9.5.63 For \( k > 7 \), \( \ln k > 2 \) so note that \( \frac{1}{k^p} < \frac{1}{k^2} \). Because \( \sum_{k=1}^{\infty} \frac{1}{k^2} \) converges, the given series converges as well.

9.5.64 Use the Limit Comparison Test with \( \{ \frac{1}{k^2} \} \). Note that \( \frac{\sin^2(1/k)}{1/k^2} = \left( \frac{\sin(1/k)}{1/k} \right)^2 \). Because \( \lim_{x \to 0} \frac{\sin x}{x} = 1 \), the limit of this expression is \( 1^2 = 1 \) as \( k \to \infty \). Because \( \sum_{k=1}^{\infty} \frac{1}{k^2} \) converges, the given series does as well.

9.5.65 Use the Limit Comparison Test with the harmonic series. \( \frac{\tan(1/k)}{1/k} \) has limit 1 as \( k \to \infty \) because \( \lim_{x \to 0} \frac{\tan x}{x} = 1 \). Thus the original series diverges.

9.5.66 Use the Root Test. \( \lim_{k \to \infty} \sqrt[k]{a_k} = \lim_{k \to \infty} \sqrt[100]{k} \cdot \frac{1}{k} = 0 \), so the given series converges.

9.5.67 Note that \( \frac{1}{(2k+1)(2k+3)} = \frac{1}{2} \left( \frac{1}{2k+1} - \frac{1}{2k+3} \right) \). Thus this series telescopes.

\[
\sum_{k=0}^{n} \frac{1}{(2k+1)(2k+3)} = \frac{1}{2} \sum_{k=0}^{n} \left( \frac{1}{2k+1} - \frac{1}{2k+3} \right) = \frac{1}{2} \left( -\frac{1}{2n+3} + 1 \right),
\]

so the given series converges to \( \frac{1}{2} \), because that is the limit of the sequence of partial sums.

9.5.68 This series is \( \sum_{k=1}^{\infty} \frac{k-1}{k^2} = \sum_{k=1}^{\infty} \left( \frac{k}{k^2} - \frac{1}{k^2} \right) \). Because \( \sum_{k=1}^{\infty} \frac{1}{k^2} \) converges, if the original series also converged, we would have that \( \sum_{k=1}^{\infty} \frac{1}{k^2} \) converged, which is false. Thus the original series diverges.

9.5.69 This series is \( \sum_{k=1}^{\infty} \frac{k^2}{k^3} \). By the Ratio Test, \( \frac{a_{k+1}}{a_k} = \frac{(k+1)^2}{(k+1)!} \cdot \frac{k!}{k^2} = \frac{1}{k+1} \left( \frac{k+1}{k} \right)^2 \), which has limit 0 as \( k \to \infty \), so the given series converges.

9.5.70 For any \( p \), if \( k \) is sufficiently large then \( k^{1/p} > \ln k \) because powers grow faster than logs, so that \( k > (\ln k)^p \) and thus \( \frac{1}{k} < \frac{1}{\ln^p k} \). Because \( \sum \frac{1}{k^2} \) diverges, we see that the original series diverges for all \( p \).

9.5.71 For \( p \leq 1 \) and \( k > e \), \( \ln k > 1 \). The series \( \sum_{k=1}^{\infty} \frac{1}{k^p} \) diverges, so the given series diverges. For \( p > 1 \), let \( q < p - 1 \); then for sufficiently large \( k \), \( \ln k < k^q \), so that by the Comparison Test, \( \frac{\ln k}{k^p} < \frac{k^q}{k^p} = \frac{1}{k^{p-q}} \). But \( p-q > 1 \), so that \( \sum_{k=1}^{\infty} \frac{1}{k^{p-q}} \) is a convergent \( p \)-series. Thus the original series is convergent precisely when \( p > 1 \).

9.5.72 For \( p \neq 1 \),

\[
\int_{2}^{\infty} \frac{dx}{x \ln x (\ln \ln x)^p} = \lim_{b \to \infty} \left( \frac{\ln \ln x}{1-p} \right)^{1-p} \bigg|_{2}^{b}.
\]

This improper integral converges if and only \( p > 1 \). If \( p = 1 \), we have

\[
\int_{2}^{\infty} \frac{dx}{x (\ln x) \ln \ln x} = \lim_{b \to \infty} \ln \ln x \bigg|_{2}^{b} = \infty.
\]

Thus the original series converges for \( p > 1 \).

Copyright © 2014 Pearson Education, Inc.
For $p < 1$, the integral 

$$
\int_1^{\infty} x^p \, dx
$$

diverges for $p \geq 3$, and the series converges for $p < 1$, so the original series diverges. For $p > 1$, let $q < p - 1$; then for sufficiently large $k$, $(\ln k)^p < k^q$. Note that 

$$
\frac{(\ln k)^p}{k^q} < \frac{1}{k^{p-q}}.
$$

But $p - q > 1$, so the series converges for $p > 1$.

9.5.74 Using the Ratio Test,

$$
\frac{a_{k+1}}{a_k} = \frac{(k+1)!p^{k+1}}{(k+2)^{k+1}}, \quad \frac{(k+1)p(k+1)}{(k+2)^{k+1}} = p \frac{k+1}{k+2}
$$

which has limit $pe^{-1}$. The series converges if the ratio limit is less than 1, so if $p < e$. If $p > e$, the given series diverges by the Ratio Test. If $p = e$, the Ratio Test is inconclusive; however, in this case the terms of the series are

$$
\frac{k!e^k}{(k+1)^k} = \frac{ke^k}{k+1},
$$

and by Stirling’s Formula, $\frac{k!e^k}{k} \sim \sqrt{2\pi}k$, so that $\left\{\frac{k!e^k}{k}\right\}$ diverges. Because $\left(\frac{k}{k+1}\right)^k \to 1$, the terms of the product diverge and thus the series diverges by the Divergence Test. Hence this series converges only for $p < e$.

9.5.75 Use the Ratio Test:

$$
\lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \frac{(k+1)p^{k+1}}{(k+2)^{k+1}} = p \lim_{k \to \infty} \frac{k^2 + 2k + 1}{k^2 + 2k} = p \lim_{k \to \infty} \frac{1 + 2/k + 1/k^2}{1 + 2/k} = p.
$$

Then this series converges when the limit is less than 1, so for $p < 1$.

9.5.76 $\ln \left(\frac{k}{k+1}\right)^p = p(\ln k - \ln(k+1))$, so

$$
\sum_{k=1}^{\infty} \ln \left(\frac{k}{k+1}\right)^p = p \sum_{k=1}^{\infty} (\ln k - \ln(k+1))
$$

which telescopes, and the $n^{th}$ partial sum is $-p \ln(n+1)$, and $\lim_{n \to \infty} (-p \ln(n+1))$ is not a finite number for any value of $p$ other than 0. The given series diverges for all values of $p$ other than $p = 0$.

9.5.77 $\lim_{k \to \infty} a_k = \lim_{k \to \infty} (1 - \frac{p}{k})^k = e^{-p} \neq 0$, so this sequence diverges for all $p$ by the Divergence Test.

9.5.78 Use the Limit Comparison Test: $\lim_{k \to \infty} \frac{a_k^2}{a_k} = \lim_{k \to \infty} a_k = 0$, because $\sum a_k$ converges. By the Limit Comparison Test, the series $\sum a_k^2$ must converge as well.

9.5.79 Note that we are assuming $r > 0$, so that the Integral, Ratio, and Root tests apply. Clearly the series do not converge for $r = 1$, so we assume $r \neq 1$ in what follows. Using the Integral Test, $\sum r^k$ converges if and only if $\int_1^{\infty} r^x \, dx$ converges. This improper integral has value $\lim_{b \to \infty} \int_1^{b} r^x \, dx$, which converges only when $\lim_{b \to \infty} r^b$ exists, which occurs only for $r < 1$. Using the Ratio Test, $\frac{a_{k+1}}{a_k} = \frac{r^{k+1}}{r^k} = r$, so by the Ratio Test, the series converges if and only if $r < 1$. Using the Root Test, $\lim_{k \to \infty} \sqrt[k]{a_k} = \lim_{k \to \infty} r^{k} = r$, so again we have convergence if and only if $r < 1$. Removing restrictions on $r$ and considering the Divergence Test, note that $\sum ar^k = a \sum r^k$, and $r^k \to 0$ if and only if $|r| < 1$. Thus if $|r| \geq 1$, the series diverges by the Divergence Test. We cannot conclude anything about the case $|r| < 1$ since the Divergence Test cannot be used to prove convergence.

9.5.80 a. Use the Limit Comparison Test with the divergent harmonic series. Note that $\lim_{k \to \infty} \frac{\sin(1/k)}{1/k} = 1$, because $\lim_{x \to 0} \frac{\sin x}{x} = 1$. Because the comparison series diverges, the given series does as well.
b. From the proof that \( \lim_{x \to 0} \frac{\sin x}{x} = 1 \) we know that for \( x < 1, \sin x < x \). Thus \( \frac{1}{k} \sin \frac{1}{k} < \frac{1}{k^2} \). Because \( \sum \frac{1}{k^2} \) is convergent, the given series is as well.

9.5.81 If \( \lim_{k \to \infty} \frac{a_k}{b_k} = L \) with \( 0 < L < \infty \), then

\[
\lim_{k \to \infty} \frac{b_k}{a_k} = \lim_{k \to \infty} \frac{1}{a_k/b_k} = \lim_{k \to \infty} \frac{1}{(a_k/b_k) L} = 1,
\]

and \( 0 < \frac{1}{L} < \infty \). Thus if \( 0 < L < \infty \) for one choice of \( a_k \) and \( b_k \), it will produce \( 0 < L < \infty \) for \( b_k \) and \( a_k \) as well. But both of those statements mean, using the Limit Comparison Test, that \( \sum a_k \) and \( \sum b_k \) either both converge or both diverge, so that it does not matter which series we choose for \( a_k \) and which for \( b_k \).

9.5.82 Note that if \( x = 0 \), the series obviously converges. So assume \( x \neq 0 \). Then

\[
\frac{a_{k+1}}{a_k} = \frac{x^{k+1}}{(k+1)!} \cdot \frac{k!}{x^k} = \frac{x}{k+1}.
\]

This has limit 0 as \( k \to \infty \) for any value of \( x \), so the series converges for all \( x \geq 0 \).

9.5.83 Note that if \( x = 0 \), the series obviously converges. So assume \( x \neq 0 \). Then

\[
\frac{a_{k+1}}{a_k} = \frac{x^{k+1}}{k+1} \cdot \frac{k}{x^k} = x \cdot \frac{k}{k+1},
\]

This has limit \( x \) as \( k \to \infty \), so the series converges for \( 0 \leq x < 1 \). It clearly does not converge for \( x \geq 1 \).

9.5.84 Note that if \( x = 0 \), the series obviously converges. So assume \( x \neq 0 \). Then

\[
\frac{a_{k+1}}{a_k} = \frac{x^{k+1}}{(k+1)^2} \cdot \frac{k}{x^k} = x \cdot \frac{k}{k+1},
\]

which has limit \( x \) as \( k \to \infty \). Thus this series converges for \( x < 1 \) and diverges for \( x > 1 \); additionally, for \( x = 1 \) (where the Ratio Test is inconclusive), the series is the harmonic series which diverges. Thus this series converges for \( 0 \leq x < 1 \).

9.5.85 Note that if \( x = 0 \), the series obviously converges. So assume \( x \neq 0 \). Then

\[
\frac{a_{k+1}}{a_k} = \frac{x^{k+1}}{(k+1)^2} \cdot \frac{k^2}{x^k} = x \left( \frac{k}{k+1} \right)^2,
\]

which has limit \( x^2 \) as \( k \to \infty \). Thus the series converges for \( x < 1 \) and diverges for \( x > 1 \). When \( x = 1 \), the series is \( \sum \frac{1}{k^2} \), which converges. Thus the original series converges for \( 0 \leq x \leq 1 \).

9.5.86 Note that if \( x = 0 \), the series obviously converges. So assume \( x \neq 0 \). Then

\[
\frac{a_{k+1}}{a_k} = \frac{x^{2k+2}}{(k+1)^2} \cdot \frac{k^2}{x^{2k}} = x^2 \left( \frac{k}{k+1} \right)^2,
\]

which has limit \( x^2 \) as \( k \to \infty \), so the series converges for \( x < 1 \) and diverges for \( x > 1 \). When \( x = 1 \), the series is \( \sum \frac{1}{k^2} \), which converges. Thus this series converges for \( 0 \leq x \leq 1 \).

9.5.87 Note that if \( x = 0 \), the series obviously converges. So assume \( x \neq 0 \). Then

\[
\frac{a_{k+1}}{a_k} = \frac{x^{k+1}}{2k+1} \cdot \frac{2k}{x^k} = \frac{x}{2},
\]

which has limit \( \frac{x}{2} \) as \( k \to \infty \). Thus the series converges for \( 0 \leq x < 2 \). For \( x \geq 2 \), it is obviously divergent.
9.5.88  

a. Let $P_n$ be the $n^{th}$ partial product of the $a_k$: $P_n = \prod_{k=1}^{n} a_k$. Then $\sum_{k=1}^{\infty} \ln a_k = \ln \prod_{k=1}^{n} a_k = \ln P_n$. If $\sum \ln a_k$ is a convergent series, then $\sum_{k=1}^{\infty} \ln a_k = \lim_{n \to \infty} \ln P_n = L < \infty$. But then $e^L = \lim_{n \to \infty} e^{\ln P_n} = \lim_{n \to \infty} P_n$, so that the infinite product converges.

<td>4/7</td>
<td>9/16</td>
</tr>
</tbody>
</table>

It appears that $P_n = \frac{n+1}{2n}$, so that $\lim_{n \to \infty} P_n = \frac{1}{2}$.

c. Because $\lim_{n \to \infty} \prod_{k=2}^{n} \left(1 - \frac{1}{k^2}\right) = \frac{1}{2}$, taking logs and using part (a) we see that

$$\lim_{n \to \infty} \sum_{k=1}^{n} \ln \left(1 - \frac{1}{k^2}\right) = \ln \frac{1}{2} = -\ln 2.$$

9.5.89  

a. $\ln \prod_{k=0}^{\infty} e^{1/2^k} = \sum_{k=0}^{\infty} \frac{1}{2^k} = 2$, so that the original product converges to $e^2$.

b. $\ln \prod_{k=2}^{\infty} (1 - \frac{1}{k^2}) = \ln \prod_{k=2}^{\infty} (\frac{k+1}{k}) = \sum_{k=2}^{\infty} \ln \frac{k+1}{k} = \sum_{k=2}^{\infty} (\ln(k+1) - \ln k)$. This series telescopes to give $S_n = -\ln n$, so the original series has limit $\lim_{n \to \infty} P_n = \lim_{n \to \infty} e^{-\ln n} = \lim_{n \to \infty} \frac{1}{n} = 0$.

9.5.90  

The sum on the left is simply the left Riemann sum over $n$ equal intervals between 0 and 1 for $f(x) = x^p$. The limit of the sum is thus $\int_{0}^{1} x^p \, dx = \left| \frac{1}{p+1} x^{p+1} \right|_{0}^{1} = \frac{1}{p+1}$, because $p$ is positive.

9.6 Alternating Series

9.6.1 Because $S_{n+1} - S_n = (-1)^n a_{n+1}$ alternates signs.

9.6.2 Check that the terms of the series are nonincreasing in magnitude after some finite number of terms, and that $\lim_{k \to \infty} a_k = 0$.

9.6.3 Because we are far enough out that the terms are nonincreasing in magnitude, we may assume the series is $\sum_{k=0}^{\infty} (-1)^k a_k$, where $a_k > 0$ for all $k$, and such that the $a_k$ are nonincreasing in magnitude starting with $a_1$. Then

$$S = S_{2n+1} + (a_{2n} - a_{2n+1}) + (a_{2n+2} - a_{2n+3}) + \cdots$$

and each term of the form $a_{2k} - a_{2k+1} > 0$, so that $S_{2n+1} < S$. Also

$$S = S_{2n} + (-a_{2n+1} + a_{2n+2}) + (-a_{2n+3} + a_{2n+4}) + \cdots$$

and each term of the form $-a_{2k+1} + a_{2k+2} < 0$, so that $S < S_{2n}$. Thus the sum of the series is trapped between the odd partial sums and the even partial sums.

9.6.4 The difference between $L$ and $S_n$ is bounded in magnitude by $a_{n+1}$.

9.6.5 The remainder is less than the first neglected term because

$$S - S_n = (-1)^{n+1} (a_{n+1} + (-a_{n+2} + a_{n+3}) + \cdots)$$

so that the sum of the series after the first disregarded term has the opposite sign from the first disregarded term.

9.6.6 The alternating harmonic series $\sum (-1)^k \frac{1}{k}$ converges, but not absolutely.

Copyright © 2014 Pearson Education, Inc.
9.6.7 No. If the terms are positive, then the absolute value of each term is the term itself, so convergence and absolute convergence would mean the same thing in this context.

9.6.8 The idea of the proof is to note that \(0 \leq |a_k| + a_k \leq 2|a_k|\) and apply the Comparison Test to conclude that if \(\sum |a_k|\) converges, then so does \(\sum 2|a_k|\), and thus so must \(\sum (|a_k| + a_k)\), and then conclude that \(\sum a_k\) must converge as well.

9.6.9 Yes. For example, \(\sum (-1)^k\) converges absolutely and thus not conditionally (see the definition).

9.6.10 The alternating harmonic series \(\sum (-1)^k\frac{1}{k}\) converges conditionally, but not absolutely.

9.6.11 The terms of the series decrease in magnitude, and \(\lim_{k \to \infty} \frac{1}{2k+1} = 0\), so the given series converges.

9.6.12 The terms of the series decrease in magnitude, and \(\lim_{k \to \infty} \frac{1}{\sqrt{k}} = 0\), so the given series converges.

9.6.13 \(\lim_{k \to \infty} \frac{k}{3k+2} = \frac{1}{3} \neq 0\), so the given series diverges.

9.6.14 \(\lim_{k \to \infty} (1 + \frac{1}{k})^k = e \neq 0\), so the given series diverges.

9.6.15 The terms of the series decrease in magnitude, and \(\lim_{k \to \infty} \frac{1}{k^2} = 0\), so the given series converges.

9.6.16 The terms of the series decrease in magnitude, and \(\lim_{k \to \infty} \frac{1}{k+10} = 0\), so the given series converges.

9.6.17 The terms of the series decrease in magnitude, and \(\lim_{k \to \infty} \frac{k^2}{k^2+1} = \lim_{k \to \infty} \frac{1/k}{1+1/k^2} = 0\), so the given series converges.

9.6.18 The terms of the series eventually decrease in magnitude, because if \(f(x) = \ln x\), then \(f'(x) = \frac{x(1-2\ln x)}{x^2} = \frac{1-2\ln x}{x}\), which is negative for large enough \(x\). Further, \(\lim_{k \to \infty} \frac{\ln k}{k^2} = \lim_{k \to \infty} \frac{1}{2k} = \lim_{k \to \infty} \frac{1}{2k^2} = 0\). Thus the given series converges.

9.6.19 \(\lim_{k \to \infty} \frac{k^2-1}{k^2+3} = 1\), so the terms of the series do not tend to zero and thus the given series diverges.

9.6.20 \(\sum_{k=0}^{\infty} (-\frac{1}{2})^k = \sum_{k=0}^{\infty} (-1)^k \left(\frac{1}{2}\right)^k\). Since \(\left(\frac{1}{2}\right)^k\) is decreasing, and tends to zero as \(k \to \infty\), the given series converges.

9.6.21 \(\lim_{k \to \infty} (1 + \frac{1}{k}) = 1\), so the given series diverges.

9.6.22 Note that \(\cos(\pi k) = (-1)^k\), and so the given series is alternating. Because \(\lim_{k \to \infty} \frac{1}{k^2} = 0\) and \(\frac{1}{k^2}\) is decreasing, the given series is convergent.

9.6.23 The derivative of \(f(k) = \frac{k^{10}+2k^5+1}{k(k^5+1)}\) is \(f'(k) = \frac{-2k+2k^{10}+12k^4-8k^5+1}{k(k^5+1)^2}\). The numerator is negative for large enough values of \(k\), and the denominator is always positive, so the derivative is negative for large enough \(k\). Also, \(\lim_{k \to \infty} \frac{k^{10}+2k^5+1}{k(k^5+1)} = \lim_{k \to \infty} \frac{1+2k^{-5}+k^{-10}}{k+k^{-9}} = 0\). Thus the given series converges.

9.6.24 Clearly \(\frac{1}{k\ln k}\) is nonincreasing, and \(\lim_{k \to \infty} \frac{1}{k\ln^2 k} = 0\), so the given series converges.

9.6.25 \(\lim_{k \to \infty} k^{1/k} = 1\) (for example, take logs and apply L'Hôpital's rule), so the given series diverges by the Divergence Test.

9.6.26 \(a_{k+1} < a_k\) because \(a_{k+1} = \frac{(k+1)!}{(k+1)^{k+1}} \cdot \frac{k^k}{k!} = \left(\frac{k}{k+1}\right)^k < 1\). Additionally, \(\frac{k!}{k^k} \to 0\) as \(k \to \infty\), so the given series converges.

9.6.27 \(\frac{1}{\sqrt{k^2+1}}\) is decreasing and tends to zero as \(k \to \infty\), so the given series converges.
9.6.28 \[ \lim_{k \to \infty} k \sin \frac{1}{k} = \lim_{k \to \infty} \sin \left( \frac{1}{k} \right) = 1, \] so the given series diverges.

9.6.29 We want \( \frac{1}{n+1} < 10^{-4} \), or \( n + 1 > 10^4 \), so \( n = 10^4 \).

9.6.30 The series starts with \( k = 0 \), so we want \( \frac{1}{n} < 10^{-4} \), or \( n! > 10^4 = 10000 \). This happens for \( n = 8 \).

9.6.31 The series starts with \( k = 0 \), so we want \( \frac{1}{2n+1} < 10^{-4} \), or \( 2n + 1 > 10^4 \), \( n = 5000 \).

9.6.32 We want \( \frac{1}{(n+1)^2} < 10^{-4} \), or \( (n + 1)^2 > 10^4 \), so \( n = 100 \).

9.6.33 We want \( \frac{1}{(n+1)^6} < 10^{-4} \), or \( (n + 1)^6 > 10^4 \), so \( n = 10 \).

9.6.34 The series starts with \( k = 0 \), so we want \( \frac{1}{(2n+1)^3} < 10^{-4} \), or \( 2n + 1 > 10^{4/3} \), so \( n = 11 \).

9.6.35 The series starts with \( k = 0 \), so we want \( \frac{1}{3n+1} < 10^{-4} \), or \( 3n + 1 > 10^4 \), \( n = 3334 \).

9.6.36 We want \( \frac{1}{(n+1)^6} < 10^{-4} \), or \( (n + 1)^6 > 10^4 \), \( n = 4 \).

9.6.37 The series starts with \( k = 0 \), so we want \( \frac{1}{4^k} \left( \frac{2}{4n+1} + \frac{2}{4n+2} + \frac{1}{4n+3} \right) < 10^{-4} \), or \( \frac{4^n(4n+1)(4n+2)(4n+3)}{4(20n^2+21n+5)} > 10000 \), which occurs first for \( n = 6 \).

9.6.38 The series starts with \( k = 0 \), so we want \( \frac{1}{3n+2} < 10^{-4} \), so \( 3n + 2 > 10000 \), \( n = 3333 \).

9.6.39 To figure out how many terms we need to sum, we must find \( n \) such that \( \frac{1}{(n+1)^5} < 10^{-3} \), so that \( (n + 1)^5 > 1000 \); this occurs first for \( n = 3 \). Thus \( -\frac{1}{1} + \frac{1}{2^5} - \frac{1}{3^5} \approx -0.973 \).

9.6.40 To figure out how many terms we need to sum, we must find \( n \) such that \( \frac{1}{(2n+1)^3} < 10^{-3} \), or \( (2n + 3)^3 > 10^3 \), so \( 2n + 3 > 10 \) and \( n = 4 \). Thus the approximation is \( \sum_{k=1}^{4} \frac{(-1)^k}{(2n+1)^3} \approx -0.306 \).

9.6.41 To figure out how many terms we need to sum, we must find \( n \) so that \( \frac{(n+1)^7+1}{n+1} > 1000 \). This occurs first for \( n = 999 \). We have \( \sum_{k=1}^{999} \frac{(-1)^k}{k^2+1} \approx -0.269 \).

9.6.42 To figure out how many terms we need to sum, we must find \( n \) such that \( \frac{n+1}{(n+1)^4+1} > 1000 \), which occurs for \( n = 9 \). We have \( \sum_{k=1}^{9} \frac{(-1)^k}{k^6+1} \approx -0.409 \).

9.6.43 To figure how many terms we need to sum, we must find \( n \) such that \( \frac{1}{(n+1)^{n+1}} < 10^{-3} \), or \( (n + 1)^{n+1} > 1000 \), so \( n = 4 \) (\( 5^5 = 3125 \)). Thus the approximation is \( \sum_{k=1}^{4} \frac{(-1)^n}{n^2} \approx -0.783 \).

9.6.44 To figure how many terms we need to sum, we must find \( n \) such that \( \frac{1}{2(2n+1)^{n+1}} < 10^{-3} \), or \( (2n+3)! > 1000 \), so \( 2n + 3 \geq 7 \) and \( n = 2 \). The approximation is \( \sum_{k=1}^{2} \frac{(-1)^{n+1}}{(2n+1)^{n+1}} \approx 0.158 \).

9.6.45 The series of absolute values is a \( p \)-series with \( p = \frac{2}{3} \), so it diverges. The given alternating series does converge, though, by the Alternating Series Test. Thus, the given series is conditionally convergent.

9.6.46 The series of absolute values is a \( p \)-series with \( p = \frac{1}{2} \), so it diverges. The given alternating series does converge, though, by the Alternating Series Test. Thus, the given series is conditionally convergent.

9.6.47 The series of absolute values is a \( p \)-series with \( p = \frac{3}{2} \), so it converges absolutely.

9.6.48 The series of absolute values is \( \sum \frac{1}{k^p} \), which converges, so the series converges absolutely.

9.6.49 The series of absolute values is \( \sum \frac{|\cos(k)|}{k^2} \), which converges by the Comparison Test because \( \frac{|\cos(k)|}{k^2} \leq \frac{1}{k^2} \). Thus the series converges absolutely.
The series of absolute values is $\sum \frac{k^2}{k^2+1}$. The limit comparison test with $\frac{1}{k}$ gives $\lim_{k \to \infty} \frac{k^3}{k^2+1} = \lim_{k \to \infty} \sqrt{\frac{k^3}{k^2+1}} = 1$. Because the comparison series diverges, so does the series of absolute values. The original series converges conditionally, however, because the terms are nonincreasing and $\lim_{k \to \infty} \frac{k^3}{k^2+1} = \lim_{k \to \infty} \sqrt{\frac{k^3}{k^2+1}} = 0$.

The absolute value of the $k^{th}$ term of this series has limit $\frac{\pi}{2}$ as $k \to \infty$, so the given series is divergent by the Divergence Test.

The series of absolute values is a geometric series with $r = \frac{1}{4}$ and $|r| < 1$, so the given series converges absolutely.

The series of absolute values is $\sum \frac{k}{2k+1}$, but $\lim_{k \to \infty} \frac{k}{2k+1} = \frac{1}{2}$, so by the Divergence Test, this series diverges. The original series does not converge conditionally, either, because $\lim_{k \to \infty} a_k = \frac{1}{2} \neq 0$.

The series of absolute values is $\sum \frac{1}{\ln k}$, which diverges, so the series does not converge absolutely. However, because $\lim_{k \to \infty} \frac{1}{\ln k} \to 0$ and the terms are nonincreasing, the series does converge conditionally.

The series of absolute values is $\sum \frac{\tan^{-1} k}{k^3}$, which converges by the Comparison Test because $\frac{\tan^{-1} k}{k^3} < \frac{1}{2 k^3}$, and $\sum \frac{1}{2 k^3}$ converges because it is a constant multiple of a convergent $p$-series. So the original series converges absolutely.

The series of absolute values is $\sum \frac{e^k}{(k+1)!}$. Using the ratio test, $\frac{a_{k+1}}{a_k} = \frac{e^{k+1}}{(k+2)!} \cdot \frac{(k+1)!}{e^k} = \frac{e}{k+2}$, which tends to zero as $k \to \infty$, so the original series converges absolutely.

a. False. For example, consider the alternating harmonic series.

b. True. This is part of Theorem 9.21.

c. True. This statement is simply saying that a convergent series converges.

d. True. This is part of Theorem 9.21.

e. False. Let $a_k = \frac{1}{k}$.

f. True. Use the Comparison Test: $\lim_{k \to \infty} \frac{a_k^2}{a_k} = \lim_{k \to \infty} a_k = 0$ because $\sum a_k$ converges, so $\sum a_k^2$ and $\sum a_k$ converge or diverge together. Because the latter converges, so does the former.

g. True, by definition. If $\sum |a_k|$ converged, the original series would converge absolutely, not conditionally.

Neither condition is satisfied. $\frac{a_{k+1}}{a_k} = \frac{(k+1)(2k+1)}{(2k+1)^2} = \frac{2k^2+4k+1}{2k^2+4k} > 1$, and $\lim_{k \to \infty} a_k = \frac{1}{2}$.

$\sum_{k=1}^{\infty} \frac{1}{k^2} - \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^2} = 2 \sum_{k=1}^{\infty} \frac{1}{(2k)^2} = 2 \frac{1}{2} \sum_{k=1}^{\infty} \frac{1}{k^2}$, and thus $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^2} = \pi^2 \frac{1}{6} - \frac{1}{2} \cdot \frac{\pi^2}{6} = \frac{\pi^2}{12}$.

$\sum_{k=1}^{\infty} \frac{1}{k^2} - \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^2} = 2 \sum_{k=1}^{\infty} \frac{1}{(2k)^2} = 2 \frac{1}{16} \sum_{k=1}^{\infty} \frac{1}{k^2}$, and thus $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^2} = \frac{\pi^2}{90} - \frac{1}{8} \cdot \frac{\pi^2}{90} = \frac{7\pi^2}{120}$.

Write $r = -s$; then $0 < s < 1$ and $\sum s^k = \sum (-1)^k k^k$. Because $|s| < 1$, the terms $s^k$ are nonincreasing and tend to zero, so by the Alternating Series Test, the series $\sum (-1)^k s^k$ converges.
9.6.62 Suppose that $\sum (-1)^k a_k$ is an alternating series, where $a_k > 0$ for all $k$. Define

$$b_k = \begin{cases} a_k, & k \text{ even} \\ 0, & k \text{ odd.} \end{cases}$$

That is, $\{b_k\}$ consists just of the positive terms of the original series, and is zero elsewhere. Then $b_k \leq a_k$ for all $k$. Since $\sum (-1)^k a_k$ converges absolutely, we know that $\sum a_k$ converges. Since both $\sum a_k$ and $\sum b_k$ are series of nonnegative terms, the comparison test shows that $\sum b_k$ converges as well. Removing the zero terms in $\sum b_k$ does not change this. To see that the negative terms form a convergent series, apply the argument above to the negative of the original series, $\sum (-1)^k a_k$, which is also obviously absolutely convergent: its positive terms are the terms $a_k$ for $k$ odd, which are the negative terms of the original series.

9.6.63 Let $S = 1 - \frac{1}{2} + \frac{1}{3} - \cdots$. Then

$$S = \left( 1 - \frac{1}{2} \right) + \left( \frac{1}{3} - \frac{1}{4} \right) + \left( \frac{1}{5} - \frac{1}{6} \right) + \cdots$$

$$\frac{1}{2} S = \frac{1}{2} - \frac{1}{4} + \frac{1}{6} - \frac{1}{8} + \cdots$$

Add these two series together to get

$$\frac{3}{2} S = \frac{3}{2} \ln 2 = 1 + \frac{1}{3} - \frac{1}{2} + \frac{1}{5} + \cdots$$

To see that the results are as desired, consider a collection of four terms:

$$\cdots + \left( \frac{1}{4k+1} - \frac{1}{4k+2} \right) + \left( \frac{1}{4k+3} - \frac{1}{4k+4} \right) + \cdots$$

$$\cdots - \frac{1}{4k+2} + \frac{1}{4k+4} + \cdots$$

Adding these results in the desired sign pattern. This repeats for each group of four elements.

9.6.64

a. Note that we can write

$$S_n = -\frac{a_1}{2} + \frac{1}{2} \left( \sum_{k=1}^{n-1} (-1)^k (a_i - a_{i+1}) \right) + \frac{(-1)^n a_n}{2},$$

so that

$$S_n + \frac{(-1)^{n+1} a_{n+1}}{2} = -\frac{a_1}{2} + \frac{1}{2} \left( \sum_{k=1}^{n} (-1)^k d_i \right)$$

where $d_i = a_i - a_{i+1}$. Now consider the expression on the right-hand side of this last equation as the nth partial sum of a series which converges to $S$. Because the $d_i$’s are decreasing and positive, the error made by stopping the sum after n terms is less than the absolute value of the first omitted term, which would be $\frac{1}{2} |a_{n+1}| = \frac{1}{2} |a_{n+1} - a_{n+2}|$. The method in the text for approximating the error simply takes the absolute value of the first unused term as an approximation of $|S - S_n|$. Here, $S_n$ is modified by adding half the next term. Because the terms are decreasing in magnitude, this should be a better approximation to $S$ than just $S_n$ itself; the right side shows that this intuition is correct, because $\frac{1}{2} |a_{n+1} - a_{n+2}|$ is at most $a_{n+1}$ and is generally less than that (because generally $a_{n+2} < a_{n+1}$).

b. i. Using the method from the text, we need $n$ such that $\frac{a_{n+1}}{n+1} < 10^{-6}$, i.e. $n > 10^6 - 1$. Using the modified method from this problem, we want $\frac{1}{2} |a_{n+1} - a_{n+2}| < 10^{-6}$, so

$$\frac{1}{2} \left( \frac{1}{n+1} - \frac{1}{n+2} \right) = \frac{1}{2(n+1)(n+2)} < 10^{-6}$$

This is true when $10^6 < 2(n+1)(n+2)$, which requires $n > 705.6$, so $n \geq 706$. 

Copyright © 2014 Pearson Education, Inc.
ii. Using the method from the book, we need \( n \) such that \( k \ln k > 10^6 \), which means \( k \geq 87848 \).

Using the method of this problem, we want

\[
\left| \frac{1}{2k \ln k} - \frac{1}{(k+1) \ln(k+1)} \right| = \left| \frac{(k+1) \ln(k+1) - k \ln k}{2k(k+1) \ln(k+1)} \right| < 10^{-6},
\]

so that \(|2k(k+1) \ln k \ln(k+1)| > 10^6(k \ln k - (k+1) \ln(k+1))|\), which means \( k \geq 319 \).

iii. Using the method from the book, we need \( k \) such that \( \sqrt{k} > 10^6 \), so \( k > 10^{12} \).

Using the method of this problem, we want

\[
\frac{1}{2} \left( \frac{1}{\sqrt{k}} - \frac{1}{\sqrt{k+1}} \right) = \frac{\sqrt{k+1} - \sqrt{k}}{2 \sqrt{k(k+1)}} < 10^{-6}
\]

which means that \( k > 3968.002 \) so that \( k \geq 3969 \).

9.6.65 Both series diverge, so comparisons of their values are not meaningful.

9.6.66

a. As \( p \) gets larger, fewer terms are needed to achieve a particular level of accuracy; this means that for larger \( p \), the series converge faster; the three graphs below are for \( p = 1 \), \( p = 2 \), and \( p = 3 \) respectively:

![Graphs for different values of p]

b. The graph below shows that \( \sum \frac{(-1)^{k+1}}{k!} \) converges much faster than any of the powers of \( k \).

![Graph showing convergence of \( \frac{(-1)^{k+1}}{k!} \)]

Chapter Review

1. 

a. False. Let \( a_n = 1 - \frac{1}{n} \). This sequence has limit 1.

b. False. The terms of a sequence tending to zero is necessary but not sufficient for convergence of the series.

c. True. This is the definition of convergence of a series.

d. False. If a series converges absolutely, the definition says that it does not converge conditionally.
e. True. It has limit 1 as \( n \to \infty \).

f. False. The subsequence of the even terms has limit 1 and the subsequence of odd terms has limit \(-1\), so the sequence does not have a limit.

g. False. It diverges by the Divergence Test because \( \lim_{k \to \infty} \frac{k^2}{k^2 + 1} = 1 \neq 0 \).

h. True. The given series converges by the Limit Comparison Test with the series \( \sum_{k=1}^{\infty} \frac{1}{k^2} \), and thus its sequence of partial sums converges.

2. \( \lim_{n \to \infty} \frac{n^2 + 4}{\sqrt{4n^4 + 1}} = \lim_{n \to \infty} \frac{1 + 4n^{-2}}{\sqrt{4 + n^{-4}}} = \frac{1}{2} \).

3. \( \lim_{n \to \infty} \frac{8^n}{n!} = 0 \) because exponentials grow more slowly than factorials.

4. After taking logs, we want to compute \( \lim_{n \to \infty} 2n \ln \left(1 + \frac{3}{n}\right) = \lim_{n \to \infty} \frac{\ln(1 + 3/n)}{1/(2n)} \).

By L'Hopital's rule, this is \( \lim_{n \to \infty} \frac{6n}{n+3} \) (after some algebraic manipulations), which is 6. Thus the original limit is \( e^6 \).

5. Take logs and compute \( \lim_{n \to \infty} \left(\frac{1}{n} \ln n\right) = \lim_{n \to \infty} \frac{\ln n}{n} = \lim_{n \to \infty} \frac{1}{n} = 0 \) by L'Hopital's rule. Thus the original limit is \( e^0 = 1 \).

6. We have \( \lim_{n \to \infty} (n - \sqrt{n^2 - 1}) = \lim_{n \to \infty} \frac{(n - \sqrt{n^2 - 1})(n + \sqrt{n^2 - 1})}{n + \sqrt{n^2 - 1}} = \lim_{n \to \infty} \frac{n^2 - (n^2 - 1)}{n + \sqrt{n^2 - 1}} = \lim_{n \to \infty} \frac{1}{n + \sqrt{n^2 - 1}} = 0 \).

7. Take logs, and then evaluate \( \lim_{n \to \infty} \frac{1}{n} \ln \frac{1}{n} = \lim_{n \to \infty} (-1) = -1 \), so the original limit is \( e^{-1} \).

8. This series oscillates among the values \( \pm \frac{1}{2}, \pm \frac{\sqrt{3}}{2}, \pm 1, \) and 0, so it has no limit.

9. \( a_n = \left(-\frac{1}{10}\right)^n = \left(-\frac{10}{10}\right)^n \). The terms grow without bound so the sequence does not converge.

10. \( \lim_{n \to \infty} \tan^{-1} n = \lim_{x \to \infty} \tan^{-1} x = \frac{\pi}{2} \).

11. 
   a. \( S_1 = \frac{1}{3}, S_2 = \frac{11}{27}, S_3 = \frac{21}{57}, S_4 = \frac{17}{37}, \)  
   b. \( S_n = \frac{1}{2} \left(\frac{1}{1} + \frac{1}{2} - \frac{1}{n + 1} - \frac{1}{n + 2}\right) \), because the series telescopes.  
   c. From part (b), \( \lim_{n \to \infty} S_n = \frac{3}{4} \), which is the sum of the series.

12. This is a geometric series with ratio \( \frac{9}{10} \), so the sum is \( \frac{9/10}{1-9/10} = 9 \).

13. \( \sum_{k=1}^{\infty} 3 \cdot 1.001^k = 3 \sum_{k=1}^{\infty} 1.001^k \). This is a geometric series with ratio greater than 1, so it diverges.

14. This is a geometric series with ratio \( -\frac{1}{5} \), so the sum is \( \frac{1}{1+1/5} = \frac{5}{6} \).

15. \( \frac{1}{k(k+1)} = \frac{1}{k} - \frac{1}{k+1} \), so the series telescopes, and \( S_n = 1 - \frac{1}{n+1} \). Thus \( \lim_{n \to \infty} S_n = 1 \), which is the value of the series.
16. This series clearly telescopes, and $S_n = \frac{1}{\sqrt{n}} - 1$, so $\lim_{n \to \infty} S_n = -1$.

17. This series telescopes. $S_n = 3 - \frac{3}{3n+1}$, so that $\lim_{n \to \infty} S_n = 3$, which is the value of the series.

18. $\sum_{k=1}^{\infty} 4^{-3k} = \sum_{k=1}^{\infty} \left(\frac{1}{64}\right)^k$. This is a geometric series with ratio $\frac{1}{64}$, so its sum is $\frac{1/64}{1-1/64} = \frac{1}{63}$.

19. $\sum_{k=1}^{\infty} \frac{2^k}{3^{k+2}} = \frac{1}{9} \sum_{k=1}^{\infty} \left(\frac{2}{3}\right)^k = \frac{1}{9} \cdot \frac{2/3}{1-2/3} = \frac{2}{9}$.

20. This is the difference of two convergent geometric series (because both have ratios less than 1). Thus the sum of the series is equal to

$$\sum_{k=0}^{\infty} \left(\frac{1}{3}\right)^k - \sum_{k=0}^{\infty} \left(\frac{2}{3}\right)^{k+1} = \frac{1}{1-1/3} - \frac{2/3}{1-2/3} = \frac{3}{2} - 2 = -\frac{1}{2}.$$

21. a. It appears that the series converges, because the sequence of partial sums appears to converge to 1.5.

b. The convergence is uncertain.

c. This series clearly appears to diverge, because the partial sums seem to be growing without bound.

22. This is $p$-series with $p = \frac{3}{2} > 1$, so this series is convergent.

23. The series can be written $\sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$, which is a $p$-series with $p = \frac{3}{2} < 1$, so this series diverges.

24. $a_k = \frac{2^{k+1}}{\sqrt{k^3+2}} = \sqrt{\frac{4k^4+4k^2+1}{k^3+2}}$, so the sequence of terms diverges. By the Divergence Test, the given series diverges as well.

25. This is a geometric series with ratio $\frac{2}{3} < 1$, so the series converges to $\frac{2/3}{1-2/3} = \frac{2}{e^2}$.

26. Note that $\frac{1}{a_k} = \left((1 + \frac{3}{k})^2\right)^2$, so $\lim_{k \to \infty} \frac{1}{a_k} = \lim_{k \to \infty} \left((1 + \frac{3}{k})^2\right)^2 = (e^3)^2$, so $\lim_{k \to \infty} a_k = \frac{1}{e^6} \neq 0$, so the given series diverges by the Divergence Test.

27. Applying the Ratio Test:

$$\lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \frac{2^{k+1}(k+1)!}{(k+1)^{k+1}} \cdot \frac{k^k}{2^k k!} = \lim_{k \to \infty} \frac{2}{k+1} = \frac{2}{e} < 1,$$

so the given series converges.

28. Use the Limit Comparison Test with $\frac{1}{k}$:

$$\frac{1}{\sqrt{k^2+k}} / k = \frac{k}{\sqrt{k^2+k}} = \sqrt{\frac{k^2}{k^2+k}},$$

which has limit 1 as $k \to \infty$. Because $\sum \frac{1}{k}$ diverges, the original series does as well.

29. Use the Comparison Test: $\frac{3}{2x^e} < \frac{4}{e}$, but $\sum \frac{3}{e^k}$ converges because it is a geometric series with ratio $\frac{1}{e} < 1$. Thus the original series converges as well.

30. $\lim_{k \to \infty} a_k = \lim_{k \to \infty} k \sin \frac{1}{k} = \lim_{k \to \infty} \sin(1/k) k = 1$, so the given series diverges by the Divergence Test.
31. \(a_k = \frac{k^{1/k}}{k!} = \frac{1}{k^{1/e}}\). For \(k \geq 2\), then, \(a_k < \frac{1}{k^2}\). Because \(\sum \frac{1}{k^2}\) converges, the given series also converges, by the Comparison Test.

32. Use the Comparison Test: \(\frac{1}{1+k}\) for \(k > 1\). Because \(\sum \frac{1}{k}\) diverges, the given series does as well.

33. Use the Ratio Test: \(\frac{a_{k+1}}{a_k} = \frac{(k+1)^{1/k}}{k^{1/k}} \cdot \frac{k!}{(k+1)!} = \frac{1}{e}^{(k+1)/k}\), which has limit \(\frac{1}{e} < 1\) as \(k \to \infty\). Thus the given series converges.

34. For \(k > 5\), we have \(k^2 - 10 > (k-1)^2\), so that \(a_k = \frac{2}{k^2 - 10} < \frac{2}{(k-1)^2}\). Because \(\sum \frac{2}{(k-1)^2}\) converges, the original series does as well.

35. Use the Comparison Test. Because \(\lim_{k \to \infty} \frac{\ln k}{k^{1/2}} = 0\), we have that for sufficiently large \(k\), \(\ln k < k^{1/2}\), so that \(a_k = \frac{2\ln k}{k^{1/2}} < \frac{2k^{1/2}}{k^{1/2}} = \frac{2}{k^{1/2}}\). Now \(\sum \frac{2}{k^{1/2}}\) is convergent, because it is a \(p\)-series with \(p = \frac{3}{2} > 1\). Thus the original series is convergent.

36. By the Ratio Test: \(\lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \frac{k+1}{k} \cdot \frac{k}{k+1} = \lim_{k \to \infty} \frac{1}{e} \cdot \frac{k^1}{k} = \frac{1}{e} < 1\). Thus the given series converges.

37. Use the Ratio Test. The ratio of successive terms is \(\frac{2a_{k+1}}{(2k+3)!} \cdot \frac{(2k+1)!}{2^k} = \frac{4}{(2k+3)!} + 3\). This has limit 0 as \(k \to \infty\), so the given series converges.

38. Use the Ratio Test. The ratio of successive term is \(\frac{a_{k+1}}{(2k+2)!} \cdot \frac{(2k)!}{9} = \frac{9}{(2k+2)!}\). This has limit 0 as \(k \to \infty\), so the given series converges.

39. Use the Root Test. Since

\[
\lim_{k \to \infty} \sqrt[k]{a_k} = \lim_{k \to \infty} \frac{k^3 + k + 1}{2k^3 - 1} = \lim_{k \to \infty} \frac{1 + 1/k^2 + 1/k^3}{2 - 1/k^3} = \frac{1}{2},
\]

this series converges.

40. This series diverges by the Divergence Test, since

\[
\lim_{k \to \infty} \frac{e^k + 2}{3e^k - 2} = \lim_{k \to \infty} \frac{1 + 2e^{-k}}{3 - 2e^{-k}} = \frac{1}{3},
\]

so that the terms do not tend to zero.

41. This series diverges by the Divergence Test, since

\[
\lim_{k \to \infty} \left(1 + \frac{3}{k}\right)^{k/2} = \lim_{k \to \infty} \left(\left(1 + \frac{3}{k}\right)^{k/3}\right)^{3/2} = \lim_{x \to 0} \left((1 + x)^{1/z}\right)^{3/2} = e^{3/2}.
\]

Since the terms do not tend to zero, the series diverges.

42. Use the Comparison Test against \(\sum_{k=2}^{\infty} \frac{1}{k^2}\). For \(k > 2\), we have \(\ln k > 2\) we have \(\ln k > 2\) we have \(\frac{1}{k^{1/e}} < \frac{1}{k^2}\). Since \(\sum_{k=2}^{\infty} \frac{1}{k^2}\) converges, so does \(\sum_{k=2}^{\infty} \frac{1}{k^{1/e}}\).

43. \(|a_k| = \frac{1}{k^{1/e}}\). Use the Limit Comparison Test with the convergent series \(\sum \frac{1}{k^2}\). Because \(\lim_{k \to \infty} \frac{k^2}{k^2} = \lim_{k \to \infty} \frac{k^2}{k^2} = \lim_{k \to \infty} 1 = 1\), the given series converges absolutely.

44. This series does not converge, because \(\lim_{k \to \infty} |a_k| = \lim_{k \to \infty} \frac{k^2 + 4}{2k^4 + 1} = \frac{1}{2}\).

45. Use the Ratio Test on the absolute values of the sequence of terms: \(\lim_{k \to \infty} \frac{|a_{k+1}|}{a_k} = \lim_{k \to \infty} \frac{k+1}{k} \cdot \frac{e^k}{k} = \lim_{k \to \infty} \frac{k+1}{k} \cdot \frac{e^k}{k} = \frac{1}{e} < 1\). Thus, the original series is absolutely convergent.
46. Using the Limit Comparison Test with the harmonic series, we consider  
\[ \lim_{k \to \infty} \frac{a_k}{(1/k)} = \lim_{k \to \infty} \frac{k}{\sqrt{k^2 + 1}} = \lim_{k \to \infty} \frac{\sqrt{k^2}}{k+1} = 1; \]
because the comparison series diverges, so does the original series. Thus the series is not absolutely convergent. However, the terms are clearly decreasing to zero, so it is conditionally convergent.

47. Use the Ratio Test on the absolute values of the sequence of terms:  
\[ \lim_{k \to \infty} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{k \to \infty} \frac{10}{k+1} = 0, \]
so the series converges absolutely.

48. \[ \sum_{k=n}^{\infty} \frac{1}{k \ln k} \] does not converge because  
\[ \int_{2}^{\infty} \frac{1}{x \ln x} \, dx = \lim_{b \to \infty} (\ln(\ln b) - \ln(\ln 2)) = \infty, \]
so the improper integral diverges. Thus the given series does not converge absolutely. However, it does converge conditionally because the terms are decreasing and approach zero.

49. Because \( k^2 \ll 2^k \), \( \lim_{k \to \infty} \frac{-2(-2)^k}{k^2} \neq 0 \). The given series thus diverges by the Divergence Test.

50. The series of absolute values converges, by the Limit Comparison Test with the convergent geometric series whose \( k \)th term is \( \frac{1}{e^k} \). This follows because  
\[ \lim_{k \to \infty} \frac{\frac{1}{e^k}}{\frac{1}{k+1}} = \lim_{k \to \infty} \frac{1}{e^k} = \frac{1}{e}. \]

51. 

a. For \( |x| < 1 \), \( \lim_{k \to \infty} x^k = 0 \), so this limit is zero.

b. This is a geometric series with ratio \( -\frac{4}{5} \), so the sum is \( \frac{1}{1+\frac{4}{5}} = \frac{5}{9} \).

52. 

a. \( \lim_{k \to \infty} \left( \frac{1}{k} - \frac{1}{k+1} \right) = \lim_{k \to \infty} \frac{1}{k(k+1)} = 0. \)

b. This series telescopes, and \( S_n = 1 - \frac{1}{n+1} \), so \( \lim_{n \to \infty} S_n = 1 \), which is the sum of the series.

53. Because the series converges, we must have \( \lim_{k \to \infty} a_k = 0 \). Because it converges to 8, the partial sums converge to 8, so that \( \lim_{k \to \infty} S_k = 8 \).

54. \( R_n \) is given by  
\[ R_n \leq \int_{n}^{\infty} \frac{1}{x^3} \, dx = \lim_{b \to \infty} \left( -\frac{1}{4} x^{-4} \right) \bigg|_{n}^{b} = \frac{1}{4n^4}. \]
Thus to approximate the sum to within \( 10^{-4} \), we need \( \frac{1}{4n^4} < 10^{-4} \), so \( 4n^4 > 10^4 \) and \( n = 8 \).

55. The series converges absolutely for \( p > 1 \), conditionally for \( 0 < p \leq 1 \) in which case \( \{k^{-p}\} \) is decreasing to zero.

56. By the Integral Test, the series converges if and only if the following integral converges:
\[ \int_{2}^{\infty} \frac{1}{x \ln^p x} \, dx = \lim_{b \to \infty} \left( \frac{1}{1-p} \ln(1-p) \right)^{b} \bigg|_{2}^{b} = \lim_{b \to \infty} \left( \frac{1}{1-p} \ln(1-p) b - \frac{1}{1-p} \ln(1-p) 2 \right). \]
This limit exists only if \( 1 - p < 0 \), i.e. \( p > 1 \). Note that the above calculation is for the case \( p \neq 1 \). In the case \( p = 1 \), the integral also diverges.

57. The sum is 0.2500000000 to ten decimal places. The maximum error is  
\[ \int_{20}^{\infty} \frac{1}{5x} \, dx = \lim_{b \to \infty} \frac{1}{5 \ln 5} \bigg|_{20}^{b} = \frac{1}{5 \ln 5} \approx 6.5 \times 10^{-15}. \]

58. The sum is 1.037. The maximum error is  
\[ \int_{20}^{\infty} \frac{1}{x^3} \, dx = \lim_{b \to \infty} \left( -\frac{1}{4x^4} \right)^{b} \bigg|_{20}^{b} = \frac{1}{4 \cdot 20^4} \approx 1.6 \times 10^{-6}. \]
59. The maximum error is \( a_{n+1} \), so we want \( a_{n+1} = \frac{1}{(k+1)^{4n}} < 10^{-8} \), or \((k + 1)^4 > 10^8\), so \( k = 100 \).

60. 
   a. \( \sum_{k=0}^{\infty} e^{kx} = \sum_{k=0}^{\infty} (e^x)^k = \frac{1}{1-e^x} = 2 \), so \( 1 - e^x = \frac{1}{2} \). Thus \( e^x = \frac{1}{2} \) and \( x = -\ln 2 \).

   b. \( \sum_{k=0}^{\infty} (3x)^k = \frac{1}{1-3x} = 4 \), so that \( 1 - 3x = \frac{1}{4} \), \( x = \frac{1}{4} \).

   c. The \( x \)'s cancel, so the equation reads \( \sum_{k=0}^{\infty} \left( \frac{1}{k-1/2} - \frac{1}{k+1/2} \right) = 6 \). The series telescopes, so that the left side, up to \( n \), is

   \[
   \sum_{k=0}^{n} \left( \frac{1}{k-1/2} - \frac{1}{k+1/2} \right) = \frac{1}{-1/2} - \frac{1}{n+1/2} = -2 - \frac{1}{n+1/2}
   \]

   and in the limit the equation then reads \(-2 = 6\), so that there is no solution.

61. 
   a. Let \( T_n \) be the amount of additional tunnel dug during week \( n \). Then \( T_0 = 100 \) and \( T_n = 0.95 \cdot T_{n-1} = 0.95^n T_0 = 100 \cdot 0.95^n \), so the total distance dug in \( N \) weeks is

   \[
   S_N = 100 \sum_{k=0}^{N-1} 0.95^k = 100 \left( \frac{1 - 0.95^N}{1 - 0.95} \right) = 2000(1 - 0.95^N).
   \]

   Then \( S_{10} \approx 802.5 \) meters and \( S_{20} \approx 1283.03 \) meters.

   b. The longest possible tunnel is \( S_\infty = 100 \sum_{k=0}^{\infty} 0.95^k = \frac{100}{1-0.95} = 2000 \) meters.

62. Let \( t_n \) be the time required to dig meters \((n - 1) \cdot 100\) through \( n \cdot 100\), so that \( t_1 = 1 \) week. Then \( t_n = 1.1 \cdot t_{n-1} = 1.1^{n-1} t_1 = 1.1^{n-1} \) weeks. The time required to dig 1500 meters is then

   \[
   \sum_{k=1}^{15} t_k = \sum_{k=1}^{15} 1.1^{k-1} \approx 31.77 \text{ weeks.}
   \]

   So it is not possible.

63. 
   a. The area of a circle of radius \( r \) is \( \pi r^2 \). For \( r = 2^{1-n} \), this is \( 2^{2-2n} \pi \). There are \( 2^{n-1} \) circles on the \( n^{\text{th}} \) page, so the total area of circles on the \( n^{\text{th}} \) page is \( 2^{n-1} \cdot \pi 2^{2-2n} = 2^{1-n} \pi \).

   b. The sum of the areas on all pages is \( \sum_{k=1}^{\infty} 2^{1-k} \pi = 2\pi \sum_{k=1}^{\infty} 2^{-k} = 2\pi \cdot \frac{1/2}{1/2} = 2\pi \).

64. \( x_0 = 1, x_1 \approx 1.540302, x_2 \approx 1.57079, x_3 \approx 1.570796327 \), which is \( \frac{\pi}{2} \) to nine decimal places. Thus \( p = 2 \).

65. 
   a. \( B_n = 1.0025 B_{n-1} + 100 \) and \( B_0 = 100 \).

   b. \( B_n = 100 \cdot 1.0025^n + 100 \cdot \frac{1 - 1.0025^n}{1 - 1.0025} = 100 \cdot 1.0025^n - 40000(1 - 1.0025^n) = 40000(1.0025^n + 1) \).

66. 
   a. \( a_n = \int_0^1 x^n \, dx = \frac{1}{n+1} x^{n+1} \bigg|_0^1 = \frac{1}{n+1} \), so \( \lim_{n \to \infty} a_n = 0 \).

   b. \( b_n = \int_1^{1-p} x^{1-p} \, dx = \frac{1}{1-p} x^{1-p} \bigg|_1^{1-p} = \frac{1}{1-p} (1-p - 1) \). Because \( p > 1 \), \( n^{1-p} \to 0 \) as \( n \to \infty \), so that \( \lim_{n \to \infty} b_n = \frac{1}{p-1} \).

67. 
   a. \( T_1 = \sqrt{3} \frac{16}{15} \) and \( T_2 = \frac{2\sqrt{3}}{64} \).

Copyright © 2014 Pearson Education, Inc.
b. At stage \( n \), \( 3^{n-1} \) triangles of side length \( \frac{1}{2^n} \) are removed. Each of those triangles has an area of \( \frac{\sqrt{3}}{4} \cdot \frac{1}{4^n} \), so a total of

\[
\frac{\sqrt{3}}{4} \cdot \frac{1}{4^n} = \frac{\sqrt{3}}{4^{n+1}} \cdot \left( \frac{3}{4} \right)^{n-1}
\]

is removed at each stage. Thus

\[
T_n = \frac{\sqrt{3}}{16} \sum_{k=1}^{n} \left( \frac{3}{4} \right)^{k-1} = \frac{\sqrt{3}}{16} \sum_{k=0}^{n-1} \left( \frac{3}{4} \right)^{k} = \frac{\sqrt{3}}{4} \left( 1 - \left( \frac{3}{4} \right)^{n} \right).
\]

c. \( \lim_{n \to \infty} T_n = \frac{\sqrt{3}}{4} \) because \( \left( \frac{3}{4} \right)^n \to 0 \) as \( n \to \infty \).

d. The area of the triangle was originally \( \frac{\sqrt{3}}{4} \), so none of the original area is left.

68. Because the given sequence is non-decreasing and bounded above by 1, it must have a limit. A reasonable conjecture is that the limit is 1.

**AP Practice Questions**

**Multiple Choice**

1. The correct answer is E, II and III. Since \( \sum_{k=1}^{\infty} 9 \cdot 0.001^k = \sum_{k=1}^{\infty} \frac{9}{1000^k} \), it is equal to

\[
\frac{0.009}{1 - 0.001} = \frac{0.009}{0.999} = \frac{1}{111}.
\]

2. The correct answer is D:

\[
\lim_{n \to \infty} \frac{3n^2 - n + 1}{\sqrt{4n^4 + 1}} = \lim_{n \to \infty} \frac{3 - 1/n + 1/n^2}{\sqrt{1/n^2} \cdot \sqrt{4n^4 + 1}} = \lim_{n \to \infty} \frac{3 - 1/n + 1/n^2}{\sqrt{4 + 1/n^2}} = \frac{3}{2}.
\]

3. The correct answer is E. Rewrite the series as

\[
\sum_{n=1}^{\infty} \frac{(-e)^n}{n^{n-1}} = -e \sum_{n=1}^{\infty} \frac{(-e)^{n-1}}{n^{n-1}} = -e \sum_{n=0}^{\infty} \left( \frac{-e}{\pi} \right)^n.
\]

This is a geometric series with first term \( -e \) and ratio \( -\frac{e}{\pi} \), which has magnitude less than 1. Thus the series converges, and its sum is

\[
\frac{-e}{1 - (-\frac{e}{\pi})} = \frac{e}{1 + \frac{e}{\pi}} = \frac{e \pi}{e + \pi}.
\]

4. The correct answer is E, series II and series III converge to 3. Series I does not converge at all; the terms of the series converge to

\[
\lim_{n \to \infty} \frac{3n^2}{n^2 + 4} = \lim_{n \to \infty} \frac{3}{1 + 4/n^2} = 3,
\]

so the series diverges by the Divergence Test. Series II is a geometric series with first term 2 and ratio \( \frac{1}{3} \), so its sum is

\[
\frac{2}{1 - \frac{1}{3}} = 3.
\]

Series III can be rewritten \( \sum_{n=1}^{\infty} \frac{(-1)^{n+1} \cdot 4}{3^n} = 4 \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{3^{n-1}} = 4 \sum_{n=0}^{\infty} \left( -\frac{1}{3} \right)^n \), which is a geometric series with first term 4 and ratio \( -\frac{1}{3} \), so its sum is

\[
\frac{4}{1 - (-\frac{1}{3})} = \frac{4}{4/3} = 3.
\]
5. The correct answer is B, sequences I and III converge to 2. For sequence I, we must compute \( \lim_{n \to \infty} n^{1/n} \).
Taking logs and computing using L'Hôpital's rule gives
\[
\lim_{n \to \infty} \left( \frac{1}{n} \ln n \right) = \lim_{n \to \infty} \frac{\ln n}{n} = \lim_{n \to \infty} \frac{1}{n} = 0,
\]
so that \( \lim_{n \to \infty} 2n^{1/n} = 2 \lim_{n \to \infty} n^{1/n} = 2e^0 = 2 \). For sequence II, use the same technique: taking logs gives
\[
\lim_{n \to \infty} n \ln \frac{1}{n} = \lim_{n \to \infty} (-n \ln n) = -\infty,
\]
so that \( \lim_{n \to \infty} 2 \left( \frac{1}{n} \right)^n = 2 \lim_{n \to \infty} \left( \frac{1}{n} \right)^n = 2 \cdot 0 = 0 \). Finally, for sequence III we have
\[
\lim_{n \to \infty} \frac{\sqrt{4n^2 + 12}}{n} = \lim_{n \to \infty} \frac{\frac{1}{n} \sqrt{4n^2 + 12}}{1} = \lim_{n \to \infty} \sqrt{4 + \frac{12}{n^2}} = 2.
\]

6. The correct answer is C; this is the only false statement. It is false because in fact \( \lim_{n \to \infty} S_n = S \), since this defines what it means for \( \sum_{k=1}^{\infty} a_k \) to converge to \( S \). Statements A and B are true since the \( a_k \) are all positive, so that \( S - S_n = \sum_{k=n+1}^{\infty} a_k > 0 \) and \( S_{n+1} - S_n = a_{n+1} > 0 \). Statement D is the definition of a partial sum of a series. Finally, statement E must be true since otherwise the series would diverge by the Divergence Test.

7. The correct answer is D; none of the series diverge. Series I is a geometric series with ratio \( \ln 2 < \ln e = 1 \), so it converges. Series II is an alternating series whose terms go to zero, so it converges by the Alternating Series Test. Finally, series III is a \( p \)-series with \( p = \frac{3}{2} > 1 \), so it converges as well.

8. The correct answer is B. Rewriting the series for clarity gives \( \sum_{k=0}^{\infty} \frac{2}{(k+1)^p} = \sum_{k=1}^{\infty} \frac{2}{k^p} \). This is a \( p \)-series, so it converges only for \( p > 1 \).

9. The correct answer is E, it converges absolutely. Statement E is true since \( \sum_{k=1}^{\infty} \frac{|(-1)^{k+1}|}{k^2} = \sum_{k=1}^{\infty} \frac{1}{k^2} \) is a \( p \)-series with \( p = 2 \), so it converges. Thus statement A is false, since conditional convergence excludes the possibility of absolute convergence, and statement C is clearly false as well. Statement B is false since the series is an alternating series, so that successive partial sums increase and decrease. Statement D is false by Theorem 9.20. Setting \( n = 1 \), we have \( S_1 = 1 \) and \( R_1 = |S - S_1| \leq a_2 = \frac{1}{4} \), so the sum cannot be less than \( 1 - \frac{1}{4} = \frac{3}{4} \). (In fact its value is \( \frac{\pi^2}{12} \approx 0.822 \).)

10. The correct answer is B. Ignoring for the moment the first term, \( \frac{2}{5} \), what remains is a geometric series with first term \( \frac{3}{10} \) and ratio \( \frac{3}{4} \), so its sum is
\[
\frac{\frac{3}{10}}{1 - \frac{3}{4}} = \frac{12}{10} = \frac{6}{5}.
\]
Adding back in the initial term gives \( \frac{2}{5} + \frac{6}{5} = \frac{8}{5} \).

11. The correct answer is A. Statement A is true since this is the conclusion of the Integral Test, which applies in this case given the conditions on \( f \). Thus statements C and D are clearly false. Statements B and E are false as well; for example, let \( f(x) = \frac{1}{x^2} \); then
\[
0 < \int_1^{\infty} f(x) \, dx = 1 < \infty, \quad \text{but} \quad \sum_{k=1}^{\infty} \frac{1}{k^2} = \frac{\pi^2}{6} > 1.
\]

12. The correct answer is C. By Theorem 9.20, we must sum at least \( n \) terms where \( a_{n+1} = \frac{1}{(n+1)^2} < 2 \times 10^{-4} \). Checking values of \( n \), or solving analytically, shows that \( \frac{1}{8^7} \approx 2.4 \times 10^{-4} \) (here \( n = 7 \)) while \( \frac{1}{9^7} \approx 1.5 \times 10^{-4} \) (here \( n = 8 \)), so we must take \( n \geq 8 \).
13. The correct answer is E, all three series converge. Series I converges since
\[ \sum_{k=1}^{\infty} \frac{3^k + 4}{5^k} = \sum_{k=1}^{\infty} \left( \frac{3}{5} \right)^k + 4 \sum_{k=1}^{\infty} \frac{1}{5^k} \]
is the sum of two geometric series with ratio less than 1, so they both converge and thus series I does as well. Series II converges by the Ratio Test:
\[ \lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \frac{(k+1)!(k+1)!}{(2(k+1))!} \cdot \frac{(2k)!}{k!k!} = \lim_{k \to \infty} \frac{(k+1)^2}{(2k+1)(2k+2)} = \lim_{k \to \infty} \frac{k^2 + 2k + 1}{4k^2 + 6k + 2} = \frac{1}{4} < 1. \]
Finally, series III converges using the Ratio Test as well:
\[ \lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \frac{2k+1}{k} \cdot \frac{2}{k+1} = \lim_{k \to \infty} \frac{2}{k+1} = 0. \]

14. The correct answer is A. By Theorem 9.20, we must sum at least \( k \) terms where \( a_{k+1} = \frac{1}{(k+1)^{3/2} \ln(k+1)} < 10^{-2} \). Checking values of \( k \) shows that \( \frac{1}{11^{3/2} \ln 11} \approx 1.1 \times 10^{-2} \) (here \( k = 10 \)) while \( \frac{1}{12^{3/2} \ln 12} \approx 9.7 \times 10^{-3} \) (here \( k = 11 \)).

Free Response

1. a. We must find the smallest value of \( k \) so that \( a_{k+1} = \frac{1}{(2k+3)^3} < 5 \times 10^{-4} \). Testing several values of \( k \), we find that \( a_5 \approx 7.5 \times 10^{-4} \) (this is \( k = 4 \)) and \( a_6 \approx 4.6 \times 10^{-4} \) (this is \( k = 5 \)). So we must use up through \( k = 5 \); that is, the first six terms of the series.

b. The approximate value using these terms is
\[ 1 - \frac{1}{3^3} + \frac{1}{5^3} - \frac{1}{7^3} + \frac{1}{9^3} - \frac{1}{11^3} \approx 0.968668. \]
c. Since the next term of the series is positive, this approximation is an underestimate.

2. a. On the first bounce it rises to a height of 8 feet, and on each subsequent bounce to 0.8 times the previous height. So the total upward travel is
\[ \sum_{k=0}^{\infty} 8 \cdot 0.8^k = \frac{8}{1 - 0.8} = 40 \text{ feet.} \]
b. To start with, it travels 10 feet down; since the upward travel at each bounce is 0.8 times the previous, it travels 8 feet up and thus 8 feet down after the first bounce. The total downward travel is
\[ \sum_{k=0}^{\infty} 10 \cdot 0.8^k = \frac{10}{1 - 0.8} = 50 \text{ feet.} \]
c. If the ball is dropped from a height of \( r \) feet, then the total downward travel is, using the same method as in part (b),
\[ \sum_{k=0}^{\infty} r \cdot 0.8^k = \frac{r}{1 - 0.8} = 5r \text{ feet.} \]

We want \( 5r = 150 \) so that \( r = 30 \) feet.
d. The total travel in the downward direction, using the method in the previous two parts, is

\[ \sum_{k=0}^{\infty} 50 \cdot r^k = \frac{50}{1-r} \text{ feet.} \]

We want \( \frac{50}{1-r} = 300 \), so that 300\(r = 250 \) and thus \( r = \frac{250}{300} = \frac{5}{6} \approx 0.833 \).

3.

a. To apply the Divergence Test, we need to compute the limit of the terms of the underlying sequence:

\[ \lim_{k \to \infty} \frac{k+1}{k^2 + 2k} = \lim_{k \to \infty} \frac{1 + 1/k}{k + 2} = 0. \]

Since the terms of the sequence go to zero, the Divergence Test is inconclusive.

b. Applying the Ratio Test gives

\[ \lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \frac{k+2}{(k+1)^2 + 2(k+1)} \cdot \frac{k^2 + 2k}{k+1} = \lim_{k \to \infty} \frac{k^3 + 4k^2 + 2k}{k^3 + 5k^2 + 7k + 3} = \lim_{k \to \infty} \frac{1 + 4/k + 2/k^2}{1 + 5/k + 7/k^2 + 3/k^3} = 1. \]

The Ratio Test is inconclusive.

c. Let \( f(x) = \frac{x+1}{x^2+2x} \); then

\[ f'(x) = \frac{(x^2 + 2x) \cdot 1 - (x + 1)(2x + 2)}{(x^2 + 2x)^2} = \frac{-x^2 - 2x - 2}{(x^2 + 2x)^2}. \]

For \( x > 0 \) clearly \( f'(x) < 0 \), so that \( f \) is continuous (since \( x^2 + 2x \) has no zeros for \( x > 0 \)), positive, and decreasing. So the Integral Test applies, and using the substitution \( u = x^2 + 2x \), so that \( du = 2(x+1) \, dx \),

\[ \int_{1}^{\infty} \frac{x+1}{x^2+2x} \, dx = \frac{1}{2} \int_{3}^{\infty} \frac{1}{u} \, du, \]

which diverges. So by the Integral Test, the original series diverges as well.

4.

a. \( S_n \) is a finite geometric series with \( n+1 \) terms, first term 1, and ratio \( -\frac{2}{3} \), so

\[ S_n = \frac{1 - \left(-\frac{2}{3}\right)^{n+1}}{1 - \left(-\frac{2}{3}\right)} = \frac{3}{5} \left( 1 - \left(-\frac{2}{3}\right)^{n+1} \right). \]

b. We have

\[ \lim_{n \to \infty} S_n = \frac{3}{5} \lim_{n \to \infty} \left( 1 - \left(-\frac{2}{3}\right)^{n+1} \right) = \frac{3}{5} \]

since \( \lim_{n \to \infty} \left(-\frac{2}{3}\right)^{n+1} = 0 \).

c. By definition, \( S = \lim_{n \to \infty} S_n \); indeed, evaluating \( S \) using the formula for the sum of an infinite geometric series gives

\[ S = \frac{1}{1 - \left(-\frac{2}{3}\right)} = \frac{3}{5}. \]
5.

a. We have

\[
I = \int_1^\infty \frac{2}{x^2 + 1} \, dx
\]

\[
= 2 \lim_{c \to \infty} \int_1^c \frac{1}{x^2 + 1} \, dx
\]

\[
= 2 \lim_{c \to \infty} \left( \tan^{-1} x \right)_1^c
\]

\[
= 2 \lim_{c \to \infty} \left( \tan^{-1} c - \frac{\pi}{4} \right)
\]

\[
= 2 \left( \frac{\pi}{2} - \frac{\pi}{4} \right) = \frac{\pi}{2}.
\]

b. Use the Limit Comparison Test against the convergent \( p \)-series \( \sum \frac{1}{k^2} \). We get

\[
\lim_{k \to \infty} \frac{\frac{2}{k^2 + 1}}{\frac{1}{k^2}} = \lim_{k \to \infty} \frac{2k^2}{k^2 + 1} = \lim_{k \to \infty} \frac{2}{1 + 1/k^2} = 2.
\]

Since the limit is finite and \( \sum \frac{1}{k^2} \) converges, so does the original series.

c. Let \( f(x) = \frac{2}{x^2 + 1} \). Clearly \( f \) is positive and continuous on \([0, \infty)\); further,

\[
f'(x) = -\frac{4x}{(x^2 + 1)^2},
\]

so that \( f'(x) < 0 \) for \( x > 0 \) and thus \( f \) is decreasing. So the Integral Test applies; since the integral is finite (see part (a)), the Integral Test tells us that the original series converges.

6.

a. By Theorem 9.6, \( n^2 \ll e^n \), so that \( \lim_{n \to \infty} n^2 e^{-n} = \lim_{n \to \infty} \frac{n^2}{e^n} = 0 \).

b. The given series is an alternating series; by part (a), the terms tend to zero. Finally, the series is decreasing, since \( \frac{d}{dx} (x^2 e^{-x}) = (2x - x^2)e^{-x} \), which is negative for \( x > 2 \). So by the Alternating Series Test, the series converges.

c. Use the Ratio Test:

\[
\lim_{k \to \infty} \frac{(k + 1)^2 e^{-(k+1)}}{k^2 e^{-k}} = \lim_{k \to \infty} \frac{k^2 + 2k + 1}{ek^2} = \lim_{k \to \infty} \frac{1 + 2/k + 1/k^2}{e} = \frac{1}{e}.
\]

Since the ratio is less than 1, the series converges.

d. Since the series in part (c) is the series composed of the absolute values of the series in part (b), the series in part (b) converges absolutely.
Chapter 10

Power Series

10.1 Approximating Functions With Polynomials

10.1.1 Let the polynomial be \( p(x) \). Then \( p(0) = f(0), \ p'(0) = f'(0) \), and \( p''(0) = f''(0) \).

10.1.2 It generally increases, because the more derivatives of \( f \) are taken into consideration, the better “fit” the polynomial will provide to \( f \).

10.1.3 The approximations are \( p_0(0.1) = 1 \), \( p_1(0.1) = 1 + \frac{0.1}{2} = 1.05 \), and \( p_2(0.1) = 1 + \frac{0.1}{2} - \frac{0.1^3}{6} \approx 1.049 \).

10.1.4 The first three terms: \( f(a) + f'(a)(x-a) + \frac{1}{2} f''(a)(x-a)^2 \).

10.1.5 The remainder is the difference between the value of the Taylor polynomial at a point and the true value of the function at that point, \( R_n(x) = f(x) - p_n(x) \).

10.1.6 This is explained in Theorem 10.2. The idea is that the error when using an \( n \)th order Taylor polynomial centered at \( a \) is \( |R_n(x)| \leq M \cdot \frac{|x-a|^{n+1}}{(n+1)!} \) where \( M \) is an upper bound for \( |f^{(n+1)}(t)| \) for values of \( t \) between \( a \) and \( x \).

10.1.7

a. Note that \( f(1) = 8 \), and \( f'(x) = 12 \sqrt{x} \), so \( f'(1) = 12 \). Thus, \( p_1(x) = 8 + 12(x-1) \).

b. \( f''(x) = \frac{6}{\sqrt{x}} \), so \( f''(1) = 6 \). Thus \( p_2(x) = 8 + 12(x-1) + 3(x-1)^2 \).

c. \( p_1(1.1) = 12 \cdot 0.1 + 8 = 9.2 \), and \( p_2(1.1) = 3(0.1)^2 + 12 \cdot 0.1 + 8 = 9.23 \).

10.1.8

a. Note that \( f(1) = 1 \), and \( f'(x) = -\frac{1}{x^2} \), so \( f'(1) = -1 \). Thus, \( p_1(x) = 1 - (x-1) = -x + 2 \).

b. \( f''(x) = \frac{2}{x^3} \), so \( f''(1) = 2 \). Thus, \( p_2(x) = 2 - x + (x-1)^2 \).

c. \( p_1(1.05) = 0.95 \). \( p_2(1.05) = (0.05)^2 - 0.05 + 2 \approx 0.953 \).

10.1.9

a. \( f'(x) = e^{-x} \), so \( p_1(x) = f(0) + f'(0)x = 1 - x \).

b. \( f''(x) = e^{-x} \), so \( p_2(x) = f(0) + f'(0)x + \frac{1}{2} f''(0)x^2 = 1 - x + \frac{1}{2} x^2 \).

c. \( p_1(0.2) = 0.8 \), and \( p_2(0.2) = 1 - 0.2 + \frac{1}{2}(0.04) = 0.82 \).
10.1.10
a. \( f'(x) = \frac{1}{2}x^{-1/2} \), so \( p_1(x) = f(4) + f'(4)(x - 4) = 2 + \frac{1}{4}(x - 4) \).

b. \( f''(x) = -\frac{1}{4}x^{-3/2} \), so \( p_2(x) = f(4) + f'(4)(x - 4) + \frac{1}{2}f''(4)(x - 4)^2 = 2 + \frac{1}{4}(x - 4) - \frac{1}{32}(x - 4)^2 \).

c. \( p_1(3.9) = 2 + \frac{1}{4}(-0.1) = 2 - 0.025 = 1.975 \), and \( p_2(3.9) = 2 - 0.025 - \frac{1}{32}(0.001) \approx 1.975 \).

10.1.11
a. \( f'(x) = -\frac{1}{(x+1)^2} \), so \( p_1(x) = f(0) + f'(0)x = 1 - x \).

b. \( f''(x) = \frac{2}{(x+1)^3} \), so \( p_2(x) = f(0) + f'(0)x + \frac{1}{2}f''(0)x^2 = 1 - x + x^2 \).

c. \( p_1(0.05) = 0.95 \), and \( p_2(0.05) = 1 - 0.05 + 0.0025 \approx 0.953 \).

10.1.12
a. \( f'(x) = -\sin x \), so \( p_1(x) = \cos \frac{x}{4} - \sin \frac{x}{4} \cdot (x - \frac{x}{4}) = \frac{x}{2}(1 - (x - \frac{x}{4})) \).

b. \( f''(x) = -\cos x \), so
\[
p_2(x) = \cos \frac{\pi}{4} - \sin \frac{\pi}{4} \cdot \left(x - \frac{\pi}{4}\right) - \frac{1}{2} \cos \frac{\pi}{4} \left(x - \frac{\pi}{4}\right)^2 = \frac{\sqrt{2}}{2} \left(1 - \left(x - \frac{\pi}{4}\right) - \frac{1}{2} \left(x - \frac{\pi}{4}\right)^2\right).
\]

c. \( p_1(0.24\pi) \approx 0.729 \) and \( p_2(0.24\pi) \approx 0.729 \).

10.1.13
a. \( f'(x) = \frac{1}{3}x^{-2/3} \), so \( p_1(x) = f(8) + f'(8)(x - 8) = 2 + \frac{1}{12}(x - 8) \).

b. \( f''(x) = -\frac{2}{3}x^{-5/3} \), so \( p_2(x) = f(8) + f'(8)(x - 8) + \frac{1}{2}f''(8)(x - 8)^2 = 2 + \frac{1}{12}(x - 8) - \frac{1}{1275}(x - 8)^2 \).

c. \( p_1(7.5) \approx 1.958 \) and \( p_2(7.5) \approx 1.957 \).

10.1.14
a. \( f'(x) = \frac{1}{1+x^2} \), so \( p_1(x) = f(0) + f'(0)x = x \).

b. \( f''(x) = \frac{-2x}{(1+x^2)^2} \), so \( p_2(x) = f(0) + f'(0)x + \frac{1}{2}f''(0)x^2 = x \).

c. \( p_1(0.1) = p_2(0.1) = 0.1 \).

10.1.15 \( f(0) = 1, f'(0) = -\sin 0 = 0, f''(0) = -\cos 0 = -1 \), so that \( p_0(x) = 1, p_1(x) = 1, p_2(x) = 1 - \frac{1}{2}x^2 \).
10.1. APPROXIMATING FUNCTIONS WITH POLYNOMIALS

10.1.16 \( f(0) = 1, f'(0) = e^0 = -1, f''(0) = e^0 = 1 \), so that \( p_0(x) = 1, p_1(x) = 1 - x, p_2(x) = 1 - x + \frac{x^2}{2} \).

\[
\begin{align*}
y &= e^{-x} \\
y &= p_2(x) \\
y &= p_0(x) \\
y &= p_1(x)
\end{align*}
\]

10.1.17 \( f(0) = 0, f'(0) = \frac{-1}{1-0} = -1, f''(0) = -\frac{1}{(1-0)^2} = -1 \), so that \( p_0(x) = 0, p_1(x) = -x, p_2(x) = -x - \frac{1}{2}x^2 \).

\[
\begin{align*}
y &= \ln(1 - x) \\
y &= p_2(x) \\
y &= p_1(x)
\end{align*}
\]

10.1.18 \( f(0) = 1, f'(0) = -\frac{1}{2}(0+1)^{-3/2} = -\frac{1}{2}, f''(0) = \frac{3}{4}(0+1)^{-5/2} = \frac{3}{4} \), so that \( p_0(x) = 1, p_1(x) = 1 - \frac{x}{2}, p_2(x) = 1 - \frac{x}{2} + \frac{3}{8}x^2 \).

\[
\begin{align*}
y &= (1+x)^{-1/2} \\
y &= p_2(x) \\
y &= p_0(x) \\
y &= p_1(x)
\end{align*}
\]
10.1.19 $f(0) = 0$. $f'(x) = \sec^2 x$, $f''(x) = 2 \tan x \sec^2 x$, so that $f'(0) = 1$, $f''(0) = 0$. Thus $p_0(x) = 0$, $p_1(x) = x$, $p_2(x) = x$.

10.1.20 $f(0) = 1$, $f'(0) = -2(1 + 0)^{-3} = -2$, $f''(0) = 6(1 + 0)^{-4} = 6$. Thus $p_0(x) = 1$, $p_1(x) = 1 - 2x$, $p_2(x) = 1 - 2x + 3x^2$. 
10.1.21 \( f(0) = 1, f'(0) = -3(1 + 0)^{-4} = -3, f''(0) = 12(1 + 0)^{-5} = 12 \), so that \( p_0(x) = 1, p_1(x) = 1 - 3x, p_2(x) = 1 - 3x + 6x^2 \).

10.1.22 \( f(0) = 0, f'(x) = \frac{1}{\sqrt{1-x^2}}, f''(x) = \frac{x}{(1-x^2)^{3/2}} \), so that \( f'(0) = 1, f''(0) = 0 \). Thus \( p_0(x) = 0, p_1(x) = x, p_2(x) = x \).

10.1.23
a. \( p_2(0.05) \approx 1.025 \).

b. The absolute error is \( \sqrt{1.05} - p_2(0.05) \approx 7.6 \times 10^{-6} \).

10.1.24
a. \( p_2(0.1) \approx 1.032 \).

b. The absolute error is \( 1.1^{1/3} - p_2(0.1) \approx 5.8 \times 10^{-5} \).

10.1.25
a. \( p_2(0.08) \approx 0.962 \).

b. The absolute error is \( p_2(0.08) - \frac{1}{\sqrt[3]{1.08}} \approx 1.5 \times 10^{-4} \).

10.1.26
a. \( p_2(0.06) = 0.058 \).
b. The absolute error is $\ln 1.06 - p_2(0.06) \approx 6.9 \times 10^{-5}$.

10.1.27

a. $p_2(0.15) = 0.861$.

b. The absolute error is $p_2(0.15) - e^{-0.15} \approx 5.4 \times 10^{-4}$.

10.1.28

a. $p_2(0.12) = 0.726$.

b. The absolute error is $p_2(0.12) - \frac{1}{1.12^2} \approx 1.5 \times 10^{-2}$.

10.1.29

a. Note that $f(1) = 1$, $f'(1) = 3$, and $f''(1) = 6$. Thus, $p_0(x) = 1$, $p_1(x) = 1 + 3(x - 1)$, and $p_2(x) = 1 + 3(x - 1) + 3(x - 1)^2$.

b. 

10.1.30

a. Note that $f(1) = 8$, $f'(1) = \frac{4}{\sqrt{2}} = 4$, and $f''(1) = -\frac{2}{18 \sqrt{2}} = -2$. Thus, $p_0(x) = 8$, $p_1(x) = 8 + 4(x - 1)$, $p_2(x) = 8 + 4(x - 1) - (x - 1)^2$.

b. 

Copyright © 2014 Pearson Education, Inc.
10.1.31

a. \( p_0(x) = \frac{\sqrt{2}}{2}, \ p_1(x) = \frac{\sqrt{2}}{2} + \frac{\sqrt{3}}{2} (x - \frac{\pi}{4}), \ p_2(x) = \frac{\sqrt{2}}{2} + \frac{\sqrt{3}}{2} (x - \frac{\pi}{4}) - \frac{\sqrt{3}}{4} (x - \frac{\pi}{4})^2. \)

b.

10.1.32

a. \( p_0(x) = \frac{\sqrt{3}}{3}, \ p_1(x) = \frac{\sqrt{3}}{2} - \frac{1}{2} (x - \frac{\pi}{6}), \ p_2(x) = \frac{\sqrt{3}}{2} - \frac{1}{2} (x - \frac{\pi}{6}) - \frac{\sqrt{3}}{4} (x - \frac{\pi}{6})^2. \)

b.

10.1.33

a. \( p_0(x) = 3, \ p_1(x) = 3 + \frac{1}{6} (x - 9), \ p_2(x) = 3 + \frac{1}{6} (x - 9) - \frac{1}{216} (x - 9)^2. \)

b.
10.1.34

a. \( p_0(x) = 2, \ p_1(x) = 2 + \frac{1}{12} (x - 8), \ p_2(x) = x + \frac{1}{12} (x - 8) - \frac{1}{288} (x - 8)^2. \)

b.

10.1.35

a. \( p_0(x) = 1, \ p_1(x) = 1 + \frac{1}{e} (x - e), \ p_2(x) = 1 + \frac{1}{e} (x - e) - \frac{1}{2e^2} (x - e)^2. \)

b.

10.1. APPROXIMATING FUNCTIONS WITH POLYNOMIALS

10.1.36
a. \( p_0(x) = 2, \ p_1(x) = 2 + \frac{1}{32}(x - 16), \ p_2(x) = 2 + \frac{1}{32}(x - 16) - \frac{3}{4096}(x - 16)^2. \)

b.

10.1.37
a. \( f(1) = 2 + \frac{\pi}{4}, \ f'(1) = \frac{1}{1+1^2} + 2 \cdot 1 = \frac{3}{2} \) and \( f''(0) = \frac{3}{2}. \) Thus \( p_0(x) = 2 + \frac{\pi}{4}, \ p_1(x) = 2 + \frac{\pi}{4} + \frac{5}{2}(x - 1), \) and \( p_2(x) = 2 + \frac{\pi}{4} + \frac{5}{2}(x - 1) + \frac{3}{4}(x - 1)^2. \)

b.

10.1.38
a. \( f(\ln 2) = 2, \ f'(\ln 2) = 2, \) and \( f''(\ln 2) = 2. \) So \( p_0(x) = 2, \ p_1(x) = 2 + 2(x - \ln 2), \ p_2(x) = 2 + 2(x - \ln 2) + (x - \ln 2)^2. \)

b.
10.1.39
a. Use the Taylor polynomial centered at 0 with \( f(x) = e^x \). Then \( f^{(n)}(x) = e^x \), so that \( f^{(n)}(0) = e^0 = 1 \). Then
\[
p_3(x) = 1 + x + \frac{1}{2}x^2 + \frac{1}{6}x^3, \quad \text{and thus} \quad p_3(0.12) \approx 1.127.
\]
b. \(|f(0.12) - p_3(0.12)| \approx 8.9 \times 10^{-6}\).

10.1.40
a. Use the Taylor polynomial centered at 0 with \( f(x) = \cos x \). Then \( f'(x) = -\sin x, f''(x) = -\cos x, \) and \( f'''(x) = \sin x \), so that \( f(0) = 1, f'(0) = 0, f''(0) = -1, \) and \( f'''(0) = 0 \). Then
\[
p_3(x) = 1 - \frac{1}{2}x^2, \quad \text{and thus} \quad p_3(-0.2) = 0.98.
\]
b. \(|f(-0.2) - p_3(-0.2)| \approx 6.7 \times 10^{-5}\).

10.1.41
a. Use the Taylor polynomial centered at 0 with \( f(x) = \tan x \). Then \( f'(x) = \sec^2 x, f''(x) = 2 \sec^2 x \tan x, \) and \( f'''(x) = 2 \sec^4 x + 4 \sec^2 x \tan^2 x \), so that \( f(0) = 0, f'(0) = \sec^2 0 = 1, f''(0) = 2 \sec^2 0 \tan 0 = 0, \) and \( f'''(0) = 2 \sec^4 0 + 4 \sec^2 0 \tan^2 0 = 2 \). Then
\[
p_3(x) = x + \frac{1}{3}x^3, \quad \text{and thus} \quad p_3(-0.1) \approx -0.100.
\]
b. \(|p_3(-0.1) - f(-0.1)| \approx 1.3 \times 10^{-6}\).

10.1.42
a. Use the Taylor polynomial centered at 0 with \( f(x) = \ln(1 + x) \). Then \( f'(x) = (x + 1)^{-1}, f''(x) = -(x + 1)^{-2}, \) and \( f'''(x) = 2(x + 1)^{-3} \), so that \( f(0) = 0, f'(0) = 1, f''(0) = -1, \) and \( f'''(0) = 2 \). Then
\[
p_3(x) = x - \frac{1}{2}x^2 + \frac{1}{3}x^3, \quad \text{and thus} \quad p_3(0.05) \approx 0.0488.
\]
b. \(|p_3(0.05) - f(0.05)| \approx 1.5 \times 10^{-6}\).

10.1.43
a. Use the Taylor polynomial centered at 0 with \( f(x) = \sqrt{1 + x} \). Then
\[
f'(x) = \frac{1}{2}(1 + x)^{-1/2}, \quad f''(x) = -\frac{1}{4}(1 + x)^{-3/2}, \quad f'''(x) = \frac{3}{8}(1 + x)^{-5/2},
\]
so that \( f(0) = 1, f'(0) = \frac{1}{2}, f''(0) = -\frac{1}{4}, \) and \( f'''(0) = \frac{3}{8} \). Then
\[
p_3(x) = 1 + \frac{1}{2}x - \frac{1}{4}x^2 + \frac{3}{8}x^3 = 1 + \frac{1}{2}x - \frac{1}{8}x^2 + \frac{1}{16}x^3, \quad \text{and thus} \quad p_3(0.06) \approx 1.030.
\]
b. \(|f(0.06) - p_3(0.06)| \approx 4.9 \times 10^{-7}\).

10.1.44
a. Use the Taylor polynomial centered at \( x = 81 \) with \( f(x) = \sqrt{x} \). Then
\[
f'(x) = \frac{1}{4}x^{-3/4}, \quad f''(x) = -\frac{3}{16}x^{-7/4}, \quad f'''(x) = \frac{21}{64}x^{-11/4},
\]
so that
\[
f(81) = 3, \quad f'(81) = \frac{1}{4} \cdot 3^{-3} = \frac{1}{108}, \quad f''(81) = -\frac{3}{16} \cdot 3^{-7} = -\frac{1}{11664}, \quad f'''(81) = \frac{21}{64} \cdot 3^{-11} = \frac{7}{3779136}.
\]
Then
\[
p_3(x) = 3 + \frac{1}{108}(x - 81) - \frac{1}{23328}(x - 81)^2 + \frac{7}{22674816}(x - 81)^3, \quad \text{and thus} \quad p_3(79) \approx 2.981.
\]
10.1. APPROXIMATING FUNCTIONS WITH POLYNOMIALS

b. \(|p_3(79) - f(79)| \approx 4.3 \times 10^{-8}.

10.1.45
a. Use the Taylor polynomial centered at \(x = 100\) with \(f(x) = \sqrt{x}\). Then

\[ f'(x) = \frac{1}{2}x^{-1/2}, \quad f''(x) = -\frac{1}{4}x^{-3/2}, \quad f'''(x) = \frac{3}{8}x^{-5/2}, \]

so that

\[ f(100) = 10, \quad f'(100) = \frac{1}{20}, \quad f''(100) = -\frac{1}{4000}, \quad f'''(100) = \frac{3}{800000}. \]

Then

\[ p_3(x) = 10 + \frac{1}{20}(x - 100) - \frac{1}{8000}(x - 100)^2 + \frac{1}{1600000}(x - 100)^3, \]

and thus \( p_3(101) \approx 10.050 \).

b. \(|p_3(101) - f(101)| \approx 3.9 \times 10^{-9}.\)

10.1.46
a. Use the Taylor polynomial centered at \(x = 125\) with \(f(x) = \sqrt[3]{x}\). Then

\[ f'(x) = \frac{1}{3}x^{-2/3}, \quad f''(x) = -\frac{2}{9}x^{-5/3}, \quad f'''(x) = \frac{10}{27}x^{-8/3}, \]

so that

\[ f(125) = 5, \quad f'(125) = \frac{1}{75}, \quad f''(125) = \frac{2}{28125}, \quad f'''(125) = \frac{2}{2109375}. \]

Then

\[ p_3(x) = 5 + \frac{1}{75}(x - 125) - \frac{1}{28125}(x - 125)^2 + \frac{1}{6328125}(x - 125)^3, \]

and thus \( p_3(126) \approx 5.013 \).

b. \(|p_3(126) - f(126)| \approx 8.4 \times 10^{-10}.\)

10.1.47
a. Use the Taylor polynomial centered at \(x = \pi\) with \(f(x) = \sin x\). Then

\[ f'(x) = \cos x, \quad f''(x) = -\sin x, \quad f'''(x) = -\cos x, \]

so that

\[ f(\pi) = 0, \quad f'(\pi) = -1, \quad f''(\pi) = 0, \quad f'''(\pi) = 1. \]

Then

\[ p_3(x) = -(x - \pi) + \frac{1}{6}(x - \pi)^3, \]

and thus \( p_3(3) \approx 0.141 \).

b. \(|p_3(3) - \sin 3| \approx 4.7 \times 10^{-7}.\)

10.1.48
a. Use the Taylor polynomial centered at \(x = 1\) with \(f(x) = x^{-2}\). Then

\[ f'(x) = -2x^{-3}, \quad f''(x) = 6x^{-4}, \quad f'''(x) = -24x^{-5}, \]

so that

\[ f(1) = 1, \quad f'(1) = -2, \quad f''(1) = 6, \quad f'''(1) = -24. \]

Then

\[ p_3(x) = 1 - 2(x - 1) + 3(x - 1)^2 - 4(x - 1)^3, \]

and thus \( p_3(1.03) \approx 0.943 \).

b. \(|p_3(1.03) - 1.03^{-2}| \approx 3.9 \times 10^{-6}.\)
10.1.49 With \( f(x) = \sin x \), we have \( R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} x^{n+1} \) for \( c \) between 0 and \( x \).

10.1.50 With \( f(x) = \cos 2x \), we have \( R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} x^{n+1} \) for \( c \) between 0 and \( x \).

10.1.51 With \( f(x) = e^{-x} \), we have \( f^{(n+1)}(x) = (-1)^{n+1} e^{-x} \), so that \( R_n(x) = \frac{e^{-c}}{(n+1)!} x^{n+1} \) for \( c \) between 0 and \( x \).

10.1.52 With \( f(x) = \cos x \), we have \( R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} \left(x - \frac{\pi}{2}\right)^{n+1} \) for \( c \) between \( \frac{\pi}{2} \) and \( x \).

10.1.53 With \( f(x) = \sin x \), we have \( R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} \left(x - \frac{\pi}{2}\right)^{n+1} \) for \( c \) between \( \frac{\pi}{2} \) and \( x \).

10.1.54 With \( f(x) = \frac{1}{1-x} \), we have \( f^{(n+1)}(x) = (-1)^{n+1} \frac{1}{(1-x)^{n+2}} \), so that \( R_n(x) = \frac{1}{(1-c)^{n+2}} x^{n+1} \) for \( c \) between 0 and \( x \).

10.1.55 \( f(x) = \sin x \), so \( f^{(5)}(x) = \cos x \). Because \( \cos x \) is bounded in magnitude by 1, the remainder is bounded by \( |R_4(x)| \leq 0.35^5 \approx 2.0 \times 10^{-5} \).

10.1.56 \( f(x) = \cos x \), so \( f^{(4)}(x) = \cos x \). Because \( \cos x \) is bounded in magnitude by 1, the remainder is bounded by \( |R_3(x)| \leq 0.45^4 \approx 1.7 \times 10^{-3} \).

10.1.57 \( f(x) = e^x \), so \( f^{(5)}(x) = e^x \). Because \( e^{0.25} \) is bounded by 2, \( |R_4(x)| \leq 2 \cdot 0.25^5 \approx 1.6 \times 10^{-5} \).

10.1.58 \( f(x) = \tan x \), so \( f^{(3)}(x) = 2 \sec^2 x (\sec^2 x + 2 \tan^2 x) \). Now, since both \( \tan x \) and \( \sec x \) are increasing on \([0, \frac{\pi}{2}]\), and \( 0.3 < \frac{\pi}{6} \approx 0.524 \), we can get an upper bound on \( f^{(3)}(x) \) on \([0, 0.3]\) by evaluating at \( \frac{\pi}{6} \); this gives \( f^{(3)}(x) < \frac{40}{9} \) on \([0, 0.3]\). Thus \( |R_2(x)| \leq \frac{40}{9} \cdot 0.3^3 = 2.0 \times 10^{-2} \).

10.1.59 \( f(x) = e^{-x} \), so \( f^{(5)}(x) = -e^{-x} \). Because \( f^{(5)} \) achieves its maximum magnitude in the range at \( x = 0 \), which has absolute value 1, \( |R_4(x)| \leq 1 \cdot 0.5^5 \approx 2.6 \times 10^{-4} \).

10.1.60 \( f(x) = \ln(1 + x) \), so \( f^{(4)}(x) = -\frac{6}{(x+1)^4} \). On \([0, 0.4]\), the maximum magnitude is 6, so \( |R_3(x)| \leq 6 \cdot 0.4^4 = 6.4 \times 10^{-3} \).

10.1.61 Here \( n = 3 \) or \( 4 \), so use \( n = 4 \), and \( M = 1 \) because \( f^{(5)}(x) = \cos x \), so that \( |R_4(x)| \leq \frac{(\pi/4)^5}{5!} \approx 2.5 \times 10^{-3} \).

10.1.62 \( n = 2 \) or \( 3 \), so use \( n = 3 \), and \( M = 1 \) because \( f^{(4)}(x) = \cos x \), so that \( |R_3(x)| \leq \frac{(\pi/4)^4}{4!} \approx 1.6 \times 10^{-2} \).

10.1.63 \( n = 2 \) and \( M = e^{1/2} < 2 \), so \( |R_2(x)| \leq 2 \cdot \frac{(1/2)^3}{3!} \approx 4.2 \times 10^{-2} \).

10.1.64 \( n = 1 \) or \( 2 \), so use \( 2 \), and \( f^{(3)}(x) = 2 \sec^2 x (\sec^2 x + 2 \tan^2 x) \). On \([-\frac{\pi}{2}, \frac{\pi}{6}]\), this achieves its maximum value at \( \pm \frac{\pi}{6} \); that value is \( \frac{10}{9} \). Thus \( |R_2(x)| \leq \frac{10}{9} \cdot \frac{(\pi/6)^3}{3!} \approx 1.3 \times 10^{-1} \).

10.1.65 \( n = 2 \); \( f^{(3)}(x) = \frac{2}{(1+x)^3} \), which achieves its maximum at \( x = -0.2 \); \( |f^{(3)}(x)| = \frac{2}{0.8^3} < 4 \). Then \( |R_2(x)| \leq 4 \cdot 0.2^3 \approx 5.4 \times 10^{-3} \).

10.1.66 \( n = 1 \), and \( f''(x) = -\frac{4}{3} (1 + x)^{-3/2} \), which achieves its maximum magnitude at \( x = -0.1 \), where it is less than \( \frac{1}{3} \). Thus \( |R_1(x)| \leq \frac{1}{3} \cdot \frac{0.1^3}{2!} \approx 1.7 \times 10^{-3} \).
10.1.67 Use the Taylor series for $e^x$ at $x = 0$. The derivatives of $e^x$ are $e^x$. On $[-0.5, 0]$, the maximum magnitude of any derivative is thus 1 at $x = 0$, so $|R_n(-0.5)| \leq \frac{0.5^{n+1}}{(n+1)!}$. Thus for $|R_n(-0.5)| < 10^{-3}$ we need $n = 4$.

10.1.68 Use the Taylor series at $x = 0$ for $\sin x$. The magnitude of any derivative of $\sin x$ is bounded by 1, so $|R_n(0.2)| \leq \frac{0.2^{n+1}}{(n+1)!}$. Thus for $|R_n(0.2)| < 10^{-3}$ we need $n = 3$.

10.1.69 Use the Taylor series for $\cos x$ at $x = 0$. The magnitude of any derivative of $\cos x$ is bounded by 1, so $|R_n(-0.25)| \leq \frac{0.25^{n+1}}{(n+1)!}$, so for $|R_n(-0.25)| < 10^{-3}$ we need $n = 3$.

10.1.70 Use the Taylor series for $f(x) = \ln(1 + x)$ at $x = 0$. Then $|f^{(n+1)}(x)| = \frac{n!}{(1+x)^{n+1}}$, which for $x \in [-0.15, 0]$ achieves its maximum at $x = -0.15$. This maximum is $\frac{n!}{0.85^{n+1}} < 1.2^{n+1} \cdot n!$. Thus

$$|R_n(-0.15)| \leq 1.2^{n+1} \cdot n! \cdot \frac{0.15^{n+1}}{(n+1)!} = \frac{1.2^{n+1} \cdot 0.15^{n+1}}{n!},$$

so for $|R_n(-0.15)| < 10^{-3}$ we need $n = 3$.

10.1.71 Use the Taylor series for $f(x) = \sqrt{x}$ at $x = 1$. Then $|f^{(n+1)}(x)| = \frac{1 \cdot 3 \cdots (2n-1)}{2^{n+1}} \cdot (1.06 - 1)^{n+1}$, which achieves its maximum on $[1, 1.06]$ at $x = 1$. Then

$$|R_n(1.06)| \leq \frac{1 \cdot 3 \cdots (2n-1)}{2^{n+1}} \cdot \frac{(1.06 - 1)^{n+1}}{(n+1)!},$$

and for $|R_n(0.06)| < 10^{-3}$ we need $n = 1$.

10.1.72 Use the Taylor series for $f(x) = \frac{1}{1-x}$ at $x = 0$. Then

$$|f^{(n+1)}(x)| = \frac{1 \cdot 3 \cdots (2n+1)}{2^{n+1}} (1-x)^{-3-2n}/2,$$

which achieves its maximum on $[0, 0.15]$ at $x = 0.15$. Thus

$$|R_n(0.15)| \leq \frac{1 \cdot 3 \cdots (2n+1)}{2^{n+1}} \cdot \left(\frac{1}{1-0.15}\right)^{2n+3}/2 \cdot \frac{0.15^{n+1}}{(n+1)!}$$

$$= \frac{1 \cdot 3 \cdots (2n+1)}{2^{n+1}(n+1)!} \cdot \left(\frac{1}{0.85}\right)^{2n+3}/2 \cdot \frac{0.15^{n+1}}{(n+1)!},$$

and for $|R_n(0.15)| < 10^{-3}$ we need $n = 3$.

10.1.73

a. False. If $f(x) = e^{-2x}$, then $f^{(n)}(x) = (-1)^n 2^n e^{-2x}$, so that $f^{(n)}(0) \neq 0$ and all powers of $x$ are present in the Taylor series.

b. True. The constant term of the Taylor series is $f(0) = 1$. Higher-order terms all involve derivatives of $f(x) = x^3 - 1$ evaluated at $x = 0$; clearly for $n < 5$, $f^{(5)}(0) = 0$, and for $n > 5$, the derivative itself vanishes. Only for $n = 5$, where $f^{(5)}(x) = 5!$, is the derivative nonzero, so the coefficient of $x^5$ in the Taylor series is $\frac{f^{(5)}(0)}{5!} = 1$ and the Taylor polynomial of order 10 is in fact $x^5 - 1$. Note that this statement is true of any polynomial of degree at most 10.

c. True. The odd derivatives of $\sqrt{1 + x^2}$ vanish at $x = 0$, while the even ones do not.

d. True. Clearly the second-order Taylor polynomial for $f$ at $a$ has degree at most 2. However, the coefficient of $(x-a)^2$ is $\frac{1}{2} f''(a)$, which is zero since $f$ has an inflection point at $a$. 
10.1.74 Let \( p(x) = \sum_{k=0}^{n} c_k (x-a)^k \) be the \( n \)th Taylor polynomial for \( f(x) \) at \( a \). Because \( f(a) = p(a) \), it follows that \( c_0 = f(0) \). Now, the \( k \)th derivative of \( p(x) \), \( 1 \leq k \leq n \), is 
\[ p^{(k)}(x) = k!c_k \text{terms involving } (x-a)^i, \ i > 0, \] 
so that 
\[ f^{(k)}(a) = p^{(k)}(a) = k! \cdot c_k \text{ so that } c_k = \frac{f^{(k)}(a)}{k!}. \]

10.1.75

a. This matches (C) because for \( f(x) = (1 + 2x)^{1/2} \), 
\[ f''(x) = -\frac{(1 + 2x)^{-3/2}}{2} \] 
so \( \frac{f''(0)}{2!} = -\frac{1}{2} \).

b. This matches (E) because for \( f(x) = (1 + 2x)^{-1/2} \), 
\[ f''(x) = 3(1 + 2x)^{-5/2} \] 
so \( \frac{f''(0)}{2!} = \frac{3}{2} \).

c. This matches (A) because \( f^{(n)}(x) = 2^n e^{2x} \), so that \( f^{(n)}(0) = 2^n \), which is (A)'s pattern.

d. This matches (D) because \( f''(x) = 8(1 + 2x)^{-3} \) and \( f''(0) = 8 \), so that \( f''(0)/2! = 4 \).

e. This matches (B) because \( f'(x) = -(6(1 + 2x)^{-4} \) so that \( f'(0) = -6 \).

f. This matches (F) because \( f^{(n)}(x) = (-2)^n e^{-2x} \) so \( f^{(n)}(0) = (-2)^n \), which is (F)'s pattern.

10.1.76

b. The error seems to be largest at \( x = \frac{1}{2} \) and smallest at \( x = 0 \).

c. The error bound found in Example 7 for \( |\ln(1-x) - p_3(x)| \) was 0.25. The actual error seems much less than that, about 0.02.

10.1.77

a. \( p_2(0.1) = 0.1 \). The maximum error in the approximation is \( 1 \cdot \frac{0.1^3}{3!} \approx 1.7 \times 10^{-4} \).

b. \( p_2(0.2) = 0.2 \). The maximum error in the approximation is \( 1 \cdot \frac{0.2^3}{3!} \approx 1.3 \times 10^{-3} \).

10.1.78

a. \( p_1(0.1) = 0.1 \). \( f''(x) = 2 \tan x \cdot (1 + \tan^2 x) \). Because \( \tan 0.1 < 0.2 \), 
\[ |f''(c)| \leq 2 \cdot 0.2(1 + 0.2^2) = 0.416 \] 
Thus the maximum error is \( \frac{0.416}{2!} \cdot 0.12 \approx 2.1 \times 10^{-3} \).

b. \( p_1(0.2) = 0.2 \). The maximum error is \( \frac{0.416}{2} \cdot 0.2^2 \approx 8.3 \times 10^{-3} \).

10.1.79

a. \( p_3(0.1) = 1 - \frac{0.01}{2} = 0.995 \). The maximum error is \( 1 \cdot \frac{0.1^4}{4!} \approx 4.2 \times 10^{-6} \).

b. \( p_3(0.2) = 1 - \frac{0.04}{2} = 0.98 \). The maximum error is \( 1 \cdot \frac{0.2^4}{4!} \approx 6.7 \times 10^{-5} \).

10.1.80

a. \( p_2(0.1) = 0.1 \) (we can take \( n = 2 \) because the coefficient of \( x^2 \) in \( p_2(x) \) is 0). \( f^{(3)}(x) = \frac{6x^2 - 2}{(x + 1)^3} \) has a maximum magnitude of 2, the maximum error is \( 2 \cdot \frac{0.1^3}{3!} \approx 3.3 \times 10^{-4} \).

b. \( p_2(0.2) = 0.2 \). The maximum error is \( 2 \cdot \frac{0.2^3}{3!} \approx 2.7 \times 10^{-3} \).
10.1. APPROXIMATING FUNCTIONS WITH POLYNOMIALS

10.1.81

a. \( p_1(0.1) = 1.05 \). Because \( |f''(x)| = \frac{1}{4}(1 + x)^{-3/2} \) has a maximum value of \( \frac{1}{4} \) at \( x = 0 \), the maximum error is \( \frac{1}{4} \cdot \frac{0.1^2}{2} = 1.3 \times 10^{-3} \).

b. \( p_1(0.2) = 1.1 \). The maximum error is \( \frac{1}{4} \cdot \frac{0.2^2}{2} = 5 \times 10^{-3} \).

10.1.82

a. \( p_2(0.1) = 0.1 - \frac{0.01}{2} = 0.095 \). Because \( |f^{(3)}(x)| = \frac{2}{(x+1)^5} \) achieves a maximum of 2 at \( x = 0 \), the maximum error is \( 2 \cdot \frac{0.1^2}{3!} \approx 3.3 \times 10^{-4} \).

b. \( p_2(0.2) = 0.2 - \frac{0.04}{2} = 0.18 \). The maximum error is \( 2 \cdot \frac{0.2^2}{6} \approx 2.7 \times 10^{-3} \).

10.1.83

a. \( p_1(0.1) = 1.1 \). Because \( f''(x) = e^x \) is less than 2 on \([0,0.1]\), the maximum error is less than \( 2 \cdot \frac{0.1^2}{2!} = 10^{-2} \).

b. \( p_1(0.2) = 1.2 \). The maximum error is less than \( 2 \cdot \frac{0.2^2}{2!} = 4 \times 10^{-2} \).

10.1.84

a. \( p_1(0.1) = 1 \). Because \( f''(x) = \frac{x}{(1-x^2)^{3/2}} \) is less than 1 on \([0,0.2]\), the maximum error is \( 1 \cdot \frac{0.1^3}{3!} \approx 1.7 \times 10^{-4} \).

b. \( p_1(0.2) = 0.2 \). The maximum error is \( 1 \cdot \frac{0.2^3}{3!} \approx 1.3 \times 10^{-3} \).

10.1.85

| \( x \) | \( |\sin x - p_3(x)| \) | \( |\sin x - p_5(x)| \) |
|---|---|---|
| -0.2 | 2.7 \times 10^{-6} | 2.5 \times 10^{-9} |
| -0.1 | 8.3 \times 10^{-8} | 2.0 \times 10^{-11} |
| 0.0 | 0 | 0 |
| 0.1 | 8.3 \times 10^{-8} | 2.0 \times 10^{-11} |
| 0.2 | 2.7 \times 10^{-6} | 2.5 \times 10^{-9} |

b. The errors are equal for positive and negative \( x \). This makes sense, because \( \sin(-x) = -\sin x \) and \( p_n(-x) = -p_n(x) \) for \( n = 3,5 \). The errors appear to get larger as \( x \) gets farther from zero.

10.1.86

| \( x \) | \( |\cos x - p_2(x)| \) | \( |\cos x - p_4(x)| \) |
|---|---|---|
| -0.2 | 6.7 \times 10^{-5} | 8.9 \times 10^{-8} |
| -0.1 | 4.2 \times 10^{-6} | 1.4 \times 10^{-9} |
| 0.0 | 0 | 0 |
| 0.1 | 4.2 \times 10^{-6} | 1.4 \times 10^{-9} |
| 0.2 | 6.7 \times 10^{-5} | 8.9 \times 10^{-8} |

b. The errors are equal for positive and negative \( x \). This makes sense, because \( \cos(-x) = \cos x \) and \( p_n(-x) = p_n(x) \) for \( n = 2,4 \). The errors appear to get larger as \( x \) gets farther from zero.

10.1.87

| \( x \) | \( |e^{-x} - p_1(x)| \) | \( |e^{-x} - p_2(x)| \) |
|---|---|---|
| -0.2 | 2.1 \times 10^{-2} | 1.4 \times 10^{-3} |
| -0.1 | 5.2 \times 10^{-3} | 1.7 \times 10^{-4} |
| 0.0 | 0 | 0 |
| 0.1 | 4.8 \times 10^{-3} | 1.6 \times 10^{-4} |
| 0.2 | 1.9 \times 10^{-2} | 1.3 \times 10^{-3} |

b. The errors are different for positive and negative displacements from zero, and appear to get larger as \( x \) gets farther from zero.
10.1.88

a. 

| $|f(x) - p_1(x)|$ | $|f(x) - p_2(x)|$ |
|-----------------|-----------------|
| $-0.2$          | $2.3 \times 10^{-2}$ | $3.1 \times 10^{-4}$ |
| $-0.1$          | $5.4 \times 10^{-3}$ | $3.6 \times 10^{-4}$ |
| $0.0$           | $0$               | $0$               |
| $0.1$           | $4.7 \times 10^{-3}$ | $3.1 \times 10^{-4}$ |
| $0.2$           | $1.8 \times 10^{-2}$ | $2.3 \times 10^{-3}$ |

b. The errors are different for positive and negative displacements from zero, and appear to get larger as $x$ gets farther from zero.

10.1.89

a. 

| $|	an x - p_1(x)||$ | $|	an x - p_3(x)||$ |
|-------------------|-------------------|
| $-0.2$            | $2.7 \times 10^{-3}$ | $4.3 \times 10^{-5}$ |
| $-0.1$            | $3.3 \times 10^{-4}$ | $1.3 \times 10^{-6}$ |
| $0.0$             | $0$               | $0$               |
| $0.1$             | $3.3 \times 10^{-4}$ | $1.3 \times 10^{-6}$ |
| $0.2$             | $2.7 \times 10^{-3}$ | $4.3 \times 10^{-5}$ |

b. The errors are equal for positive and negative $x$. This makes sense, because $\tan(-x) = -\tan x$ and $p_n(-x) = -p_n(x)$ for $n = 1, 3$. The errors appear to get larger as $x$ gets farther from zero.

10.1.90 The true value of $\cos \frac{\pi}{12}$ is $\frac{1 + \sqrt{3}}{2\sqrt{2}} \approx 0.966$. The 6th-order Taylor polynomial for $\cos x$ centered at $x = 0$ is

$$p_6(x) = 1 - \frac{x^2}{2} + \frac{x^4}{24} - \frac{x^6}{720}.$$ 

Evaluating the polynomials at $x = \frac{\pi}{12}$ produces the following table:

| $n$ | $p_n\left(\frac{\pi}{12}\right)$ | $|p_n\left(\frac{\pi}{12}\right) - \cos\frac{\pi}{12}|$ |
|-----|---------------------------------|----------------------------------------|
| 1   | 1.000                           | $3.4 \times 10^{-2}$                   |
| 2   | 0.966                           | $2.0 \times 10^{-4}$                   |
| 3   | 0.966                           | $2.0 \times 10^{-4}$                   |
| 4   | 0.966                           | $4.5 \times 10^{-7}$                   |
| 5   | 0.966                           | $4.5 \times 10^{-7}$                   |
| 6   | 0.966                           | $5.5 \times 10^{-10}$                  |

The 6th-order Taylor polynomial for $\cos x$ centered at $x = \frac{\pi}{6}$ is

$$p_6(x) = \frac{\sqrt{3}}{2} - \frac{1}{2} \left(x - \frac{\pi}{6}\right) - \frac{\sqrt{3}}{4} \left(x - \frac{\pi}{6}\right)^2 + \frac{1}{12} \left(x - \frac{\pi}{6}\right)^3$$
$$+ \frac{\sqrt{3}}{48} \left(x - \frac{\pi}{6}\right)^4 - \frac{1}{240} \left(x - \frac{\pi}{6}\right)^5 - \frac{\sqrt{3}}{1440} \left(x - \frac{\pi}{6}\right)^6.$$ 

Evaluating the polynomials at $x = \frac{\pi}{12}$ produces the following table:
The true value of $10.1.91$

The table shows that using the polynomial centered at $x = 0$ is more accurate when $n$ is even while using the polynomial centered at $x = \frac{\pi}{6}$ is more accurate when $n$ is odd. To see why, consider the remainder. Let $f(x) = \cos x$. By Theorem 9.2, the magnitude of the remainder when approximating $f \left( \frac{\pi}{12} \right)$ by the polynomial $p_n$ centered at 0 is:

$$|R_n \left( \frac{\pi}{12} \right)| = \frac{|f^{(n+1)}(c)|}{(n+1)!} \left( \frac{\pi}{12} \right)^n$$

for some $c$ with $0 < c < \frac{\pi}{6}$, while the magnitude of the remainder when approximating $f \left( \frac{\pi}{12} \right)$ by the polynomial $p_n$ centered at $\frac{\pi}{6}$ is:

$$|R_n \left( \frac{\pi}{6} \right)| = \frac{|f^{(n+1)}(c)|}{(n+1)!} \left( \frac{\pi}{6} \right)^n$$

for some $c$ with $\frac{\pi}{6} < c < \frac{\pi}{2}$. When $n$ is odd, $|f^{(n+1)}(c)| = |\cos c|$. Because $\cos x$ is a positive and decreasing function over $[0, \frac{\pi}{6}]$, the magnitude of the remainder in using the polynomial centered at $\frac{\pi}{6}$ will be less than the remainder in using the polynomial centered at 0, and the former polynomial will be more accurate. When $n$ is even, $|f^{(n+1)}(c)| = |\sin c|$. Because $\sin x$ is a positive and increasing function over $[0, \frac{\pi}{6}]$, the remainder in using the polynomial centered at 0 will be less than the remainder in using the polynomial centered at $\frac{\pi}{6}$, and the former polynomial will be more accurate.

10.1.91 The true value of $e^{0.35} \approx 1.419$. The 6th-order Taylor polynomial for $e^x$ centered at $x = 0$ is

$$p_6(x) = 1 + x + \frac{x^2}{2} + \frac{x^3}{6} + \frac{x^4}{24} + \frac{x^5}{120} + \frac{x^6}{720}.$$ 

Evaluating the polynomials at $x = 0.35$ produces the following table:

| $n$ | $p_n (0.35)$ | $|p_n (0.35) - e^{0.35}|$ |
|-----|-------------|-------------------------|
| 1   | 1.350       | 6.9 × 10^{-2}           |
| 2   | 1.411       | 7.8 × 10^{-3}           |
| 3   | 1.418       | 6.7 × 10^{-4}           |
| 4   | 1.419       | 4.6 × 10^{-5}           |
| 5   | 1.419       | 2.7 × 10^{-6}           |
| 6   | 1.419       | 1.3 × 10^{-7}           |

The 6th-order Taylor polynomial for $e^x$ centered at $x = \ln 2$ is

$$p_6(x) = 2 + 2(x - \ln 2) + (x - \ln 2)^2 + \frac{1}{3}(x - \ln 2)^3 + \frac{1}{12}(x - \ln 2)^4 + \frac{1}{60}(x - \ln 2)^5 + \frac{1}{360}(x - \ln 2)^6.$$ 

Evaluating the polynomials at $x = 0.35$ produces the following table:

Copyright © 2014 Pearson Education, Inc.
Comparing the tables shows that using the polynomial centered at $x = 0$ is more accurate for all $n$. To see why, consider the remainder. Let $f(x) = e^x$. By Theorem 9.2, the magnitude of the remainder when approximating $f(0.35)$ by the polynomial $p_n$ centered at 0 is:

$$|R_n(0.35)| = \left| \frac{f^{(n+1)}(c)}{(n+1)!} \right| (0.35)^{n+1} = \frac{e^c}{(n+1)!} (0.35)^{n+1}$$

for some $c$ with $0 < c < 0.35$ while the magnitude of the remainder when approximating $f(0.35)$ by the polynomial $p_n$ centered at $\ln 2$ is:

$$|R_n(0.35)| = \left| \frac{f^{(n+1)}(c)}{(n+1)!} \right| |0.35 - \ln 2|^{n+1} = \frac{e^c}{(n+1)!} (0.35)^{n+1}$$

for some $c$ with $0.35 < c < \ln 2$. Because $\ln 2 - 0.35 \approx 0.35$, the relative size of the magnitudes of the remainders is determined by $e^c$ in each remainder. Because $e^x$ is an increasing function, the remainder in using the polynomial centered at 0 will be less than the remainder in using the polynomial centered at $\ln 2$, and the former polynomial will be more accurate.

10.1.92

a. Let $x$ be a point in the interval on which the derivatives of $f$ are assumed continuous. Then $f'$ is continuous on $[a, x]$, and the Fundamental Theorem of Calculus implies that because $f$ is an antiderivative of $f'$, then $\int_a^x f'(t) \, dt = f(x) - f(a)$, or $f(x) = f(a) + \int_a^x f'(t) \, dt$.

b. Using integration by parts with $u = f'(t)$ and $dv = dt$, note that we may choose any antiderivative of $dv$; we choose $t - x = -(x-t)$. Then

$$f(x) = f(a) - f'(t)(x-t)|_{t=a} + \int_a^x (x-t)f''(t) \, dt$$

$$= f(a) - f'(a)(x-a) + \int_a^x (x-t)f''(t) \, dt.$$ 

c. Integrate by parts again, using $u = f''(t)$, $dv = (x-t) \, dt$, so that $v = -\frac{(x-t)^2}{2}$:

$$f(x) = f(a) + f'(a)(x-a) + \int_a^x (x-t)f''(t) \, dt$$

$$= f(a) + f'(a)(x-a) - \frac{(x-t)^2}{2} f''(t)|_{t=a} + \frac{1}{2} \int_a^x (x-t)^2 f'''(t) \, dt$$

$$= f(a) + f'(a)(x-a) + \frac{f''(t)}{2} (x-a)^2 + \frac{1}{2} \int_a^x (x-t)^2 f'''(t) \, dt$$

It is clear that continuing this process will give the desired result, because successive integrals of $x-t$ give $-\frac{1}{k!}(x-t)^k$.

d. **Lemma:** Let $g$ and $h$ be continuous functions on the interval $[a, b]$ with $g(t) \geq 0$. Then there is a number $c$ in $[a, b]$ with

$$\int_a^b h(t)g(t) \, dt = h(c) \int_a^b g(t) \, dt.$$
10.1. APPROXIMATING FUNCTIONS WITH POLYNOMIALS 889

**Proof:** We note first that if \( g(t) = 0 \) for all \( t \in [a, b] \), then the result is clearly true. We can thus assume that there is some \( t \) in \([a, b]\) for which \( g(t) > 0 \). Because \( g \) is continuous, there must be an interval about this \( t \) on which \( g \) is strictly positive, so we may assume that

\[
\int_a^b g(t) \, dt > 0.
\]

Because \( h \) is continuous on \([a, b]\), the Extreme Value Theorem shows that \( h \) has an absolute minimum value \( m \) and an absolute maximum value \( M \) on the interval \([a, b]\). Thus

\[
m \leq h(t) \leq M
\]

for all \( t \in [a, b] \), so

\[
m \int_a^b g(t) \, dt \leq \int_a^b h(t)g(t) \, dt \leq M \int_a^b g(t) \, dt.
\]

Because \( \int_a^b g(t) \, dt > 0 \), we have

\[
m \leq \frac{\int_a^b h(t)g(t) \, dt}{\int_a^b g(t) \, dt} \leq M.
\]

Now there are points in \([a, b]\) at which \( h(t) \) equals \( m \) and \( M \), so the Intermediate Value Theorem shows that there is a point \( c \) in \([a, b]\) at which

\[
h(c) = \frac{\int_a^b h(t)g(t) \, dt}{\int_a^b g(t) \, dt} \quad \text{or} \quad \int_a^b h(t)g(t) \, dt = h(c) \int_a^b g(t) \, dt.
\]

Applying the lemma with \( h(t) = \frac{f^{(n+1)}(t)}{n!}, g(t) = (x-t)^n \), we see that

\[
R_n(x) = \frac{f^{(n+1)}(c)}{n!} \int_a^x (x-t)^n \, dt = \frac{f^{(n+1)}(c)}{n!} \cdot \frac{1}{n+1}(x-a)^{n+1} = \frac{f^{(n+1)}(c)}{(n+1)!}(x-a)^{n+1}
\]

for some \( c \in [a, b] \).

10.1.93

a. The slope of the tangent line to \( f(x) \) at \( x = a \) is by definition \( f'(a) \); by the point-slope form for the equation of a line, we have \( y - f(a) = f'(a)(x-a) \), or \( y = f(a) + f'(a)(x-a) \).

b. The Taylor polynomial centered at \( a \) is \( p_1(x) = f(a) + f'(a)(x-a) \), which is the tangent line at \( a \).

10.1.94

a. \( p_2(x) = f(a) + f'(a)(x-a) + \frac{f''(a)}{2!}(x-a)^2 \), so that \( p_2'(x) = f'(a) + f''(a)(x-a) \) and \( p_2''(x) = f''(a) \). If \( f \) has a local maximum at \( a \), then \( f'(a) = 0, f''(a) \leq 0 \), but then \( p_2'(a) = 0 \) and \( p_2''(a) \leq 0 \) by the above, so that \( p_2(x) \) also has a local maximum at \( a \).

b. Similarly, if \( f \) has a local minimum at \( a \), then \( f'(a) = 0, f''(a) \geq 0 \), but then \( p_2'(a) = 0 \) and \( p_2''(a) \geq 0 \) by the above, so that \( p_2(x) \) also has a local minimum at \( a \).

c. Recall that \( f \) has an inflection point at \( a \) if the second derivative of \( f \) changes sign at \( a \). But \( p_2''(x) \) is a constant, so \( p_2 \) does not have an inflection point at \( a \) (or anywhere else).

d. No. For example, let \( f(x) = x^3 \). Then \( p_2(x) = 0 \), so that the second-order Taylor polynomial has a local maximum at \( x = 0 \), but \( f(x) \) does not. It also has a local minimum at \( x = 0 \), but \( f(x) \) does not.
a. We have

\[ f(0) = f^{(4)}(0) = \sin 0 = 0 \quad \text{and} \quad f(\pi) = f^{(4)}(\pi) = \sin \pi = 0 \]
\[ f'(0) = f^{(5)}(0) = \cos 0 = 1 \quad \text{and} \quad f'(\pi) = f^{(5)}(\pi) = \cos \pi = -1 \]
\[ f''(0) = -\sin 0 = 0 \quad \text{and} \quad f''(\pi) = -\sin \pi = 0 \]
\[ f'''(0) = -\cos 0 = -1 \quad \text{and} \quad f'''(\pi) = -\cos \pi = 1. \]

Thus

\[ p_5(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!} \]
\[ q_5(x) = -(x - \pi) + \frac{1}{3!}(x - \pi)^3 - \frac{1}{5!}(x - \pi)^5. \]

b. A plot of the three functions, with \(\sin x\) the black solid line, \(p_5(x)\) the dashed line, and \(q_5(x)\) the dotted line, is

\[ p_5(x) \text{ and } \sin x \text{ are almost indistinguishable on } [-\frac{\pi}{2}, \frac{\pi}{2}], \text{ after which } p_5(x) \text{ diverges pretty quickly from } \sin x. \text{ } q_5(x) \text{ is reasonably close to } \sin x \text{ over the entire range, but the two are almost indistinguishable on } [\frac{\pi}{2}, \frac{3\pi}{2}]. \text{ } p_5(x) \text{ is a better approximation than } q_5(x) \text{ on about } [-\pi, \frac{\pi}{2}], \text{ while } q_5(x) \text{ is better on about } (\frac{\pi}{2}, 2\pi]. \]

c. Evaluating the errors gives

| \(x\) | \(|f(x) - p_5(x)|\) | \(|f(x) - q_5(x)|\) |
|---|---|---|
| \(\frac{\pi}{4}\) | \(3.6 \times 10^{-5}\) | \(7.4 \times 10^{-2}\) |
| \(\frac{\pi}{2}\) | \(4.5 \times 10^{-3}\) | \(4.5 \times 10^{-3}\) |
| \(\frac{3\pi}{4}\) | \(7.4 \times 10^{-2}\) | \(3.6 \times 10^{-5}\) |
| \(\frac{5\pi}{4}\) | \(2.3\) | \(3.6 \times 10^{-5}\) |
| \(\frac{7\pi}{4}\) | \(20.4\) | \(7.4 \times 10^{-2}\) |

d. \(p_5(x)\) is a better approximation than \(q_5(x)\) only at \(x = \frac{\pi}{4}\), in accordance with part (b). The two are equal at \(x = \frac{\pi}{2}\), after which \(q_5(x)\) is a substantially better approximation than \(p_5(x)\).
10.1. APPROXIMATING FUNCTIONS WITH POLYNOMIALS

10.1.96

a. We have

\[ f(1) = \ln 1 = 0 \quad f(e) = \ln e = 1 \]
\[ f'(1) = \frac{1}{1} = 1 \quad f'(e) = \frac{1}{e} \]
\[ f''(1) = -\frac{1}{1^2} = -1 \quad f''(e) = -\frac{1}{e^2} \]
\[ f'''(1) = \frac{2}{1^3} = 2 \quad f'''(e) = \frac{2}{e^3}. \]

Thus

\[ p_3(x) = (x - 1) - \frac{1}{2!}(x - 1)^2 + \frac{2}{3!}(x - 1)^3 = (x - 1) - \frac{1}{2}(x - 1)^2 + \frac{1}{3}(x - 1)^3 \]
\[ q_3(x) = 1 + \frac{1}{e}(x - e) - \frac{1}{2e^2}(x - e)^2 + \frac{1}{3e^3}(x - e)^3. \]

b. A plot of the three functions, with \( \ln x \) the black solid line, \( p_3(x) \) the dashed line, and \( q_3(x) \) the dotted line, is

![Plot of functions](image)

c. Evaluating the errors gives

| \( x \) | \( |f(x) - p_3(x)| \) | \( |f(x) - q_3(x)| \) |
|---|---|---|
| 0.5 | \( 2.6 \times 10^{-2} \) | \( 3.6 \times 10^{-1} \) |
| 1.0 | 0 | \( 8.4 \times 10^{-2} \) |
| 1.5 | \( 1.1 \times 10^{-2} \) | \( 1.6 \times 10^{-2} \) |
| 2.0 | \( 1.4 \times 10^{-1} \) | \( 1.5 \times 10^{-3} \) |
| 2.5 | \( 5.8 \times 10^{-1} \) | \( 1.1 \times 10^{-5} \) |
| 3.0 | 1.6 | \( 2.7 \times 10^{-5} \) |
| 3.5 | 3.3 | \( 1.4 \times 10^{-3} \) |

d. \( p_3(x) \) is a better approximation than \( q_3(x) \) for \( x = 0.5, 1.0, \) and \( 1.5 \), and \( q_3(x) \) is a better approximation for the other points. To see why this is true, note that on \([0.5, 4]\) that \( f^{(4)}(x) = -\frac{6}{x^5} \) is bounded in magnitude by \( \frac{6}{0.5^5} = 96 \), so that (using \( P_3 \) for the error term for \( p_3 \) and \( Q_3 \) for the error term for \( q_3 \))

\[ P_3(x) \leq 96 \cdot \frac{|x - 1|^4}{4!} = 4 |x - 1|^4, \quad Q_3(x) \leq 96 \cdot \frac{|x - e|^4}{4!} = 4 |x - e|^4. \]

Thus the relative sizes of \( P_3(x) \) and \( Q_3(x) \) are governed by the distance of \( x \) from 1 and \( e \). Looking at the different possibilities for \( x \) reveals why the results in part (c) hold. (Note that finer estimates of \( P_3 \) and \( Q_3 \) could be determined on smaller ranges if desired, but this would affect only the multiplier \( M \), so that the result of the analysis would be the same.)

Copyright © 2014 Pearson Education, Inc.
10.1.97

a. We have

\[
\begin{align*}
 f(36) &= \sqrt{36} = 6 \\
 f(49) &= \sqrt{49} = 7 \\
 f'(36) &= \frac{1}{2}\cdot\frac{1}{\sqrt{36}} = \frac{1}{12} \\
 f'(49) &= \frac{1}{2}\cdot\frac{1}{\sqrt{49}} = \frac{1}{14}.
\end{align*}
\]

Thus

\[
p_1(x) = 6 + \frac{1}{12}(x - 36) \quad \quad q_1(x) = 7 + \frac{1}{14}(x - 49).
\]

b. Evaluating the errors gives

\[
\begin{array}{|c|c|c|}
\hline
 x & |f(x) - p_1(x)| & |f(x) - q_1(x)| \\
\hline
 37 & 5.7 \times 10^{-4} & 6.0 \times 10^{-2} \\
 39 & 5.0 \times 10^{-3} & 4.1 \times 10^{-2} \\
 41 & 1.4 \times 10^{-2} & 2.5 \times 10^{-2} \\
 43 & 2.6 \times 10^{-2} & 1.4 \times 10^{-2} \\
 45 & 4.2 \times 10^{-2} & 6.1 \times 10^{-3} \\
 47 & 6.1 \times 10^{-2} & 1.5 \times 10^{-3} \\
\hline
\end{array}
\]

c. \(p_1(x)\) is a better approximation that \(q_1(x)\) for \(x \leq 41\), and \(q_1(x)\) is a better approximation for \(x \geq 43\). To see why this is true, note that

\[
f''(x) = -\frac{1}{4}x^{-3/2},
\]

so that on \([36, 49]\), it is bounded in magnitude by

\[
\frac{1}{4} \cdot 36^{-3/2} = \frac{1}{864}.
\]

Thus (using \(P_1\) for the error term for \(p_1\) and \(Q_1\) for the error term for \(q_1\))

\[
P_1(x) \leq \frac{1}{864} \cdot \frac{|x - 36|^2}{2!} = \frac{1}{1728} \cdot (x - 36)^2, \quad Q_1(x) \leq \frac{1}{864} \cdot \frac{|x - 49|^2}{2!} = \frac{1}{1728} \cdot (x - 49)^2.
\]

It follows that the relative sizes of \(P_1(x)\) and \(Q_1(x)\) are governed by the distance of \(x\) from 36 and 49. Looking at the different possibilities for \(x\) reveals why the results in part (b) hold.

10.1.98

a. The quadratic Taylor polynomial for \(\sin x\) centered at \(\pi/2\) is

\[
p_2(x) = \sin \frac{\pi}{2} + \cos \frac{\pi}{2} \cdot \left(x - \frac{\pi}{2}\right) - \frac{1}{2} \sin \frac{\pi}{2} \cdot \left(x - \frac{\pi}{2}\right)^2
\]

\[
= 1 - \frac{1}{2} \left(x - \frac{\pi}{2}\right)^2
\]

\[
= -\frac{1}{2}x^2 + \frac{\pi}{2}x + 1 - \frac{\pi^2}{8}.
\]

b. Let \(q(x) = ax^2 + bx + c\). Since \(q(0) = \sin 0 = 0\) we must have \(c = 0\), so that \(q(x) = ax^2 + bx\). Then the other two conditions give us a pair of linear equations in \(a\) and \(b\):

\[
q\left(\frac{\pi}{2}\right) = \sin \frac{\pi}{2} \quad \Rightarrow \quad \frac{\pi^2}{4}a + \frac{\pi}{2}b = 1
\]

\[
q(\pi) = \sin \pi \quad \Rightarrow \quad \pi^2a + \pi b = 0.
\]

Multiplying the first equation by 4 and subtracting the second equation gives \(\pi b = 4\), so that \(b = \frac{4}{\pi}\); then \(a = -\frac{4}{\pi^2}\), so that

\[
q(x) = -\frac{4}{\pi^2}x^2 + \frac{4}{\pi}x.
\]

c. A plot of the three functions, with \(\sin x\) the black solid line, \(p_2(x)\) the dashed line, and \(q(x)\) the dotted line, is

Copyright © 2014 Pearson Education, Inc.
d. Evaluating the errors gives

| $x$ | $|f(x) - p_2(x)|$ | $|f(x) - q(x)|$ |
|-----|------------------|------------------|
| $\frac{\pi}{4}$ | $1.6 \times 10^{-2}$ | $4.3 \times 10^{-2}$ |
| $\frac{\pi}{2}$ | $0$ | $0$ |
| $\frac{3\pi}{4}$ | $1.6 \times 10^{-2}$ | $4.3 \times 10^{-2}$ |
| $\pi$ | $2.3 \times 10^{-1}$ | $0$ |

e. $q$ is a better approximation than $p$ at $x = \pi$, and the two are equal at $x = \frac{\pi}{2}$. At the other two points, however, $p_2(x)$ is a better approximation than $q(x)$. Clearly $q(x)$ will be exact at $x = 0$, $x = \frac{\pi}{2}$, and $x = \pi$, since it was chosen that way. Also clearly $p_2(x)$ will be exact at $x = \frac{\pi}{2}$ since it is the Taylor polynomial centered at $\frac{\pi}{2}$. The fact that $p_2(x)$ is a better approximation than $q(x)$ at the two intermediate points is a result of the way the polynomials were constructed: the goal of $p_2(x)$ was to be as good an approximation as possible near $x = \frac{\pi}{2}$, while the goal of $q(x)$ was to match $\sin x$ at three given points. Overall, it appears that $q(x)$ does a better job over the full range (the total area between $q(x)$ and $\sin x$ is certainly smaller than the total area between $p_2(x)$ and $\sin x$).

## 10.2 Properties of Power Series

10.2.1 $c_0 + c_1x + c_2x^2 + c_3x^3$.

10.2.2 $c_0 + c_1(x - 3) + c_2(x - 3)^2 + c_3(x - 3)^3$.

10.2.3 Generally the Ratio Test or Root Test is used.

10.2.4 Some terms of a power series may be negative; the Ratio and Root Tests apply only to series with positive terms.

10.2.5 The radius of convergence does not change, but the interval of convergence may change at the endpoints.

10.2.6 $2R$, because for $|x| < 2R$ we have $|\frac{x}{2}| < R$ so that $\sum c_k \left(\frac{x}{2}\right)^k$ converges.

10.2.7 $|x| < \frac{1}{4}$.

10.2.8 $(-1)^k c_k x^k = c_k (-x)^k$, so the two series have the same radius of convergence, because $|-x| = |x|$.

10.2.9 Using the Root Test: $\lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} |2x| = |2x|$. So the radius of convergence is $\frac{1}{2}$. At $x = \frac{1}{2}$ the series is $\sum 1$ which diverges, and at $x = -\frac{1}{2}$ the series is $\sum (-1)^k$ which also diverges. So the interval of convergence is $(-\frac{1}{2}, \frac{1}{2})$.

10.2.10 Using the Ratio Test: $\lim_{k \to \infty} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{k \to \infty} \left| \frac{(2x)^{k+1}}{(k+1)!} \cdot \frac{k!}{(2x)^k} \right| = \lim_{k \to \infty} \left| \frac{2x}{k+1} \right| = 0$. So the radius of convergence is $\infty$ and the interval of convergence is $(-\infty, \infty)$.
Using the Ratio Test, \[ \lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \left| \frac{x-1}{k} \right| = |x-1|. \] So the radius of convergence is 1. At \( x = 2 \), we have the harmonic series (which diverges) and at \( x = 0 \) we have the alternating harmonic series (which converges). Thus the interval of convergence is \([0, 2)\).

Using the Root Test: \[ \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} |x| = |x|. \] Thus, the radius of convergence is \(0\) and the interval of convergence is \((0, 0)\).

10.2.13 Using the Ratio Test: \[ \lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \left| \frac{(k+1)k^{k+1}}{k^{k+1}} \right| = \lim_{k \to \infty} |k+1| |x| = \infty \] because \( \lim_{k \to \infty} \left( \frac{k+1}{k} \right)^k = e \). Thus, the radius of convergence is 0, the series only converges at \( x = 0 \).

Using the Root Test: \[ \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} \sqrt[k]{|k|} = \infty \] because \( \lim_{k \to \infty} \sqrt[k]{k} = \infty \). Thus, the radius of convergence is 0, the series only converges at \( x = 0 \).

10.2.14 Using the Ratio Test: \[ \lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \left| \frac{(k+1)(k+10)^{k+1}}{k(k+10)^k} \right| = \lim_{k \to \infty} (k+1) |x-10| = \infty \] Thus, the radius of convergence is \(0\) and the interval of convergence is \((0, 0)\).

10.2.17 Using the Root Test: \[ \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} \frac{|x|}{3} = \frac{|x|}{3}, \] so the radius of convergence is 3. At \(-3\), the series is \(\sum(-1)^k\), which diverges. At 3, the series is \(\sum 1\), which diverges. So the interval of convergence is \((-3, 3)\).

10.2.18 Using the Root Test: \[ \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} \frac{|x|}{5} = \frac{|x|}{5}, \] so the radius of convergence is 5. At 5, we obtain \(\sum(-1)^k\) which diverges. At -5, we have \(\sum 1\), which also diverges. So the interval of convergence is \((-5, 5)\).

10.2.19 Using the Root Test: \[ \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} \frac{x}{k} = 0, \] so the radius of convergence is infinite and the interval of convergence is \((-\infty, \infty)\).

10.2.20 Using the Ratio Test: \[ \lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \left| \frac{(k+1)(k-4)^{k+1}}{2^{k+1}} \cdot \frac{2^k}{k(x-4)^k} \right| = \lim_{k \to \infty} \left( \frac{k+1}{k} \cdot \frac{|x-4|}{2} \right) = \left| \frac{x-4}{2} \right|, \] so that the radius of convergence is 2. The interval is \((2, 6)\), because at the left endpoint, the series becomes \(\sum k\) (which diverges) and at the right endpoint, it becomes \(\sum (-1)^k k\), which diverges.

10.2.21 Using the Ratio Test: \[ \lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \left| \frac{(k+1)^2}{(k+1)^2} \cdot \frac{k^2}{k^2} \cdot \frac{x^2}{x^2} \right| = \lim_{k \to \infty} \frac{k+1}{k} \cdot |x|^2 = 0, \] so the radius of convergence is infinite, and the interval of convergence is \((-\infty, \infty)\).

10.2.22 Using the Root Test: \[ \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} k^{1/k}|x-1| = |x-1|. \] The radius of convergence is therefore 1. At both \( x = 2 \) and \( x = 0 \) the series diverges by the Divergence Test. The interval of convergence is therefore \((0, 2)\).

10.2.23 Using the Ratio Test: \[ \lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \left| \frac{x^2k^3}{3^k} - \frac{3^k-1}{x^2k^3} \right| = \frac{x^2}{3} \] so that the radius of convergence is \(\sqrt{3}\).

At \( x = \sqrt{3} \), the series is \(\sum 3\sqrt{3} \), which diverges. At \( x = -\sqrt{3} \), the series is \(\sum (-3\sqrt{3}) \), which also diverges, so the interval of convergence is \((-\sqrt{3}, \sqrt{3})\).

10.2.24 \[ \sum \frac{(-x)^{2k}}{100} = \sum \left( \frac{x^2}{100} \right)^k. \] Using the Root Test: \[ \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} \frac{x^2}{100} = \frac{x^2}{100}, \] so that the radius of convergence is 10. At \( x = \pm 10 \), the series is then \(\sum 1\), which diverges, so the interval of convergence is \((-10, 10)\).
10.2.25 Using the Root Test: \( \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} \frac{|x-1|}{k+1} = |x-1| \), so the series converges when \(|x-1| < 1\), so for \(0 < x < 2\). The radius of convergence is 1. At \(x = 2\), the series diverges by the Divergence Test. At \(x = 0\), the series diverges as well by the Divergence Test. Thus the interval of convergence is \((0, 2)\).

10.2.26 Using the Ratio Test:
\[
\lim_{k \to \infty} \frac{|a_{k+1}|}{|a_k|} = \frac{(-2)^{k+1}(x+3)^{k+1}}{3^{k+2}} \cdot \frac{3^{k+1}}{(-2)^k(x+3)} \cdot \frac{|x+3|}{3} = \frac{2}{3} |x+3|.
\]
Thus the series converges when \(\frac{2}{3} |x+3| < 1\), or \(-\frac{2}{3} < x < -\frac{3}{2}\). At \(x = -\frac{3}{2}\), the series diverges by the Divergence Test. At \(x = -\frac{3}{2}\), the series diverges by the Divergence Test. Thus the interval of convergence is \((-\frac{3}{2}, -\frac{3}{2})\).

10.2.27 Using the Ratio Test: \(\lim_{k \to \infty} \frac{|a_{k+1}|}{|a_k|} = \frac{(k+1)^{20}x^{k+1}}{(2k+3)!} \cdot \frac{(2k+1)!}{x^{k+2}} = \lim_{k \to \infty} \frac{(k+1)^{20}}{(2k+2)(2k+3)} = 0\), so the radius of convergence is infinite, and the interval of convergence is \((-\infty, \infty)\).

10.2.28 Using the Root Test: \(\lim_{k \to \infty} \frac{|a_k|^{1/k}}{x} = \lim_{k \to \infty} \frac{|x|^2}{|x|^k} = |x|^2\), so the radius of convergence is 3. The series is divergent by the Divergence Test for \(x = \pm 3\), so the interval of convergence is \((-3, 3)\).

10.2.29 \(f(3x) = \frac{1}{1-3x} = \sum_{k=0}^{\infty} 3^k x^k\), which converges for \(|x| < \frac{1}{3}\), and diverges at the endpoints.

10.2.30 \(g(x) = \frac{x^3}{1-x} = \sum_{k=0}^{\infty} x^{k+3}\), which converges for \(|x| < 1\) and is divergent at the endpoints.

10.2.31 \(h(x) = \frac{2x^3}{1-x} = \sum_{k=0}^{\infty} 2x^{k+3}\), which converges for \(|x| < 1\) and is divergent at the endpoints.

10.2.32 \(f(x^3) = \frac{1}{1-x^3} = \sum_{k=0}^{\infty} x^{3k}\). By the Root Test, \(\lim_{k \to \infty} \frac{|a_k|^{1/k}}{x} = |x|^3\), so this series also converges for \(|x| < 1\). It is divergent at the endpoints.

10.2.33 \(p(x) = \frac{4x^{12}}{1-x} = \sum_{k=0}^{\infty} 4x^{k+12}\), which converges for \(|x| < 1\). It is divergent at the endpoints.

10.2.34 \(f(-4x) = \frac{1}{1+4x} = \sum_{k=0}^{\infty} (-4x)^k = \sum_{k=0}^{\infty} (-1)^k 4^k x^k\), which converges for \(|x| < \frac{1}{4}\) and is divergent at the endpoints.

10.2.35 \(f(3x) = \ln(1-3x) = -\sum_{k=1}^{\infty} \frac{(3x)^k}{k} = -\sum_{k=1}^{\infty} \frac{3^k}{k} x^k\). Using the Ratio Test: \(\lim_{k \to \infty} \frac{|a_{k+1}|}{|a_k|} = \lim_{k \to \infty} \frac{3^{k+1}}{k+1} |x| = 3|x|\), so the radius of convergence is \(\frac{1}{3}\). The series diverges at \(\frac{1}{3}\) (harmonic series), and converges at \(-\frac{1}{3}\) (alternating harmonic series).

10.2.36 \(g(x) = x^3 \ln(1-x) = -\sum_{k=1}^{\infty} \frac{x^{k+3}}{k} - \sum_{k=1}^{\infty} \frac{x^{k+3}}{k} = -\sum_{k=1}^{\infty} \frac{x^{k+3}}{k^2} \cdot x^k\). Using the Ratio Test: \(\lim_{k \to \infty} \frac{|a_{k+1}|}{|a_k|} = \lim_{k \to \infty} \frac{k+1}{k} |x| = |x|\), so the radius of convergence is 1. The series diverges at 1 and converges at \(-1\).

10.2.37 \(h(x) = x \ln(1-x) = -\sum_{k=1}^{\infty} \frac{x^{k+1}}{k} \cdot x^k\). Using the Ratio Test: \(\lim_{k \to \infty} \frac{|a_{k+1}|}{|a_k|} = \lim_{k \to \infty} \frac{k}{k+1} |x| = |x|\), so the radius of convergence is 1, and the series diverges at 1 (harmonic series) but converges at \(-1\) (alternating harmonic series).

10.2.38 \(f(x^3) = \ln(1-x^3) = -\sum_{k=1}^{\infty} \frac{x^{3k}}{k} \cdot x^k\). Using the Ratio Test: \(\lim_{k \to \infty} \frac{|a_{k+1}|}{|a_k|} = \lim_{k \to \infty} \frac{k+1}{k+1} |x^3| = |x^3|\), so the radius of convergence is 1. The series diverges at 1 (harmonic series) but converges at \(-1\) (alternating harmonic series).

10.2.39 \(p(x) = 2x^6 \ln(1-x) = -2 \sum_{k=1}^{\infty} \frac{x^{k+6}}{k} \cdot x^k\). Using the Ratio Test: \(\lim_{k \to \infty} \frac{|a_{k+1}|}{|a_k|} = \lim_{k \to \infty} \frac{k}{k+1} |x| = |x|\), so the radius of convergence is 1. The series diverges at 1 (harmonic series) but converges at \(-1\) (alternating harmonic series).

Copyright © 2014 Pearson Education, Inc.
10.2.40 \( f(-4x) = \ln(1 + 4x) = -\sum_{k=1}^{\infty} \frac{(-4x)^k}{k} \). Using the Ratio Test: \( \lim_{{k \to \infty}} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{{k \to \infty}} \frac{k}{k+1} = 1 \), so the radius of convergence is \( \frac{1}{4} \). The series converges at \( \frac{1}{4} \) (alternating harmonic series) but diverges at \(-\frac{1}{4} \). (harmonic series).

10.2.41 The power series for \( f(x) = \sum_{k=0}^{\infty} x^k \), convergent for \(-1 < x < 1 \), so the power series for \( g(x) = f'(x) \) is \( \sum_{k=1}^{\infty} kx^{k-1} = \sum_{k=0}^{\infty} (k+1)x^k \), also convergent on \( |x| < 1 \). By the Divergence test, it diverges at both endpoints.

10.2.42 The power series for \( f(x) = \sum_{k=0}^{\infty} x^k \), convergent for \(-1 < x < 1 \), so the power series for \( g(x) = \frac{1}{2} f''(x) \) is \( \frac{1}{6} \sum_{k=2}^{\infty} k(k-1)x^{k-2} = \frac{1}{2} \sum_{k=0}^{\infty} (k+1)(k+2)x^k \), also convergent on \( |x| < 1 \). By the Divergence test, it diverges at both endpoints.

10.2.43 The power series for \( f(x) = \sum_{k=0}^{\infty} x^k \), convergent for \(-1 < x < 1 \), so the power series for \( g(x) = \frac{1}{3} f'''(x) \) is \( \frac{1}{6} \sum_{k=3}^{\infty} k(k-1)(k-2)x^{k-3} = \frac{1}{6} \sum_{k=0}^{\infty} (k+1)(k+2)(k+3)x^k \), also convergent on \( |x| < 1 \). By the Divergence test, it diverges at both endpoints.

10.2.44 The power series for \( f(x) = \sum_{k=0}^{\infty} (-1)^k x^{2k} \), convergent on \( |x| < 1 \). Because \( g(x) = -\frac{1}{2} f'(x) \), the power series for \( g \) is \( \frac{-1}{2} \sum_{k=1}^{\infty} (-1)^k 2kx^{2k-1} = \sum_{k=1}^{\infty} (-1)^{k+1} kx^{2k-1} \), also convergent on \( |x| < 1 \). By the Divergence test, it diverges at both endpoints.

10.2.45 The power series for \( f(x) = \sum_{k=0}^{\infty} (3x)^k \), convergent on \( |x| < \frac{1}{3} \). Because \( g(x) = \ln(1 - 3x) = -\sum_{k=1}^{\infty} \frac{3^k x^k}{k} \) and \( g(0) = 0 \), the power series for \( g(x) \) is \( -3 \sum_{k=0}^{\infty} \frac{3^k}{k+1} x^{k+1} = -3 \sum_{k=1}^{\infty} \frac{3^k}{k} x^k \), also convergent on \( (-\frac{1}{3}, \frac{1}{3}) \). Checking the endpoints we see that at \(-\frac{1}{3} \) we get the negative of the alternating harmonic series, which is convergent; at \( \frac{1}{3} \), we get the negative of the harmonic series, which is divergent. Thus the series is convergent on \( [-\frac{1}{3}, \frac{1}{3}] \).

10.2.46 The power series for \( f(x) = \sum_{k=0}^{\infty} (-1)^k x^{2k} = \sum_{k=0}^{\infty} (-1)^k x^{2k+1} \), convergent on \( |x| < 1 \). Because \( g(x) = 2 \sum_{f(x) \text{ dx}} \) and \( g(0) = 0 \), the power series for \( g(x) \) is \( 2 \sum_{k=0}^{\infty} (-1)^k \frac{1}{k+1} x^{k+2} = \sum_{k=0}^{\infty} (-1)^k \frac{1}{k+1} x^{k+2} \). This can be written as \( \sum_{k=0}^{\infty} (-1)^{k+1} \frac{1}{k+1} x^{2k+2} \), also convergent on \((-1, 1)\). At both endpoints we get the alternating harmonic series, so this series converges on \([-1, 1]\).

10.2.47 Start with \( g(x) = \frac{1}{1-x} \). The power series for \( g(x) = \sum_{k=0}^{\infty} (-1)^k x^k \). Because \( f(x) = g(x^2) \), its power series is \( \sum_{k=0}^{\infty} (-1)^k x^{2k} \). The radius of convergence is still \( 1 \), and the series is divergent at both endpoints. The interval of convergence is \((-1, 1)\).

10.2.48 Start with \( g(x) = \frac{1}{1-x} \). The power series for \( g(x) = \sum_{k=0}^{\infty} x^k \). Because \( f(x) = g(x^4) \), its power series is \( \sum_{k=0}^{\infty} x^{4k} \). The radius of convergence is still \( 1 \), and the series is divergent at both endpoints. The interval of convergence is \((-1, 1)\).

10.2.49 Note that \( f(x) = \frac{3}{3+x} = \frac{1}{\frac{1}{3} + \frac{1}{x}} \). Let \( g(x) = \frac{1}{1-x} \). The power series for \( g(x) \) is \( \sum_{k=0}^{\infty} (-1)^k x^k \), so the power series for \( f(x) = g\left(\frac{1}{4}\right) x \) is \( \sum_{k=0}^{\infty} (-1)^k 3^{-k} x^k = \sum_{k=0}^{\infty} (-\frac{3}{4})^k \). Using the Ratio Test: \( \lim_{{k \to \infty}} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{{k \to \infty}} \left| \frac{3^{-(k+1)} x^{k+1}}{3^{-k} x^k} \right| = \frac{|x|}{3} \), so the radius of convergence is \( 3 \). The series diverges at both endpoints. The interval of convergence is \((-3, 3)\).

10.2.50 Note that \( f(x) = \frac{1}{2} \ln(1 - x^2) \). The power series for \( g(x) = \ln(1 - x) \) is \( -\sum_{k=1}^{\infty} \frac{1}{k} x^k \), so the power series for \( f(x) = \frac{1}{2} g(x^2) \) is \( -\frac{1}{2} \sum_{k=1}^{\infty} \frac{1}{k} x^{2k} \). The radius of convergence is still \( 1 \). The series diverges at both \( 1 \) and \(-1 \), so its interval of convergence is \((-1, 1)\).

10.2.51 Note that \( f(x) = \ln \sqrt{4 - x^2} = \frac{1}{2} \ln(4 - x^2) = \frac{1}{2} \left( \ln 4 + \ln \left(1 - \frac{x^2}{4}\right) \right) = \ln 2 + \frac{1}{2} \ln \left(1 - \frac{x^2}{4}\right) \). Now, the power series for \( g(x) = \ln(1 - x) \) is \( -\sum_{k=1}^{\infty} \frac{1}{k} x^k \), so the power series for \( f(x) \) is \( \ln 2 - \frac{1}{2} \sum_{k=1}^{\infty} \frac{1}{k} x^{2k} \). Now, \( \lim_{{k \to \infty}} \frac{a_{k+1}}{a_k} = \lim_{{k \to \infty}} \frac{x^{2k+1}}{(k+1) x^{2k}} = \lim_{{k \to \infty}} \frac{k}{(k+1) x^2} = \frac{x^2}{4} \), so that the radius of convergence is \( 2 \). The series diverges at both endpoints, so its interval of convergence is \((-2, 2)\).
10.2.52 By Example 5, the Taylor series for \( g(x) = \tan^{-1} x \) is \( \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{2k+1} \), so that \( f(x) = g((2x)^2) \) has the Taylor series \( \sum_{k=0}^{\infty} \frac{(-1)^k x^{4k+2}}{2k+1} \). Using the Ratio Test: \( \lim_{k \to \infty} |\frac{a_{k+1}}{a_k}| = \frac{16(2k+1)}{2k+3} \cdot \frac{4k+6}{4k+4} \cdot x^4 = 16x^4 \). The interval of convergence is \( \frac{1}{2} \). The interval of convergence is \( \left(-\frac{1}{2}, \frac{1}{2}\right) \).

10.2.53

a. True. This power series is centered at \( x = 3 \), so its interval of convergence will be symmetric about 3.

b. True. Use the Root Test.

c. True. Substitute \( x^2 \) for \( x \) in the first series.

d. True. Because the power series is zero on the interval, all its derivatives are as well, which implies differentiating the power series that all the \( c_k \) are zero.

10.2.54 Using the Root Test: \( \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} (1 + \frac{1}{k})^{|x|} = e^{|x|} \). Thus, the radius of convergence is \( e^{|x|} \).

10.2.55 Using the Ratio Test: \( \lim_{k \to \infty} |\frac{a_{k+1}}{a_k}| = \lim_{k \to \infty} \frac{(k+1) x^{k+1}}{(k+1)! \cdot x^{k+1}} \cdot \frac{1}{(k+1)!} \cdot x^k = \lim_{k \to \infty} \left(\frac{1}{(k+1)!}\right)^k |x| = \frac{1}{e^{|x|}} \). The radius of convergence is therefore \( e \).

10.2.56 \( 1 + \sum_{k=1}^{\infty} \frac{1}{2k^2} x^k \)

10.2.57 \( \sum_{k=0}^{\infty} (-1)^k \frac{1}{k+1} x^k \)

10.2.58 \( \sum_{k=0}^{\infty} (-1)^k \frac{2^{k+1}}{(k+1)!} x^k \)

10.2.59 \( \sum_{k=1}^{\infty} (-1)^k \frac{x^{2k}}{k!} \)

10.2.60 The power series for \( f(ax) = \sum c_k(ax)^k \). Then \( \sum c_k(ax)^k \) converges if and only if \( |ax| < R \) (because \( \sum c_k x^k \) converges for \( |x| < R \), which happens if and only if \( |x| < \frac{R}{|a|} \).

10.2.61 The power series for \( f(x-a) = \sum c_k(x-a)^k \). Then \( \sum c_k(x-a)^k \) converges if and only if \( |x-a| < R \), which happens if and only if \( a - R < x < a + R \), so the radius of convergence is the same.

10.2.62 Let’s first consider where this series converges. By the Root Test, \( \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} (x^2 + 1)^{2k} = (x^2 + 1)^2 \), which is always greater than 1 for \( x \neq 0 \). This series also diverges when \( x = 0 \), because there we have the divergent series \( \sum 1 \). Because this series diverges everywhere, it doesn’t represent any function.

10.2.63 This is a geometric series with ratio \( \sqrt{x} - 2 \), so its sum is \( \frac{1}{1-(\sqrt{x} - 2)} = \frac{1}{3 - \sqrt{x}} \). Again using the Root Test, \( \lim_{k \to \infty} \sqrt[k]{|a_k|} = |\sqrt{x} - 2| \), so the interval of convergence is given by \( |\sqrt{x} - 2| < 1 \), so \( 1 < \sqrt{x} < 3 \) and \( 1 < x < 9 \). The series diverges at both endpoints.

10.2.64 This series is \( \frac{1}{2} \sum_{k=1}^{\infty} \frac{x^{2k}}{k} \). Because \( \sum_{k=1}^{\infty} \frac{x^k}{k} \) is the power series for \( -\ln(1-x) \), the power series given is \( -\frac{1}{2} \ln(1-x^2) \). Using the Ratio Test: \( \lim_{k \to \infty} |\frac{a_{k+1}}{a_k}| = \lim_{k \to \infty} \frac{2^{k+2}}{k+4} \cdot \frac{4k}{x^2} = \lim_{k \to \infty} \frac{x^2}{k+1} = x^2 \), so the radius of convergence is 1. The series diverges at both endpoints (it is a multiple of the harmonic series). The interval of convergence is \( (-1, 1) \).

10.2.65 This is a geometric series with ratio \( e^{-x} \), so its sum is \( \frac{1}{1-e^{-x}} \). By the Root Test, \( \lim_{k \to \infty} \sqrt[k]{|a_k|} = e^{-x} \), so the power series converges for \( x > 0 \).

10.2.66 This is a geometric series with ratio \( \frac{x-2}{9} \), so its sum is \( \frac{(x-2)/9}{1-((x-2)/9)} = \frac{x-2}{9-(x-2)} = \frac{x-2}{11-x} \). Using the Root Test: \( \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} \left|\frac{2}{9}x^2\right| = \left|\frac{x-2}{9}\right| \), so the series converges for \( |x-2| < 9 \), or \(-7 < x < 11 \). It diverges at both endpoints.
Replacing the power series for 10.2.69

Substitute 2

This is a geometric series with ratio \((x^2 - 1)/3\), so its sum is \(\frac{1}{1 - \frac{x^2}{3}} \frac{3}{x^2 - 1} \frac{3}{x^2 - 2} \frac{3}{x^2 - 2} \). Using the Root Test, the series converges for \(|x^2 - 1| < 3\), so that \(-2 < x^2 < 4\) or \(-2 < x < 2\). It diverges at both endpoints.

Replacing \(x\) by \(x - 1\) gives \(\ln x = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}(x-1)^k}{k}\). Using the Ratio Test: \(\lim_{k \to \infty} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{k \to \infty} \left| \frac{k}{k+1} x \right| = \lim_{k \to \infty} x - 1 = |x - 1|\), so that the series converges for \(|x - 1| < 1\). Checking the endpoints, the interval of convergence is \((0, 2]\).

The power series for \(e^x\) is \(\sum_{k=0}^{\infty} \frac{x^k}{k!}\). Substitute \(-x\) for \(x\) to get \(e^{-x} = \sum_{k=0}^{\infty} \frac{(-1)^k x^k}{k!}\). The series converges for all \(x\).

Substitute \(2x\) for \(x\) in the power series for \(e^x\) to get \(e^{2x} = \sum_{k=0}^{\infty} \frac{(2x)^k}{k!} = \sum_{k=0}^{\infty} \frac{2^k}{k!} x^k\). The series converges for all \(x\).

Substitute \(-3x\) for \(x\) in the power series for \(e^x\) to get \(e^{-3x} = \sum_{k=0}^{\infty} \frac{(-3x)^k}{k!} = \sum_{k=0}^{\infty} \frac{(-1)^k 3^k x^k}{k!}\). The series converges for all \(x\).

Multiply the power series for \(e^x\) by \(x^2\) to get \(x^2e^x = \sum_{k=0}^{\infty} \frac{x^{k+2}}{k!}\), which converges for all \(x\).

The power series for \(x^m f(x)\) is \(\sum c_k x^{k+m}\). The radius of convergence of this power series is determined by the limit

\[
\lim_{k \to \infty} \left| \frac{c_{k+1} x^{k+1+m}}{c_k x^{k+m}} \right| = \lim_{k \to \infty} \left| \frac{c_{k+1} x^{k+1}}{c_k x^k} \right|
\]

and the right-hand side is the limit used to determine the radius of convergence for the power series for \(f(x)\). Thus the two have the same radius of convergence.

\[ R_n = f(x) - S_n(x) = \sum_{k=n}^{\infty} x^k \]

This is a geometric series with ratio \(x\). Its sum is then \(R_n = \frac{x^n}{1-x}\) as desired.

\(R_n(x)\) increases without bound as \(x\) approaches 1, and its absolute value smallest at \(x = 0\) (where it is zero). In general, for \(x > 0\), \(R_n(x) < R_{n-1}(x)\), so the approximations get better the more terms of the series are included.

c. To minimize \(|R_n(x)|\), set its derivative to zero. Assuming \(n > 1\), we have \(R'_n(x) = \frac{n(1-x)x^{n-1}+x^n}{(1-x)^2}\), which is zero for \(x = 0\). There is a minimum at this critical point.
The following is a plot that shows, for each $x \in (0, 1)$, the $n$ required so that $R_n(x) < 10^{-6}$. The closer $x$ gets to 1, the more terms are required in order for the estimate given by the power series to be accurate. The number of terms increases rapidly as $x \to 1$.

**10.2.75**

a. $f(x)g(x) = c_0d_0 + (c_0d_1 + c_1d_0)x + (c_0d_2 + c_1d_1 + c_2d_0)x^2 + \cdots$.

b. The coefficient of $x^n$ in $f(x)g(x)$ is $\sum_{i=0}^{n} c_id_{n-i}$.

**10.2.76** The function $\frac{1}{\sqrt{1-x^2}}$ is the derivative of the inverse sine function, and $\sin^{-1}0 = 0$, so the power series for $\sin^{-1}x$ is the integral of the given power series, or $x + \frac{1}{6}x^3 + \frac{13}{120}x^5 + \frac{135}{720}x^7 + \cdots$. This can also be written $x + \sum_{k=1}^{\infty} \frac{1\cdot3\cdots(2k-1)}{2\cdot4\cdots(2k-2)}x^{2k+1}$.

**10.2.77**

a. For both graphs, the difference between the true value and the estimate is greatest at the two ends of the range; the difference at 0.9 is greater than that at −0.9.

b. The difference between $f(x)$ and $S_n(x)$ is greatest for $x = 0.9$; at that point, $f(x) = \frac{1}{(1-0.9)^2} = 100$, so we want to find $n$ such that $S_n(x)$ is within 0.01 of 100. We find that $S_{111} \approx 99.99084790$, so $n = 112$.

**10.3 Taylor Series**

**10.3.1** The $n^{th}$ Taylor Polynomial is the $n^{th}$ sum of the corresponding Taylor Series.

**10.3.2** In order to have a Taylor series centered at $a$, a function $f$ must have derivatives of all orders on some interval containing $a$. 

Copyright © 2014 Pearson Education, Inc.
10.3.3 The $n^{th}$ coefficient is $\frac{f^{(n)}(a)}{n!}$.

10.3.4 The interval of convergence is found in the same manner that it is found for a more general power series.

10.3.5 Substitute $x^2$ for $x$ in the Taylor series. By theorems proved in the previous section about power series, the interval of convergence does not change except perhaps at the endpoints of the interval.

10.3.6 The Taylor series terminates if $f^{(n)}(0) = 0$ for $n > N$ for some $N$. For $(1 + x)^p$, this occurs if and only if $p$ is an integer $\geq 0$.

10.3.7 It means that the limit of the remainder term is zero.

10.3.8 The Maclaurin series is $e^{2x} = \sum_{k=0}^{\infty} \frac{(2x)^k}{k!}$. This is determined by substituting $2x$ for $x$ in the Maclaurin series for $e^x$.

10.3.9 a. Note that $f(0) = 1$, $f'(0) = -1$, $f''(0) = 1$, and $f'''(0) = -1$. So the Maclaurin series is $1 - x + \frac{1}{2}x^2 - \frac{1}{6}x^3 + \cdots$.

b. $\sum_{k=0}^{\infty} (-1)^k \frac{x^k}{k!}$.

c. The series converges on $(-\infty, \infty)$, as can be seen from the Ratio Test.

10.3.10 a. Note that $f(0) = 1$, $f'(0) = 0$, $f''(0) = -4$, $f'''(0) = 0$, $f^{(4)}(0) = 16$, .... Thus the Maclaurin series is $1 - 2x^2 + \frac{2x^3}{3} - \frac{4x^4}{45} + \cdots$.

b. $\sum_{k=0}^{\infty} (-1)^k \frac{(2x)^{2k}}{(2k)!}$.

c. The series converges on $(-\infty, \infty)$, as can be seen from the Ratio Test.

10.3.11 a. Because the series for $\frac{1}{1+x}$ is $1 - x + x^2 - x^3 + \cdots$, the series for $\frac{1}{1+x^2}$ is $1 - x^2 + x^4 - x^6 + \cdots$.

b. $\sum_{k=0}^{\infty} (-1)^k x^{2k}$.

c. The absolute value of the ratio of consecutive terms is $x^2$, so by the Ratio Test, the radius of convergence is 1. The series diverges at the endpoints by the Divergence Test, so the interval of convergence is $(-1, 1)$.

10.3.12 a. Note that $f(0) = 0$, $f'(0) = 1$, $f''(0) = -1$, $f'''(0) = 2$, and $f''''(0) = -6$. Thus, the series is given by $x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \frac{1}{4}x^4 + \cdots$.

b. $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k} x^k$.

c. The absolute value of the ratio of consecutive terms is $\frac{n|x|}{n+1}$, which has limit $|x|$ as $n \to \infty$, so by the Ratio Test, the radius of convergence is 1. The series converges at $x = 1$ because it is the alternating harmonic series, but $-1$ isn’t in the domain of the function, so the interval of convergence is $(-1, 1]$.

10.3.13 a. Note that $f(0) = 1$, and that $f^{(n)}(0) = 2^n$. Thus, the series is given by $1 + 2x + \frac{4x^2}{2} + \frac{8x^3}{6} + \cdots$.

b. $\sum_{k=0}^{\infty} \frac{(2x)^k}{k!}$.

c. The absolute value of the ratio of consecutive terms is $\frac{2|x|}{n}$, which has limit 0 as $n \to \infty$. So by the Ratio Test, the interval of convergence is $(-\infty, \infty)$.
10.3.14
a. Substitute $2x$ for $x$ in the Taylor series for $(1 + x)^{-1}$, to obtain the series $1 - 2x + 4x^2 - 8x^3 + \cdots$.

b. $\sum_{k=0}^{\infty}(-1)^k(2x)^k$.

c. The Root Test shows that the series converges absolutely for $|2x| < 1$, or $|x| < \frac{1}{2}$. The interval of convergence is $(-\frac{1}{2}, \frac{1}{2})$, because the series at both endpoints diverge by the Divergence Test.

10.3.15
a. By integrating the Taylor series for $\frac{1}{1 + x^2}$ (which is the derivative of $\tan^{-1} x$), we obtain the series $x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots$.

b. $\sum_{k=0}^{\infty}(-1)^k\frac{1}{(2k+1)!}x^{2k+1}$.

c. By the Ratio Test (the ratio of consecutive terms has limit $x^2$), the radius of convergence is $|x| < 1$. Also, at the endpoints we have convergence by the Alternating Series Test, so the interval of convergence is $[-1, 1]$.

10.3.16
a. Substitute $3x$ for $x$ in the Taylor series for $\sin x$, to obtain the series $3x - \frac{9x^3}{3} + \frac{81x^5}{40} - \frac{243x^7}{560} + \cdots$.

b. $\sum_{k=0}^{\infty}(-1)^k\frac{3^{2k+1}}{(2k+1)!}x^{2k+1}$.

c. The ratio of successive terms is $\frac{9}{2(2n+1)}x^2$, which has limit zero as $n \to \infty$, so the interval of convergence is $(-\infty, \infty)$.

10.3.17
a. Note that $f(0) = 1$, $f'(0) = \ln 3$, $f''(0) = \ln^2 3$, $f'''(0) = \ln^3 3$. So the first four terms of the desired series are $1 + (\ln 3)x + \frac{\ln^2 3}{2}x^2 + \frac{\ln^3 3}{6}x^3 + \cdots$.

b. $\sum_{k=0}^{\infty} \frac{(\ln^k 3)x^k}{k!}$.

c. The ratio of successive terms is $\frac{\ln^{k+1} 3}{(k+1)!} \cdot \frac{k!}{(\ln^k 3)x^k} = \frac{\ln 3}{k+1} x$, and the limit as $k \to \infty$ of this quantity is $0$, so the interval of convergence is $(-\infty, \infty)$.

10.3.18
a. Note that $f(0) = 0$, $f'(0) = \frac{1}{\ln 3}$, $f''(0) = -\frac{1}{\ln^2 3}$, $f'''(0) = \frac{2}{\ln^3 3}$. So the first terms of the desired series are $0 + \frac{x}{\ln 3} - \frac{x^2}{2\ln^2 3} + \frac{x^3}{3\ln^3 3} - \frac{x^4}{4\ln^4 3} + \cdots$.

b. $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}x^k}{k\ln 3}$.

c. The absolute value of the ratio of successive terms is $\left| \frac{x^{k+1}}{(k+1)\ln 3} \cdot \frac{k\ln 3}{x^k} \right| = \frac{k}{k+1} |x|$, which has limit $|x|$ as $k \to \infty$. Thus the radius of convergence is 1. At $x = -1$ we have a multiple of the harmonic series (which diverges) and at $x = 1$ we have a multiple of the alternating harmonic series (which converges) so the interval of convergence is $[-1, 1]$.

10.3.19
a. Note that $f(0) = 1$, $f'(0) = -3$, $f''(0) = 18$, $f'''(0) = -162$. So the first terms of the desired series are $1 - 3x + \frac{18}{2}x^2 - \frac{162}{6}x^3 = 1 - 3x + 9x^2 - 27x^3$.

b. $\sum_{k=0}^{\infty}(-1)^k3^{k}x^k$.

c. The absolute value of the ratio of successive terms is $\left| \frac{(-1)^k3^{k+1}x^{k+1}}{(-1)^k3^kx^k} \right| = 3|x|$, which is constant as a function of $k$. Thus the radius of convergence is $\frac{1}{3}$. The series diverges at both endpoints by the Divergence test, so the interval of convergence is $\left( -\frac{1}{3}, \frac{1}{3} \right)$. 

Copyright © 2014 Pearson Education, Inc.
10.3.20
a. Note that \( f(0) = \frac{1}{2}, f'(0) = -\frac{1}{4}, f''(0) = \frac{1}{4}, f'''(0) = -\frac{3}{8} \). So the first terms of the desired series are \( 1 - \frac{1}{4}x + \frac{1}{8}x^2 - \frac{1}{16}x^3 \).
b. \( \sum_{k=0}^{\infty} (-1)^k \frac{k!}{2^{k+1}} x^k \).
c. The absolute value of the ratio of successive terms is
\[
\frac{|(k+1)(-1)^{k+1}x^{k+1}|}{|k(-1)^{k+1}x^k|} = \frac{1}{2} |x|
\]
which is constant as a function of \( k \). Thus the radius of convergence is 2. The series diverges at both endpoints by the Divergence test, so the interval of convergence is \((-2, 2)\).

10.3.21
a. Note that \( f \left( \frac{x}{2} \right) = 1, f' \left( \frac{x}{2} \right) = \cos \frac{x}{2} = 0, f'' \left( \frac{x}{2} \right) = -\sin \frac{x}{2} = -1, f''' \left( \frac{x}{2} \right) = -\cos \frac{x}{2} = 0 \), and so on. Thus the series is given by \( 1 - \frac{1}{2} (x - \frac{x}{2})^2 + \frac{1}{24} (x - \frac{x}{2})^4 - \frac{1}{720} (x - \frac{x}{2})^6 + \cdots \).
b. \( \sum_{k=0}^{\infty} (-1)^k \frac{1}{(2k)!} \left( x - \frac{x}{2} \right)^{2k} \).

10.3.22
a. Note that \( f(\pi) = -1, f'(\pi) = -\sin \pi = 0, f''(\pi) = -\cos \pi = 1, f'''(\pi) = -\sin \pi = 0 \), and so on. Thus the series is given by \(-1 + \frac{1}{2}(x - \pi)^2 - \frac{1}{24}(x - \pi)^4 + \frac{1}{720}(x - \pi)^6 + \cdots \).
b. \( \sum_{k=0}^{\infty} (-1)^{k+1} \frac{1}{(2k)!} (x - \pi)^{2k} \).

10.3.23
a. Note that \( f^{(k)}(1) = (-1)^k \frac{k!}{(k+1)!} = (-1)^k k! \). Thus the series is given by \( 1 - (x-1) + (x-1)^2 - (x-1)^3 + \cdots \).
b. \( \sum_{k=0}^{\infty} (-1)^k (x - 1)^k \).

10.3.24
a. Note that \( f^{(k)}(2) = (-1)^k \frac{k!}{2^{k+1}} \). Thus the series is given by \( \frac{1}{2} - \frac{x-2}{4} + \frac{1}{8}(x-2)^2 - \frac{1}{16}(x-2)^3 + \frac{1}{32}(x-2)^4 + \cdots \).
b. \( \sum_{k=0}^{\infty} (-1)^k \frac{1}{2^{k+1}} (x - 2)^k \).

10.3.25
a. Note that \( f^{(k)}(3) = (-1)^{k-1} \frac{(k-1)!}{3^k} \). Thus the series is given by \( \ln 3 + \frac{x-3}{3} - \frac{1}{18}(x-3)^2 + \frac{1}{81}(x-3)^3 + \cdots \).
b. \( \ln 3 + \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k\cdot3^k} (x - 3)^k \).

10.3.26
a. Note that \( f^{(k)}(\ln 2) = 2 \). Thus the series is given by \( 2 + 2(x - \ln 2) + (x - \ln 2)^2 + \frac{1}{3}(x - \ln 2)^3 + \frac{1}{12}(x - \ln 2)^4 + \cdots \).
b. \( \sum_{k=0}^{\infty} \frac{2}{k!}(x - \ln 2)^k \).

10.3.27
a. Note that \( f(1) = 2, f'(1) = 2 \ln 2, f''(1) = 2 \ln^2 2, f'''(1) = 2 \ln^3 2 \). The first terms of the series are \( 2 + (2 \ln 2)(x - 1) + (\ln^2 2)(x - 1)^2 + \frac{(\ln^2 2)(x-1)^3}{3} + \cdots \).
b. \( \sum_{k=0}^{\infty} \frac{2(x-1)^k \ln^2 2}{k!} \).

10.3.28
a. Note that \( f(2) = 100, f'(2) = 100 \ln 10, f''(2) = 100 \ln^2 10, f'''(2) = 100 \ln^3 10 \). The first terms of the series are \( 100 + 100(\ln 10)(x-2) + 50(\ln^2 10)(x-2)^2 + \frac{50}{3}(\ln^3 10)(x-2)^3 + \cdots \).
b. \( \sum_{k=0}^{\infty} \frac{100(x-2)^k \ln^k 10}{k!} \).

10.3.29 Because the Taylor series for \( \ln(1+x) \) is \( x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots \), the first four terms of the Taylor series for \( \ln(1+x^2) \) are \( x^2 - \frac{x^4}{2} + \frac{x^6}{3} - \frac{x^8}{4} + \cdots \), obtained by substituting \( x^2 \) for \( x \).

Copyright © 2014 Pearson Education, Inc.
10.3.30 Because the Taylor series for \( \sin x \) is \( x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots \), the first four terms of the Taylor series for \( \sin x^2 \) are \( x^2 - \frac{x^6}{3!} + \frac{x^{10}}{5!} - \frac{x^{14}}{7!} + \cdots \), obtained by substituting \( x^2 \) for \( x \).

10.3.31 Because the Taylor series for \( \frac{1}{1-x} = 1 + x + x^2 + x^3 + \cdots \), the first four terms of the Taylor series for \( \frac{1}{1-x^2} \) are \( 1 + 2x + 4x^2 + 8x^3 + \cdots \) obtained by substituting \( 2x \) for \( x \).

10.3.32 Because the Taylor series for \( \ln(1+x) \) is \( x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots \), the first four terms of the Taylor series for \( \ln(1+2x) \) are \( 2x - 2x^2 + \frac{8x^3}{3} - 4x^4 + \cdots \) obtained by substituting \( 2x \) for \( x \).

10.3.33 The Taylor series for \( e^x - 1 \) is the Taylor series for \( e^x \), less the constant term of 1, so it is \( x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \cdots \). Thus, the first four terms of the Taylor series for \( \frac{e^x-1}{x} \) are \( 1 + \frac{x}{2} + \frac{x^2}{3} + \frac{x^3}{4} + \cdots \), obtained by dividing the terms of the first series by \( x \).

10.3.34 The Taylor series for \( \cos(3x^2) \) is found by substituting \( 3x^2 \) for \( x \) in the Taylor series for \( \cos x \):

\[
1 - \frac{1}{2!}(3x^2)^2 + \frac{1}{4!}(3x^2)^4 - \frac{1}{6!}(3x^2)^6 + \cdots = 1 - \frac{9}{2}x^4 + \frac{27}{8}x^8 - \frac{81}{80}x^{12} + \cdots.
\]

10.3.35 Because the Taylor series for \( (1+x)^{-1} \) is \( 1 - x + x^2 - x^3 + \cdots \), if we substitute \( x^4 \) for \( x \), we obtain

\[
1 - x^4 + x^8 - x^{12} + \cdots.
\]

10.3.36 The Taylor series for \( \tan^{-1} x \) is \( x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} - \cdots \). Thus, the Taylor series for \( \tan^{-1} x^2 \) is

\[
x^2 - \frac{x^6}{3} + \frac{x^{10}}{5} - \frac{x^{14}}{7} - \cdots
\]

and, multiplying by \( x \), the Taylor series for \( x \tan^{-1} x^2 \) is \( x^3 - \frac{x^7}{3} + \frac{x^{11}}{5} - \frac{x^{15}}{7} - \cdots \).

10.3.37 First write \( (9 + x^2)^{-1} = \frac{1}{9} \cdot \frac{1}{(1+ (x/3)^2)} \). Thus the Taylor series at 0 is obtained by substituting \( (\frac{x}{3})^2 \) into the Taylor series at 0 for \( \frac{1}{1+x} \) and multiplying by \( \frac{1}{9} \):

\[
\frac{1}{9} \sum_{k=0}^{\infty} (-1)^k \left(\frac{x}{3}\right)^{2k} = \sum_{k=0}^{\infty} (-1)^k \frac{3^{-2k-2}2^{2k}}{k!} = \frac{1}{9} - \frac{1}{81}x^2 + \frac{1}{729}x^3 - \frac{1}{6561}x^4 + \cdots.
\]

10.3.38 We find the Taylor series at 0 for \( \ln(1-x^2) \) by substituting \( -x^2 \) for \( x \) in the Taylor series at 0 for \( \ln(1+x) \), and multiply the result by \( x \):

\[
x \sum_{k=1}^{\infty} (-1)^{k+1} \frac{(-x^2)^k}{k} = -x \sum_{k=1}^{\infty} \frac{x^{2k}}{k} = -\sum_{k=1}^{\infty} \frac{1}{k} x^{2k+1} = -x^3 - \frac{1}{2}x^5 - \frac{1}{3}x^7 - \frac{1}{4}x^9 - \cdots.
\]

10.3.39

a. The required derivatives are

\[
\begin{align*}
f(x) &= (1+x)^{-2} \\
f'(x) &= -(1+x)^{-3} \\
f''(x) &= 6(1+x)^{-4} \\
f'''(x) &= -24(1+x)^{-5}
\end{align*}
\]

Thus the first four terms of the series are

\[
p_4(x) = 1 - 2x + \frac{6}{2!}x^2 - \frac{24}{3!}x^3 = 1 - 2x + 3x^2 - 4x^3.
\]

b. \( p_4(0.1) = 1 - 2 \cdot 0.1 + 3 \cdot 0.01 - 4 \cdot 0.001 = 0.826 \).

Copyright © 2014 Pearson Education, Inc.
10.3.40

a. The required derivatives are

\[
\begin{align*}
    f(x) &= (1 + x)^{1/2} \quad \Rightarrow \quad f(0) = 1 \\
    f'(x) &= \frac{1}{2} (1 + x)^{-1/2} \quad \Rightarrow \quad f'(0) = \frac{1}{2} \\
    f''(x) &= -\frac{1}{4} (1 + x)^{-3/2} \quad \Rightarrow \quad f''(0) = -\frac{1}{4} \\
    f'''(x) &= \frac{3}{8} (1 + x)^{-5/2} \quad \Rightarrow \quad f'''(0) = \frac{3}{8}.
\end{align*}
\]

Thus the first four terms of the series are

\[
p_4(x) = 1 + \frac{1}{2} x - \frac{1}{4} \cdot \frac{1}{2!} x^2 + \frac{3}{8} \cdot \frac{1}{3!} x^3 = 1 + \frac{1}{2} x - \frac{1}{8} x^2 + \frac{1}{16} x^3.
\]

b. \(p_4(0.06) = 1 + \frac{1}{2} \cdot 0.06 - \frac{1}{8} \cdot 0.06^2 + \frac{1}{16} \cdot 0.06^3 \approx 1.030\).

10.3.41

a. The required derivatives are

\[
\begin{align*}
    f(x) &= (1 + x)^{1/4} \quad \Rightarrow \quad f(0) = 1 \\
    f'(x) &= \frac{1}{4} (1 + x)^{-3/4} \quad \Rightarrow \quad f'(0) = \frac{1}{4} \\
    f''(x) &= -\frac{3}{16} (1 + x)^{-7/4} \quad \Rightarrow \quad f''(0) = -\frac{3}{16} \\
    f'''(x) &= \frac{21}{64} (1 + x)^{-11/4} \quad \Rightarrow \quad f'''(0) = \frac{21}{64}.
\end{align*}
\]

so the first four terms of the series are

\[
p_4(x) = 1 + \frac{1}{4} x - \frac{3}{16} \cdot \frac{1}{2!} x^2 + \frac{21}{64} \cdot \frac{1}{3!} x^3 = 1 + \frac{1}{4} x - \frac{3}{32} x^2 + \frac{7}{128} x^3.
\]

b. Substitute \(x = 0.12\) to get \(p_4(x) \approx 1.029\).

10.3.42

a. The required derivatives are

\[
\begin{align*}
    f(x) &= (1 + x)^{-3} \quad \Rightarrow \quad f(0) = 1 \\
    f'(x) &= -3(1 + x)^{-4} \quad \Rightarrow \quad f'(0) = -3 \\
    f''(x) &= 12(1 + x)^{-5} \quad \Rightarrow \quad f''(0) = 12 \\
    f'''(x) &= -60(1 + x)^{-6} \quad \Rightarrow \quad f'''(0) = -60.
\end{align*}
\]

Thus the first four terms of the series are

\[
p_4(x) = 1 - 3x + \frac{12}{2!} x^2 - \frac{60}{3!} x^3 = 1 - 3x + 6x^2 - 10x^3.
\]

b. Substitute \(x = 0.1\) to get 0.750.

10.3.43

a. The required derivatives are

\[
\begin{align*}
    f(x) &= (1 + x)^{-2/3} \quad \Rightarrow \quad f(0) = 1 \\
    f'(x) &= -\frac{2}{3} (1 + x)^{-5/3} \quad \Rightarrow \quad f'(0) = -\frac{2}{3} \\
    f''(x) &= \frac{10}{9} (1 + x)^{-8/3} \quad \Rightarrow \quad f''(0) = \frac{10}{9} \\
    f'''(x) &= -\frac{80}{27} (1 + x)^{-11/3} \quad \Rightarrow \quad f'''(0) = -\frac{80}{27}.
\end{align*}
\]

Copyright © 2014 Pearson Education, Inc.
Thus the first four terms of the series are
\[ p_4(x) = 1 - \frac{2}{3}x + \frac{10}{9 \cdot 2!}x^2 - \frac{80}{27 \cdot 3!}x^3 = 1 - \frac{2}{3}x + \frac{5}{9}x^2 - \frac{40}{81}x^3. \]

b. Substitute \( x = 0.18 \) to get \( p_4(0.18) \approx 0.895. \)

10.3.44

a. The required derivatives are
\[
\begin{align*}
  f(x) &= (1 + x)^{2/3} \\
  f'(x) &= \frac{2}{3}(1 + x)^{-1/3} \\
  f''(x) &= -\frac{2}{9}(1 + x)^{-4/3} \\
  f'''(x) &= \frac{8}{27}(1 + x)^{-7/3}
\end{align*}
\]

Thus the first four terms of the series are
\[ p_4(x) = 1 + \frac{2}{3}x - \frac{2}{9 \cdot 2!}x^2 + \frac{8}{27 \cdot 3!}x^3 = 1 + \frac{2}{3}x - \frac{1}{9}x^2 + \frac{4}{81}x^3. \]

b. Substitute \( x = 0.02 \) to get \( \approx 1.013. \)

10.3.45 Replace \( x \) with \( x^2 \) in the given series for \( \sqrt{1 + x} \), giving
\[ \sqrt{1 + x^2} = 1 + \frac{x^2}{2} - \frac{x^4}{8} + \frac{x^6}{16} - \cdots. \]

Since the series for \( \sqrt{1 + x^2} \) converges for \(-1 \leq x^2 \leq 1\), it follows from Theorem 10.4 part 3 that the above series for \( \sqrt{1 + x^2} \) converges for \(-1 \leq x^2 \leq 1\), which is the same thing as \(-1 \leq x \leq 1\). Thus this series converges on the interval \(-1 \leq x \leq 1\).

10.3.46 We have, after a little algebra and then substituting \( \frac{x}{4} \) for \( x \) in the given series for \( \sqrt{1 + x} \),
\[ \sqrt{4 + x} = 2\sqrt{1 + x/4} = 2 + \frac{x}{4} - \frac{x^2}{64} + \frac{x^3}{512} + \cdots. \]

Since the series for \( \sqrt{4 + x} \) converges for \(-1 \leq x \leq 1\), it follows from Theorem 10.4 part 3 that the above series for \( \sqrt{4 + x} \) converges if \(-1 \leq \frac{x}{4} \leq 1\). Simplifying gives \(-4 \leq x \leq 4\) for the interval of convergence.

10.3.47 We have, after a little algebra and then substituting \(-x\) for \( x\) in the given series for \( \sqrt{1 + x} \),
\[ \sqrt{9 - 9x} = 3\sqrt{1 - x} = 3 - \frac{3}{2}x - \frac{3}{8}x^2 - \frac{3}{16}x^3 - \cdots. \]

Since the series for \( \sqrt{1 + x} \) converges for \(-1 \leq x \leq 1\), it follows from Theorem 10.4 part 3 that the above series for \( \sqrt{9 - 9x} \) converges for \(-1 \leq -x \leq 1\), which is the same thing as \(-1 \leq x \leq 1\). Thus this series converges on the interval \(-1 \leq x \leq 1\).

10.3.48 Replace \( x \) by \(-4x\) in the given series for \( \sqrt{1 + x} \) to get
\[ \sqrt{1 - 4x} = 1 - 2x - 2x^2 - 4x^3 - \cdots. \]

Since the series for \( \sqrt{1 + x} \) converges for \(-1 \leq x \leq 1\), it follows from Theorem 10.4 part 3 that the above series for \( \sqrt{1 - 4x} \) converges for \(-1 \leq -4x \leq 1\), which is the same thing as \(-\frac{1}{4} \leq x \leq \frac{1}{4}\). Thus this series converges on the interval \(-\frac{1}{4} \leq x \leq \frac{1}{4}\).
10.3.49 We have, after a little algebra and then substituting \( \frac{x^2}{a^2} \) for \( x \) in the given series for \( \sqrt{1 + x} \),
\[
\sqrt{a^2 + x^2} = a \sqrt{1 + \frac{x^2}{a^2}} = a + \frac{x^2}{2a} - \frac{x^4}{8a^3} + \frac{x^6}{16a^5} - \cdots.
\]
Since the series for \( \sqrt{1 + x} \) converges for \(-1 \leq x \leq 1\), it follows from Theorem 10.4 part 3 that the above series for \( \sqrt{a^2 - x^2} \) converges for \(-1 \leq \frac{x^2}{a^2} \leq 1\), which is the same thing as \( 0 \leq \frac{x^2}{a^2} \leq 1 \), or \( 0 \leq x^2 \leq a^2 \). Thus this series converges for \(-a \leq x \leq a\).

10.3.50 We have, after a little algebra and then substituting \(-4x^2\) for \( x \) in the given series for \( \sqrt{1 + x} \),
\[
\sqrt{4 - 16x^2} = 2 \sqrt{1 - (2x)^2} = 2 - 4x^2 - 4x^4 - 8x^6 - \cdots.
\]
Since the series for \( \sqrt{1 + x} \) converges for \(-1 \leq x \leq 1\), it follows from Theorem 10.4 part 3 that the above series for \( \sqrt{4 - 16x^2} \) converges for \(-1 \leq -4x^2 \leq 1\), which is the same thing as \(-\frac{1}{4} \leq x^2 \leq \frac{1}{4}\). Thus this series converges for \(-\frac{1}{2} \leq x \leq \frac{1}{2}\).

10.3.51 \((1 + 4x)^{-2} = 1 - 2(4x) + 3(4x)^2 - 4(4x)^3 + \cdots = 1 - 8x + 48x^2 - 256x^3 + \cdots\).

10.3.52 \(\frac{1}{(1 - 4x)^2} = (1 - 4x)^{-2} = 1 - 2(-4x) + 3(-4x)^2 - 4(-4x)^3 + \cdots = 1 + 8x + 48x^2 + 256x^3 + \cdots\).

10.3.53
\[
\frac{1}{(4 + x^2)^2} = (4 + x^2)^{-2} = \frac{1}{16} \left(1 + \frac{x^2}{4}\right)^{-2} = \frac{1}{16} \left(1 - 2 \cdot \frac{x^2}{4} + 3 \cdot \frac{x^4}{16} - 4 \cdot \frac{x^6}{64} + \cdots\right) = \frac{1}{16} - \frac{1}{32} x^2 + \frac{3}{256} x^4 - \frac{1}{256} x^6 + \cdots.
\]

10.3.54 Note that \(x^2 - 4x + 5 = 1 + (x - 2)^2\), so \((1 + (x - 2)^2)^{-2} = 1 - 2(x - 2)^2 + 3(x - 2)^4 - 4(x - 2)^6 + \cdots\).

10.3.55 \((3 + 4x)^{-2} = \frac{1}{9} \left(1 + \frac{4x}{3}\right)^{-2} = \frac{1}{9} - \frac{2}{9} \left(\frac{4x}{3}\right) + \frac{3}{9} \left(\frac{4x}{3}\right)^2 - \frac{4}{9} \left(\frac{4x}{3}\right)^3 + \cdots = \frac{1}{9} - \frac{8}{27} x + \frac{16}{27} x^2 - \frac{256}{243} x^3 + \cdots\).

10.3.56 \((1 + 4x^2)^{-2} = (1 + (2x)^2)^{-2} = 1 - 2(2x)^2 + 3(2x)^4 - 4(2x)^6 + \cdots = 1 - 8x^2 + 48x^4 - 256x^6 + \cdots\).

10.3.57 The interval of convergence for the Taylor series for \(f(x) = \sin x\) is \((-\infty, \infty)\). The remainder is \(R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} x^{n+1}\) for some \(c\). Because \(f^{(n+1)}(x)\) is \pm \sin x or \pm \cos x, we have
\[
\lim_{n \to \infty} |R_n(x)| \leq \lim_{n \to \infty} \frac{1}{(n+1)!} |x^{n+1}| = 0
\]
for any \(x\).

10.3.58 The interval of convergence for the Taylor series for \(f(x) = \cos 2x\) is \((-\infty, \infty)\). The remainder is \(R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} x^{n+1}\) for some \(c\). The \(n\)th derivative of \(\cos 2x\) is \(2^n\) times either \(\pm \sin x\) or \(\pm \cos x\), so that \(f^{(n+1)}(x)\) is bounded by \(2^{n+1}\) in magnitude. Thus \(\lim_{n \to \infty} |R_n(x)| \leq \lim_{n \to \infty} \frac{2^{n+1}}{(n+1)!} |x^{n+1}| = 0 \text{ for any } x\).

10.3.59 The interval of convergence for the Taylor series for \(e^{-x}\) is \((-\infty, \infty)\). The remainder is \(R_n(x) = \frac{(-1)^{n+1} x^{n+1}}{(n+1)!} e^{-c} x^{n+1}\) for some \(c\). Thus \(\lim_{n \to \infty} |R_n(x)| = 0 \text{ for any } x\).

10.3.60 The interval of convergence for the Taylor series for \(f(x) = \cos x\) is \((-\infty, \infty)\). The remainder is \(R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} (x - \pi)^{n+1}\) for some \(c\). Because \(f^{n+1}(x)\) is \(\pm \cos x\) or \(\pm \sin x\), we have
\[
\lim_{n \to \infty} |R_n(x)| \leq \lim_{n \to \infty} \frac{1}{(n+1)!} \left| (x - \frac{\pi}{2})^{n+1}\right| = 0
\]
for any \(x\).

10.3.61

a. False. Not all of its derivatives are defined at zero - in fact, none of them are.

b. True. The derivatives of \( \csc x \) involve positive powers of \( \csc x \) and \( \cot x \), both of which are defined at \( \frac{\pi}{2} \), so that \( \csc x \) has continuous derivatives at \( \frac{\pi}{2} \).

c. False. For example, the Taylor series for \( f(x^2) \) doesn’t converge at \( x = 1.9 \), because the Taylor series for \( f(x) \) doesn’t converge at \( 1.9^2 = 3.61 \).

d. False. The Taylor series centered at 1 involves derivatives of \( f \) evaluated at 1, not at 0.

e. True. This follows because the Taylor series must itself be an even function.

10.3.62

The relevant Taylor series are: \( \cos 2x = 1 - 2x^2 + \frac{2^2}{2!}x^4 - \frac{2^4}{4!}x^6 + \cdots \), and \( \sin x = 2x - \frac{1}{3!}x^3 + \frac{1}{5!}x^5 - \cdots \).

Thus, the first three terms of the resulting series are \( 2x + 2 \sin x = 1 + 2x - 2x^2 + \cdots \).

10.3.63

The relevant Taylor series are: \( e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \frac{x^5}{5!} + \cdots \) and \( e^{-x} = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \frac{x^5}{5!} + \cdots \). Thus the first three terms of the resulting series are \( \frac{1}{2} (e^x + e^{-x}) = 1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \cdots \).

10.3.64

With \( f(x) = \sec x \), computing derivatives gives

\[
egin{align*}
  f(x) &= \sec x \quad \Rightarrow \quad f(0) = 1 \\
  f'(x) &= \sec x \tan x \quad \Rightarrow \quad f'(0) = 0 \\
  f''(x) &= \sec^3 x + \sec x \tan^2 x \quad \Rightarrow \quad f''(0) = 1 \\
  f'''(x) &= 5 \sec^3 x \tan x + \sec x \tan^3 x \quad \Rightarrow \quad f'''(0) = 0 \\
  f^{(4)}(x) &= 5 \sec^3 x + 18 \sec^3 x \tan^2 x + \sec x \tan^4 x \quad \Rightarrow \quad f^{(4)}(0) = 5
\end{align*}
\]

Thus the first three nonzero terms are \( \sec x = 1 + \frac{1}{2} x^2 + \frac{5}{24} x^4 \).

10.3.65

Computing derivatives gives

\[
egin{align*}
  f(x) &= (1 + x^2)^{-2/3} \quad \Rightarrow \quad f(0) = 1 \\
  f'(x) &= -\frac{4}{3} x (1 + x^2)^{-5/3} \quad \Rightarrow \quad f'(0) = 0 \\
  f''(x) &= \frac{4}{9} (7x^2 - 3)(1 + x^2)^{-8/3} \quad \Rightarrow \quad f''(0) = -\frac{4}{9} \\
  f'''(x) &= -\frac{40}{27} (7x^3 - 9x)(1 + x^2)^{-11/3} \quad \Rightarrow \quad f'''(0) = 0 \\
  f^{(4)}(x) &= \frac{40}{81} (91x^4 - 234x^2 + 27)(1 + x^2)^{-14/3} \quad \Rightarrow \quad f^{(4)}(0) = \frac{40}{3}
\end{align*}
\]

Thus the first three nonzero terms of the Taylor series are

\[
1 - \frac{4}{3 \cdot 2!} x^2 + \frac{40}{3 \cdot 4!} x^4 = 1 - \frac{2}{3} x^2 + \frac{5}{9} x^4.
\]

10.3.66

The first three derivatives of \( f(x) = \tan x \) that are not equal to 0 at \( x = 0 \) are \( f'(0) = 1, f''(0) = 2 \), and \( f^{(5)}(0) = 16 \). Thus the first three terms of the Taylor series for \( \tan x \) are \( x + \frac{2}{3} x^3 + \frac{16}{15} x^5 \).

10.3.67

Computing derivatives gives

\[
egin{align*}
  f(x) &= (1 - x^2)^{1/2} \quad \Rightarrow \quad f(0) = 1 \\
  f'(x) &= -x(1 - x^2)^{-1/2} \quad \Rightarrow \quad f'(0) = 0 \\
  f''(x) &= -\frac{1}{2} (1 - x^2)^{-3/2} \quad \Rightarrow \quad f''(0) = -1 \\
  f'''(x) &= -3x(1 - x^2)^{-5/2} \quad \Rightarrow \quad f'''(0) = 0 \\
  f^{(4)}(x) &= -3(4x^2 + 1)(1 - x^2)^{-7/2} \quad \Rightarrow \quad f^{(4)}(0) = -3
\end{align*}
\]

Copyright © 2014 Pearson Education, Inc.
Thus the first three nonzero terms of the Taylor series are
\[ 1 - \frac{1}{2!} x^2 - \frac{3}{4!} x^4 = 1 - \frac{1}{2} x^2 - \frac{1}{8} x^4. \]
so that

10.3.68 Because \( b^x = e^{x \ln b} \), the Taylor series is \( 1 + x \ln b + \frac{1}{2!} (x \ln b)^2 + \cdots \).

10.3.69 \( f(x) = (1 + x^2)^{-2} \). The required derivatives are
\begin{align*}
f(x) &= (1 + x^2)^{-2} \quad \Rightarrow \quad f(0) = 1 \\
f'(x) &= -4x(1 + x^2)^{-3} \quad \Rightarrow \quad f'(0) = 0 \\
f''(x) &= 4(5x^2 - 1)(1 + x^2)^{-4} \quad \Rightarrow \quad f''(0) = -4 \\
f'''(x) &= 24(3x - 5x^3)(1 + x^2)^{-5} \quad \Rightarrow \quad f'''(0) = 0 \\
f^{(4)}(x) &= 24(35x^4 - 42x^2 + 3)(1 + x^2)^{-6} \quad \Rightarrow \quad f^{(4)}(0) = 72
\end{align*}
Thus the first three nonzero terms of the Taylor series are
\[ 1 - \frac{4}{2!} x^2 + \frac{72}{4!} x^4 = 1 - 2x^2 + 3x^4. \]

10.3.70 Because \( f(36) = 6 \), and
\begin{align*}
f'(x) &= \frac{1}{2} x^{-1/2} \quad \Rightarrow \quad f'(36) = \frac{1}{12}
\\f''(x) &= -\frac{1}{4} x^{-3/2} \quad \Rightarrow \quad f''(36) = -\frac{1}{864}
\\f'''(x) &= \frac{3}{8} x^{-5/2} \quad \Rightarrow \quad f'''(36) = \frac{3}{62208}
\end{align*}
the first four terms of the Taylor series are \( 6 + \frac{1}{12} (x - 36) - \frac{1}{864} (x - 36)^2 + \frac{3}{62208} (x - 36)^3 \). Evaluating at \( x = 39 \) we get \( \approx 6.245 \).

10.3.71 Because \( f(64) = 4 \), and
\begin{align*}
f'(x) &= \frac{1}{3} x^{-2/3} \quad \Rightarrow \quad f'(64) = \frac{1}{48}
\\f''(x) &= -\frac{2}{9} x^{-5/3} \quad \Rightarrow \quad f''(64) = -\frac{1}{4608}
\\f'''(x) &= \frac{10}{27} x^{-8/3} \quad \Rightarrow \quad f'''(64) = \frac{10}{1769472} = \frac{5}{884736},
\end{align*}
the first four terms of the Taylor series are \( 4 + \frac{1}{48} (x - 64) - \frac{1}{4608} (x - 64)^2 + \frac{5}{884736} (x - 64)^3 \). Evaluating at \( x = 60 \), we get \( \approx 3.915 \).

10.3.72 Because \( f(4) = \frac{1}{2} \), and
\begin{align*}
f'(x) &= -\frac{1}{2} x^{-3/2} \quad \Rightarrow \quad f'(4) = -\frac{1}{16}
\\f''(x) &= \frac{3}{4} x^{-5/2} \quad \Rightarrow \quad f''(4) = \frac{3}{128}
\\f'''(x) &= -\frac{15}{8} x^{-7/2} \quad \Rightarrow \quad f'''(4) = -\frac{15}{1024},
\end{align*}
the first four terms of the Taylor series are \( \frac{1}{2} - \frac{1}{16} (x - 4) + \frac{3}{128} (x - 4)^2 - \frac{15}{1024} (x - 4)^3 \). Evaluating at \( x = 3 \), we get \( \approx 0.577 \).

Copyright © 2014 Pearson Education, Inc.
10.3.73 Because \( f(16) = 2 \), and

\[
f'(x) = \frac{1}{4}x^{-3/4} \quad f'(16) = \frac{1}{32}
\]

\[
f''(x) = -\frac{3}{16}x^{-7/4} \quad f''(16) = -\frac{3}{2048}
\]

\[
f'''(x) = \frac{21}{64}x^{-11/4} \quad f'''(16) = \frac{21}{131072},
\]

the first four terms of the Taylor series are

\[2 + \frac{1}{32}(x - 16) - \frac{3}{2048}(x - 16)^2 + \frac{21}{131072}(x - 16)^3.\]

Evaluating at \( x = 13 \), we get \( \approx 1.899 \).

10.3.74 Computing derivatives gives

\[f(x) = (1 - x)^{-1}, \quad f'(x) = 1(1 - x)^{-2}, \quad f''(x) = 1 \cdot 2(1 - x)^{-3}, \quad f'''(x) = 1 \cdot 2 \cdot 3(1 - x)^{-4},\]

and so forth. It is clear that \( f^{(n)}(x) = n!(1 - x)^{-n-1} \), so that \( f^{(n)}(0) = n! \). Thus the Maclaurin series is

\[
\sum_{k=0}^{\infty} \frac{f^{(n)}(0)}{n!} x^n = \sum_{k=0}^{\infty} \frac{n!}{n!} x^n = \sum_{k=0}^{\infty} x^n.
\]

10.3.75 The relevant derivatives are

\[
f(x) = \sqrt{1 + 4x}
\]

\[
f'(x) = \frac{1}{2} (1 + 4x)^{-1/2} \cdot 4 = 2(1 + 4x)^{-1/2}
\]

\[
f''(x) = -\frac{1}{2} \cdot 2(1 + 4x)^{-3/2} \cdot 4 = -4(1 + 4x)^{-3/2}
\]

\[
f'''(0) = -\frac{3}{2} \cdot \left(-4(1 + 4x)^{-5/2}\right) \cdot 4 = 24(1 + 4x)^{-5/2}
\]

\[
f^{(4)}(0) = -\frac{5}{2} \cdot 24(1 + 4x)^{-7/2} \cdot 4 = -240(1 + 4x)^{-7/2}
\]

Thus the first five terms of the Taylor series are

\[1 + 2x + \frac{1}{2!}(-4x^2) + \frac{1}{3!} \cdot 24x^3 - \frac{1}{4!}(-240x^4) = 1 + 2x - 2x^2 + 4x^3 - 10x^4.\]

10.3.76 The two Taylor series are:

\[
8 + \frac{1}{16}(x - 64) - \frac{1}{4096}(x - 64)^2 + \frac{1}{524288}(x - 64)^3 - \frac{5}{2097152}(x - 64)^4 + \ldots
\]

\[
9 + \frac{1}{18}(x - 81) - \frac{1}{5832}(x - 81)^2 + \frac{1}{944784}(x - 81)^3 - \frac{5}{61220032}(x - 81)^4 + \ldots
\]

Evaluating these Taylor series at \( n = 2, 3, 4 \) (after the quadratic, cubic, and quartic terms) we obtain the

\[
\begin{array}{c|cc}
 n & 64 & 81 \\
\hline
 2 & 9.064 \times 10^{-4} & -8.297 \times 10^{-4} \\
 3 & -7.019 \times 10^{-5} & -5.813 \times 10^{-5} \\
 4 & 6.106 \times 10^{-6} & -4.550 \times 10^{-6} \\
\end{array}
\]

The errors using the Taylor series centered at 81 are consistently smaller.

10.3.77

a. The Maclaurin series for \( \sin x \) is \( x - \frac{1}{3!}x^3 + \frac{1}{5!}x^5 - \frac{1}{7!}x^7 + \cdots \). Squaring the first four terms yields

\[
\left(x - \frac{1}{3!}x^3 + \frac{1}{5!}x^5 - \frac{1}{7!}x^7\right)^2 = x^2 - \frac{2}{3!} x^4 + \left(\frac{2}{5!} + \frac{1}{3!}\right)x^6 + \left(\frac{2}{7!} - 2 \cdot \frac{1}{3!}\right)x^8 + \cdots
\]

\[
= x^2 - \frac{1}{3} x^4 + \frac{2}{45} x^6 - \frac{1}{315} x^8 + \cdots.
\]
b. The Maclaurin series for \( \cos x \) is \( 1 - \frac{1}{2}x^2 + \frac{1}{4!}x^4 - \frac{1}{6!}x^6 + \frac{1}{8!}x^8 - \ldots \). Substituting \( 2x \) for \( x \) in the Maclaurin series for \( \cos x \) and then computing the first four terms of \( \frac{1-\cos 2x}{2} \), we obtain

\[
\frac{1}{2} \left( 1 - \left( \frac{1}{2} (2x)^2 + \frac{1}{4!} (2x)^4 - \frac{1}{6!} (2x)^6 + \frac{1}{8!} (2x)^8 \right) \right) = \frac{1}{2} \left( 2x^2 - \frac{2}{3} x^4 + \frac{4}{45} x^6 - \frac{2}{315} x^8 \right)
\]

\[
= x^2 - \frac{1}{3} x^4 + \frac{2}{45} x^6 - \frac{1}{315} x^8;
\]

and the two are the same.

c. If \( f(x) = \sin^2 x \), then \( f(0) = 0, \quad f'(x) = \sin 2x, \quad f''(x) = 2 \cos 2x, \quad f'''(x) = -4 \sin 2x, \quad f''''(x) = -8 \cos 2x \). Note that from this point \( f^{(n)}(0) = 0 \) if \( n \) is odd and \( f^{(n)}(0) = \pm 2^{n-1} \) if \( n \) is even, with the signs alternating for every other even \( n \). Thus, the first four terms of the series for \( \sin^2 x \) are

\[
\frac{1}{2!} \cdot 2x^2 - \frac{1}{4!} \cdot 8x^4 + \frac{1}{6!} \cdot 32x^6 - \frac{1}{8!} \cdot 128x^8 + \ldots = x^2 - \frac{1}{3} x^4 + \frac{2}{45} x^6 - \frac{1}{315} x^8 + \ldots,
\]

matching parts (a) and (b).

10.3.78

a. The Maclaurin series for \( \cos x \) is \( 1 - \frac{1}{2}x^2 + \frac{1}{4!}x^4 - \frac{1}{6!}x^6 - \ldots \). Squaring the first four terms yields

\[
\left( 1 - \frac{1}{2}x^2 - \frac{1}{4!}x^4 - \frac{1}{6!}x^6 \right)^2
\]

\[
= 1 - \left( \frac{1}{2} + \frac{1}{2} \right) x^2 + \left( \frac{1}{4!} + \frac{1}{4!} + \frac{1}{4} \right) x^4 + \left( \frac{1}{6!} - \frac{1}{6!} - \frac{1}{2 \cdot 4!} - \frac{1}{2 \cdot 4!} \right) x^6 + \ldots
\]

\[
= 1 - x^2 + \frac{1}{2} x^4 + \frac{2}{45} x^6 + \ldots.
\]

b. Substituting \( 2x \) for \( x \) in the Maclaurin series for \( \cos x \) and then computing the first four terms of \( \frac{1-\cos 2x}{2} \), we obtain

\[
\frac{1}{2} \left( 1 + 1 - \frac{1}{2} (2x)^2 + \frac{1}{4!} (2x)^4 - \frac{1}{6!} (2x)^6 \right) = \frac{1}{2} \left( 2 - 2x^2 + \frac{2}{3} x^4 - \frac{4}{45} x^6 \right)
\]

\[
= 1 - x^2 + \frac{1}{3} x^4 - \frac{2}{45} x^6,
\]

and the two are the same.

c. If \( f(x) = \cos^2 x \), then \( f(0) = 1 \). Also, \( f'(x) = -2 \cos x \sin x = -\sin 2x \). So \( f'(0) = 0, \quad f''(x) = -2 \cos 2x, \quad f'''(x) = 8 \sin 2x, \quad f''''(x) = 0 \). Note that from this point on, \( f^{(n)}(0) = \pm 2^{n-1} \) if \( n \) is even, with the signs alternating for every other even \( n \). Thus, the first four terms of the series for \( \cos^2 x \) are

\[
1 - \frac{1}{2!} \cdot 2x^2 + \frac{1}{4!} \cdot 8x^4 - \frac{1}{6!} \cdot 32x^6 + \ldots = 1 - x^2 + \frac{1}{3} x^4 - \frac{2}{45} x^6 + \ldots,
\]

matching parts (a) and (b).

10.3.79 There are many solutions. For example, first find a series that has \((-1, 1)\) as an interval of convergence, say \( \frac{1}{1-x} = \sum_{k=0}^{\infty} x^k \). Then the series \( \frac{1}{1-x^2} = \sum_{k=0}^{\infty} (\frac{x}{2})^k \) has \((-2, 2)\) as its interval of convergence. Now shift the series up so that it is centered at \( 4 \): \( \sum_{k=0}^{\infty} \left( \frac{x-4}{2} \right)^k \) has interval of convergence \((2, 6)\).

10.3.80 \( -\frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6 \cdot 8} x^4, \quad \frac{1 \cdot 3 \cdot 5 \cdot 7}{2 \cdot 4 \cdot 6 \cdot 8 \cdot 10} x^5 \).

10.3.81 \( \frac{1 \cdot 3 \cdot 5 \cdot 7}{2 \cdot 4 \cdot 6 \cdot 8} x^4, \quad -\frac{1 \cdot 3 \cdot 5 \cdot 7 \cdot 9}{2 \cdot 4 \cdot 6 \cdot 8 \cdot 10} x^5 \).
10.3.82

a. The Maclaurin series in question are

$$\sin x = x - \frac{1}{3!}x^3 + \frac{1}{5!}x^5 - \cdots$$
$$e^x = 1 + x + \frac{1}{2!}x^2 + \frac{1}{3!}x^3 + \cdots$$

so substituting the series for $\sin x$ for $x$ in the series for $e^x$ (and considering only those terms that will give us an exponent at most 3), we obtain

$$e^{\sin x} = 1 + \left(x - \frac{1}{3!}x^3\right) + \frac{1}{2!}x^2 + \frac{1}{3!}x^3 + \cdots = 1 + x + \frac{1}{2}x^2 + \cdots.$$

b. The Maclaurin series in question are

$$\tan x = x + \frac{1}{3}x^3 + \frac{2}{15}x^5 + \cdots$$
$$e^x = 1 + x + \frac{1}{2!}x^2 + \frac{1}{3!}x^3 + \cdots$$

so substituting the series for $\tan x$ for $x$ in the series for $e^x$ (and considering only those terms that will give us an exponent at most 3), we obtain

$$e^{\tan x} = 1 + \left(x + \frac{1}{3}x^3\right) + \frac{1}{2!}x^2 + \frac{1}{3!}x^3 + \cdots = 1 + x + \frac{1}{2}x^2 + \cdots.$$

c. The Maclaurin series in question are

$$\sin x = x - \frac{1}{3!}x^3 + \frac{1}{5!}x^5 - \cdots$$
$$\sqrt{1 + x^2} = 1 + \frac{1}{2}x^2 - \frac{1}{8}x^4 + \cdots$$

so substituting the series for $\sin x$ for $x$ in the series for $\sqrt{1 + x^2}$ (and considering only those terms that will give us an exponent at most 4), we obtain

$$\sqrt{1 + \sin^2 x} = 1 + \frac{1}{2} \left(x - \frac{1}{3!}x^3\right)^2 - \frac{1}{8}x^4 + \cdots = 1 + \frac{1}{2}x^2 - \frac{7}{24}x^4 + \cdots.$$

10.3.83 Use the Taylor series for $\cos x$ centered at $\frac{\pi}{4}$:

$$\frac{\sqrt{2}}{2} \left(1 - \left(x - \frac{\pi}{4}\right) - \frac{1}{2} \left(x - \frac{\pi}{4}\right)^2 + \frac{1}{6} \left(x - \frac{\pi}{4}\right)^3 + \cdots\right).$$

The remainder after $n$ terms (because the derivatives of $\cos x$ are bounded by 1 in magnitude) is

$$|R_n(x)| \leq \frac{1}{(n+1)!} \left(\frac{\pi}{4} - \frac{2\pi}{9}\right)^{n+1}.$$  

Solving for $|R_n(x)| < 10^{-4}$, we obtain $n = 3$. Evaluating the first four terms (through $n = 3$) of the series we get $\approx 0.766$.

10.3.84 Use the Taylor series for $\sin x$ centered at $\pi$:

$$-(x - \pi) + \frac{1}{6} (x - \pi)^3 - \frac{1}{120} (x - \pi)^5 + \cdots.$$  

The remainder after $n$ terms (because the derivatives of $\sin x$ are bounded by 1 in magnitude) is

$$|R_n(x)| \leq \frac{1}{(n+1)!} \cdot (\pi - 0.98\pi)^{n+1}.$$  

Solving for $|R_n(x)| < 10^{-4}$, we obtain $n = 2$. Evaluating the first term of the series gives 0.063.
10.3.85 Use the Taylor series for $f(x) = x^{1/3}$ centered at 64:

$$4 + \frac{1}{48}(x - 64) - \frac{1}{9216}(x - 64)^2 + \cdots.$$  

Because we wish to evaluate this series at $x = 83$,

$$|R_n(x)| = \frac{|f^{(n+1)}(c)|}{(n+1)!}(83 - 64)^{n+1}.$$  

We compute that $|f^{(n+1)}(c)| = 2 \cdot 5 \cdots (3n - 1)$, which is maximized at $c = 64$. Therefore,

$$|R_n(x)| \leq \frac{2 \cdot 5 \cdots (3n - 1)}{3^{n+1}164^{(3n+2)/3}(n+1)!}19^{n+1}.$$  

Solving for $|R_n(x)| < 10^{-4}$, we obtain $n = 5$. Evaluating the terms of the series through $n = 5$ gives 4.362.

10.3.86 Use the Taylor series for $f(x) = x^{-1/4}$ centered at 16:

$$\frac{1}{2} - \frac{1}{128}(x - 16) + \frac{5}{16384}(x - 16)^2 - \cdots.$$  

Because we wish to evaluate this series at $x = 17$,

$$|R_n(x)| = \frac{|f^{(n+1)}(c)|}{(n+1)!}(17 - 16)^{n+1}.$$  

We compute that $|f^{(n+1)}(c)| = 1 \cdot 5 \cdots (4n + 1)$, which is maximized at $c = 16$. Thus

$$|R_n(x)| \leq \frac{1 \cdot 5 \cdots (4n + 1)}{4^{n+1}16^{(4n+5)/4}(n+1)!}1^{n+1}.$$  

Solving for $|R_n(x)| < 10^{-4}$, we obtain $n = 2$. Evaluating the terms of the series through $n = 2$ gives 0.492.

10.3.87

a. Use the Taylor series for $(125 + x)^{1/3}$ centered at $x = 0$. Using the first four terms and evaluating at $x = 3$ gives a result (5.03968) accurate to within $10^{-4}$.

b. Use the Taylor series for $x^{1/3}$ centered at $x = 125$. Note that this gives the identical Taylor series except that the exponential terms are $(x - 125)^n$ rather than $x^n$. Thus we need terms up through $(x - 125)^3$, just as before, evaluated at $x = 128$, and we obtain the identical result.

c. Because the two Taylor series are the same except for the shifting, the results are equivalent.

10.3.88 Suppose that $f$ is differentiable. Consider the remainder after the zeroth term of the Taylor series. Taylor’s Theorem says that

$$R_0(x) = \frac{f'(c)}{1!}(x - a)^1$$

for some $c$ between $x$ and $a$,

but $f(x) = f(a) + R_0(x)$, which gives $f(x) = f(a) + f'(c)(x - a)$. Rearranging, we obtain $f'(c) = \frac{f(x) - f(a)}{x - a}$ for some $c$ between $x$ and $a$, which is the conclusion of the Mean Value Theorem.

10.3.89 Consider the remainder after the first term of the Taylor series. Taylor’s Theorem indicates that

$$R_1(x) = \frac{f''(c)}{2!}(x - a)^2$$

for some $c$ between $x$ and $a$, so that $f(x) = f(a) + f'(a)(x - a) + \frac{f''(c)}{2}(x - a)^2$.

But $f'(a) = 0$, so that for every $x$ in an interval containing $a$, there is a $c$ between $x$ and $a$ such that $f(x) = f(a) + \frac{f''(c)}{2}(x - a)^2$.
a. If \( f'''(x) > 0 \) on the interval containing \( a \), then for every \( x \) in that interval, we have \( f(x) = f(a) + \frac{f''(c)}{2}(x-a)^2 \) for some \( c \) between \( x \) and \( a \). But \( f''(c) > 0 \) and \((x-a)^2 > 0\), so that \( f(x) > f(a) \) and \( a \) is a local minimum.

b. If \( f'''(x) < 0 \) on the interval containing \( a \), then for every \( x \) in that interval, we have \( f(x) = f(a) + \frac{f''(c)}{2}(x-a)^2 \) for some \( c \) between \( x \) and \( a \). But \( f''(c) < 0 \) and \((x-a)^2 > 0\), so that \( f(x) < f(a) \) and \( a \) is a local maximum.

10.3.90

a. We must first prove that \( f \) is continuous at \( 0 \). But clearly

\[
\lim_{x \to 0} e^{-1/x^2} = e^{-1/(0^2)} = e^{-\infty} = 0.
\]

To show that \( f \) is differentiable at \( 0 \), we compute the limits of the left and right difference quotients and show that they are both zero:

\[
\lim_{x \to 0^+} \frac{e^{-1/x^2} - 0}{x} = \lim_{x \to 0^+} \frac{e^{-1/x^2}}{x} \quad \text{and} \quad \lim_{x \to 0^-} \frac{e^{-1/x^2} - 0}{x} = \lim_{x \to 0^-} \frac{e^{-1/x^2}}{x}
\]

For the limit from the right, use the substitution \( x = \frac{1}{\sqrt{y}} \); then \( y = x^2 \) and the limit becomes

\[
\lim_{y \to \infty} e^{-y} \sqrt{y} = \lim_{y \to \infty} \frac{\sqrt{y}}{e^y} = 0
\]

since exponentials dominate power functions. Similarly, for the limit from the left, use the substitution \( x = -\frac{1}{\sqrt{y}} \); then again \( y = x^2 \) and the limit becomes

\[
\lim_{y \to \infty} (-e^{-y} \sqrt{y}) = - \lim_{y \to \infty} \frac{\sqrt{y}}{e^y} = 0.
\]

Since the left and right limits are both zero, it follows that \( f \) is differentiable at \( x = 0 \), and its derivative is zero.

b. Because \( f^{(k)}(0) = 0 \) for \( k > 0 \) and \( f(0) = 0 \), the Taylor series centered at \( 0 \) is zero.

c. It does not converge to \( f(x) \) because \( f(x) \neq 0 \) for all \( x \neq 0 \).

10.3.91 The first few derivatives of \( f(x) = (1 + x)^p \) are

\[
f'(x) = p(1 + x)^{p-1}, \quad f''(x) = p(p-1)(1 + x)^{p-2}, \quad f'''(x) = p(p-1)(p-2)(1 + x)^{p-3}, \ldots
\]

and it is clear that the pattern continues:

\[
f^{(k)}(x) = p(p-1) \cdots (p - (k-1))(1 + x)^{p-k}, \quad \text{so that} \quad f^{(k)}(0) = p(p-1) \cdots (p - k + 1).
\]

Thus the Maclaurin series for \((1 + x)^p\) is

\[
(1 + x)^p = f(0) + \sum_{k=1}^{\infty} \frac{f^{(k)}(0)}{k!} x^k = 1 + \sum_{k=1}^{\infty} \frac{p(p-1)(p-2) \cdots (p - k + 1)}{k!} x^k.
\]

Equating coefficients with the series \((1 + x)^p = \sum_{k=0}^{\infty} \binom{p}{k} x^k \) gives the equation in Table 10.5.
10.3.92

a. From Table 10.5 we get

\[ p_1(x) = x \]
\[ p_2(x) = x - \frac{x^2}{2} \]
\[ p_3(x) = x - \frac{x^2}{2} + \frac{x^3}{3} \]
\[ p_4(x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} \]
\[ p_5(x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \frac{x^5}{5}. \]

b. A plot of \( \ln(1 + x) \) together with the five approximations is below. \( \ln(1 + x) \) is the thick curve in black, and the \( p_i \) are in gray, with \( p_1 \) being the lightest and \( p_5 \) the darkest:

![Graph of ln(1 + x) and its approximations.]

c. From the graph, it is clear that \( p_n(x) \to f(x) \) slower for \( x \) close to either 1 or -1.

d. We get

\[
\begin{array}{c|c}
  n & |f(1) - p_n(1)| \\
  \hline
  1 & 3.1 \times 10^{-1} \\
  2 & 1.9 \times 10^{-1} \\
  3 & 1.4 \times 10^{-1} \\
  4 & 1.1 \times 10^{-1} \\
  5 & 9.0 \times 10^{-2} \\
\end{array}
\]

e. The Taylor series for \( \ln(1 + x) \) is an alternating series, and its terms at \( x = 0.5 \) decrease to zero since \( 0.5 < 1 \). Then to ensure that the absolute error is less than 0.01, we must find the first value of \( n \) such that the next term has absolute value less than 0.01; that is, the smallest \( n \) such that

\[
\frac{0.5^{n+1}}{n+1} < 0.01.
\]

Solving for \( n \) gives \( n = 4 \) for the smallest integer value, so we need to use \( p_4(0.5) \).

f. At \( x = 1 \), the Taylor series for \( \ln(1 + x) \) is the alternating harmonic series, whose terms decrease to zero. Then to ensure that the absolute error is less than 0.01, we must find the first value of \( n \) such that the next term has absolute value less than 0.01; that is, the smallest \( n \) such that

\[
\frac{1}{n+1} < 0.01.
\]

Solving for \( n \) gives \( n = 100 \) for the smallest integer value, so we need to use \( p_{100}(1) \).
a. From Table 10.5 we get

\[ p_1(x) = 1 + x \]
\[ p_2(x) = 1 + x + x^2 \]
\[ p_3(x) = 1 + x + x^2 + x^3 \]
\[ p_4(x) = 1 + x + x^2 + x^3 + x^4 \]
\[ p_5(x) = 1 + x + x^2 + x^3 + x^4 + x^5. \]

b. A plot of \( \frac{1}{1-x} \) together with the five approximations is below. \( \ln(1 + x) \) is the thick curve in black, and the \( p_i \) are in gray, with \( p_1 \) being the lightest and \( p_5 \) the darkest:

![Graph of Taylor Series Approximations](image)

c. From the graph, it is clear that \( p_n(x) \to f(x) \) more slowly for \( x \) close to either 1 or \(-1\); for \( x \) close to 1 they converge very slowly.

d. Since \( f(0) = 1 \), we see that the error in \( p_1(0) = 1 + 0 = 1 \) is already zero (in fact, the error in \( p_0(0) = 1 \) is zero as well).

e. We get

| \( n \) | \( |f(0.9) - p_n(0.9)| \) |
|-------|-----------------|
| 1     | 8.1             |
| 2     | 7.3             |
| 3     | 6.6             |
| 4     | 5.9             |
| 5     | 5.3             |

f. At \( x = 0.9 \), the Taylor series for \( f(x) \) is a geometric series with ratio 0.9 and first term 1, so it converges. If we approximate with \( p_n(x) \), we will take terms up through \( 0.9^n \), so the sum of this finite series will be

\[
\frac{1 - 0.9^{n+1}}{1 - 0.9}.
\]

Thus we want to find \( n \) so that

\[
\left| f(0.9) - \frac{1 - 0.9^{n+1}}{0.1} \right| = \left| 10 - 10(1 - 0.9^{n+1}) \right| = 0.9^{n+1} < 0.01,
\]

so that \( 0.9^{n+1} < 10^{-3} \), or \((n + 1) \ln 0.9 < \ln 10^{-3} \). Solving for \( n \) gives \( n = 65 \) as the smallest value of \( n \), so we must use at least \( p_{65}(x) \).
10.4 Working with Taylor Series

10.4.1 Replace \( f \) and \( g \) by their Taylor series centered at \( a \), and evaluate the limit.

10.4.2 Integrate the Taylor series for \( f(x) \) centered at \( a \), and evaluate it at the endpoints.

10.4.3 Substitute \(-0.6\) for \( x \) in the Taylor series for \( e^x \) centered at 0. Note that this series is an alternating series, so the error can easily be estimated by looking at the magnitude of the first neglected term.

10.4.4 Take the Taylor series for \( \sin^{-1} x \) centered at 0 and evaluate it at \( x = 1 \), then multiply the result by 2.

10.4.5 The series is \( f'(x) = \sum_{k=1}^{\infty} k c_k x^{k-1} \), which converges for \(|x| < b\).

10.4.6 It must have derivatives of all orders on some interval containing \( a \).

10.4.7 Because \( e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots \), we have

\[
\frac{e^x - 1}{x} = 1 + x + \frac{x^2}{2} + \frac{x^3}{3!} + \cdots - 1 = 1 + \frac{x}{2!} x + \frac{1}{3!} x^2 + \cdots ,
\]
so \( \lim_{x \to 0} \frac{e^x - 1}{x} = 1 \).

10.4.8 Because \( \tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \cdots \), we have

\[
\frac{\tan^{-1} x - x}{x^3} = -\frac{1}{3} + \frac{x^2}{5} - \cdots .
\]
So \( \lim_{x \to 0} \frac{\tan^{-1} x - x}{x^3} = -\frac{1}{3} \).

10.4.9 Because \( -\ln(1 - x) = x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \cdots \), we have

\[
\frac{-x - \ln(1 - x)}{x^2} = \frac{1}{2} + \frac{x}{3} + \frac{x^2}{4} + \cdots ,
\]
so \( \lim_{x \to 0} \frac{-x - \ln(1 - x)}{x^2} = \frac{1}{2} \).

10.4.10 Because \( \sin 2x = 2x - \frac{4x^3}{3} + \frac{4x^5}{15} + \cdots \), we have

\[
\frac{\sin 2x}{x} = 2 - \frac{4x^2}{3} + \frac{4x^4}{15} + \cdots ,
\]
so \( \lim_{x \to 0} \frac{\sin 2x}{x} = 2 \).

10.4.11 We compute that

\[
\frac{e^x - e^{-x}}{x} = \frac{1}{x} \left( (1 + x + \frac{x^2}{2} + \frac{x^3}{6} + \cdots) - (1 - x - \frac{x^2}{2} - \frac{x^3}{6} + \cdots) \right) = \frac{1}{x} \left( 2x + \frac{x^3}{3} + \cdots \right) = 2 + \frac{x^2}{3} + \cdots ,
\]
so the limit of \( \frac{e^x - e^{-x}}{x} \) as \( x \to 0 \) is 2.

10.4.12 Because \( -e^x = -1 - x - \frac{x^2}{2} - \frac{x^3}{6} + \cdots \), we have

\[
\frac{1 + x - e^x}{4x^2} = \frac{-x^2/2 + x^3/6 + \cdots}{4x^2} = -\frac{1}{8} - \frac{x}{24} + \cdots ,
\]
so \( \lim_{x \to 0} \frac{1 + x - e^x}{4x^2} = -\frac{1}{8} \).
10.4.13 We compute that
\[
\frac{2 \cos 2x - 2 + 4x^2}{2x^4} = \frac{1}{2x^4} \left( 2(1 - \frac{(2x)^2}{2} + \frac{(2x)^4}{24} - \frac{(2x)^6}{720} + \cdots) - 2 + 4x^2 \right)
\]
\[
= \frac{1}{2x^4} \left( \frac{(2x)^4}{12} - \frac{(2x)^6}{360} + \cdots \right) = \frac{2}{3} - \frac{4x^2}{45} + \cdots
\]
so the limit of \(\frac{2 \cos 2x - 2 + 4x^2}{2x^4}\) as \(x \to 0\) is \(\frac{2}{3}\).

10.4.14 We substitute \(t = \frac{1}{x}\) and find \(\lim_{t \to 0} \frac{\sin t}{t}\). We compute that
\[
\frac{\sin t}{t} = \frac{1}{t} \left( t - \frac{t^3}{6} + \cdots \right) = 1 - \frac{t^2}{6} + \cdots
\]
so the limit of \(x \sin \frac{1}{x}\) as \(x \to \infty\) is 1.

10.4.15 We have \(\ln(1 + x) = x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \frac{1}{4}x^4 + \cdots\), so that
\[
\frac{\ln(1 + x) - x + x^2/2}{x^3} = \frac{x^3/3 - x^4/4 + \cdots}{x^3} = \frac{1}{3} - \frac{x}{4} + \cdots,
\]
so that \(\lim_{x \to 0} \frac{\ln(1 + x) - x + x^2/2}{x^3} = \frac{1}{3}\).

10.4.16 The Taylor series for \(\ln(x - 3)\) centered at \(x = 4\) is
\[
(x - 4) - \frac{1}{2}(x - 4)^2 + \cdots.
\]
We compute that
\[
\frac{x^2 - 16}{\ln(x - 3)} = \frac{x^2 - 16}{(x - 4) - \frac{1}{2}(x - 4)^2 + \cdots}
\]
\[
= \frac{(x - 4)(x + 4)}{(x - 4) - \frac{1}{2}(x - 4)^2 + \cdots}
\]
\[
= \frac{x + 4}{1 - \frac{1}{2}(x - 4) + \cdots}
\]
so the limit of \(\frac{x^2 - 16}{\ln(x - 3)}\) as \(x \to 4\) is 8.

10.4.17 We compute that
\[
\frac{3 \tan^{-1} x - 3x + x^3}{x^5} = \frac{1}{x^5} \left( 3 \left( x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots \right) - 3x + x^3 \right)
\]
\[
= \frac{1}{x^5} \left( \frac{3x^5}{5} - \frac{3x^7}{7} + \cdots \right)
\]
\[
= \frac{3}{5} - \frac{3x^2}{7} + \cdots
\]
so the limit of \(\frac{3 \tan^{-1} x - 3x + x^3}{x^5}\) as \(x \to 0\) is \(\frac{3}{5}\).
10.4.18 The Taylor series for \( \sqrt{1+x} \) centered at 0 is

\[
\sqrt{1+x} = 1 + \frac{1}{2}x - \frac{1}{8}x^2 + \frac{1}{16}x^3 + \cdots.
\]

We compute that

\[
\frac{\sqrt{1+x} - 1 - x/2}{4x^2} = \frac{1}{4x^2} \left( \left( 1 + \frac{x}{2} - \frac{x^2}{8} + \frac{x^3}{16} + \cdots \right) - 1 - \frac{x}{2} \right)
\]

\[
= \frac{1}{4x^2} \left( -\frac{x^2}{8} + \frac{x^3}{16} + \cdots \right)
\]

\[
= -\frac{1}{32} + \frac{x}{64} + \cdots.
\]

so

\[
\lim_{x \to 0} \frac{\sqrt{1+x} - 1 - x/2}{4x^2} = -\frac{1}{32}.
\]

10.4.19 The Taylor series for \( \sin 2x \) centered at 0 is

\[
\sin 2x = 2x - \frac{1}{3!}(2x)^3 + \frac{1}{5!}(2x)^5 - \frac{1}{7!}(2x)^7 + \cdots = 2x - \frac{4}{3}x^3 + \frac{4}{15}x^5 - \frac{8}{315}x^7 + \cdots.
\]

Thus

\[
\frac{12x - 8x^3 - 6\sin 2x}{x^5} = \frac{12x - 8x^3 - (12x - 8x^3 + \frac{8}{5}x^5 - \frac{16}{105}x^7 + \cdots)}{x^5}
\]

\[
= -\frac{8}{5} + \frac{16}{105}x^2 + \cdots,
\]

so

\[
\lim_{x \to 0} \frac{12x - 8x^3 - 6\sin 2x}{x^5} = -\frac{8}{5}.
\]

10.4.20 The Taylor series for \( \ln x \) centered at 1 is

\[
\ln x = (x - 1) - \frac{1}{2}(x - 1)^2 + \cdots.
\]

We compute that

\[
\frac{x - 1}{\ln x} = \frac{x - 1}{(x - 1) - \frac{1}{2}(x - 1)^2 + \cdots} = \frac{1}{1 - \frac{1}{2}(x - 1) + \cdots}
\]

so the limit of \( \frac{x - 1}{\ln x} \) as \( x \to 1 \) is 1.

10.4.21 The Taylor series for \( \ln(x - 1) \) centered at 2 is

\[
\ln(x - 1) = (x - 2) - \frac{1}{2}(x - 2)^2 + \cdots.
\]

We compute that

\[
\frac{x - 2}{\ln(x - 1)} = \frac{x - 2}{(x - 2) - \frac{1}{2}(x - 2)^2 + \cdots} = \frac{1}{1 - \frac{1}{2}(x - 2) + \cdots}
\]

so the limit of \( \frac{x - 2}{\ln(x - 1)} \) as \( x \to 2 \) is 1.

10.4.22 Because \( e^{1/x} = 1 + \frac{1}{x} + \frac{1}{2x^2} + \cdots \), we have

\[
x(e^{1/x} - 1) = 1 + \frac{1}{2x} + \cdots,
\]

so

\[
\lim_{x \to \infty} x(e^{1/x} - 1) = 1.
\]
10.4.23 Computing Taylor series centered at 0 gives

\[ e^{-2x} = 1 - 2x + \frac{1}{2!}(-2x)^2 + \frac{1}{3!}(-2x)^3 + \cdots = 1 - 2x + 2x^2 - \frac{4}{3}x^3 + \cdots \]

\[ e^{-x/2} = 1 - \frac{x}{2} + \frac{1}{2!} \left( -\frac{x}{2} \right)^2 + \frac{1}{3!} \left( -\frac{x}{2} \right)^3 + \cdots = 1 - \frac{x}{2} + \frac{1}{8}x^2 - \frac{1}{48}x^3 + \cdots. \]

Thus

\[
\frac{e^{-2x} - 4e^{-x/2} + 3}{2x^2} = \frac{1 - 2x + 2x^2 - \frac{4}{3}x^3 + \cdots - (4 - 2x + \frac{1}{2}x^2 - \frac{1}{12}x^3 + \cdots) + 3}{2x^2}
= \frac{\frac{3}{2}x^2 - \frac{5}{2}x^3 + \cdots}{2x^2}
= \frac{3}{4} - \frac{5}{8}x + \cdots,
\]

so \( \lim_{x \to 0} \frac{e^{-2x} - 4e^{-x/2} + 3}{2x^2} = \frac{3}{4} \).

10.4.24 The Taylor series for \((1 - 2x)^{-1/2}\) centered at 0 is

\[ (1 - 2x)^{-1/2} = 1 + x + \frac{3x^2}{2} + \frac{5x^3}{2} + \cdots. \]

We compute that

\[
\frac{(1 - 2x)^{-1/2} - e^x}{8x^2} = \frac{1}{8x^2} \left( \left( 1 + x + \frac{3x^2}{2} + \frac{5x^3}{2} + \cdots \right) - \left( 1 + x + \frac{x^2}{2} + \frac{x^3}{6} + \cdots \right) \right)
= \frac{1}{8x^2} \left( x^2 + \frac{7x^3}{3} + \cdots \right)
= \frac{1}{8} + \frac{7x}{24} + \cdots,
\]

so the limit of \( \frac{(1 - 2x)^{-1/2} - e^x}{8x^2} \) as \( x \to 0 \) is \( \frac{1}{8} \).

10.4.25

a. \( f'(x) = \frac{d}{dx} \left( \sum_{k=0}^{\infty} \frac{x^k}{k!} \right) = \sum_{k=1}^{\infty} k \frac{x^{k-1}}{k!} = \sum_{k=0}^{\infty} \frac{x^k}{k!} = f(x). \)

b. \( f'(x) = e^x \) as well.

c. The series converges on \((-\infty, \infty)\).

10.4.26

a. \( f'(x) = \frac{d}{dx} \left( \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k}}{(2k)!} \right) = \sum_{k=1}^{\infty} (-1)^k \frac{(2k)x^{2k-1}}{(2k)!} = \sum_{k=1}^{\infty} (-1)^k \frac{x^{2k-1}}{(2k-1)!} = -\sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{(2k+1)!}. \)

b. \( f'(x) = -\sin x. \)

c. The series converges on \((-\infty, \infty)\), because the series for \( \cos x \) does.

10.4.27

a. \( f'(x) = \frac{d}{dx} (\ln(1 + x)) = \frac{d}{dx} \left( \sum_{k=1}^{\infty} (-1)^k+1 \frac{1}{k} x^k \right) = \sum_{k=1}^{\infty} (-1)^k+1 x^{k-1} = \sum_{k=0}^{\infty} (-1)^k x^k. \)

b. This is the power series for \( \frac{1}{1+x} \).

c. The Taylor series for \( \ln(1 + x) \) converges on \((-1, 1)\), as does the Taylor series for \( \frac{1}{1+x} \).
10.4.28
a. 
\[ f'(x) = \frac{d}{dx} (\sin x^2) = \frac{d}{dx} \left( \sum_{k=0}^{\infty} (-1)^k \frac{x^{4k+2}}{(2k+1)!} \right) = \sum_{k=0}^{\infty} (-1)^k \cdot 2(2k+1) \frac{x^{4k+1}}{(2k+1)!} = 2 \sum_{k=0}^{\infty} (-1)^k \frac{x^{4k+1}}{(2k)!} = 2x \sum_{k=0}^{\infty} (-1)^k \frac{x^k}{(2k)!}. \]

b. This is the Taylor series for \( 2x \cos x^2 \).

c. Because the Taylor series for \( \sin x^2 \) converges everywhere, the Taylor series for \( 2x \cos x^2 \) does as well.

10.4.29
a. 
\[ f'(x) = \frac{d}{dx} (e^{-2x}) = \frac{d}{dx} \left( \sum_{k=0}^{\infty} \frac{(-2)^k x^k}{k!} \right) = -2 \sum_{k=1}^{\infty} (-2)^{k-1} \frac{x^{k-1}}{(k-1)!} = -2 \sum_{k=0}^{\infty} \frac{(-2)^k}{k!}. \]

b. This is the Taylor series for \( -2e^{-2x} \).

c. Because the Taylor series for \( e^{-2x} \) converges on \((-\infty, \infty)\), so does this one.

10.4.30
a. We have 
\[ f'(x) = \frac{d}{dx} \left( \frac{1}{1-x} \right) = \frac{d}{dx} \left( \sum_{k=0}^{\infty} x^k \right) = \frac{d}{dx} \left( 1 + \sum_{k=1}^{\infty} x^k \right) = \sum_{k=1}^{\infty} kx^{k-1} = \sum_{k=0}^{\infty} (k+1)x^k. \]

b. From the formula for \( (1+x)^p \) in Table 10.5, we see that the Taylor series for \( \frac{1}{(1-x)^2} \) is 
\[ \sum_{k=0}^{\infty} \frac{(-2)(-3)\cdots(-2-k+1)}{k!} \cdot (-x)^k = \sum_{k=0}^{\infty} (-1)^k \frac{(k+1)!}{k!} x^k = \sum_{k=0}^{\infty} (k+1)x^k, \]
so that \( f'(x) \) is simply \( \frac{1}{(1-x)^2} \), as expected.

c. Since the Taylor series for \( \frac{1}{1-x} \) converges on \((-1, 1)\), so does the series for \( \frac{1}{(1-x)^2} \). Checking the endpoints, we see that the series diverges at both endpoints by the Divergence Test, so that the interval of convergence for the series for \( f'(x) \) is also \((-1, 1)\).

10.4.31
a. \( \tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \cdots \), so \( \frac{d}{dx} (\tan^{-1} x^2) = 1 - x^2 + x^4 - x^6 + \cdots \).

b. This is the series for \( \frac{1}{1+x^2} \).

c. Because the series for \( \tan^{-1} x \) has a radius of convergence of 1, this series does too. Checking the endpoints shows that the interval of convergence is \((-1, 1)\).

10.4.32
a. \( -\ln(1-x) = x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \frac{x^5}{5} + \cdots \), so \( \frac{d}{dx} [-\ln(1-x)] = 1 + x + x^2 + x^3 + \cdots \).
b. This is the series for $\frac{1}{1-x}$.

c. The interval of convergence for $\frac{1}{1-x}$ is $(-1, 1)$.

10.4.33
a. Because $y(0) = 2$, we have $0 = y'(0) = y'(0) - 2$ so that $y'(0) = 2$. Differentiating the equation gives $y''(0) = y'(0)$, so that $y''(0) = 2$. Successive derivatives also have the value 2 at 0, so the Taylor series is $2 \sum_{k=0}^{\infty} \frac{k^2}{k!}$.

b. $2 \sum_{k=0}^{\infty} \frac{k^2}{k!} = 2e^t$.

10.4.34
a. Because $y(0) = 0$, we see that $y'(0) = 8$. Differentiating the equation gives $y''(0) + 4y'(0) = 0$, so $y''(0) + 4 \cdot 8 = 0$, $y''(0) = -4 \cdot 8$. Continuing, $y''''(0) + 4 \cdot (-4 \cdot 8) = 0$, so $y''''(0) = 4 \cdot 4 \cdot 8$, and in general $y^{(k)}(0) = (-1)^{k+1} 2^k 4^k$ for $k \geq 1$, so the Taylor series is $2 \sum_{k=1}^{\infty} (-1)^{k+1} \frac{(4t)^k}{k!}$.

b. $2 \sum_{k=1}^{\infty} (-1)^{k+1} \frac{(4t)^k}{k!} = 2(1 - e^{-4t})$.

10.4.35
a. $y(0) = 2$, so that $y'(0) = 16$. Differentiating, $y''(t) - 3y'(t) = 0$, so that $y''(0) = 48$, and in general $y^{(k)}(0) = 3^k y^{(k-1)}(0) = 3^{k-1} 16$. Thus the power series is $2 + \frac{16}{3} \sum_{k=1}^{\infty} \frac{(3t)^k}{k!} = 2 + \sum_{k=1}^{\infty} \frac{3^{k-1} 16 t^k}{k!}$.

b. $2 + \frac{16}{3} \sum_{k=1}^{\infty} \frac{(3t)^k}{k!} = 2 + \frac{16}{3} e^{3t} - 1 = \frac{16}{3} e^{3t} - \frac{10}{3}$.

10.4.36
a. $y(0) = 2$, so $y'(0) = 12 + 9 = 21$. Differentiating, $y^{(n)}(0) = 6y^{(n-1)}(0)$ for $n > 1$, so that $y^{(n)}(0) = 6^{n-1} 21$ for $n \geq 1$. Thus the power series is $2 + \sum_{k=1}^{\infty} 21 \cdot 6^{k-1} \frac{t^k}{k!}$.

b. $2 + \frac{7}{2} \sum_{k=1}^{\infty} \frac{(6t)^k}{k!} = 2 + \frac{7}{2} e^{6t} - 1 = \frac{7}{2} e^{6t} - \frac{3}{2}$.

10.4.37 The Taylor series for $e^{-x^2}$ is $\sum_{k=0}^{\infty} (-1)^k \frac{x^{2k}}{k!}$. Thus, the desired integral is

$$\int_0^{0.25} \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k}}{k!} dx = \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{(2k+1)k!} \bigg|_0^{0.25} = \sum_{k=0}^{\infty} (-1)^k \frac{1}{(2k+1)k!4^{2k+1}}.$$  

Because this is an alternating series, to approximate it to within $10^{-4}$, we must find $n$ such that $a_n + 1 < 10^{-4}$, or $rac{1}{(2n+3)(2n+4)n!} < 10^{-4}$. This occurs for $n = 1$, so $\sum_{k=0}^{1} (-1)^k \frac{1}{(2k+1)k!4^{2k+1}} = \frac{1}{3} - \frac{1}{192} \approx 0.245$.

10.4.38 The Taylor series for $\sin x^2$ is $\sum_{k=0}^{\infty} (-1)^k \frac{x^{4k+2}}{(2k+1)k!}$. Thus the desired integral is

$$\int_0^{0.2} \sum_{k=0}^{\infty} (-1)^k \frac{x^{4k+2}}{(2k+1)k!} dx = \sum_{k=0}^{\infty} (-1)^k \frac{x^{4k+3}}{(4k+3)(2k+1)k!} \bigg|_0^{0.2} = \sum_{k=0}^{\infty} (-1)^k \frac{0.2^{4k+3}}{(4k+3)(2k+1)k!}.$$  

Because this is an alternating series, to approximate it to within $10^{-4}$, we must find $n$ such that $a_n + 1 < 10^{-4}$, or $\frac{0.2^{4n+7}}{(4n+7)(2n+3)n!} < 10^{-4}$. This occurs first for $n = 0$, so we obtain $\frac{0.2^7}{3!} \approx 2.667 \times 10^{-3}$.

10.4.39 The Taylor series for $\cos 2x^2$ is $\sum_{k=0}^{\infty} (-1)^k \frac{(2x^2)^{2k}}{(2k)!} = \sum_{k=0}^{\infty} (-1)^k \frac{4^{2k}x^{4k}}{(2k)!}$. Note that $\cos x$ is an even function, so we compute the integral from 0 to 0.35 and double it:

$$2 \int_0^{0.35} \sum_{k=0}^{\infty} (-1)^k \frac{4^k x^{4k}}{(2k)!} dx = 2 \left( \sum_{k=0}^{\infty} (-1)^k \frac{4^k x^{4k+1}}{(4k+1)(2k)!} \right) \bigg|_0^{0.35} = 2 \left( \sum_{k=0}^{\infty} (-1)^k \frac{4^k \cdot 0.35^{4k+1}}{(4k+1)(2k)!} \right).$$  

Because this is an alternating series, to approximate it to within $10^{-4}$, we must find $n$ such that $a_n + 1 < 10^{-4}$, or $\frac{4^{n+1} \cdot 0.35^{4n+5}}{(4n+5)(2n+2)!} < 0.1 \cdot 10^{-4}$. This occurs first for $n = 1$, and we have $2 \left( 0.35 - \frac{4 \cdot 0.35^5}{5 \cdot 2!} \right) \approx 0.696$.  

Copyright © 2014 Pearson Education, Inc.
10.4.40 From Table 10.5 or Exercise 10.3.40, the first few terms of the Taylor series for \((1 + x^4)^{1/2}\) are

\[1 + \frac{1}{2}x^4 - \frac{1}{8}x^8 + \frac{1}{16}x^{12}.\]

The first few terms of the desired integral are thus

\[\int_0^{0.2} \left( 1 + \frac{1}{2}x^4 - \frac{1}{8}x^8 + \frac{1}{16}x^{12} \right) dx = \left( x + \frac{1}{10}x^5 - \frac{1}{72}x^9 + \frac{1}{208}x^{13} \right) \bigg|_0^{0.2} = 0.2 + \frac{0.2^5}{10} - \frac{0.2^9}{72} + \frac{0.2^{13}}{208}.\]

This is an alternating series (after the first term), so to approximate it to within \(10^{-4}\) we must find \(n\) such that \(a_{n+1} < 10^{-4}\). But \(\frac{0.2^5}{10} = 32 \times 10^{-6} < 10^{-4}\), so that using just the initial term produces a result, 0.2, accurate to within \(10^{-4}\).

10.4.41 We have

\[\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \frac{x^9}{9} - \cdots,\]

so

\[\int \tan^{-1} x \, dx = \int \left( x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \frac{x^9}{9} - \cdots \right) dx = \frac{x^2}{2} - \frac{x^4}{12} + \frac{x^6}{30} - \frac{x^8}{56} + \cdots.\]

Thus,

\[\int_0^{0.35} \tan^{-1} x \, dx = 0.35^2 - \frac{0.35^4}{12} + \frac{0.35^6}{30} - \frac{0.35^8}{56} + \cdots.\]

Note that this series is alternating, and \(\frac{0.35^5}{30} < 10^{-4}\), so we add the first two terms to approximate the integral to the desired accuracy. Calculating gives approximately 0.060.

10.4.42 We have

\[\ln(1 + x^2) = x^2 - \frac{x^4}{2} + \frac{x^6}{3} - \frac{x^8}{4} + \cdots,\]

so

\[\int \ln(1 + x^2) \, dx = \int \left( x^2 - \frac{x^4}{2} + \frac{x^6}{3} - \frac{x^8}{4} + \cdots \right) dx = C + \frac{x^3}{3} - \frac{x^5}{10} + \frac{x^7}{21} - \frac{x^9}{36} + \frac{x^{11}}{55} + \cdots.\]

Thus,

\[\int_0^{0.4} \ln(1 + x^2) \, dx = \frac{0.4^3}{3} - \frac{0.4^5}{10} + \frac{0.4^7}{21} - \frac{0.4^9}{36} + \cdots.\]

Because \(\frac{0.4^7}{21} < 10^{-4}\), we add the first two terms to approximate the integral to the desired accuracy. Calculating gives approximately 0.020.

10.4.43 From Table 10.5, the first few terms of the Taylor series for \((1 + x^6)^{-1/2}\) are

\[1 - \frac{1}{2}x^6 + \frac{3}{8}x^{12} - \frac{5}{16}x^{18}.\]

The first few terms of the desired integral are thus

\[\int_0^{0.5} \left( 1 - \frac{1}{2}x^6 + \frac{3}{8}x^{12} - \frac{5}{16}x^{18} \right) dx = \left( x - \frac{1}{14}x^7 + \frac{3}{104}x^{13} - \frac{5}{304}x^{19} \right) \bigg|_0^{0.5} = 0.5 - \frac{0.5^7}{14} + 3 \cdot \frac{0.5^{13}}{104} - \frac{5 \cdot 0.5^{19}}{304}.\]

This is an alternating series, so to approximate it to within \(10^{-4}\) we must find the smallest \(n\) such that \(a_{n+1} < 10^{-4}\). Since

\[a_1 = \frac{0.5^7}{14} \approx 5.6 \times 10^{-4}, \quad a_2 = \frac{3 \cdot 0.5^{13}}{104} \approx 3.5 \times 10^{-6},\]

we must use the first two terms, so that to within \(10^{-4}\), the correct value is

\[0.5 - \frac{0.5^7}{14} \approx 0.499.\]
10.4.44 The Taylor series for \( \ln(1 + x) \) centered at 0 is \( \sum_{k=0}^{\infty} (-1)^k \frac{x^k}{k+1} \). The desired integral is thus
\[
\int_0^{0.2} \sum_{k=0}^{\infty} (-1)^k \frac{x^k}{k+1} \, dx = \sum_{k=0}^{\infty} (-1)^k \frac{x^{k+1}}{(k+1)^2} \bigg|_0^{0.2} = \sum_{k=0}^{\infty} (-1)^k \frac{0.2^{k+1}}{(k+1)^2}.
\]
This is an alternating series, so to approximate it to within \( 10^{-4} \), we must find \( n \) such that \( a_{n+1} < 10^{-4} \), or \( \frac{0.2^{n+2}}{(n+2)^2} < 10^{-4} \). This occurs first for \( n = 3 \), so we have \( \sum_{k=0}^{3} (-1)^k \frac{0.2^{k+1}}{(k+1)^2} \approx 0.191 \).

10.4.45 Use the Taylor series for \( e^x \) at 0: \( 1 + \frac{2x}{1!} + \frac{2x^2}{2!} + \frac{2x^3}{3!} \).

10.4.46 Use the Taylor series for \( e^x \) at 0: \( 1 + \frac{1}{2!} + \frac{(1/2)^2}{3!} = 1 + \frac{2}{2} + \frac{1}{8} + \frac{1}{8} \cdot 3! \).

10.4.47 Use the Taylor series for \( \cos x \) at 0: \( 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} = 1 - 2 + \frac{4}{3} - \frac{4}{45} \).

10.4.48 Use the Taylor series for \( \sin x \) at 0: \( 1 - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} = 1 - \frac{4}{3} + \frac{1}{16} \).

10.4.49 Use the Taylor series for \( \ln(1 + x) \) at 0: \( \frac{x}{2} - \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} - \frac{x^5}{5} \).

10.4.50 Use the Taylor series for \( \tan^{-1} x \) at 0: \( \frac{1}{2} + \frac{1}{3} \cdot \frac{1}{8} + \frac{1}{5} \cdot \frac{1}{32} - \frac{1}{7} \).

10.4.51 The Taylor series for \( f \) centered at 0 is
\[
-1 + \sum_{k=0}^{\infty} \frac{x^k}{x^{k+1}} = \frac{\sum_{k=1}^{\infty} x^k}{x} = \sum_{k=1}^{\infty} \frac{x^k}{k!} = \sum_{k=0}^{\infty} \frac{x^k}{(k+1)!}.
\]
Evaluating both sides at \( x = 1 \), we have \( e - 1 = \sum_{k=0}^{\infty} \frac{1}{(k+1)!} \).

10.4.52 The Taylor series for \( f \) centered at 0 is
\[
-1 + \sum_{k=0}^{\infty} \frac{x^k}{x^{k+1}} = \sum_{k=1}^{\infty} \frac{x^k}{k!} = \sum_{k=1}^{\infty} \frac{x^k}{k!} = \sum_{k=0}^{\infty} \frac{x^k}{(k+1)!}.
\]
Differentiating, the Taylor series for \( f'(x) \) is \( f'(x) = \frac{(x-1)x^{x+1}}{x^2} = \sum_{k=1}^{\infty} \frac{k^{k-1} x^k}{(k+1)!} \). Evaluating both sides at 2 gives \( e^2 - 1 = \sum_{k=1}^{\infty} \frac{k^{k-1} x^k}{(k+1)!} \).

10.4.53 The Taylor series for \( \ln(1 + x) \) centered at 0 is \( x - \frac{1}{2} x^2 + \frac{1}{3} x^3 - \frac{1}{4} x^4 + \cdots = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{x^k}{k} \). By the Ratio Test, \( \lim_{k \to \infty} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{k \to \infty} \left| \frac{\frac{1}{k+1} x^{k+1}}{x^k} \right| = |x| \), so the radius of convergence is 1. The series diverges at -1 and converges at 1, so the interval of convergence is \((-1, 1]\). Evaluating at 1 gives \( \ln 2 = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \cdots \).

10.4.54 The Taylor series for \( \ln(1 + x) \) at 0 is \( x - \frac{1}{2} x^2 + \frac{1}{3} x^3 - \frac{1}{4} x^4 + \cdots = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{x^k}{k} \). By the Ratio Test, \( \lim_{k \to \infty} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{k \to \infty} \left| \frac{x^{k+1}}{x^{k+1}} \right| = |x| \), so the radius of convergence is 1. The series diverges at -1 and converges at 1, so the interval of convergence is \((-1, 1]\). Evaluate both sides at \(-\frac{1}{2}\) to get
\[
f \left( -\frac{1}{2} \right) = \ln 1 - \ln 2 = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{(-1/2)^k}{k} = -\sum_{k=1}^{\infty} \frac{1}{k \cdot 2^k},
\]
so that \( \sum_{k=1}^{\infty} \frac{1}{k \cdot 2^k} = \ln 2 \).
10.4.55 \[
\sum_{k=0}^{\infty} \frac{x^k}{2^k} = \sum_{k=0}^{\infty} \left( \frac{x}{2} \right)^k = \frac{1}{1 - \frac{x}{2}} = \frac{2}{2 - x}.
\]

10.4.56 \[
\sum_{k=0}^{\infty} (-1)^k \frac{x^k}{3^k} = \sum_{k=0}^{\infty} \left( -\frac{x}{3} \right)^k = \frac{1}{1 + \frac{x}{3}} = \frac{3}{3 + x}.
\]

10.4.57 \[
\sum_{k=0}^{\infty} (-1)^k \frac{x^{2k}}{4^k} = \sum_{k=0}^{\infty} \left( -\frac{x^2}{4} \right)^k = \frac{1}{1 + \frac{x^2}{4}} = \frac{4}{4 + x^2}.
\]

10.4.58 \[
\sum_{k=0}^{\infty} 2^k x^k + 1 = x \sum_{k=0}^{\infty} (2x^2)^k = \frac{x}{1 - 2x^2}.
\]

10.4.59 \[
\ln(1 + x) = -\sum_{k=1}^{\infty} (-1)^k \frac{x^k}{k}, \text{ so } \ln(1 - x) = -\sum_{k=1}^{\infty} \frac{x^k}{k}, \text{ and finally } -\ln(1 - x) = \sum_{k=1}^{\infty} \frac{x^k}{k}.
\]

10.4.60 \[
\sum_{k=0}^{\infty} (-1)^k \frac{x^{k+1}}{4^k} = -4 \sum_{k=0}^{\infty} \left( -\frac{x}{4} \right)^{k+1} = -4 \left( -1 + \sum_{k=0}^{\infty} \left( -\frac{x}{4} \right)^k \right) = 4 - \frac{4}{1 + \frac{x}{4}} = 4 - \frac{16}{4 + x} = \frac{4x}{4 + x}.
\]

10.4.61 \[
\sum_{k=1}^{\infty} (-1)^k \frac{kx^k+1}{3^k} = \sum_{k=1}^{\infty} (-1)^k \frac{k}{3^k} x^{k+1} = \sum_{k=1}^{\infty} k \left( -\frac{1}{3} \right)^k x^{k+1} = x^2 \sum_{k=1}^{\infty} \left( -\frac{1}{3} \right)^k k x^{k-1} = x^2 \sum_{k=1}^{\infty} \left( -\frac{1}{3} \right)^k \frac{d}{dx}(x^k) = x^3 \frac{d}{dx} \left( \sum_{k=1}^{\infty} \left( -\frac{x}{3} \right)^k \right) = x^3 \frac{d}{dx} \left( \frac{1}{1 + \frac{x}{3}} \right) = \frac{3x^2}{(x + 3)^2}.
\]

10.4.62 By Exercise 53, \[
\sum_{k=1}^{\infty} \frac{x^k}{k} = -\ln(1 - x), \text{ so } \sum_{k=1}^{\infty} \frac{x^{2k}}{k} = \sum_{k=1}^{\infty} \frac{(x^2)^k}{k} = -\ln(1 - x^2).
\]
10.4. WORKING WITH TAYLOR SERIES

10.4.63

\[ \sum_{k=2}^{\infty} \frac{k(k-1)x^k}{3^k} = x^2 \sum_{k=2}^{\infty} \frac{k(k-1)x^{k-2}}{3^k} \]

\[ = x^2 \frac{d^2}{dx^2} \left( \sum_{k=2}^{\infty} \frac{x^k}{3^k} \right) \]

\[ = x^2 \frac{d^2}{dx^2} \left( \frac{x^2}{9} \cdot \frac{1}{1 - \frac{x}{3}} \right) \]

\[ = x^2 \frac{d^2}{dx^2} \left( \frac{x^2}{9 - 3x} \right) \]

\[ = \frac{6x^2}{(x - 3)^3}. \]

10.4.64

\[ \sum_{k=2}^{\infty} \frac{x^k}{k(k-1)} = \sum_{k=2}^{\infty} \frac{x^k}{k} - \sum_{k=2}^{\infty} \frac{x^k}{k} \]

\[ = x \sum_{k=1}^{\infty} \frac{x^k}{k} - \sum_{k=1}^{\infty} \frac{x^k}{k} + x \]

\[ = -x \ln(1 - x) + \ln(1 - x) + x \]

\[ = x + (1 - x) \ln(1 - x). \]

10.4.65

a. False, because \( \frac{1}{1 - x} \) is not continuous at 1, which is in the interval of integration.

b. False, because the Ratio Test shows that the radius of convergence for the Taylor series for \( \tan^{-1} x \) centered at 0 is 1.

c. True, because \( \sum_{k=0}^{\infty} \frac{x^k}{k!} = e^x \). Substitute \( x = \ln 2 \).

10.4.66 The Taylor series for \( e^{ax} \) centered at 0 is

\[ e^{ax} = 1 + ax + \frac{(ax)^2}{2} + \frac{(ax)^3}{6} + \cdots. \]

We compute that

\[ \frac{e^{ax} - 1}{x} = \frac{1}{x} \left[ \left( 1 + ax + \frac{(ax)^2}{2} + \frac{(ax)^3}{6} + \cdots \right) - 1 \right] \]

\[ = \frac{1}{x} \left( ax + \frac{(ax)^2}{2} + \frac{(ax)^3}{6} + \cdots \right) = a + \frac{a^2x}{2} + \frac{a^3x^2}{6} + \cdots \]

so the limit of \( \frac{e^{ax} - 1}{x} \) as \( x \to 0 \) is \( a \).

10.4.67 The Taylor series for \( \sin x \) centered at 0 is

\[ \sin x = x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots. \]

We compute that

\[ \frac{\sin ax}{\sin bx} = \frac{ax - \frac{(ax)^3}{6} + \frac{(ax)^5}{120} - \cdots}{bx - \frac{(bx)^3}{6} + \frac{(bx)^5}{120} - \cdots} = \frac{a - \frac{a^3x^2}{6} + \frac{a^5x^4}{120} - \cdots}{b - \frac{b^3x^2}{6} + \frac{b^5x^4}{120} - \cdots} \]
so that \( \lim_{x \to 0} \frac{\sin ax}{\sin bx} = \frac{a}{b} \)

**10.4.68** The Taylor series for \( \sin ax \) and for \( \tan^{-1} ax \) centered at 0 are

\[
\sin ax = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} (ax)^{2k+1} = ax - \frac{(ax)^3}{6} + \frac{(ax)^5}{120} - \ldots
\]

\[
\tan^{-1} ax = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} (ax)^{2k+1} = ax - \frac{(ax)^3}{3} + \frac{(ax)^5}{5} - \ldots.
\]

We compute that

\[
\frac{\sin ax - \tan^{-1} ax}{bx^3} = \frac{1}{bx^3} \left( \left( ax - \frac{(ax)^3}{6} + \frac{(ax)^5}{120} - \ldots \right) - \left( ax - \frac{(ax)^3}{3} + \frac{(ax)^5}{5} - \ldots \right) \right)
\]

\[
= \frac{1}{bx^3} \left( \frac{(ax)^3}{6} - \frac{23(ax)^5}{120} + \ldots \right)
\]

\[
= \frac{a^3}{6b} - \frac{23a^5}{120b} x^2 + \ldots
\]

so that \( \lim_{x \to 0} \frac{\sin ax - \tan^{-1} ax}{bx^3} = \frac{a^3}{6b} \)

**10.4.69** We compute the limit of the log of this expression,

\[
\lim_{x \to 0} \frac{\ln(\sin x/x)}{x^2}.
\]

Suppose the Taylor series of \( \ln \frac{\sin x}{x} \) around 0 is \( \sum_{k=0}^{\infty} c_k x^k \). Then

\[
\lim_{x \to 0} \frac{\ln(\sin x/x)}{x^2} = \lim_{x \to 0} \sum_{k=0}^{\infty} c_k x^{k-2} = \lim_{x \to 0} \left( c_0 x^{-2} + c_1 x^{-1} + c_2 + c_3 x + \cdots \right) = \lim_{x \to 0} \left( c_0 x^{-2} + c_1 x^{-1} + c_2 \right),
\]

because the higher-order terms have positive powers of \( x \) and thus approach zero as \( x \) does. So we need only compute the terms of the Taylor series of \( \ln \frac{\sin x}{x} \) up through the quadratic term. The relevant Taylor series are:

\[
\frac{\sin x}{x} = 1 - \frac{1}{6} x^2 + \frac{1}{120} x^4 - \cdots, \quad \ln(1 + x) = x - \frac{1}{2} x^2 + \frac{1}{3} x^3 - \cdots.
\]

Substitute the series for \( \frac{\sin x}{x} - 1 \) for \( x \) into the Taylor series for \( \ln(1 + x) \). Because the lowest power of \( x \) in the series for \( \frac{\sin x}{x} - 1 \) is 2, it follows that only the linear term in the series for \( \ln(1 + x) \) will give any powers of \( x \) that are at most quadratic. Thus the only term that results is \( \frac{1}{6} x^2 \). So \( c_0 = c_1 = 0 \) and \( c_2 = -\frac{1}{6} \), so that

\[
\lim_{x \to 0} \frac{\ln(\sin x/x)}{x^2} = -\frac{1}{6}
\]

and thus

\[
\lim_{x \to 0} \left( \frac{\sin x}{x} \right)^{1/2} = e^{-1/6}.
\]

**10.4.70** Using the definition as an integral, start with the Taylor series for \( (1 + t^2)^{-1/2} \). From the series for \( (1 + x)^p \) in Table 10.5, this is

\[
1 - \frac{1}{2} t^2 + \frac{3}{8} t^4 - \frac{5}{16} t^6 + \cdots.
\]

Integrate this series term by term to get

\[
\int_0^x \left( 1 - \frac{1}{2} t^2 + \frac{3}{8} t^4 - \frac{5}{16} t^6 + \cdots \right) dt = \left( t - \frac{1}{6} t^3 + \frac{3}{40} t^5 - \frac{5}{112} t^7 + \cdots \right) \bigg|_0^x
\]

\[
= x - \frac{1}{6} x^3 + \frac{3}{40} x^5 - \frac{5}{112} x^7 + \cdots.
\]
Using the first definition, note that we can find the Taylor series for \(\ln(x + \sqrt{1 + x^2})\) by substituting into \(\ln(1 + t)\) the Taylor series for \(x + \sqrt{x^2 + 1} - 1\). The Taylor series in question are (again from Table 10.5):

\[
x + \sqrt{x^2 + 1} - 1 = x + \frac{1}{2}x^2 - \frac{1}{8}x^4 + \frac{1}{16}x^6 - \ldots
\]

\[
\ln(1 + t) = t - \frac{1}{2}t^2 + \frac{1}{3}t^3 - \frac{1}{4}t^4 + \frac{1}{5}t^5 - \frac{1}{6}t^6 + \frac{1}{7}t^7 - \ldots.
\]

Now we must substitute the first series into the second and simplify. From the result above, we need only be concerned with terms where the powers of \(x\) are at most 7. So we get

\[
\ln(x + \sqrt{x^2 + 1} - 1) = \left(x + \frac{1}{2}x^2 - \frac{1}{8}x^4 + \frac{1}{16}x^6 - \ldots\right)^2 - \frac{1}{2}\left(x + \frac{1}{2}x^2 - \frac{1}{8}x^4 + \frac{1}{16}x^6 - \ldots\right)^2
\]

\[
+ \frac{1}{3}\left(x + \frac{1}{2}x^2 - \frac{1}{8}x^4 + \frac{1}{16}x^6 - \ldots\right)^3 - \frac{1}{4}\left(x + \frac{1}{2}x^2 - \frac{1}{8}x^4 + \frac{1}{16}x^6 - \ldots\right)^4
\]

\[
+ \frac{1}{5}\left(x + \frac{1}{2}x^2 - \frac{1}{8}x^4 + \frac{1}{16}x^6 - \ldots\right)^5 - \frac{1}{6}\left(x + \frac{1}{2}x^2 - \frac{1}{8}x^4 + \frac{1}{16}x^6 - \ldots\right)^6
\]

\[
+ \frac{1}{7}\left(x + \frac{1}{2}x^2 - \frac{1}{8}x^4 + \frac{1}{16}x^6 - \ldots\right)^7
\]

\[
= x + \frac{1}{2}x^2 - \frac{1}{8}x^4 + \frac{1}{16}x^6
\]

\[- \left(\frac{1}{2}x^2 + \frac{1}{2}x^3 + \frac{1}{4}x^5 - \frac{1}{8}x^6 + \frac{1}{16}x^7\right)
\]

\[+ \frac{1}{3}x^3 + \frac{1}{2}x^4 + \frac{1}{4}x^5 - \frac{1}{8}x^6 - \frac{1}{16}x^7\]

\[- \frac{1}{4}x^4 + \frac{1}{2}x^5 + \frac{3}{8}x^6
\]

\[+ \frac{1}{5}x^5 + \frac{1}{2}x^6 + \frac{1}{2}x^7\]

\[- \frac{1}{6}x^6 + \frac{1}{2}x^7
\]

\[+ \frac{1}{7}x^7
\]

\[= x - \frac{1}{6}x^3 + \frac{3}{40}x^5 - \frac{5}{112}x^7 + \ldots,
\]

which matches the result above.

For Exercises 71-74, suppose that the coefficient of \((x - a)^k\) in the Taylor series centered at \(a\) for \(f(x)\) is \(r\). Then \(f^{(k)}(x)\) has a Taylor series centered at \(a\) that is computed by taking the \(k\)th derivative of the series for \(f(x)\). Terms where the exponent of \(x - a\) is less than \(k\) vanish after \(k\) derivatives. The term \(r(x - a)^k\) becomes \(r \cdot k!\), and terms where the exponent is higher than \(k\) become some constant times a nonzero power of \(x - a\). Thus when evaluated at \(a\), we get \(f^{(k)}(a) = r \cdot k!\), which is indeed \(k!\) times the coefficient of \((x - a)^k\) in the Taylor series for \(f(x)\) centered at \(a\).

10.4.71 The Taylor series we need are centered at 0:

\[
\cos x = 1 - \frac{1}{2}x^2 + \frac{1}{24}x^4 + \ldots
\]

\[
e^t = 1 + t + \frac{1}{2!}t^2 + \frac{1}{3!}t^3 + \frac{1}{4!}t^4 + \ldots.
\]

To find \(f^{(3)}(0)\) and \(f^{(4)}(0)\), we are looking for powers of \(x^3\) and \(x^4\) that occur when the first series is substituted for \(t\) in the second series. Clearly there will be no odd powers of \(x\), because \(\cos x\) has only even
powers. Thus the coefficient of \(x^3\) is zero, so that \(f^{(3)}(0) = 0\). The coefficient of \(x^4\) will come from the expansion of \(1 - \frac{1}{2}x^2 + \frac{1}{24}x^4\) in the series for \(e^t\), since higher powers of \(x\) clearly cannot result in an \(x^4\) term. There are two ways of getting an \(x^4\) in the expansion:

- Combine two factors of \(-\frac{1}{2}x^2\) with \(k - 2\) factors of 1, for \(k \geq 2\). There are \(\binom{k}{2} \cdot \frac{1}{2}\) ways of doing this. (If you are not familiar with the binomial coefficient \(\binom{k}{2}\), think of it this way: of the \(k\) factors in the product, you need to choose 2 of them to be \(-\frac{1}{2}x^2\). There are \(k\) choices for the first one; once you’ve chosen it, there are \(k - 1\) choices for the second one. But this counts each possibility twice, since you could have chosen the second one first and the first one second).

- Combine one factor of \(\frac{1}{24}x^4\) with \(k - 1\) factors of 1, for \(k \geq 1\).

Thus the entire term involving \(x^4\) in the series for \(e^{\cos x}\) is

\[
\sum_{k=2}^{\infty} \frac{1}{k!} \cdot \frac{k}{2} \left( -\frac{1}{2}x^2 \right) + \sum_{k=1}^{\infty} \frac{1}{k!} \cdot k \left( \frac{1}{24}x^4 \right) = \frac{1}{8} \sum_{k=2}^{\infty} \frac{1}{(k-2)!} x^4 + \frac{1}{24} \sum_{k=1}^{\infty} \frac{1}{(k-1)!} x^4
\]

\[
= \frac{1}{8} \sum_{k=0}^{\infty} \frac{1}{k!} x^4 + \frac{1}{24} \sum_{k=0}^{\infty} \frac{1}{k!} x^4
\]

\[
= \frac{1}{6} x^4 \sum_{k=0}^{\infty} \frac{1}{k!}
\]

\[
= \frac{1}{6} e x^4,
\]

since the final infinite sum is the Taylor series for \(e^x\) centered at 0 evaluated at 1. So by the analysis above, we see that

\[f^{(4)}(0) = 4! \cdot \frac{1}{6} e = 4e.\]

10.4.72 The Taylor series for \((1 + x)^{-1/3}\) is

\[(1 + x)^{-1/3} = 1 - \frac{1}{3}x + \frac{2}{9}x^2 - \frac{14}{81}x^3 + \frac{35}{243}x^4 - \ldots ,\]

so we want the coefficients of \(x^3\) and \(x^4\) in

\[(x^2 + 1) \left( 1 - \frac{1}{3}x + \frac{2}{9}x^2 - \frac{14}{81}x^3 + \frac{35}{243}x^4 \right).\]

The coefficient of \(x^3\) is \(-\frac{1}{3} - \frac{14}{81} = -\frac{41}{81}\), and the coefficient of \(x^4\) is \(\frac{14}{27} + \frac{35}{243} = \frac{89}{243}\). Thus

\[f^{(3)}(0) = 6 \cdot \left( -\frac{41}{81} \right) = -\frac{82}{27}, \quad f^{(4)}(0) = 24 \cdot \frac{89}{243} = \frac{712}{81}.\]

10.4.73 The Taylor series for \(\sin t^2\) is

\[\sin t^2 = t^2 - \frac{1}{3!} t^6 + \frac{1}{5!} t^{10} - \ldots ,\]

so that

\[
\int_0^x \sin t^2 dt = \frac{1}{3} t^3 - \frac{1}{7 \cdot 3!} t^7 + \ldots \bigg|_0^x = \frac{1}{3} x^3 - \frac{1}{7 \cdot 3!} x^7 + \ldots .
\]

Thus \(f^{(3)}(0) = 3! \cdot \frac{1}{3} = 2\) and \(f^{(4)}(0) = 0\).
10.4.74 The Taylor series at 0 for \( \frac{1}{1+t^4} \) is

\[
\frac{1}{1+t^4} = 1 - t^4 + t^8 + \cdots,
\]

so that

\[
\int_0^x \frac{1}{1+t^4}dt = t - \frac{1}{5}t^5 + \frac{1}{9}t^9 + \cdots \bigg|_0^x = x - \frac{1}{5}x^5 + \cdots,
\]

so that both \( f^{(3)}(0) \) and \( f^{(4)}(0) \) are zero.

10.4.75 Consider the series

\[
x = x \sum_{k=0}^{\infty} x^k = \sum_{k=1}^{\infty} x^k.
\]

Differentiating both sides gives

\[
\frac{1}{(1-x)^2} = \sum_{k=1}^{\infty} kx^{k-1} = \frac{1}{x} \sum_{k=1}^{\infty} kx^k,
\]

so that

\[
\frac{x}{(1-x)^2} = \sum_{k=1}^{\infty} kx^k.
\]

Substitute \( x = \frac{1}{2} \) to see that the sum of the series is

\[
\frac{1/2}{(1-1/2)^2} = 2 = \sum_{k=1}^{\infty} k \left( \frac{1}{2} \right)^k.
\]

Thus the expected number of tosses is 2.

10.4.76

a. \( \sum_{k=0}^{\infty} \frac{1}{6} \left( \frac{5}{6} \right)^{2k} = \frac{1}{6} \sum_{k=0}^{\infty} \left( \frac{25}{36} \right)^k = \frac{1}{6} \cdot \frac{1}{1-25/36} = 6 \)

b. Consider the series \( \sum_{k=1}^{\infty} x^k = \frac{x}{1-x} \). Differentiating both sides gives \( \frac{1}{(1-x)^2} = \sum_{k=1}^{\infty} kx^{k-1} \). Evaluating at \( x = \frac{1}{6} \) and multiplying the result by \( \frac{1}{6} \), we get \( \frac{1}{6} \cdot \frac{1}{(1-1/6)^2} = 6 \).

10.4.77

a. We look first for a Taylor series for \( (1 - k^2 \sin^2 \theta)^{-1/2} \). Because

\[
(1 - k^2x^2)^{-1/2} = (1 - (kx)^2)^{-1/2} = 1 + \frac{1}{2}k^2x^2 + \frac{3}{8}k^4x^4 + \frac{5}{16}k^6x^6 + \frac{35}{128}k^8x^8 + \cdots
\]

\[
\sin \theta = \theta - \frac{1}{3!}\theta^3 + \frac{1}{5!}\theta^5 - \cdots,
\]

substituting the second series into the first gives

\[
\frac{1}{\sqrt{1 - k^2 \sin^2 \theta}} = 1 + \frac{1}{2}k^2\theta^2 + \left( -\frac{1}{6}k^2 + \frac{3}{8}k^4 \right)\theta^4 + \left( \frac{1}{45}k^2 - \frac{1}{4}k^4 + \frac{5}{16}k^6 \right)\theta^6
\]

\[
+ \left( -\frac{1}{630}k^2 + \frac{3}{40}k^4 - \frac{5}{16}k^6 + \frac{35}{128}k^8 \right)\theta^8 + \cdots.
\]

Now integrate with respect to \( \theta \). Evaluating the antiderivative at 0 gives 0, while evaluating at \( \frac{\pi}{2} \) gives

\[
\frac{1}{2}\pi + \frac{1}{48}k^2\pi^3 + \frac{1}{160} \left( -\frac{1}{6}k^2 + \frac{3}{8}k^4 \right)\pi^5 + \frac{1}{896} \left( \frac{1}{45}k^2 - \frac{1}{4}k^4 + \frac{5}{16}k^6 \right)\pi^7
\]

\[
+ \frac{1}{4608} \left( -\frac{1}{630}k^2 + \frac{3}{40}k^4 - \frac{5}{16}k^6 + \frac{35}{128}k^8 \right)\pi^9.
\]

Evaluating these terms for \( k = 0.1 \) gives \( F(0.1) \approx 1.575 \), which is correct to three decimal places.
b. The terms above, with coefficients of \( k^n \) converted to decimal approximations, is
\[
1.571 + 0.392 \cdot k^2 + 0.360 \cdot k^4 - 0.968 \cdot k^6 + 1.769 \cdot k^8.
\]
The coefficients are all less than 2 and do not appear to be increasing very rapidly, so if we want the result to be accurate to within \( 10^{-3} \) we should probably take \( n \) such that \( k^n < \frac{1}{2} \times 10^{-3} = 0.0005 \), so \( n = 4 \) for this value of \( k \).

c. By the above analysis, we would need a larger \( n \) because \( 0.2^n > 0.1^n \) for a given value of \( n \).

### 10.4.78

a. \[
\frac{\sin t}{t} = \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k}}{(2k+1)!} = 1 - \frac{x^2}{3!} + \frac{x^4}{5!} - \cdots.
\]

b. \[
\int_0^x \frac{\sin t}{t} \, dt = \sum_{k=0}^{\infty} \int_0^x (-1)^k \frac{t^{2k}}{(2k+1)!} \, dt = \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{(2k+1)(2k+1)!}.
\]

c. This is an alternating series, so we want \( n \) such that \( a_{n+1} < 10^{-3} \), or \( \frac{0.5^{2n+3}}{(2n+3)(2n+3)!} < 10^{-3} \) (resp. \( \frac{1^{2n+3}}{(2n+3)(2n+3)!} < 10^{-3} \)), which gives \( n = 1 \) (resp. \( n = 2 \)). Thus
\[
\text{Si}(0.5) \approx \frac{0.5}{1} - \frac{0.5^3}{3 \cdot 3!} \approx 0.493, \quad \text{Si}(1.0) \approx 1 - \frac{1}{3 \cdot 3!} + \frac{1}{5 \cdot 5!} \approx 0.946.
\]

### 10.4.79

a. By the Fundamental Theorem, \( S'(x) = \sin x^2, \ C'(x) = \cos x^2 \).

b. The relevant Taylor series are \( \sin t^2 = t^2 - \frac{t^6}{3!} + \frac{t^{10}}{7!} + \cdots \), and \( \cos t^2 = 1 - \frac{t^4}{2!} + \frac{t^8}{4!} - \frac{t^{12}}{6!} + \cdots \). Integrating, we have
\[
S(x) = \frac{1}{3} x^3 - \frac{1}{7 \cdot 3!} x^7 + \frac{1}{11 \cdot 5!} x^{11} - \frac{1}{15 \cdot 7!} x^{15} + \cdots;
\]
\[
C(x) = x - \frac{1}{5 \cdot 2!} x^5 + \frac{1}{9 \cdot 4!} x^9 - \frac{1}{13 \cdot 6!} x^{13} + \cdots.
\]

c. \[
S(0.05) \approx \frac{1}{3} (0.05)^3 - \frac{1}{42} (0.05)^5 + \frac{1}{1320} (0.05)^{11} - \frac{1}{75600} (0.05)^{15} \approx 4.167 \times 10^{-5},
\]
\[
C(-0.25) \approx (-0.25) - \frac{1}{10} (-0.25)^5 + \frac{1}{216} (-0.25)^9 - \frac{1}{9360} (-0.25)^{13} \approx -0.250.
\]

d. The series is alternating. Because \( a_{n+1} = \frac{1}{(4n+5)(2n+1)!} (0.05)^{4n+5} \), and this is less than \( 10^{-4} \) for \( n = 0 \), only one term is required.

e. The series is alternating. Because \( a_{n+1} = \frac{1}{(4n+5)(2n+2)!} (0.25)^{4n+5} \), and this is less than \( 10^{-6} \) for \( n = 1 \), two terms are required.

### 10.4.80

a. \[
\frac{d}{dx} \text{erf}(x) = \frac{2}{\sqrt{\pi}} (e^{-x^2}).
\]

b. \[
e^{-x^2} = 1 - t^2 + \frac{t^4}{2!} - \frac{t^6}{3!} + \cdots = \sum_{k=0}^{\infty} (-1)^k \frac{t^{2k}}{k!}, \text{ so that the Maclaurin series for the error function is}
\]
\[
\text{erf}(x) = \frac{2}{\sqrt{\pi}} \left( x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots \right).
\]

c. \[
\text{erf}(0.15) \approx \frac{2}{\sqrt{\pi}} \left( 0.15 - \frac{0.15^3}{3} + \frac{0.15^5}{10} - \frac{0.15^7}{42} \right) \approx 0.168
\]
\[
\text{erf}(-0.09) \approx \frac{2}{\sqrt{\pi}} \left( -0.09 + \frac{0.09^3}{3} - \frac{0.09^5}{10} + \frac{0.09^7}{42} \right) \approx -0.101.
\]
d. The first omitted term in each case is \( \frac{x^6}{1000} = \frac{x^6}{10^3} \). For \( x = 0.15 \), this is \( \approx 3.6 \times 10^{-11} \). For \( x = -0.09 \), this is (in absolute value) \( \approx 3.6 \times 10^{-13} \).

10.4.81

a. \( J_0(x) = 1 - \frac{1}{4}x^2 + \frac{1}{16}\pi^4x^4 - \frac{1}{256}\pi^4x^6 + \ldots \)

b. Using the Ratio Test: \( \left| \frac{a_{k+1}}{a_k} \right| = \frac{x^2k^2(k+1)^2}{x^{k-1}} = x^2 \frac{k^2(k+1)^2}{(k+1)^2} \), which has limit 0 as \( k \to \infty \) for any \( x \). Thus the radius of convergence is infinite and the interval of convergence is \(( -\infty, \infty )\).

c. Starting only with terms up through \( x^8 \), we have

\[
J_0(x) = 1 - \frac{1}{4}x^2 + \frac{1}{64}x^4 - \frac{1}{2304}x^6 + \frac{1}{147456}x^8 + \ldots
\]

\[
J'_0(x) = -\frac{1}{2}x + \frac{1}{16}x^3 - \frac{1}{384}x^5 + \frac{1}{18432}x^7 + \ldots
\]

\[
J''_0(x) = -\frac{1}{2} + \frac{3}{16}x^2 - \frac{5}{384}x^4 + \frac{7}{18432}x^6 + \ldots
\]

so that

\[
x^2J_0(x) = x^2 - \frac{1}{4}x^4 + \frac{1}{64}x^6 - \frac{1}{2304}x^8 + \frac{1}{147456}x^{10} + \ldots
\]

\[
x'J'_0(x) = -\frac{1}{2}x^2 + \frac{1}{16}x^4 - \frac{1}{384}x^6 + \frac{1}{18432}x^8 + \ldots
\]

\[
x^2J''_0(x) = -\frac{1}{2}x^2 + \frac{3}{16}x^4 - \frac{5}{384}x^6 + \frac{7}{18432}x^8 + \ldots,
\]

and thus \( x^2J''_0(x) + xJ'_0(x) + x^2J_0(x) = 0 \).

10.4.82

\[\sec x = \frac{1}{\cos x} = \frac{1}{1 - \frac{x^2}{2} + \frac{x^4}{24} + \ldots} = 1 + \frac{1}{2}x^2 + \frac{5}{24}x^4 + \frac{61}{720}x^6 + \ldots.\]

10.4.83

a. The power series for \( \cos x \) has only even powers of \( x \), so that the power series has the same value evaluated at \( -x \) as it does at \( x \).

b. The power series for \( \sin x \) has only odd powers of \( x \), so that evaluating it at \( -x \) gives the opposite of its value at \( x \).

10.4.84 Long division gives \( \csc x = \frac{1}{x} + \frac{1}{6}x + \frac{7}{360}x^3 + \cdots \), so that \( \csc x \approx \frac{1}{x} + \frac{1}{6}x \) as \( x \to 0^+ \). Thus \( a = b = 1 \) and \( c = \frac{1}{6} \).

10.4.85

a. Because \( f(a) = g(a) = 0 \), we use the Taylor series for \( f(x) \) and \( g(x) \) centered at \( a \) to compute that

\[
\lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} \frac{f(a) + f'(a)(x-a) + \frac{1}{2}f''(a)(x-a)^2 + \cdots}{g(a) + g'(a)(x-a) + \frac{1}{2}g''(a)(x-a)^2 + \cdots} = \frac{f'(a)}{g'(a)}.
\]

Because \( f'(x) \) and \( g'(x) \) are assumed to be continuous at \( a \) and \( g'(a) \neq 0 \),

\[
\frac{f'(a)}{g'(a)} = \lim_{x \to a} \frac{f'(x)}{g'(x)} \quad \text{and} \quad \lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} \frac{f'(x)}{g'(x)},
\]

which is one form of L'Hôpital's Rule.
b. Because \( f(a) = g(a) = f'(a) = g'(a) = 0 \), we use the Taylor series for \( f(x) \) and \( g(x) \) centered at \( a \) to compute that

\[
\lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} \frac{f(a) + f'(a)(x-a) + \frac{1}{2}f''(a)(x-a)^2 + \frac{1}{6}f'''(a)(x-a)^3 + \cdots}{g(a) + g'(a)(x-a) + \frac{1}{2}g''(a)(x-a)^2 + \frac{1}{6}g'''(a)(x-a)^3 + \cdots}
\]

\[
= \lim_{x \to a} \frac{\frac{1}{2}f''(a)(x-a)^2 + \frac{1}{6}f'''(a)(x-a)^3 + \cdots}{\frac{1}{2}g''(a)(x-a)^2 + \frac{1}{6}g'''(a)(x-a)^3 + \cdots}
\]

\[
= \lim_{x \to a} \frac{\frac{1}{2}f''(a)(x-a) + \frac{1}{6}f'''(a)(x-a) + \cdots}{\frac{1}{2}g''(a) + \frac{1}{6}g'''(a)(x-a) + \cdots}
\]

\[
= \frac{f''(a)}{g''(a)}.
\]

Because \( f''(x) \) and \( g''(x) \) are assumed to be continuous at \( a \) and \( g''(a) \neq 0 \),

\[
\frac{f''(a)}{g''(a)} = \lim_{x \to a} \frac{f''(x)}{g''(x)} \quad \text{and} \quad \lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} \frac{f''(x)}{g''(x)},
\]

which is consistent with two applications of L'Hôpital's Rule.

10.4.86

a. Clearly \( x = \sin y \) because \( BE \), of length \( x \), is the side opposite the angle measured by \( y \) in a right triangle with unit length hypotenuse.

b. In the formula \( \frac{1}{2}r^2\theta \) for the formula for the area of a circular sector, we have \( r = 1 \), and \( \theta = y \), so that the area is in fact \( \frac{y}{2} \). But the area can also be expressed as an integral as follows: the area of the sector is the area under the circle between \( P \) and \( F \) (i.e. the area of the region \( PAEF \)), minus the area of the right triangle \( PEF \). The area of the right triangle is \( \frac{1}{2}x\sqrt{1-x^2} \) by the Pythagorean theorem and the formula for the area of a triangle. Equating these two formulae for the area of the sector, we have

\[
y = \int_0^\frac{y}{2} \sqrt{1-t^2} \, dt = \frac{1}{2}x\sqrt{1-x^2}, \quad \text{so} \quad y = 2 \int_0^x \sqrt{1-t^2} \, dt - x\sqrt{1-x^2}.
\]

c. The Taylor series for \( \sqrt{1-t^2} \) is

\[
1 - \frac{1}{2}t^2 - \frac{1}{8}t^4 - \frac{1}{16}t^6 - \frac{5}{128}t^8 - \ldots \quad \text{Integrating and evaluating at} \quad x = 0, \quad \text{we have}
\]

\[
y = \sin^{-1} x = 2 \left( x - \frac{1}{6}x^3 - \frac{1}{40}x^5 - \frac{1}{112}x^7 - \frac{5}{1152}x^9 \right) - x \left( 1 - \frac{1}{2}x^2 - \frac{1}{8}x^4 - \frac{1}{16}x^6 - \frac{5}{128}x^8 \right) + \cdots
\]

\[
= x + \frac{1}{6}x^3 + \frac{3}{40}x^5 + \frac{5}{112}x^7 + \frac{35}{1152}x^9 + \cdots.
\]

d. Suppose \( x = \sin y = a_0 + a_1y + a_2y^2 + \ldots \). Then \( x = \sin(\sin^{-1}(x)) = a_0 + a_1(x + \frac{1}{6}x^3 + \frac{3}{40}x^5 + \ldots) + a_2((x + \frac{1}{6}x^3 + \frac{3}{40}x^5 + \ldots)^2 + \ldots \). Equating coefficients yields \( a_0 = 0, a_1 = 1, a_2 = 0, a_3 = -\frac{1}{6}, \) and so on.

10.4.87

a. Since

\[
\tan^{-1} x = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} x^{2k+1} = x - \frac{1}{3}x^3 + \frac{1}{5}x^5 - \frac{1}{7}x^7 + \cdots,
\]

we get

\[
\tan^{-1} \frac{1}{2} = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} \left( \frac{1}{2} \right)^{2k+1}
\]

\[
\tan^{-1} \frac{1}{3} = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} \left( \frac{1}{3} \right)^{2k+1}
\]

\[
\tan^{-1} \frac{1}{2} + \tan^{-1} \frac{1}{3} = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} \left( \frac{1}{2^{2k+1}} + \frac{1}{3^{2k+1}} \right).
\]
b. Summing the terms up through \( k = 4 \) (the first five terms) gives \( \frac{\pi}{4} \approx 0.785435 \).

c. The 6th term is when \( k = 5 \), which is in magnitude

\[
\left| \frac{(-1)^5}{11} \left( \frac{1}{2^{11}} + \frac{1}{3^{11}} \right) \right| \approx 4.5 \times 10^{-5}.
\]

Thus the error is bounded by \( 4.5 \times 10^{-5} \).

d. Multiplying the series representation for \( \frac{\pi}{4} \) above by 4, we get

\[
\pi = \sum_{k=0}^{\infty} \left( \frac{(-1)^k}{2k+1} \right) \left( \frac{1}{2^{2k+1}} + \frac{1}{3^{2k+1}} \right).
\]

For \( k = 8 \) the corresponding term is \( \approx 1.8 \times 10^{-6} \), while for \( k = 9 \) it is \( \approx 4.0 \times 10^{-7} \). Thus we must take terms through \( k = 8 \); that is, the first nine terms of the series, to approximate \( \pi \) to within \( 10^{-6} \).

10.4.88

a. Since

\[
\tan^{-1} x = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} x^{2k+1} = x - \frac{1}{3} x^3 + \frac{1}{5} x^5 - \frac{1}{7} x^7 + \cdots,
\]

we get

\[
\tan^{-1} \frac{1}{5} = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} \left( \frac{1}{5} \right)^{2k+1} = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} \left( \frac{1}{239} \right)^{2k+1}.
\]

\[
4 \tan^{-1} \frac{1}{5} + \tan^{-1} \frac{1}{239} = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} \left( \frac{4}{5^{2k+1}} - \frac{1}{239^{2k+1}} \right).
\]

The error when \( n \) terms are summed is bounded by the magnitude of the term for \( k = n \). With \( n = 5 \) we have

\[
\left| \frac{(-1)^5}{11} \left( \frac{4}{5^{11}} - \frac{1}{239^{11}} \right) \right| \approx 7.4 \times 10^{-9}.
\]

b. Multiplying the series representation for \( \frac{\pi}{4} \) above by 4, we get

\[
\pi = \sum_{k=0}^{\infty} \left( \frac{(-1)^k}{2k+1} \right) \left( \frac{16}{5^{2k+1}} - \frac{4}{239^{2k+1}} \right).
\]

For \( k = 3 \) the corresponding term is \( \approx 2.9 \times 10^{-5} \), while for \( k = 4 \) it is \( \approx 9.1 \times 10^{-7} \). Thus we must take terms through \( k = 3 \); that is, the first four terms of the series, to approximate \( \pi \) to within \( 10^{-6} \).

Note that less than half as many terms are required as are needed using the series from Exercise 87.

Chapter Review

1.

a. True. The approximations tend to get better as \( n \) increases in size, and also when the value being approximated is closer to the center of the series. Because 2.1 is closer to 2 than 2.2 is, and because 3 > 2, we should have \( |p_3(2.1) - f(2.1)| < |p_2(2.2) - f(2.2)| \).

b. False. The interval of convergence may or may not include the endpoints.

Copyright © 2014 Pearson Education, Inc.
c. True. The interval of convergence is an interval centered at 0, and the endpoints may or may not be included.

d. True. Because \( f(x) \) is a polynomial, all its derivatives vanish after a certain point (in this case, \( f^{(12)}(x) \) is the last nonzero derivative).

2. \( p_3(x) = 2x - \frac{(2x)^3}{3!} \).

3. \( p_2(x) = 1 \).

4. \( p_3(x) = x - \frac{x^2}{2} + \frac{x^3}{3} \).

5. \( p_2(x) = \frac{\sqrt{2}}{2} \left( 1 - (x - \frac{\pi}{4}) - \frac{1}{2} \left( x - \frac{\pi}{4} \right)^2 \right) \).

6. \( p_2(x) = x - 1 - \frac{1}{2}(x-1)^2 \).

7. \( p_4(x) = 1 - x + x^2 - x^3 + x^4 \).

8. \( p_3(x) = \frac{x}{4} + \frac{x}{2}(x-1) - \frac{1}{4}(x-1)^2 + \frac{1}{12}(x-1)^3 \).

9. \( p_2(x) = 1 - x - x^2 + \frac{x^3}{2} \).

10. a. \( p_0(x) = p_1(x) = 1 \), and \( p_2(x) = 1 - \frac{x^2}{2} \).

b. 

| \( n \) | \( p_n(-0.08) \) | \( |p_n(-0.08) - \cos(-0.08)| \) |
|------|---------------|----------------|
| 0    | 1             | 3.2 \times 10^{-3} |
| 1    | 1             | 3.2 \times 10^{-3} |
| 2    | 0.997         | 1.7 \times 10^{-6} |

11. a. \( p_0(x) = 1 \), \( p_1(x) = 1 + x \), and \( p_2(x) = 1 + x + \frac{x^2}{2} \).

b. 

| \( n \) | \( p_n(-0.08) \) | \( |p_n(-0.08) - e^{-0.08}| \) |
|------|---------------|----------------|
| 0    | 1             | 7.7 \times 10^{-2} |
| 1    | 0.92          | 3.1 \times 10^{-3} |
| 2    | 0.923         | 8.4 \times 10^{-5} |

12. a. \( p_0(x) = 1 \), \( p_1(x) = 1 + \frac{1}{2}x \), and \( p_2(x) = 1 + \frac{1}{2}x - \frac{1}{8}x^2 \).

b. 

| \( n \) | \( p_n(0.08) \) | \( |p_n(0.08) - \sqrt{1+0.08}| \) |
|------|---------------|----------------|
| 0    | 1             | 3.9 \times 10^{-2} |
| 1    | 1.04          | 7.7 \times 10^{-4} |
| 2    | 1.039         | 3.0 \times 10^{-5} |

13. a. \( p_0(x) = \frac{\sqrt{2}}{2} \), \( p_1(x) = \frac{\sqrt{2}}{2} (1 + (x - \frac{\pi}{4})) \), and \( p_2(x) = \frac{\sqrt{2}}{2} \left( 1 + (x - \frac{\pi}{4}) - \frac{1}{2} \left( x - \frac{\pi}{4} \right)^2 \right) \).
b.

| \( n \) | \( p_n \left( \frac{\pi}{2} \right) \) | \( |p_n \left( \frac{\pi}{2} \right) - \sin \frac{\pi}{2}| \) |
|------|----------------------|----------------------------------|
| 0    | 0.707                | \( 1.2 \times 10^{-1} \)          |
| 1    | 0.596                | \( 8.2 \times 10^{-3} \)          |
| 2    | 0.587                | \( 4.7 \times 10^{-4} \)          |

14. The bound is \( \left| R_n(x) \right| \leq M \frac{|x^p|}{(n+1)!} \), where \( M \) is a bound for \( |e^x| \) (because \( e^x \) is its own derivative) on \([-1, 1]\). Thus make \( M = 3 \) so that \( |R_3(x)| \leq 3e^x = \frac{3}{4} \). But \( |x| < 1 \), so this is at most \( \frac{1}{4} \).

15. The derivatives of \( \sin x \) are bounded in magnitude by 1, so \( |R_n(x)| \leq M \frac{|x|^{n+1}}{(n+1)!} \leq \frac{|x|^{n+1}}{(n+1)!} \). But \( |x| < 1 \), so \( |R_3(x)| \leq \frac{1}{4} \).

16. The third derivative of \( \ln(1-x) \) is \( -\frac{2}{(x-1)^3} \), which is bounded in magnitude by 16 on \( |x| < \frac{1}{2} \). Thus \( |R_3(x)| \leq 16 \frac{1}{4!} \leq 16 \frac{1}{2^4} = \frac{1}{4} \).

17. Using the Ratio Test, \( \lim_{k \to \infty} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{k \to \infty} \frac{(k+1)^2}{k^2} \cdot \frac{k!}{(k+1)!} = \lim_{k \to \infty} \frac{1}{k+1}(k+1)^2 \cdot \frac{1}{k^2} = \frac{1}{k+1} \) so the interval of convergence is \((-\infty, \infty)\).

18. Using the Ratio Test, \( \lim_{k \to \infty} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{k \to \infty} \frac{1}{k+1}(k+1)^2 \cdot \frac{k^2}{(k+1)!} = \lim_{k \to \infty} \frac{k^2}{(k+1)!} \cdot \frac{1}{k+1} = 0 \) so the interval of convergence is \([0, \infty)\).

19. Using the Ratio Test, \( \lim_{k \to \infty} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{k \to \infty} \frac{1}{k+1}(k+1)^2 \cdot \frac{k^2}{(k+1)!} = \lim_{k \to \infty} \frac{k}{(k+1)!} \cdot (k+1)^2 = 0 \) so the interval of convergence is \((-\infty, \infty)\).

20. Using the Ratio Test, \( \lim_{k \to \infty} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{k \to \infty} \frac{1}{k+1}(k+1)^2 \cdot \frac{k^2}{(k+1)!} = \lim_{k \to \infty} \frac{k}{(k+1)!} \cdot (k+1)^2 = 0 \) so the series converges when \( |1/(k(x-1)| < 1 \), or \(-5 < x-1 < 5 \), so that \(-4 < x < 6 \). At \( x = -4 \), the series is the alternating harmonic series. At \( x = 6 \), it is the harmonic series, so the interval of convergence is \([-4, 6)\).

21. By the Root Test, \( \lim_{k \to \infty} \sqrt[k]{|a_k|} = \lim_{k \to \infty} \left| \frac{|x|}{n^2} \right| = \frac{|x|}{2^k} \) so the series converges for \( |x| < 9 \). The series given by letting \( x = \pm 9 \) are both divergent by the Divergence Test. Thus, \((-9, 9)\) is the interval of convergence.

22. By the Ratio Test, \( \lim_{k \to \infty} \left| \frac{a_{k+1}}{a_k} \right| = \lim_{k \to \infty} \frac{|x+2|}{(k+1)!} \cdot \frac{2^k}{(x+2)^k} = \lim_{k \to \infty} \frac{2^k}{(k+1)!} \cdot \frac{2^k}{x^k} = \frac{2^k}{(k+1)!} \cdot \frac{2^k}{x^k} = 0 \) so the series converges for \( |x+2| < 1 \), so \(-3 < x < -1 \). At \( x = -3 \), we have a series which converges by the Alternating Series Test. At \( x = -1 \), we have the divergent \( p \)-series with \( p = \frac{1}{2} \). Thus, \((-3, -1)\) is the interval of convergence.

23. By the Ratio Test, \( \lim_{k \to \infty} \left| \frac{x+2}{(x+2)^k} \right| = \lim_{k \to \infty} \frac{|x+2|}{(x+2)^k} \cdot \frac{2^k}{x^k} = \lim_{k \to \infty} \frac{2^k}{x^k} \cdot \frac{2^k}{x^k} = \frac{2^k}{x^k} \cdot \frac{2^k}{x^k} = 0 \) so the series converges for \( |x+2| < 1 \), so \(-3 < x < -1 \). At \( x = -3 \), we have a series which converges by the Alternating Series Test. At \( x = -1 \), we have the divergent \( p \)-series with \( p = \frac{1}{2} \). Thus, \((-3, -1)\) is the interval of convergence.

24. By the Root Test, \( \lim_{k \to \infty} \left| \frac{x^{2k+3}}{x^{2k+1}} \right| = x^2 \) so the series converges for \( |x^2| < 1 \), so \(-1 < x < 1 \). It diverges at both endpoints, so the interval of convergence is \((-1, 1)\).

25. The Maclaurin series for \( f(x) \) is \( \sum_{k=0}^{\infty} x^{2k} \). By the Root Test, this converges for \( |x^2| < 1 \), so \(-1 < x < 1 \). It diverges at both endpoints, so the interval of convergence is \((-1, 1)\).
26. The Maclaurin series for \( f(x) \) is determined by replacing \( x \) by \((-x)^3\) in the power series for \( \frac{1}{1-x^2} \), so it is 
\[ \sum_{k=0}^{\infty}(-1)^kx^{2k} \] 
The radius of convergence is still 1. The series diverges at both endpoints, so the interval

of convergence is \((-1,1)\).

27. The Maclaurin series for \( f(x) \) is 
\[ \sum_{k=0}^{\infty}(3x)^k = \sum_{k=0}^{\infty}3^kx^k. \] 
By the Root Test, this has radius of convergence \( \frac{1}{3} \). Checking the endpoints, we obtain an interval of convergence of \((-\frac{1}{3}, \frac{1}{3})\).

28. Replace \( x \) by \(-x\) in the original power series, and multiply the result by \(10x\), to get the Maclaurin series for \( f(x) \), which is 
\[ \sum_{k=0}^{\infty}(-1)^k10x^{k+1}. \] 
By the Ratio Test, the radius of convergence is 1. Checking the endpoints, we obtain an interval of convergence of \((-1,1)\).

29. Taking the derivative of \( \frac{1}{1-x} \) gives \( f(x) \). Thus, the Maclaurin series for \( f(x) \) is 
\[ \sum_{k=1}^{\infty}kx^{k-1}. \] 
Using the Ratio Test, \( \lim_{k \to \infty} \frac{|a_{k+1}|}{|a_k|} = \lim_{k \to \infty} \frac{(k+1)x^k}{kx^{k-1}} = \lim_{k \to \infty} \frac{k+1}{k} |x| = |x| \), so the radius of convergence is 1. Checking the endpoints, we obtain \((-1,1)\) for the interval of convergence.

30. Integrating \( \frac{1}{1-x} \) and then replacing \( x \) by \(-x^2\) gives \(-f(x)\), so the series for \( f(x) \) is 
\[ -\sum_{k=0}^{\infty} \frac{1}{k+1}(-x^2)^{k+1} = \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+2}}{k+1}. \] 
The Ratio Test shows that the series has a radius of convergence of 1; checking the endpoints, we obtain an interval of convergence of \([-1,1]\), because the series given by \( x = \pm 1 \) is the alternating harmonic series.

31. The first three terms are \( 1 + 3x + \frac{9x^2}{2} \). The series is \( \sum_{k=0}^{\infty} \frac{(3x)^k}{k!} \).

32. The first three terms are \( 1 - (x - 1)^2 \). The series is \( \sum_{k=0}^{\infty}(-1)^k(x - 1)^k \).

33. The first three terms are \( -(x - \frac{\pi}{2}) + \frac{1}{6} (x - \frac{\pi}{2})^3 - \frac{1}{120} (x - \frac{\pi}{2})^5 \). The series is 
\[ \sum_{k=0}^{\infty} (-1)^{k+1} \frac{1}{(2k+1)!} (x - \frac{\pi}{2})^{2k+1}. \]

34. The first three terms are \( x + \frac{1}{2}x^2 + \frac{1}{3}x^3 \). The series is \( \sum_{k=1}^{\infty} \frac{x^k}{k!} \).

35. The first three terms are \( x - \frac{1}{3}x^3 + \frac{1}{5}x^5 \). The series is \( \sum_{k=1}^{\infty} \frac{2k+1}{(2k+1)!} (x - \frac{\pi}{2})^{2k+1} \).

36. The \( n^{th} \) derivative of \( f(x) = \sin(2x) \) is \( \pm 2^n \) times either \( \sin 2x \) or \( \cos 2x \). Evaluated at \(-\frac{\pi}{2}\), the even derivatives are therefore zero, and the \((2n+1)^{st}\) derivative is \( (-1)^{n+1}2^{2n+1} \). The Taylor series for \( \sin 2x \) around \( x = -\frac{\pi}{2} \) is thus 
\[ -2 \left( x + \frac{\pi}{2} \right) + \frac{2^3}{3!} \left( x + \frac{\pi}{2} \right)^3 - \frac{2^5}{5!} \left( x + \frac{\pi}{2} \right)^5 + \ldots, \]
and the general series is 
\[ \sum_{k=0}^{\infty} (-1)^{k+1} \frac{2^{2k+1}}{(2k+1)!} (x + \frac{\pi}{2})^{2k+1}. \]

37. Since the Taylor series centered at 0 for \((1 + x)^{-1}\) is 
\( 1 - x + x^2 - x^3 + \ldots = \sum_{k=0}^{\infty}(-1)^k x^k \), substitute \( 4x^2 \) for \( x \) to get 
\( (1 + 4x^2)^{-1} = 1 - 4x^2 + 16x^4 - 64x^6 + \ldots = \sum_{k=0}^{\infty} (-1)^k 4^k x^{2k} \).

38. \( f(0) = \frac{1}{4}, f'(x) = -\frac{2x}{(x^2+4)^2} \), so \( f'(0) = 0 \). \( f''(x) = \frac{6x^2 - 8}{(x^2+4)^3} \), so \( f''(0) = -\frac{1}{8} \). \( f'''(0) = 0 \), and \( f''''(0) = \frac{3}{8} \). 
The first three terms are \( \frac{1}{4} - \frac{x^2}{16} + \frac{x^4}{64} \). The series is given by \( \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{4^k} \).

39. From Table 10.5, the first three terms of this series are 
\[ f(x) = \left( \frac{1}{3} \right)^0 + \left( \frac{1}{3} \right)^1 x + \left( \frac{1}{3} \right)^2 x^2 + \ldots = 1 + \frac{1}{3} x - \frac{1}{9} x^2 + \ldots \]
40. From Table 10.5, the first three terms of this series are
\[ f(x) = \left( -\frac{1}{2} \right) + \left( \frac{-1}{2} \right)x + \left( \frac{-1}{2} \right)x^2 + \cdots = 1 - \frac{1}{2}x + \frac{3}{8}x^2 + \cdots. \]

41. From Table 10.5, the first three terms of this series are
\[ f(x) = \left( -\frac{3}{2} \right) + \left( \frac{-3}{2} \right)x + \left( \frac{-3}{2} \right)x^2 + \cdots = 1 - \frac{3}{2}x + \frac{3}{2}x^2 + \cdots. \]

42. From Table 10.5, the first three terms of this series are
\[ f(x) = \left( -\frac{5}{2} \right) + \left( \frac{-5}{2} \right)(2x) + \left( \frac{-5}{2} \right)(2x)^2 + \cdots = 1 - 10x + 60x^2 + \cdots. \]

43. \( R_n(x) = \frac{(-1)^{n+1}e^{-c}}{(n+1)!}x^{n+1} \) for some \( c \) between 0 and \( x \), and \( \lim_{n \to \infty} |R_n(x)| \leq e^{-|x|} \lim_{n \to \infty} \frac{|x|^{n+1}}{(n+1)!} = 0 \), because \( n! \) grows faster than \( |x|^n \) as \( n \to \infty \) for all \( x \).

44. \( R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!}x^{n+1} \) for some \( c \) between 0 and \( x \). Because all derivatives of \( \sin x \) are bounded in magnitude by 1, we have \( \lim_{n \to \infty} |R_n(x)| \leq \lim_{n \to \infty} \frac{|x|^{n+1}}{(n+1)!} = 0 \) because \( n! \) grows faster than \( |x|^n \) as \( n \to \infty \) for all \( x \).

45. \( R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!}x^{n+1} \) for some \( c \) in \( (-\frac{1}{2}, \frac{1}{2}) \). Now, \( |f^{(n+1)}(c)| = \frac{n!}{(1+c)^{n+1}} \), so \( \lim_{n \to \infty} |R_n(x)| \leq \lim_{n \to \infty} (2|x|)^{n+1} \).

46. \( R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!}x^{n+1} \) for some \( c \) in \( (-\frac{1}{2}, \frac{1}{2}) \). Now the \( (n+1) \)st derivative of \( \sqrt{1+x} \) is \( \pm \frac{1}{2^{n+1}(1+x)^{2n+1/2}} \), so for \( c \) in \( (-\frac{1}{2}, \frac{1}{2}) \), this is bounded in magnitude by \( \frac{1}{2^{n+1}(1/2)^{2n+1/2}} \), and thus

\[ \lim_{n \to \infty} |R_n(x)| = \lim_{n \to \infty} \frac{f^{(n+1)}(c)x^{n+1}}{(n+1)!} \leq \lim_{n \to \infty} \frac{1}{\sqrt{2}} \frac{1}{2^{n+1}} \frac{1}{(n+1)!} \]
\[ = \lim_{n \to \infty} \frac{1}{\sqrt{2}} \frac{1}{2} \frac{3}{4} \cdots \frac{2n-1}{2n} \frac{1}{2n+2} = 0 \]

for \( x \) in \( (-\frac{1}{2}, \frac{1}{2}) \).

47. The Taylor series for \( \cos x \) centered at 0 is
\[ \cos x = 1 - \frac{x^2}{2} + \frac{x^4}{24} - \frac{x^6}{720} + \cdots. \]

We compute that
\[ \frac{x^2/2 - 1 + \cos x}{x^4} = \frac{1}{x^4} \left( x^2/2 - 1 + \left( 1 - \frac{x^2}{2} + \frac{x^4}{24} - \frac{x^6}{720} + \cdots \right) \right) \]
\[ = \frac{1}{x^4} \left( x^2/2 - \frac{x^6}{720} + \cdots \right) = \frac{1}{24x^4} \frac{x^2}{2} + \cdots \]
so the limit of \( \frac{x^2/2 - 1 + \cos x}{x^4} \) as \( x \to 0 \) is \( \frac{1}{24} \).
48. The Taylor series for \( \sin x \) centered at 0 is
\[
\sin x = x - \frac{x^3}{6} + \frac{x^5}{120} - \frac{x^7}{5040} + \cdots
\]
and the Taylor series for \( \tan^{-1} x \) centered at 0 is
\[
\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots
\]
We compute that
\[
\frac{2 \sin x - \tan^{-1} x - x}{2x^5} = \frac{1}{2x^5} \left( 2 \left( x - \frac{x^3}{6} + \frac{x^5}{120} - \frac{x^7}{5040} + \cdots \right) - \left( x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots \right) - x \right)
\]
\[
= \frac{1}{2x^5} \left( 11x^5 - \frac{359x^7}{60} + \cdots \right) = -\frac{11}{120} + \frac{359x^2}{5040} - \cdots
\]
so the limit of \( \frac{2 \sin x - \tan^{-1} x - x}{2x^5} \) as \( x \to 0 \) is \( -\frac{11}{120} \).

49. The Taylor series for \( \ln(x - 3) \) centered at 4 is
\[
\ln(x - 3) = (x - 4) - \frac{1}{2}(x - 4)^2 + \frac{1}{3}(x - 4)^3 - \cdots
\]
We compute that
\[
\frac{\ln(x - 3)}{x^2 - 16} = \frac{1}{(x - 4)(x + 4)} \left( (x - 4) - \frac{1}{2}(x - 4)^2 + \frac{1}{3}(x - 4)^3 - \cdots \right)
\]
\[
= \frac{1}{(x - 4)(x + 4)} \left( (x - 4) \left( 1 - \frac{1}{2}(x - 4) + \frac{1}{3}(x - 4)^2 - \cdots \right) \right)
\]
\[
= \frac{1}{x + 4} \left( 1 - \frac{1}{2}(x - 4) + \frac{1}{3}(x - 4)^2 - \cdots \right)
\]
so the limit of \( \frac{\ln(x - 3)}{x^2 - 16} \) as \( x \to 4 \) is \( \frac{1}{8} \).

50. The Taylor series for \( \sqrt{1 + 2x} \) centered at 0 is
\[
\sqrt{1 + 2x} = 1 + x - \frac{x^2}{2} + \frac{x^3}{2} - \cdots
\]
We compute that
\[
\frac{\sqrt{1 + 2x} - 1 - x}{x^2} = \frac{1}{x^2} \left( \left( 1 + x - \frac{x^2}{2} + \frac{x^3}{2} - \cdots \right) - 1 - x \right)
\]
\[
= \frac{1}{x^2} \left( -\frac{x^2}{2} + \frac{x^3}{2} - \cdots \right) = -\frac{1}{2} + \frac{x}{2} - \cdots
\]
so the limit of \( \frac{\sqrt{1 + 2x} - 1 - x}{x^2} \) as \( x \to 0 \) is \( -\frac{1}{2} \).

51. The Taylor series for \( \sec x \) centered at 0 is
\[
\sec x = 1 + \frac{x^2}{2} + \frac{5x^4}{24} + \frac{61x^6}{720} + \cdots
\]
Copyright © 2014 Pearson Education, Inc.
and the Taylor series for \( \cos x \) centered at 0 is
\[
\cos x = 1 - \frac{x^2}{2} + \frac{x^4}{24} - \frac{x^6}{720} + \cdots.
\]

We compute that
\[
\frac{\sec x - \cos x - x^2}{x^4}
\]
\[
= \frac{1}{x^4} \left( \left( 1 + \frac{x^2}{2} + \frac{5x^4}{24} + \frac{61x^6}{720} + \cdots \right) - \left( 1 - \frac{x^2}{2} + \frac{x^4}{24} - \frac{x^6}{720} + \cdots \right) - x^2 \right)
\]
\[
= \frac{1}{x^4} \left( \frac{x^4}{6} + \frac{31x^6}{360} + \cdots \right) = \frac{1}{6} + \frac{31x^2}{360} + \cdots
\]
so the limit of \( \frac{\sec x - \cos x - x^2}{x^4} \) as \( x \to 0 \) is \( \frac{1}{6} \).

52. The Taylor series for \( (1 + x)^{-\frac{1}{2}} \) centered at 0 is
\[
(1 + x)^{-\frac{1}{2}} = 1 - 2x + 3x^2 - 4x^3 + \cdots
\]
and the Taylor series for \( \sqrt{1-6x} \) centered at 0 is
\[
\sqrt{1-6x} = 1 - 2x - 4x^2 - \frac{40x^3}{3} - \cdots.
\]

We compute that
\[
\frac{(1 + x)^{-\frac{1}{2}} - \sqrt{1-6x}}{2x^2}
\]
\[
= \frac{1}{2x^2} \left( \left( 1 - 2x + 3x^2 - 4x^3 + \cdots \right) - \left( 1 - 2x - 4x^2 - \frac{40x^3}{3} - \cdots \right) \right)
\]
\[
= \frac{1}{2x^2} \left( 7x^2 + \frac{28x^3}{3} + \cdots \right) = \frac{7}{2} + \frac{14x}{3} + \cdots
\]
so the limit of \( \frac{(1 + x)^{-\frac{1}{2}} - \sqrt{1-6x}}{2x^2} \) as \( x \to 0 \) is \( \frac{7}{2} \).

53. We have \( e^{-x^2} = 1 - x^2 + \frac{x^4}{2} - \frac{x^6}{6} + \frac{x^8}{24} - \cdots \), so
\[
\int e^{-x^2} \, dx = \int \left( 1 - x^2 + \frac{x^4}{2} - \frac{x^6}{6} + \frac{x^8}{24} - \cdots \right) \, dx = C + x - \frac{x^3}{3} + \frac{x^5}{10} - \frac{x^7}{42} + \cdots.
\]

Thus,
\[
\int_{0}^{1/\sqrt{2}} e^{-x^2} \, dx = 0.5 - \frac{0.5^3}{3} + \frac{0.5^5}{10} - \frac{0.5^7}{42} + \cdots.
\]
Because \( \frac{0.5^7}{42} < 0.001 \), we can calculate the approximation using the first three numbers shown, arriving at approximately 0.461.

54. \( \tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \frac{x^9}{9} - \cdots \), so
\[
\int \tan^{-1} x \, dx = \int \left( x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \frac{x^9}{9} - \cdots \right) \, dx = C + \frac{x^2}{2} - \frac{x^4}{12} + \frac{x^6}{30} - \frac{x^8}{56} + \cdots.
\]

Thus,
\[
\int_{0}^{0.5} \tan^{-1} x \, dx = \frac{0.5^2}{2} - \frac{0.5^4}{12} + \frac{0.5^6}{30} - \frac{0.5^8}{56} + \cdots.
\]
Note that this series is alternating, and \( \frac{0.5^6}{30} < 0.001 \), so we add the first two terms showing to approximate the integral to the desired accuracy. Calculating gives approximately 0.120.
55. \(x \cos x = x - \frac{x^3}{2} + \frac{x^5}{24} - \frac{x^7}{720} + \cdots\), so

\[
\int x \cos x \, dx = \int \left(x - \frac{x^3}{2} + \frac{x^5}{24} - \frac{x^7}{720} + \cdots\right) \, dx = \frac{x^2}{2} - \frac{x^4}{8} + \frac{x^6}{144} - \frac{x^8}{5760} + \frac{x^{10}}{403200} - \cdots.
\]

Thus

\[
\int_0^1 x \cos x \, dx = \frac{1}{2} - \frac{1}{8} + \frac{1}{144} - \frac{1}{5760} + \cdots.
\]

Because \(\frac{1}{5760} < 0.001\), we add the first three terms to approximate to the desired accuracy. Calculating gives \(\int_0^1 x \cos x \, dx \approx 0.382\).

56. \(x^2 \tan^{-1} x = x^3 - \frac{x^5}{3} + \frac{x^7}{5} - \frac{x^9}{7} + \frac{x^{11}}{9} + \cdots\), so

\[
\int x^2 \tan^{-1} x \, dx = \int \left(x^3 - \frac{x^5}{3} + \frac{x^7}{5} - \frac{x^9}{7} + \frac{x^{11}}{9} - \cdots\right) \, dx = C + \frac{x^4}{4} - \frac{x^6}{18} + \frac{x^8}{40} - \frac{x^{10}}{70} + \cdots.
\]

Thus,

\[
\int_0^{0.5} x^2 \tan^{-1} x \, dx = \frac{0.5^4}{4} - \frac{0.5^6}{18} + \frac{0.5^8}{40} - \frac{0.5^{10}}{70} + \cdots.
\]

Note that this series is alternating, and \(\frac{0.5^6}{18} < 0.001\), so we use the first term showing to approximate the integral to the desired accuracy. Calculating gives approximately 0.015.

57. The series for \(f(x) = \sqrt{x}\) centered at \(a = 121\) is \(11 + \frac{x-121}{22} - \frac{(x-121)^2}{10648} + \frac{(x-121)^3}{2576816} + \cdots\). Letting \(x = 119\) gives \(\sqrt{119} \approx 11 - \frac{1}{11} - \frac{1}{221}r^2 - \frac{1}{11761}r^4\).

58. Because \(20^\circ\) corresponds to \(\frac{\pi}{9}\) radians, we consider the series for \(\sin x\) centered at 0. We have \(\sin x = x - \frac{x^3}{6} + \frac{x^5}{120} - \frac{x^7}{5040} + \cdots\), so \(\sin \frac{\pi}{9} \approx \frac{\pi}{9} - \frac{(\pi/9)^3}{3!} + \frac{(\pi/9)^5}{5!} - \frac{(\pi/9)^7}{7!}\).

59. \(\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \frac{x^9}{9} + \cdots\), so \(\tan^{-1} \left(-\frac{1}{4}\right) \approx \frac{1}{x} - \frac{1}{3x^3} - \frac{1}{5x^5} + \frac{1}{7x^7}\).

60. The first four nonzero terms of the Taylor series centered at 64 for \(x^{1/3}\) are

\[p_3(x) = 4 + \frac{1}{48} (x-64) - \frac{1}{9216} (x-64)^2 + \frac{5}{5308416} (x-64)^3.\]

Thus

\[p_3(69) = 4 + \frac{1}{48} \cdot 5 - \frac{1}{9216} \cdot 25 + \frac{5}{5308416} \cdot 125.\]

61. Because \(y(0) = 4\), we have \(y'(0) = 0\) and \(y''(0) = 0\), so \(y'(0) = 4\). Differentiating the equation \(n - 1\) times and evaluating at 0 we obtain \(y^{(n)}(0) = 4y^{(n-1)}(0)\), so that \(y^{(n)}(0) = 4^n\). The Taylor series for \(y(x)\) is thus \(y(x) = 4 + 4x + \frac{4^2 x^2}{2!} + \frac{4^3 x^3}{3!} + \cdots\), or \(y(x) = 3 + e^{4x}\).

62. We begin with \(e^{-102x^2} = 1 - 102x^2 + \frac{102^2 x^4}{2!} + \cdots\). For \(n = 2\), we have \(11.4 \int_0^{0.14} (1 - 102x^2) \, dx = 11.4(x - 34x^3)\big|_0^{0.14} \approx 0.532\). For \(n = 3\), \(11.4 \int_0^{0.14} (1 - 102x^2 + 5202x^4) \, dx = 11.4(x - 34x^3 + 1040.4x^5)\big|_0^{0.14} \approx 1.170\). Clearly the second estimate is too high, because the true probability cannot exceed 1. The true value is approximately 0.955.

63. a. The Taylor series for \(\ln(1 + x)\) is \(\sum_{k=1}^{\infty} \frac{(-1)^{k+1} x^k}{k}\). Evaluating at \(x = 1\) gives \(\ln 2 = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k}\).

b. The Taylor series for \(\ln(1 - x)\) is \(-\sum_{k=1}^{\infty} \frac{x^k}{k}\). Evaluating at \(x = \frac{1}{2}\) gives \(\ln \frac{1}{2} = -\sum_{k=1}^{\infty} \frac{1}{k2^k}\), so that \(\ln 2 = \sum_{k=1}^{\infty} \frac{1}{k2^k}\).
c. \( f(x) = \ln \left( \frac{1+x}{1-x} \right) = \ln(1+x) - \ln(1-x) \). Using the two Taylor series above we get
\[
f(x) = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{x^k}{k} - \left( -\sum_{k=1}^{\infty} \frac{x^k}{k} \right) = \sum_{k=1}^{\infty} (1 + (-1)^{k+1}) \frac{x^k}{k} = 2 \sum_{k=0}^{\infty} \frac{x^{2k+1}}{2k+1}.
\]
d. Because \( \frac{1+x}{1-x} = 2 \) when \( x = \frac{1}{3} \), the resulting infinite series for \( \ln 2 \) is \( 2 \sum_{k=0}^{\infty} \frac{1}{3^{k+1}(2k+1)} \).
e. The first four terms of each series are:
\[
1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} \approx 0.583, \quad \frac{1}{2} + \frac{1}{8} + \frac{1}{24} + \frac{1}{64} \approx 0.682, \quad \frac{2}{3} + \frac{2}{81} + \frac{2}{1215} + \frac{2}{15309} \approx 0.693.
\]
The true value is \( \ln 2 \approx 0.693 \). The third series converges the fastest, because it has \( 3^{k+1} \) in the denominator as opposed to \( 2^k \), so its terms get small faster.

64.

a. \( p_3(x) = 1 - 4x + 10x^2 - 20x^3 \).

b.

c. The constant polynomial looks like \( f(x) \) only at 0. The linear polynomial looks like \( f(x) \) on about \((-0.1, 0.1)\). The quadratic approximation looks like \( f(x) \) on about \((-0.1, 0.1)\) as well, and the cubic approximation looks like \( f(x) \) on about \((-0.2, 0.2)\).

AP Practice Questions

Multiple Choice

1. The correct answer is E. The third-order Taylor polynomial centered at 2 is
\[
p_3(x) = f(2) + f'(2)(x - 2) + \frac{f''(2)}{2!}(x - 2)^2 + \frac{f'''(2)}{3!}(x - 2)^3 = (x - 2) - (x - 2)^2 + \frac{2}{3}(x - 2)^3.
\]

2. The correct answer is D. Substituting \(-3x \) for \( x \) in \( f(x) \) gives \( (1 - (-3x))^{-1} = (1 + 3x)^{-1} \), so substitute \(-3x \) for \( x \) in the given Taylor polynomial to get
\[
p_n(x) = \sum_{k=0}^{n} (-3x)^k.
\]

3. The correct answer is C. We have \( f(\pi) = f^{(4)}(\pi) = \sin \pi = 0, f'(\pi) = f^{(5)}(\pi) = \cos \pi = -1, f''(\pi) = -\sin \pi = 0, \) and \( f'''(\pi) = -\cos \pi = 1 \), so the Taylor polynomial is
\[
0 - (x - \pi) + \frac{0}{2!}(x - \pi)^2 + \frac{1}{3!}(x - \pi)^3 - \frac{0}{4!}(x - \pi)^4 - \frac{1}{5!}(x - \pi)^5 = -(x - \pi) + \frac{1}{6}(x - \pi)^3 - \frac{1}{120}(x - \pi)^5.
\]
4. The correct answer is A. Using the Ratio test we have
\[
\lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \frac{(3x)^{2k+2}}{(k+1)!} \cdot \frac{k!}{(3x)^{2k}} = \lim_{k \to \infty} \frac{9x^2}{k+1} = 0.
\]
Thus the series converges for \(-\infty < x < \infty\).

5. The correct answer is B. Using the Ratio test we have
\[
\lim_{k \to \infty} \frac{a_{k+1}}{a_k} = \lim_{k \to \infty} \frac{(3x)^{2k+2}}{(k+1)!} \cdot \frac{k!}{(3x)^{2k}} = \frac{9x^2}{k+1} \lim_{k \to \infty} \frac{k}{k+1} = 9x^2.
\]
Thus the series converges when \(9x^2 < 1\), or \(|x| < \frac{1}{3}\). At the endpoints, substituting either \(x = \frac{1}{3}\) or \(x = -\frac{1}{3}\) gives the harmonic series, so the series diverges at both endpoints. Thus the interval of convergence is \(-\frac{1}{3} < x < \frac{1}{3}\).

6. The correct answer is B. The first three nonzero terms of the Maclaurin series for \(\cos x\) are
\[
1 - \frac{1}{2}x^2 + \frac{1}{24}x^4.
\]
Substituting \(2x^3\) for \(x\) in the third term gives
\[
\frac{1}{24}(2x^3)^4 = \frac{2}{3}x^{12}.
\]

7. The correct answer is D. The Maclaurin series is
\[
f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3 + \cdots = 1 - 2x + 2x^2 - \frac{4}{3}x^3 + \cdots.
\]

8. The correct answer is B. The third term of the Maclaurin series is
\[
\frac{f^{(3)}(0)}{3!}x^3 = -8x^3,
\]
so that \(f^{(3)}(0) = 3! \cdot (-8) = -48\).

9. The correct answer is C, all three statements are true. Since \(f\) has an inflection point at \(a\), we know that \(f''(a) = 0\). But then
\[
p_2(x) = f(a) + f'(a)(x-a) + \frac{f''(a)}{2!}(x-a)^2 = f(a) + f'(a)(x-a),
\]
so that \(p_2(x)\) is linear, and it is equal to \(p_1(x) = f(a) + f'(a)(x-a)\). Thus the other two statements are true as well.

10. The correct answer is D. The Taylor series for \(e^{-x}\) is found by substituting \(-x\) for \(x\) in the Taylor series for \(e^x\) to get
\[
\sum_{k=0}^{\infty} \frac{(-1)^k}{k!} x^k,
\]
so that
\[
f(0.3) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} \cdot 0.3^k.
\]
This is an alternating series, so to approximate \(f(0.3)\) with an error no greater than \(10^{-3}\), we must find the first \(k\) such that \(\frac{0.3^{k+1}}{(k+1)!} < 10^{-3}\). With \(k = 2\) we get \(4.5 \times 10^{-3}\), while with \(k = 3\) we get \(\approx 3.4 \times 10^{-4}\), so we must sum four terms of the series, up through \(k = 3\).

11. The correct answer is A. Substitute \(\frac{1}{2}\) for \(x\) in the first three terms of the Taylor series for \(e^x\) centered at 0 to get
\[
1 + \frac{1}{2} + \frac{1}{2!} \left(\frac{1}{2}\right)^2 = \frac{13}{8} = 1.625.
\]
Free Response

1. 
a. Since \( f'(x) = -\frac{1}{2} \sin \frac{x}{2}, \ f''(x) = -\frac{1}{4} \cos \frac{x}{2}, \ f'''(x) = \frac{1}{8} \sin \frac{x}{2}, \) and \( f^{(4)}(x) = \frac{1}{16} \cos \frac{x}{2}, \) we have

\[
p_4(x) = f(0) + f'(0)x + \frac{f''(0)}{2!} x^2 + \frac{f'''(0)}{3!} x^3 + \frac{f^{(4)}(0)}{4!} x^4 = 1 - \frac{1}{8} x^2 + \frac{1}{384} x^4
\]

\[
q_4(x) = f(\pi) + f'(\pi)(x-\pi) + \frac{f''(\pi)}{2!} (x-\pi)^2 + \frac{f'''(\pi)}{3!} (x-\pi)^3 + \frac{f^{(4)}(\pi)}{4!} (x-\pi)^4
\]

\[= -\frac{1}{2} (x-\pi) + \frac{1}{48} (x-\pi)^3.\]

b. Evaluating the two gives

\[
p_4 \left( \frac{\pi}{2} \right) = 1 - \frac{1}{8} \cdot \frac{\pi^2}{4} + \frac{1}{384} \cdot \frac{\pi^4}{16} \approx 0.707429
\]

\[
q_4 \left( \frac{\pi}{2} \right) = -\frac{1}{2} \left( \frac{\pi}{2} - \pi \right) + \frac{1}{48} \left( \frac{\pi}{2} - \pi \right)^3 \approx 0.704653.
\]

The true value is \( f \left( \frac{\pi}{2} \right) = \cos \frac{\pi}{4} = \frac{\sqrt{2}}{2} \approx 0.707107, \) so the absolute error in \( p_4 \) is \( 3.2 \times 10^{-4} \) and the absolute error in \( q_4 \) is \( 2.5 \times 10^{-3} \). Thus \( p_4 \) is the better approximation. The reason that this is so is that the error in the approximation due to \( p_4 \) is dependent on the magnitude of the next nonzero derivative at 0, which is the sixth derivative, while the error in the approximation due to \( q_4 \) is dependent on the magnitude of the next nonzero derivative at \( \pi \), which is the fifth derivative. Since the magnitude of the derivatives decreases as the number of derivatives increases, we get a tighter error bound on \( p_4 \) than on \( q_4 \).

c. Note that \( f^{(n)}(x) = \pm \frac{1}{\pi^n} \) times either \( \sin \frac{x}{2} \) or \( \cos \frac{x}{2}, \) so that it is bounded by \( \frac{1}{\pi^n} \) in magnitude. So at \( x = 2, \) the error is bounded by

\[
R_n(2) \leq \frac{1}{2^n} \cdot (2-0)^n = \frac{1}{(n+1)!}.
\]

d. With \( n = 4, \) the bound in part (c) becomes

\[
R_4(2) \leq \frac{1}{5!} = \frac{1}{120}.
\]

2. 
a. Substitute \( x^2 \) for \( x \) in the given series to get

\[
g(x) = \frac{1}{1-x^2} = \sum_{k=0}^{\infty} (x^2)^k = \sum_{k=0}^{\infty} x^{2k}.
\]

b. Using the Ratio test (or using Theorem 10.5) we get

\[
\lim_{k \to \infty} \frac{x^{2(k+1)}}{x^{2k}} = \lim_{k \to \infty} x^2 = x^2,
\]

so that the series converges on \((-1, 1)\). At both endpoints, the series diverges by the Divergence test (both series are \( \sum_{k=0}^{\infty} 1 \)). Thus the Taylor series for \( g(x) \) converges for \(-1 < x < 1\).

c. Integrating term by term gives

\[
h(x) = \int_0^x g(t) \, dt = \sum_{k=0}^{\infty} \int_0^x t^{2k} \, dt = \sum_{k=0}^{\infty} \left. \left( \frac{1}{2k+1} t^{2k+1} \right) \right|_0^x = \sum_{k=0}^{\infty} \frac{x^{2k+1}}{2k+1}.
\]

Thus the first three nonzero terms of the power series for \( h(x) \) are \( x + \frac{x^3}{3} + \frac{x^5}{5} \).
3. 
   a. Substitute $2x$ for $x$ in the Taylor series for $\ln(1 + x)$ centered at 0 to get 
      \[ 2x - \frac{(2x)^2}{2} + \frac{(2x)^3}{3} + \cdots = 2x - 2x^2 + \frac{8}{3}x^3 + \cdots. \]
   b. Substitute $2x$ for $x$ in the general formula for the Taylor series of $\ln(1 + x)$ centered at 0:
      \[ \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} (2x)^k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}2^k}{k} x^k. \]
      Thus the $n^{\text{th}}$ term is $\frac{(-1)^{n+1}2^n}{n} x^n$.
   c. Substitute 0.2 for $x$ in the above series to get the following series for $f(0.2)$:
      \[ \sum_{k=1}^{\infty} \frac{(-1)^{k+1}2^k}{k} \cdot 0.2^k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}0.4^k}{k}. \]
      This is an alternating series, so to approximate it to within $\frac{1}{200} = 5 \times 10^{-3}$, we need to sum $n$ terms of the series, where $n$ is such that the $n + 1^{\text{st}}$ term is less than $\frac{1}{200}$; that is, we must use at least $n$ terms of the series, where $n$ satisfies the inequality
      \[ \frac{0.4^{n+1}}{n + 1} < \frac{1}{200}. \]

4. 
   a. Clearly the series converges for $x = -2$, since all the terms are zero. For $x > -2$, this is an alternating series, so it converges if the terms go to zero. But the terms are $\frac{(x+2)^k}{k^2}$, and if $x + 2 > 1$ then the exponential in the numerator grows faster than the quadratic in the denominator and the terms do not go to zero. If $x + 2 \leq 1$ then the exponential in the numerator stays between 0 and 1, so that the terms are dominated by $\frac{1}{k^2}$ and thus go to zero. So for $x > -2$, the series converges for $x + 2 \leq 1$, or $x \leq -1$. If on the other hand $x < -2$, then this is not an alternating series, but rather is the series
      \[ \sum_{k=1}^{\infty} \frac{(-1)^k (x + 2)^k}{k^2} = \sum_{k=1}^{\infty} \frac{(-1)^k \cdot (-1)^k |x + 2|^k}{k^2} = \sum_{k=1}^{\infty} \frac{|x + 2|^k}{k^2}, \]
      since $x + 2 < 0$. Using the Ratio test, we get
      \[ \lim_{k \to \infty} \frac{|x + 2|^{k+1}}{(k+1)^2} \cdot \frac{k^2}{|x + 2|^k} = |2 + x| \lim_{k \to \infty} \frac{k^2}{(k+1)^2} = |2 + x|, \]
      so the series converges when $|2 + x| < 1$, or (since we are assuming $x < -2$) $-3 < x < -2$. Checking the endpoint at $x = -3$ we get the series $\sum_{k=1}^{\infty} \frac{1}{k^2}$, which converges. Thus the original series converges for $-3 \leq x \leq -1$.
   b. We have
      \[ g(-1) = \sum_{k=1}^{\infty} \frac{(-1)^k}{k^2}, \]
      so if we use 10 terms, the error is bounded by the magnitude of the eleventh term, which is
      \[ \frac{1}{11^2} < \frac{1}{10^2} = \frac{1}{100}. \]
c. We have

\[ g(-3) = \sum_{k=1}^{\infty} \frac{(-1)^k(-3+2)^k}{k^2} = \sum_{k=1}^{\infty} \frac{1}{k^2} = \frac{\pi^2}{6} \]

\[ g(-2) = \sum_{k=1}^{\infty} \frac{(-1)^k(-2+2)^k}{k^2} = 0 \]

\[ g(-1) = \sum_{k=1}^{\infty} \frac{(-1)^k(-1+2)^k}{k^2} = \sum_{k=1}^{\infty} \frac{(-1)^k}{k^2}. \]

Now, \( g(-1) \) is an alternating series with decreasing terms, and the first term is negative, so its sum is also negative. To see this, approximate the sum by its first term, which is negative. The error in that approximation is bounded in magnitude by the size of the next term, so the sum must be negative. Thus \( g(-1) < g(-2) < g(-3) \).

5.

a, b. Substitute \( x^2 \) for \( x \) in the Maclaurin series for \( \sin x \) to get

\[ \sin x^2 = \sum_{k=0}^{\infty} (-1)^k \frac{1}{(2k+1)!} (x^2)^{2k+1} = \sum_{k=0}^{\infty} (-1)^k \frac{1}{(2k+1)!} x^{4k+2} = x^2 - \frac{1}{6} x^6 + \frac{1}{120} x^{10} - \ldots. \]

c. We have

\[ \int_0^1 \sin x^2 \, dx \approx \int_0^1 \left( x^2 - \frac{1}{6} x^6 + \frac{1}{120} x^{10} - \ldots \right) \, dx = \left( \frac{x^3}{3} - \frac{x^7}{7} + \frac{x^{11}}{1320} \right) \bigg|_0^1. \]

Using the first two terms gives

\[ \frac{1}{3} - \frac{1}{42} = \frac{13}{42} \approx 0.310, \]

and the error is bounded by the third term, which is \( \frac{1}{1320} < \frac{1}{1000} \) since the Maclaurin series for \( \sin x^2 \) is an alternating series.

d. Using the series from part (a), we have

\[ \lim_{x \to 0} \frac{x^6}{x^2 - \sin x^2} = \lim_{x \to 0} \frac{x^6}{x^2 - \left( x^2 - \frac{1}{6} x^6 + \frac{1}{120} x^{10} - \ldots \right)} \]

\[ = \lim_{x \to 0} \frac{x^6}{\frac{1}{6} x^6 - \frac{1}{120} x^{10} + \ldots} = \lim_{x \to 0} \frac{1}{\frac{1}{6} - \frac{1}{120} x^4 + \ldots} = 6. \]

6.

a. Compute \( f'(x) \) by differentiating the power series term by term to get

\[ f'(x) = \sum_{k=1}^{\infty} \frac{k \cdot kx^{k-1}}{k!} = \sum_{k=1}^{\infty} \frac{kx^{k-1}}{(k-1)!} = \sum_{k=0}^{\infty} \frac{(k+1)x^k}{k!}. \]

Then \( f'(0) \) is the term in the power series where \( k = 0 \), since the other terms vanish at \( x = 0 \). This term is \( \frac{1}{0!} = 1 \). Since \( f'(0) \neq 0 \), we see that \( f \) has neither a minimum nor a maximum at \( x = 0 \).

b. To compute \( f^{(10)}(0) \) we differentiate the series 10 times and evaluate at 0. Evaluating the power series at \( x = 0 \) means considering only the constant term of the power series. Now, after 10 differentiations, terms in the series for \( f(x) \) where \( k < 10 \) vanish. For \( k > 10 \), differentiating \( x^k \) ten times results in a positive power of \( x \), so those terms vanish at 0. Finally, the \( k = 10 \) term is \( \frac{10^{10} 10^{10}}{10!} \); differentiating 10 times gives \( \frac{10^{10} 10^{10}}{10!} = 10. \) Thus \( f^{(10)}(0) = 10 \) (see also Exercises 71-74 in Section 10.4).

c. From part (a), it is clear that \( f'(x) > 0 \) for \( x \geq 0 \), so that \( f \) is increasing on \([0, \infty)\).
d. \( f^{(5)}(x) = e^x(x + 5) \) is increasing on \([0, 1]\), so it achieves its maximum of \(6e\) at \(x = 1\). Then by the Lagrange error bound, the error in the approximation at \(x = 1\) using the first four terms is bounded in magnitude by

\[
|R_4(1)| \leq 6e \frac{(1 - 0)^5}{5!} = \frac{e}{20} \approx 0.136 > \frac{1}{100}.
\]

We cannot conclude that this approximation is correct to within \(\frac{1}{100}\).
Chapter 11

Parametric and Polar Curves

11.1 Parametric Equations

11.1.1 Plotting \{(f(t), g(t)) : a \leq t \leq b\} generates a curve in the \(xy\)-plane.

11.1.2 \(x = 6 \cos t\) and \(y = 6 \sin t\) for \(0 \leq t \leq 2\pi\) generates the circle, because \(x^2 + y^2 = 36 \cos^2 t + 36 \sin^2 t = 36\). Similarly, \(x = 6 \sin t\) and \(y = 6 \cos t\) for \(0 \leq t \leq 2\pi\) generates the same curve.

11.1.3 Let \(x = R \cos \frac{\pi t}{5}\) and \(y = -R \sin \frac{\pi t}{5}\). Note that as \(t\) ranges from 0 to 10, \(\frac{\pi t}{5}\) ranges from 0 to 2\(\pi\). Because \(x^2 + y^2 = R^2\), this curve represents a circle of radius \(R\). Finally, the orientation is clockwise because of the minus sign on \(y\).

11.1.4 Let \(x = t\) and \(y = -2t + 5\) for \(t \in (-\infty, \infty)\).

11.1.5 Let \(x = t\) and \(y = t^2\) for \(t \in (-\infty, \infty)\).

11.1.6 The former represents the part of the parabola \(y = x^2\) lying in the first quadrant. The latter represents the part of that same parabola lying in the second quadrant.

11.1.7 Solving the first equation for \(t\) gives \(t = \frac{1-x}{2}\). Substitute that value for \(t\) in the second equation to get \(y = 3 \left(1-x^2\right)^2\); simplifying gives \(y = \frac{3}{4}x^2 - \frac{3}{2}x + \frac{3}{4}\).

11.1.8 The initial point of the curve is \((-2 \sin 0, 4 \cos 0) = (0, 4)\). As \(t\) increases from 0, the \(x\) coordinate becomes negative, while the \(y\) coordinate decreases. Thus this curve is generated counterclockwise, running successively through \((0, 4)\), then \((-2, 0)\) for \(t = \frac{\pi}{2}\), then \((0, -4)\) for \(t = \pi\), then \((2, 0)\) for \(t = \frac{3\pi}{2}\), and finally back to \((0, 4)\) for \(t = 2\pi\).

b.

![Graph](image)

c. Solving $x = -t + 6$ for $t$ yields $t = 6 - x$, so $y = 3t - 3 = 18 - 3x - 3 = 15 - 3x$.

d. The curve is the line segment from $(11, -18)$ to $(1, 12)$.
11.1.12

a. | $t$ | $x$ | $y$ |
---|---|---|---|
-3 | -28 | -14 |
-2 | -9 | -9 |
-1 | -2 | -4 |
0 | -1 | 1 |
1 | 0 | 6 |
2 | 7 | 11 |
3 | 26 | 16 |

b. [Graph](#)

c. Because $t = \sqrt[3]{x + 1}$, we have $y = 5\sqrt[3]{x + 1} + 1$.

d. The curve is a shifted and scaled version of the cube root function.

11.1.13

a. Solving $x = \sqrt{t} + 4$ for $t$ yields $t = (x - 4)^2$. Thus, $y = 3\sqrt{t} = 3(x - 4)$, where $x$ ranges from 4 to 8. Note that all $t \geq 0$, $x > 0$, and $y > 0$.

b. The curve is the line segment from (4, 0) to (8, 12).

11.1.14

a. Solving $y = t + 2$ for $t$ yields $t = y - 2$. Thus, $x = (t + 1)^2 = (y - 2 + 1)^2 = (y - 1)^2$, where $-8 \leq y \leq 12$.

b. The curve is the part of the parabola $x = (y - 1)^2$ from $(81, -8)$ to $(121, 12)$.

11.1.15

a. Because $\cos^2 t + \sin^2 t = 1$, we have $x^2 + y = 1$, so $y = 1 - x^2$, $-1 \leq x \leq 1$.

b. This is a parabola opening downward with a vertex at $(0, 1)$, and starting at $(1, 0)$ and ending at $(-1, 0)$.

11.1.16

a. Note that $(1 - \sin^2 s) - \cos^2 s = 0$, so $x - y^2 = 0$, so $x = y^2$, $-1 \leq y \leq 1$.

b. This is a parabola opening to the right with a vertex at $(0, 0)$, starting at $(1, -1)$ and ending at $(1, 1)$.

11.1.17

a. Solving $x = r - 1$ for $r$ yields $r = x + 1$. Thus, $y = r^3 = (x + 1)^3$, where $-5 \leq x \leq 3$.

b. The curve is the part of the standard cubic curve, shifted one unit to the left, from $(-5, -64)$ to $(3, 64)$.

11.1.18

a. Solving $x = e^{2t}$ for $t$ yields $t = \ln \sqrt{x}$. Thus, $y = e^t + 1 = \sqrt{x} + 1$, where $1 \leq x \leq e^{50}$.

b. The curve is the part of the standard square root function, shifted one unit vertically, from the point $(1, 2)$ to $(e^{50}, e^{25} + 1)$.

11.1.19 Note that $x^2 + y^2 = 9\cos^2 t + 9\sin^2 t = 9$, so this represents an arc of the circle of radius 3 centered at the origin from $(-3, 0)$ to $(3, 0)$ traversed counterclockwise.

11.1.20 Note that $x^2 + y^2 = 9\cos^2 t + 9\sin^2 t = 9$, so this represents an arc of the circle of radius 3 centered at the origin from $(3, 0)$ to $(0, 3)$ traversed counterclockwise.
11.1.21 Note that $x^2 + (y - 1)^2 = \cos^2 t + \sin^2 t = 1$, so we have a circle of radius 1 centered at (0, 1), traversed counterclockwise starting at (1, 1).

11.1.22 Note that $(x + 3)^2 + (y - 5)^2 = 4$. This is a circle of radius 2 centered at (-3, 5) and traversed clockwise starting at (-3, 7).

11.1.23 Note that $x^2 + y^2 = 49 \cos^2 2t + 49 \sin^2 2t = 49$, so this represents the circle of radius 7 centered at the origin from (-7, 0) to (-7, 0) traversed counterclockwise.

11.1.24 Note that $(x - 1)^2 + (y - 2)^2 = 9 \sin^2 4\pi t + 9 \cos^2 4\pi t = 9$, so this represents the circle of radius 3 centered at (1, 2) from (1, 5) to (1, 5) traversed counterclockwise.

11.1.25

Let $x = 4 \cos t$ and $y = 4 \sin t$ for $0 \leq t \leq 2\pi$. Then $x^2 + y^2 = 16 \cos^2 t + 16 \sin^2 t = 16$.

11.1.26

Let $x = 12 \sin t$ and $y = 12 \cos t$ for $0 \leq t \leq 2\pi$. Then $x^2 + y^2 = 144 \cos^2 t + 144 \sin^2 t = 144$, and for $t = 0$ the value of $(x, y)$ is (0, 12).
11.1.27

Let $x = \cos t + 2$ and $y = \sin t + 3$ for $0 \leq t \leq 2\pi$. Then $(x-2)^2 + (y-3)^2 = 1$, which is a circle with the desired center and radius and orientation.

11.1.28

Let $x = 3\sin t + 2$ and $y = 3\cos t$ for $0 \leq t \leq 2\pi$. Then $(x-2)^2 + y^2 = 9$, which is a circle with the desired center and radius and orientation.

11.1.29

Let $x = -2 + 8\sin t$ and $y = -3 + 8\cos t$ for $0 \leq t \leq 2\pi$. Then $(x+2)^2 + (y+3)^2 = 64\sin^2 t + 64\cos^2 t = 64$. 

Copyright © 2014 Pearson Education, Inc.
11.1.30

Let \( x = 2 - \frac{3}{2} \cos t \) and \( y = -4 - \frac{3}{2} \sin t \) for \( \pi \leq t \leq 3\pi \). Then \( (x - 2)^2 + (y + 4)^2 = \frac{9}{4} \). Note that for \( t = \pi \), we have \( x = \frac{7}{2} \) and \( y = -4 \).

11.1.31 Let \( t \) be time in minutes, so \( 0 \leq t \leq 1.5 \). Let \( x = 400 \cos \frac{4\pi}{3} t \) and \( y = 400 \sin \frac{4\pi}{3} t \). Then because \( x^2 + y^2 = 400^2 \), the path is a circle of radius 400. Note that the values of \( x \) and \( y \) are the same at \( t = 0 \) and \( t = 1.5 \), and that the circle is traversed counterclockwise.

11.1.32 Let \( t \) be time in seconds, so \( 0 \leq t \leq 60 \). Let \( x = 15 \sin \frac{\pi}{30} t \) and \( y = 15 \cos \frac{\pi}{30} t \). Then because \( x^2 + y^2 = 15^2 \), the path is a circle of radius 15. Note that the values of \( x \) and \( y \) are the same at \( t = 0 \) and \( t = 60 \), and that the circle is traversed clockwise.

11.1.33 Let \( t \) be time in seconds, so \( 0 \leq t \leq 24 \). Let \( x = 50 \cos \frac{\pi}{12} t \) and \( y = 50 \sin \frac{\pi}{12} t \). Then because \( x^2 + y^2 = 50^2 \), the path is a circle of radius 50. Note that the values of \( x \) and \( y \) are the same at \( t = 0 \) and \( t = 24 \), and that the circle is traversed counterclockwise.

11.1.34 Let \( t \) be time in minutes, so \( 0 \leq t \leq 3 \). Because the low point is the origin, the circle we seek has its center at \((0, 20)\) and a radius of 20. Let \( x = -20 \sin \frac{\pi}{12} t \) and \( y = 20 - 20 \cos \frac{\pi}{12} t \). Then because \( x^2 + (y - 20)^2 = 20^2 \), the path is a circle of radius 20. Note that the values of \( x \) and \( y \) are the same for \( t = 0 \) and \( t = 3 \).

11.1.35

Because \( t = x - 3 \), we have \( y = 1 - (x - 3) = 4 - x \), so the line has slope \(-1\). When \( t = 0 \), we have the point \((3, 1)\).
11.1.36

Because $t = \frac{4 - x}{3}$, we have $y = -2 + 6(\frac{4 - x}{3}) = 6 - 2x$, so the line has slope $-2$. When $t = 0$, we have the point $(4, -2)$.

11.1.37

Because $y = 1$, this is a horizontal line with slope 0. When $t = 0$, we have the point $(8, 1)$.

11.1.38

Because $t = \frac{3}{2}(x - 1)$, we have $y = -\frac{1}{2} - \frac{15}{4}x$, so the line has slope $-\frac{15}{4}$. When $t = 0$, we have the point $(1, -4)$.

11.1.39 Let $x = x_0 + at$ and $y = y_0 + bt$, and parametrize from $t = 0$ to $t = 1$. Since the point is at $P = (0, 0)$ when $t = 0$, we have $(x_0, y_0) = (0, 0)$, so that $x = at$ and $y = bt$. Then since the point is at $Q = (2, 8)$ at $t = 1$, we must have $a = 2$ and $b = 8$, so that $x = 2t$, $y = 8t$ for $0 \leq t \leq 1$.

11.1.40 Let $x = x_0 + at$ and $y = y_0 + bt$, and parametrize from $t = 0$ to $t = 1$. Since the point is at $(1, 3)$ at $t = 0$, we have $x_0 = 1$ and $y_0 = 3$. At $t = 1$, the point is at $Q = (-2, 6)$, so that $-2 = 1 + a \cdot 1$ and $6 = 3 + b \cdot 1$ and thus $a = -3$ and $b = 3$. Thus $x = 1 - 3t$, $y = 3 + 3t$ for $0 \leq t \leq 1$.

11.1.41 Let $x = x_0 + at$ and $y = y_0 + bt$, and parametrize from $t = 0$ to $t = 1$. Since the point is at $(-1, -3)$ at $t = 0$, we have $x_0 = -1$ and $y_0 = -3$. At $t = 1$, the point is at $Q = (6, -16)$, so that $6 = -1 + a \cdot 1$ and $-16 = -3 + b \cdot 1$ and thus $a = 7$ and $b = -13$. Thus $x = -1 + 7t$, $y = -3 - 13t$ for $0 \leq t \leq 1$.

11.1.42 Let $x = x_0 + at$ and $y = y_0 + bt$, and parametrize from $t = 0$ to $t = 1$. Since the point is at $(8, 2)$ when $t = 0$, we have $x_0 = 8$ and $y_0 = 2$. At $t = 1$, the point is at $(-2, -3)$, so that $-2 = 8 + a \cdot 1$ and $-3 = 2 + b \cdot 1$ and thus $a = -10$ and $b = -5$. Thus $x = 8 - 10t$, $y = 2 - 5t$ for $0 \leq t \leq 1$.
11.1.43

Let \( x = t \) and \( y = 2t^2 - 4, \) \(-1 \leq t \leq 5\).

11.1.44

Let \( x = t^3 - 3t \) and \( y = t, \) \(-\infty < t < \infty\).

11.1.45

Let \( x = -2 + 4t \) and \( y = 3 - 6t, \) \(0 \leq t \leq 1,\)
and \( x = t + 1, \) \( y = 8t - 11 \) for \( 1 \leq t \leq 2.\)
11.1.46

Let \( x = -4 + 4t \) and \( y = 4 + 4t \), \( 0 \leq t \leq 1 \), and \( x = t - 1 \), \( y = 8 - 2(t - 1)^2 \) for \( 1 \leq t \leq 3 \).
11.1.51

11.1.52

11.1.53

11.1.54

11.1.55

11.1.56

11.1.57

a. False. This generates a circle in the counterclockwise direction.

b. True. Note that when \( t \) is increased by one, the value of \( 2\pi t \) is increased by \( 2\pi \), which is the period of both the sine and the cosine functions.

c. False. This generates only the portion of the parabola in the first quadrant, omitting the portion in the second quadrant.

Copyright © 2014 Pearson Education, Inc.
d. True. They describe the portion of the unit circle in the 4th and 1st quadrants.

11.1.58 Let \( x = -t \) and \( y = t^2 + 1 \), for \( 0 \leq t < \infty \).

11.1.59 Let \( x = 1 + 2t \) and \( y = 1 + 4t \), for \( -\infty < t < \infty \). Note that \( t = 0 \) corresponds to \((1, 1)\) while \( t = 1 \) corresponds to \((3, 5)\). Also, solving for \( t \) and substituting gives \( y = 2x - 1 \).

11.1.60 Let \( x = -2 - 6 \cos t \) and \( y = 2 - 6 \sin t \), for \( 0 \leq t \leq \pi \). Then \((x + 2)^2 + (y - 2)^2 = 36\), so the curve represented is part of the circle of radius 6 centered at \((-2, 2)\). Note also that as \( t \) runs from 0 to \( \pi \), the portion of the circle traversed is the lower portion, from \((-8, 2)\) to \((4, 2)\).

11.1.61 Let \( x = t^2 \) and \( y = t \), for \( 0 \leq t < \infty \). Note that \( x = t^2 = y^2 \), and that the starting point is \((0, 0)\).

11.1.62

a. This corresponds to graph (D). Note that \( t = 0 \) corresponds to the point \((-2, 0)\) and as \( t \to \infty \), both \( x \to \infty \) and \( y \to \infty \).

b. This corresponds to graph (B). Note that \(-1 \leq x \leq 1\) and \(-1 \leq y \leq 1\) for all values of \( t \).

c. This corresponds to graph (A). Note that as \( t \to -\infty \), we have \( x \to -\infty \) and \( y \to -\infty \).

d. This corresponds to graph (C). Note that \(-3 \leq x \leq 3\) and \(-3 \leq y \leq 3\) for all values of \( t \).

11.1.63

The entire curve is traversed for \( 0 \leq t \leq 2\pi \).

11.1.64

The entire curve is traversed for \( 0 \leq t \leq \pi \).
11.1.65

Let \( x = 3 \cos t \) and \( y = \frac{3}{2} \sin t \) for \( 0 \leq t \leq 2\pi \).
Then the major axis on the \( x \)-axis has length \( 2 \cdot 3 = 6 \) and the minor axis on the \( y \)-axis has length \( 2 \cdot \frac{3}{\sqrt{2}} = 3 \). Note that \( \left(\frac{x}{3}\right)^2 + \left(\frac{2y}{3}\right)^2 = \cos^2 t + \sin^2 t = 1 \).

11.1.66

Let \( x = 6 \cos t \) and \( y = -\sin t \) for \( 0 \leq t \leq 2\pi \).
Then the major axis on the \( x \)-axis has length \( 2 \cdot 6 = 12 \) and the minor axis on the \( y \)-axis has length \( 2 \cdot 1 = 2 \). Note that \( \left(\frac{x}{6}\right)^2 + y^2 = \cos^2 t + \sin^2 t = 1 \).

11.1.67

Let \( x = 15 \cos t - 2 \) and \( y = 10 \sin t - 3 \) for \( 0 \leq t \leq 2\pi \).
Note that \( \left(\frac{x+2}{15}\right)^2 + \left(\frac{y+3}{10}\right)^2 = \cos^2 t + \sin^2 t = 1 \). Then the major axis has length 30 and the minor axis has length 20.

11.1.68

Let \( x = 5 \cos t \) and \( y = -\frac{3}{2} \sin t - 4 \) for \( 0 \leq t \leq 2\pi \).
Note that \( \left(\frac{x}{5}\right)^2 + \left(\frac{y+4}{3/2}\right)^2 = \cos^2 t + \sin^2 t = 1 \). Then the major axis has length 10 and the minor axis has length 3.

11.1.69

a. For \((1+s, 2s) = (1+2t, 3t)\), we must have \(1+s = 1+2t\) and \(2s = 3t\), so that \(s = 2t\) and \(2s = 3t\). The only solution to this pair of equations is \(s = t = 0\), so these two lines intersect when \(s = t = 0\), at the point \((1, 0)\).

b. For \((2+5s, 1+s) = (4+10t, 3+2t)\), we must have \(2+5s = 4+10t\) and \(1+s = 3+2t\), so that \(s = \frac{2}{5} + 2t\) and \(s = 2 + 2t\). This pair of equations has no solutions, so the lines are parallel but not identical.

Copyright © 2014 Pearson Education, Inc.
c. For \((1 + 3s, 4 + 2s) = (4 - 3t, 6 + 4t)\), we must have \(1 + 3s = 4 - 3t\) and \(4 + 2s = 6 + 4t\), so that \(s = 1 - t\) and \(s = 1 + 2t\). The only solution to this pair of equations is \(s = 1\) and \(t = 0\), so these two lines intersect for these values of \(s\) and \(t\), at the point \((4, 6)\).

11.1.70 All three represent portions of the parabola \(x = 2 \cdot (y - 4)^2\) where \(x\) is between 0 and 32. However, the curve in part \(b\) only represents the portion of the parabola where \(y \geq 4\), because for that curve, \(y = 4 + t^2 \geq 4\).

11.1.71 Note that \(x^2 + y^2 = 4 \sin^2 8t + 4 \cos^2 8t = 4\), so the curve is \(x^2 + y^2 = 4\).

11.1.72 Note that \(4x^2 + y^2 = 4 \sin^2 8t + 4 \cos^2 8t = 4\), so the curve is \(4x^2 + y^2 = 4\).

11.1.73 Note that because \(t = x\), we have \(y = \sqrt{4 - t^2} = \sqrt{4 - x^2}\).

11.1.74 Note that \(x^2 = t + 1\), so \(y = \frac{1}{t + 1} = \frac{1}{x^2} - 1\).

11.1.75 Note that in equation \(B\), the parameter is scaled by a factor of 3. Thus, the curves are the same when the corresponding interval for \(t\) is scaled by a factor of \(\frac{1}{3}\), so for \(a = 0\) and \(b = \frac{2\pi}{3}\). In fact, the same curve will be generated for \(a = p, b = p + \frac{2\pi}{3}\), where \(p\) is any real number.

11.1.76 Note that equation \(B\) can be obtained from \(A\) by replacing \(t\) by \(t^{1/3}\). Thus, the curves are the same when \(a = (-2)^3 = -8\) and \(b = 2^3 = 8\).

11.1.77

a. The tangent lines appear to be horizontal where the curve crosses the \(y\) axis away from the origin, so when \(\sin 2t = 0\) but \(2 \sin t \neq 0\). This occurs for \(t = \frac{\pi}{2}\) and \(t = \frac{3\pi}{2}\), so that the points are \((0, 2)\) and \((0, -2)\).

b. The tangent lines appear to be vertical when \(x = \pm 1\). This occurs when \(\sin 2t = \pm 1\), so when \(2t = \frac{\pi}{2} + 2k\pi\) or \(2t = \frac{3\pi}{2} + 2k\pi\). Thus \(t = \frac{\pi}{4} + k\pi\) or \(t = \frac{3\pi}{4} + k\pi\). Restricting to the range \([0, 2\pi]\) we get \(t = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}\) and \(\frac{7\pi}{4}\). The four corresponding points are \((\pm 1, \pm \sqrt{2})\).

11.1.78

a. There appear to be six points with horizontal tangents, three at the top and three at the bottom. These points all have \(y\)-coordinate equal to \(\pm 1\), so they occur when \(\sin 3t = \pm 1\), so for \(t = \frac{k\pi}{6}\) for \(k = 1, 3, 5, 7, 9, \text{ and } 11\). The corresponding points are

\[
\left(\frac{\sqrt{3}}{2}, 1\right), \quad \left(\frac{-\sqrt{3}}{2}, -1\right), \quad \left(\frac{\sqrt{3}}{2}, 1\right), \quad \left(\frac{-\sqrt{3}}{2}, -1\right), \quad (0, 1), \quad (0, -1).
\]

b. There appear to be eight points with vertical tangents, four on the left and four on the right. These points all have \(x\)-coordinate equal to \(\pm 1\), so they occur when \(\sin 4t = \pm 1\), so for \(t = \frac{k\pi}{8}\) for \(k = 1, 3, 5, 7, 9, 11, 13, 15\). The corresponding points are

\[
\left(1, \sin \frac{3\pi}{8}\right), \quad \left(-1, \sin \frac{9\pi}{8}\right), \quad \left(1, \sin \frac{15\pi}{8}\right), \quad \left(-1, \sin \frac{21\pi}{8}\right), \\
\left(1, \sin \frac{27\pi}{8}\right), \quad \left(-1, \sin \frac{33\pi}{8}\right), \quad \left(1, \sin \frac{39\pi}{8}\right), \quad \left(-1, \sin \frac{45\pi}{8}\right).
\]

11.1.79

a. Note that this curve is symmetric about both axes (that is, if \((x, y)\) lies on the curve, so do \((-x, y), (x, -y), \text{ and } (-x, -y))\). So think first about the case where \(x\) and \(y\) are both nonnegative; then the equation becomes \((\frac{x}{2})^2 + (\frac{y}{2})^2 = 1\), and we can use the parametrization \(x = a \cos^{2/n} t, y = b \sin^{2/n} t\) for \(0 \leq t \leq \frac{\pi}{2}\). So if we define

\[
sgn(x) = \begin{cases} 
1 & \text{if } x \geq 0 \\
-1 & \text{if } x < 0,
\end{cases}
\]

we can in general take a parametrization \(x = a \cdot sgn(\cos t) |\cos t|^{2/n} \text{ and } y = b \cdot sgn(\sin t) |\sin t|^{2/n}\) for \(0 \leq t \leq 2\pi\), which properly adjusts for the signs. If desired, this can be written as four separate equations depending on which quadrant \(t \in [0, 2\pi]\) lies in.
c. As $n$ increases from near 0 to near 1, the curves change from star-shaped to a rectangular shape with corners at $(\pm a, 0)$ and $(0, \pm b)$. As $n$ increases from 1 on, the curves become more rectangular with corners at $(\pm a, \pm b)$. Note that when $n = 2$ we get an ellipse, since the parametrization is then $x = a \cdot \text{sgn}(|\cos t|) \cos t = a \cos t$ and $y = b \cdot \text{sgn}(|\sin t|) \sin t = b \sin t$. 

11.1.80

b. $a = 4, n = 4$

For a fixed $a$, there appear to be loops when $n > a$. 

Copyright © 2014 Pearson Education, Inc.
11.1.81

a.

b.

c.

Copyright © 2014 Pearson Education, Inc.
11.1.82

The package lands when \( y = 0 \), so we seek a solution to \( 0 = -4.9t^2 + 3000 \). So \( t = \sqrt{\frac{3000}{4.9}} \approx 24.744 \) seconds, at which point \( x \approx 80 \cdot 24.744 \approx 1979.487 \) meters.

11.1.83 The package lands when \( y = 0 \), so when \( -4.9t^2 + 4000 = 0 \) for \( t > 0 \). This occurs when \( t = \sqrt{\frac{4000}{4.9}} \approx 28.571 \) seconds. At that time, \( x \approx 100 \cdot 28.57 = 2857 \) meters.

11.1.84

a.

b. The maximum appears to be reached when \( \theta = \frac{\pi}{4} \).

11.1.85 Suppose that \( a^2 + c^2 = b^2 + d^2 \), and that \( ab + cd = 0 \). Note that

\[
x^2 + y^2 = a^2 \cos^2 t + 2ab \sin t \cos t + b^2 \sin^2 t + c^2 \cos^2 t + 2cd \sin t \cos t + d^2 \sin^2 t,
\]

which can be rewritten as

\[
(a^2 + c^2) \cos^2 t + (b^2 + d^2) \sin^2 t + (2ab + 2cd) \sin t \cos t.
\]

Because \( b^2 + d^2 = a^2 + c^2 \) and because \( 2ab + 2cd = 0 \), we can write this as

\[
(a^2 + c^2)(\cos^2 t + \sin^2 t) = R^2,
\]

so we have the circle \( x^2 + y^2 = R^2 \), as desired.
11.1.86 Note that the period of \( \cos 3t \) is \( \frac{2\pi}{3} \), while the period of \( \sin 2t \) is \( \pi \). Thus both curves start a new period for the first time after \( t = 0 \) when \( t = 2\pi \). Thus the period of this Lissajous curve is \( 2\pi \). The interval \([0, \pi]\) will not generate the complete curve, since at \( t = \pi \), the \( y \) coordinate, \( \sin 2t \), will be starting a new period but the \( x \) coordinate will not, so we will get new points on the curve. Since both coordinates repeat after any interval of \( 2\pi \), it follows that any interval of length \( 2\pi \) will generate the complete curve. Plots of this curve for three different intervals are below:

11.1.87 Plots of all four curves are below:
11.1.88 For the example suggested in the exercise, \( x = \cos(5t + \theta_0) \), \( y = \sin 4t \), plots for various values of \( \theta_0 \) are shown below:

It appears that the curves for \( \theta_0 = 0 \) and \( \theta_0 = \frac{\pi}{4} \) are identical, and in between, the curve changes smoothly, the two apparent branches coming closer together and actually overlapping at \( \theta_0 = \frac{\pi}{8} \). However, all the curves look roughly the same. As another example, consider \( a = 2 \) and \( b = 1 \):

Here, for \( \theta_0 = 0 \) and \( \theta_0 = \pi \), the curves look like parabolas (and in fact they are). For other values of \( \theta_0 \), they appear to be more or less distorted figure eights.

For both of these examples, if you visualize the figure for, say, \( \theta_0 = \frac{\pi}{4} \) as a rigid string in 3-space, and think about rotating that frame around the \( x \) axis, you can see all of the Lissajous curves for given values of \( a \) and \( b \) as rotations of one another (this is easier to visualize for the second example than for the first). In summary, varying the phase angle can produce a wide variety of Lissajous curves, all similar in some respects to the one with a phase angle of zero. All these curves lie within the box bounded by the lines \( x = \pm 1 \) and \( y = \pm 1 \), since the amplitude of both the \( x \) and \( y \) coordinates is 1 (since we took \( A = B = 1 \)).

11.1.89 With \( r = 1 \) and \( k = 4 \), the parametric curve is

\[
 x = 3 \cos t + \cos 3t, \quad y = 3 \sin t - \sin 3t,
\]

with plot
It has four cusps.

11.1.90 Plots of the hypocycloids for various values of $k$ are below. It appears that if $k > 1$ is rational, and $k = \frac{p}{q}$ in lowest terms, then the hypocycloid has $p$ cusps. If $k < 1$ is rational, then there are also $p$ cusps, but they point “inwards.” Finally, if $k$ is irrational, the curve does not appear to close.

11.2 Calculus with Parametric Equations

11.2.1 By Theorem 11.1, we have

$$\frac{dy}{dx}_{(x,y) = (f(t), g(t))} = \frac{g'(t)}{f'(t)} \bigg|_{t = a} = \frac{g'(a)}{f'(a)}.$$
11.2.2 Since the slope of the tangent line is \( \frac{g'(t)}{f'(t)} \), the tangent line is horizontal for values of \( t \) where \( g'(t) = 0 \) but \( f'(t) \neq 0 \).

11.2.3 The easiest way of solving this problem is to note that we can eliminate \( t \) to get \( y = 2x \); then this is the line segment from \((3,6)\) to \((4,8)\), which has length \( \sqrt{(4-3)^2 + (8-6)^2} = \sqrt{5} \). One can also use the definition for arc length of parametric curves:

\[
L = \int_{3}^{4} \sqrt{f'(t)^2 + g'(t)^2} \, dt = \int_{3}^{4} \sqrt{1 + 4} \, dt = \sqrt{5}.
\]

11.2.4 The definition of the arc length of this curve is

\[
L = \int_{a}^{b} \sqrt{f'(t)^2 + g'(t)^2} \, dt.
\]

11.2.5

b.

a. \( \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{-8}{4} = -2 \) for all \( t \). Because the curve is a line, the tangent line to the curve at the given point is the line itself.

11.2.6

b.

a. \( \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{-3\sin t}{4\cos t} = -\tan t \). At the given value of \( t \), the value of \( \frac{dy}{dx} \) doesn’t exist, and the tangent line is the vertical line \( x = 3 \).
11.2.7

a. \( \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{8 \cos t}{-\sin t} = -8 \cot t \). At the given value of \( t \), the value of \( \frac{dy}{dx} \) is \(-8 \cot \frac{\pi}{2} = 0\). The tangent line at the point \((0, 8)\) is thus the horizontal line \( y = 8 \).

b.

11.2.8

a. \( \frac{du}{dx} = \frac{du/dt}{dx/dt} = \frac{3t^2}{\frac{3}{2}} = \frac{2t^2}{3} \). At the given value of \( t \), the value of \( \frac{du}{dx} \) is \(\frac{3}{2}t^2\), and the tangent line is \( y = \frac{3}{2}x + 2 \), tangent at the point \((-2, -1)\).

b.

11.2.9

a. \( \frac{du}{dx} = \frac{du/dt}{dx/dt} = \frac{1 + \frac{1}{x^2}}{\frac{1}{x^2}} = x^2 + 1 \). At the given value of \( t \), the derivative doesn't exist, and the tangent line is the vertical line \( x = 2 \), tangent at the point \((2, 0)\).

b.
11.2.10

\[ \frac{du}{dx} = \frac{dy}{dt} \frac{dx}{dt} = \frac{2}{1/(2\sqrt{7})} = 4\sqrt{7}. \] At the given value of \( t \), the value of \( \frac{du}{dx} \) is 8. The equation of the tangent line is \( y = 8x - 8 \), tangent at the point \((2, 8)\).

11.2.11 \( L = \int_0^1 \sqrt{(6t)^2 + (8t)^2} \, dt = \int_0^1 \sqrt{36t^2 + 64t^2} \, dt = \int_0^1 10t \, dt = 5t^2 \bigg|_0^1 = 5. \)

11.2.12 \( L = \int_{-1}^2 \sqrt{3t^2 + 4t^2} \, dt = \int_{-1}^2 \sqrt{9 + 16} \, dt = 5t \bigg|_{-1}^2 = 15. \)

11.2.13 \( L = \int_0^\pi \sqrt{(-3 \sin t)^2 + (3 \cos t)^2} \, dt = \int_0^\pi 3 \, dt = 3\pi. \)

11.2.14 \( L = \int_0^{2\pi/3} \sqrt{(-12 \sin 3t)^2 + (12 \cos 3t)^2} \, dt = \int_0^{2\pi/3} 12 \, dt = 12t \bigg|_0^{2\pi/3} = 8\pi. \)

11.2.15 Note that

\[ (\cos t + t \sin t)' = -\sin t + \sin t + t \cos t = t \cos t \quad \text{and} \quad (\sin t - t \cos t)' = \cos t - (t \cos t - t \sin t) = t \sin t. \]

Then \( L = \int_0^{\pi/2} \sqrt{t \cos t)^2 + (t \sin t)^2} \, dt = \int_0^{\pi/2} t \, dt = \frac{t^2}{2} \bigg|_0^{\pi/2} = \frac{\pi^2}{8}. \)

11.2.16 Note that \((\cos t + sin t)' = -\sin t + \cos t, \text{ and } (\cos t - \sin t)' = -\sin t - \cos t.\)

\[
L = \int_0^{2\pi} \sqrt{(- \sin t + \cos t)^2 + (- \sin t - \cos t)^2} \, dt = \int_0^{2\pi} \sqrt{2 - 2 \cos t \sin t + 2 \cos t \sin t} \, dt
= \int_0^{2\pi} \sqrt{2} \, dt = 2\pi \sqrt{2}.
\]

11.2.17 \( L = \int_0^3 \sqrt{t^2 + \left(\sqrt{t + \frac{1}{2}}\right)^2} \, dt = \int_0^3 \sqrt{t^2 + \frac{1}{4} + t} \, dt = \int_0^3 (t + \frac{1}{2}) \, dt = \left(t^2 + \frac{1}{2}\right) \bigg|_0^3 = 6. \)

11.2.18 Since \( \frac{d}{dt} \left( \frac{t^2}{2} \right) = t \) and \( \frac{d}{dt} \left( \frac{1}{2} (2t + 1)^{3/2} \right) = \sqrt{2t + 1}, \) we have

\[
L = \int_0^2 \sqrt{t^2 + (2t + 1)^2} \, dt = \int_0^2 (t + 1) \, dt = \left(t^2 + t\right) \bigg|_0^2 = 4.
\]

11.2.19 Since \( \frac{d}{dt}(\cos^3 t) = -3 \cos^2 t \sin t \) and \( \frac{d}{dt}(\sin^3 t) = 3 \sin^2 t \cos t, \) we have

\[
L = \int_0^{\pi/2} \sqrt{9 \cos^4 t \sin^2 t + 9 \sin^4 t \cos^2 t} \, dt = \int_0^{\pi/2} \left(3 \sin t \cos t \sqrt{\cos^2 t + \sin^2 t}\right) \, dt
= \int_0^{\pi/2} 3 \sin t \cos t \, dt = \frac{3}{2} \sin^2 t \bigg|_0^{\pi/2} = \frac{3}{2}.
\]

11.2.20 \( L = \int_0^1 \sqrt{(4t)^2 + (3t^2)^2} \, dt = \int_0^1 \sqrt{9t^4 + 16t^2} \, dt = \int_0^1 (t\sqrt{9t^2 + 16}) \, dt. \) Now use the substitution \( u = 9t^2 + 16, \) so that \( du = 18t \, dt; \) then \( t = 0 \) corresponds to \( u = 16 \) and \( t = 1 \) to \( u = 25; \) then we get

\[
L = \int_{16}^{25} \frac{1}{18} \sqrt{u} \, du = \frac{1}{27} u^{3/2} \bigg|_{16}^{25} = \frac{1}{27} (125 - 64) = \frac{61}{27}.
\]
The point corresponding to $(x, y) = (3 \cos 3t, 4 \sin 3t)$ is $(3 \cos \frac{\pi}{2}, 4 \sin \frac{\pi}{2}) = (0, 4)$. Then the point on the second curve is the same as the point $(f(s^2), g(s^2))$ on the second curve. Thus the two curves are parametrized differently but are identical. So they have the same length.

d. False. For any value of $t$, both $x$ and $y$ are nonnegative, so this describes only the portion of the line $y = x$ that lies in the first quadrant (including the origin). Each point except the origin is traced twice, once for $-\infty < t < 0$ and once for $0 < t < \infty$.

11.2.26 The point corresponding to $t = \frac{\pi}{4}$ is $\left( \frac{4\sqrt{2} + \pi \sqrt{2}}{8}, \frac{4\sqrt{2} - \pi \sqrt{2}}{8} \right)$. Then

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{\cos t - (\cos t - t \sin t)}{-\sin t + (\sin t + t \cos t)} = \tan t.$$

At $t = \frac{\pi}{4}$, this gives a slope of 1. The equation of the tangent line is thus

$$y - \frac{4\sqrt{2} - \pi \sqrt{2}}{8} = 1 \left( x - \frac{4\sqrt{2} + \pi \sqrt{2}}{8} \right)$$

or

$$y = x - \frac{\pi \sqrt{2}}{4}.$$

11.2.30 We have $\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{5}{2}$. Then the slope is $-\frac{3}{2}$ when $3t = -\frac{3}{2}$, so only for $t = -\frac{1}{2}$. This corresponds to the point $\left( 2 \left( -\frac{1}{2} \right), 3 \left( -\frac{1}{2} \right)^2 + 1 \right) = (-1, \frac{7}{4})$.

11.2.31 $\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{4 \cos t}{-4 \sin t} = -\cot t$. We seek $t$ so that $\cot t = -\frac{1}{2}$. This equation holds for either a second-quadrant or a fourth-quadrant angle, in which cases

$$\sin t = \frac{2\sqrt{5}}{5}, \cos t = -\frac{\sqrt{5}}{5} \quad \text{or} \quad \sin t = -\frac{2\sqrt{5}}{5}, \cos t = \frac{\sqrt{5}}{5}.$$
11.2.32 \( \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{8\cos t}{x\sin t} = -4\cot t \). We seek \( t \) so that \( \cot t = \frac{1}{4} \). This equation holds for either a first-quadrant or a third-quadrant angle, in which cases

\[
\sin t = \frac{4}{\sqrt{17}}, \quad \cos t = \frac{1}{\sqrt{17}} \quad \text{or} \quad \sin t = -\frac{4}{\sqrt{17}}, \quad \cos t = -\frac{1}{\sqrt{17}}.
\]

The corresponding points on the curve are therefore \( \left( \frac{2\sqrt{17}}{17}, \frac{32\sqrt{17}}{17} \right) \) and \( \left( -\frac{2\sqrt{17}}{17}, -\frac{32\sqrt{17}}{17} \right) \).

11.2.33 \( \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{1+(1/t^2)}{1-(1/t^2)} = \frac{t^2+1}{t^2-1} \). We seek \( t \) so that \( \frac{t^2+1}{t^2-1} = 1 \), which never occurs. Thus, there are no points on this curve with slope 1.

11.2.34 \( \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{-4}{(2\sqrt{t})} = -8\sqrt{t} \) for \( t \neq 0 \). Solving \(-8\sqrt{t} = -8\) gives \( t = 1 \), so the point is \( (2 + \sqrt{1}, 2 - 4 \cdot 1) = (3, -2) \).

11.2.35 \( \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = -e^{-t} = -e^{-3t} \). So we want \(-e^{-3t} = -e \) and thus \(-3t = 1 \) or \( t = -\frac{1}{3} \). The corresponding point is \( (\frac{1}{2}e^{-2/3}, e^{1/3}) \).

11.2.36

a. \( x = x_0 + t(x_1 - x_0), \ y = y_0 + t(y_1 - y_0), \) where \( 0 \leq t \leq 1 \).

b. Integrating gives

\[
L = \int_0^1 \sqrt{x'(t)^2 + y'(t)^2} \, dt = \int_0^1 \sqrt{(x_1 - x_0)^2 + (y_1 - y_0)^2} \, dt
= t\sqrt{(x_1 - x_0)^2 + (y_1 - y_0)^2}\bigg|_0^1 = \sqrt{(x_1 - x_0)^2 + (y_1 - y_0)^2}.
\]

c. The distance formula also gives the length of this line segment to be \( \sqrt{(x_1 - x_0)^2 + (y_1 - y_0)^2} \).

11.2.37

a. Since \( x'(t) = Ah'(t) \) and \( y'(t) = Bh'(t) \), we get

\[
L = \int_a^b \sqrt{A^2h'(t)^2 + B^2h'(t)^2} \, dt = \int_a^b |h'(t)| \sqrt{A^2 + B^2} \, dt = \sqrt{A^2 + B^2} \int_a^b |h'(t)| \, dt.
\]

b. \( L = \sqrt{2^2 + 5^2} \int_0^4 |3t^2| \, dt = \sqrt{2^2 + 5^2} \int_0^4 3t^2 \, dt = \sqrt{29} t^3 \bigg|_0^4 = 64\sqrt{29} \).

c. \( L = \sqrt{4^2 + 10^2} \int_1^8 \left| - \frac{1}{t^2} \right| \, dt = \sqrt{116} \int_1^8 \frac{1}{t^2} \, dt = 2\sqrt{29} \left( -\frac{1}{t} \right) \bigg|_1^8 = \frac{7\sqrt{29}}{4} \).

11.2.38 \( x'(t) = a(1 - \cos t) \) and \( y'(t) = a\sin t \). So \( x'(t)^2 + y'(t)^2 = a\sqrt{2 - 2\cos t} = 2a |\sin \frac{t}{2}| \). Thus (since \( \sin \frac{t}{2} \geq 0 \)) for \( t \in [0, 2\pi] \)

\[
L = \int_0^{2\pi} 2a \left| \sin \frac{t}{2} \right| \, dt = \int_0^{2\pi} 2a \sin \frac{t}{2} \, dt = 2a \left( -2 \cos \frac{t}{2} \right) \bigg|_0^{2\pi} = 8a.
\]

11.2.39

a. \( y = -4.9t^2 + 25t \) is zero for \( t > 0 \) when \(-4.9t + 25 = 0 \), or \( t = \frac{25}{4.9} \approx 5.102 \) seconds.

b. \( L \approx \int_0^{5.102} \sqrt{400 + (25 - 9.8t)^2} \, dt. \)

c. Let \( u = -9.8t + 25 \) so that \( du = -9.8dt \). Then \( L \approx \int_{25}^{-25} \sqrt{400 + u^2} \, du \approx 124.431 \) meters.

Copyright © 2014 Pearson Education, Inc.
d. \( x = u_0(5.102) = 20(5.102) = 102.041 \) meters.

11.2.40 Note that

\[
\frac{dy}{dt} = \frac{dy}{dx} \frac{dx}{dt}
\]

so that

\[
\frac{d^2y}{dt^2} = \frac{d}{dt} \left( \frac{dy}{dx} \right) \frac{dx}{dt} + \frac{dy}{dx} \frac{d^2x}{dt^2} + \frac{dx}{dt} \frac{d}{dt} \left( \frac{dy}{dx} \right).
\]

Also,

\[
\frac{d}{dt} \left( \frac{dy}{dx} \right) = \frac{d^2y}{dx^2} \frac{dx}{dt}
\]

and

\[
\frac{dy}{dt} = \frac{dy}{dx} \frac{dx}{dt}
\]

Thus

\[
y''(t) = \frac{d^2y}{dt^2} = \frac{dy}{dx} \frac{d^2x}{dx^2} + \frac{dx}{dt} \frac{d^2y}{dx^2} \frac{dx}{dt} = \frac{dy}{dx} \frac{d}{dt} \left( \frac{d^2y}{dx^2} \right) \frac{dx}{dt} + \frac{dx}{dt} \frac{d^2y}{dx^2} \frac{dy}{dx} \frac{dx}{dt} + \frac{d^2y}{dx^2} \frac{dx}{dt} \frac{dy}{dx} \frac{dx}{dt} = \frac{y'(t)}{x'(t)} x''(t) + \frac{d^2y}{dx^2} x'(t)^2.
\]

Solving for \( \frac{d^2y}{dx^2} \) yields

\[
y'' = \frac{x'(t)y''(t) - x''(t)y'(t)}{x'(t)^3}.
\]

11.2.41 The curve \( y = f(x) \) can be parametrized by \( x = t \) and \( y = f(t) \). Then \( \sqrt{x'(t)^2 + y'(t)^2} = \sqrt{1 + f'(t)^2} \), so that the arc length is

\[
\int_a^b \sqrt{1 + f'(t)^2} \, dt = \int_a^b \sqrt{1 + f'(x)^2} \, dx.
\]

### 11.3 Polar Coordinates

#### 11.3.1

The coordinates \((2, \frac{\pi}{6})\), \((2, -\frac{11\pi}{6})\), and \((-2, \frac{\pi}{6})\) all give rise to the same point.

Also, the coordinates \((-3, -\frac{\pi}{2})\), \((3, \frac{\pi}{2})\) and \((-3, \frac{3\pi}{2})\) give rise to the same point.

#### 11.3.2

For a point with polar coordinates \((r, \theta)\), we have the Cartesian coordinates \( x = r \cos \theta \) and \( y = r \sin \theta \).

#### 11.3.3

If a point has Cartesian coordinates \((x, y)\) then \( r^2 = x^2 + y^2 \) and \( \tan \theta = \frac{y}{x} \) for \( x \neq 0 \). If \( x = 0 \), then \( \theta = \frac{\pi}{2} \) and \( r = y \).

#### 11.3.4

A circle of radius \(|a|\) centered at the origin has polar equation \( r = |a| \).

#### 11.3.5

Because \( x = r \cos \theta \), we have that the vertical line \( x = 5 \) has polar equation \( r = 5 \sec \theta \).

#### 11.3.6

Because \( y = r \sin \theta \), the horizontal line \( y = 5 \) has polar equation \( r = 5 \csc \theta \).

#### 11.3.7

\( x \)-axis symmetry occurs if \((r, \theta)\) on the graph implies \((r, -\theta)\) is on the graph. \( y \)-axis symmetry occurs if \((r, \theta)\) on the graph implies \((r, \pi - \theta) = (-r, -\theta)\) is on the graph. Symmetry about the origin occurs if \((r, \theta)\) on the graph implies \((-r, \theta) = (r, \theta + \pi)\) is on the graph.
11.3.8 Graph $r = f(\theta)$ as if $r$ and $\theta$ were Cartesian coordinates with $\theta$ on the horizontal axis and $r$ on the vertical axis. Choose an interval in $\theta$ on which the entire polar curve is produced. Then use this graph as a guide to sketch the points $(r, \theta)$ on the final polar curve.

11.3.9

The coordinates $(2, \frac{\pi}{4})$, $(-2, \frac{5\pi}{4})$, and $(2, \frac{9\pi}{4})$ represent the same point.

11.3.10

The coordinates $(3, \frac{2\pi}{3})$, $(-3, \frac{5\pi}{3})$ and $(3, \frac{8\pi}{3})$ represent the same point.

11.3.11

The coordinates $(-1, -\frac{\pi}{3})$, $(1, \frac{2\pi}{3})$ and $(1, -\frac{4\pi}{3})$ represent the same point.
11.3.12

The coordinates \((2, \frac{7\pi}{4})\), \((-2, \frac{3\pi}{4})\) and \((2, -\frac{\pi}{4})\) represent the same point.

11.3.13

The coordinates \((-4, \frac{3\pi}{2})\), \((4, \frac{\pi}{2})\) and \((-4, -\frac{\pi}{2})\) represent the same point.

11.3.14

\(A = (4, \frac{\pi}{6}) = (-4, \frac{7\pi}{6}),\ B = (3, \frac{\pi}{4}) = (-3, \frac{5\pi}{4}),\ C = (2, \frac{\pi}{7}) = (-2, \frac{4\pi}{7}),\ D = (4, \frac{\pi}{2}) = (-4, \frac{3\pi}{2}),\ E = (2, \frac{2\pi}{7}) = (-2, \frac{3\pi}{7}),\ F = (4, -\frac{\pi}{7}) = (-4, \frac{2\pi}{7}).\)

11.3.15

\[x = 3 \cos \frac{\pi}{4} = \frac{3\sqrt{2}}{2}, \quad y = 3 \sin \frac{\pi}{4} = \frac{3\sqrt{2}}{2}.\]

11.3.16

\[x = \cos \frac{3\pi}{4} = -\frac{1}{2}, \quad y = \sin \frac{3\pi}{4} = \frac{\sqrt{2}}{2}.\]

11.3.17

\[x = \cos \left(-\frac{\pi}{4}\right) = \frac{1}{2}, \quad y = \sin \left(-\frac{\pi}{4}\right) = -\frac{\sqrt{2}}{2}.\]

11.3.18

\[x = 2 \cos \frac{7\pi}{4} = 2 \cdot \frac{\sqrt{2}}{2} = \sqrt{2}, \quad y = 2 \sin \frac{7\pi}{4} = -\sqrt{2}.\]

11.3.19

\[x = -4 \cos \frac{3\pi}{4} = -2\sqrt{2}, \quad y = -4 \sin \frac{3\pi}{4} = -2\sqrt{2}.\]

11.3.20

\[x = 4 \cos 5\pi = -4, \quad y = 4 \sin 5\pi = 0.\]

11.3.21

\[r^2 = x^2 + y^2 = 4 + 4 = 8, \quad so \ r = \sqrt{8}. \quad Now, \ \tan \theta = 1, \ so \ \theta = \frac{\pi}{4}, \ so \ \left(2\sqrt{2}, \frac{\pi}{4}\right) \ is \ one \ representation \ of \ this \ point, \ and \ \left(-2\sqrt{2}, -\frac{\pi}{4}\right) \ is \ another.\]

11.3.22

\[r^2 = x^2 + y^2 = 1 + 0, \ so \ r = \pm 1. \quad Now, \ \tan \theta = 0, \ so \ \theta = 0, \ \pi. \quad Thus \ (-1, 0) \ is \ one \ representation \ of \ this \ point, \ and \ (1, \pi) \ is \ another.\]
11.3.23 \( r^2 = x^2 + y^2 = 1 + 3 = 4 \), so \( r = \pm 2 \). Now, \( \tan \theta = \sqrt{3} \), so \( \theta = \frac{\pi}{3}, \frac{4\pi}{3} \). Thus \((2, \frac{\pi}{3})\) is one representation of this point, and \((-2, -\frac{\pi}{3})\) is another.

11.3.24 \( r^2 = 81 \), so \( r = \pm 9 \). Now, \( \tan \theta = 0 \), so \( \theta = 0, \pi \). One representation of the given point is \((9, \pi)\), and \((-9, 0)\) is another.

11.3.25 \( r^2 = 64 \), so \( r = \pm 8 \). Now, \( \tan \theta = -\sqrt{3} \), so \( \theta = -\frac{\pi}{3}, \frac{2\pi}{3} \). One representation of the given point is \((8, \frac{2\pi}{3})\), and \((-8, -\frac{\pi}{3})\) is another.

11.3.26 \( r^2 = 16 + 48 = 64 \), so \( r = \pm 8 \). Also, \( \tan \theta = \sqrt{3} \). One representation of the given point is \((8, \frac{\pi}{3})\), and another is \((-8, \frac{4\pi}{3})\).

11.3.27 \( x = r \cos \theta = -4 \), so this is the vertical line \( x = -4 \) through \((-4, 0)\).

11.3.28 \( y = r \sin \theta = \cot \theta \csc \theta \sin \theta = \cot \theta = \frac{x}{y} \). Thus, \( y^2 = x \). This curve is a parabola with vertex at \((0, 0)\) which opens to the right.

11.3.29 Because \( x^2 + y^2 = r^2 = 4 \), this is a circle of radius 2 centered at the origin.

11.3.30 Because \( y = r \sin \theta = 3 \csc \theta \sin \theta = 3 \), this is the horizontal line \( y = 3 \).

11.3.31 Note that \( x^2 + y^2 = r^2 = 4 \sin^2 \theta + 8 \sin \theta \cos \theta + 4 \cos^2 \theta = 4 + 8 \sin \theta \cos \theta \). Also note that \( x = r \cos \theta = 2 \sin \theta \cos \theta + 2 \cos^2 \theta \) and \( y = r \sin \theta = 2 \sin^2 \theta + 2 \sin \theta \cos \theta \). Thus, \( 2x + 2y = 4 + 8 \sin \theta \cos \theta \). If we combine these, we see that \( x^2 + y^2 - 2(x + 2y) = 0 \). Thus \( (x^2 - 2x + 1) + (y^2 - 2y + 1) = 2 \), so we have the circle \( (x - 1)^2 + (y - 1)^2 = 2 \). This is a circle of radius \( \sqrt{2} \) centered at \((1, 1)\).

11.3.32 We have \( r \sin \theta = \pm r \cos \theta \), so \( y = \pm x \). These are lines through the origin with slopes \( \pm 1 \).

11.3.33 \( r \cos \theta = \sin 2\theta = 2 \sin \theta \cos \theta \). Note that if \( \cos \theta = 0 \), then \( r \) can be any real number, and the equation is satisfied. For \( \cos \theta \neq 0 \), we have \( x = r \cos \theta = 2 \sin \theta \cos \theta \), so \( r = 2 \sin \theta \), and thus \( y = r \sin \theta = 2 \sin^2 \theta \). Thus \( x^2 + y^2 - 2y = 4 \sin^2 \theta \cos^2 \theta + 4 \sin^2 \theta \sin^2 \theta - 4 \sin^2 \theta = 4 \sin^2 \theta (\sin^2 \theta + \cos^2 \theta) - 4 \sin^2 \theta = 4 \sin^2 \theta - 4 \sin^2 \theta = 0 \). Note also that \( x^2 + y^2 - 2y = 0 \) is equivalent to \( x^2 + (y - 1)^2 = 1 \), so we have a circle of radius one centered at \((0, 1)\), as well as the line \( x = 0 \) which is the \( y \)-axis.

11.3.34 \( r = \sin \theta \sec^2 \theta \), so \( x = r \cos \theta = \tan \theta = \frac{y}{x} \), so \( y = x^2 \), the standard parabola.

11.3.35 \( r = 8 \sin \theta \), so \( r^2 = 8r \sin \theta \), so \( x^2 + y^2 = 8y \). This can be written \( x^2 + (y - 4)^2 = 16 \), which represents a circle of radius 4 centered at \((0, 4)\).

11.3.36 The given equation implies that \( 2r \cos \theta + 3r \sin \theta = 1 \), so \( 2x + 3y = 1 \). This is a line with slope \( \frac{2}{3} \) and \( y \)-intercept \( \frac{1}{3} \).

11.3.37

| \( \theta \) | \( 0 \) | \( \frac{\pi}{6} \) | \( \frac{\pi}{4} \) | \( \frac{\pi}{3} \) | \( \frac{2\pi}{3} \) | \( \frac{3\pi}{4} \) | \( \frac{5\pi}{6} \) | \( \pi \) |
|-----------------|
| \( r \)         | 8   | 4\( \sqrt{3} \) | 4\( \sqrt{2} \) | 4   | 0   | -4\( \sqrt{2} \) | -4\( \sqrt{3} \) | -8  |

11.3.47

11.3.48

11.3.49 Points $B$, $D$, $F$, $H$, $J$ and $L$ have $y$-coordinate 0, so the graph is at the pole for each of these points. Points $E$, $I$ and $M$ have maximal radius, so these correspond to the points at the tips of the outer loops. The points $C$, $G$ and $K$ correspond to the tips of the smaller loops. Point $A$ corresponds to the polar point $(1, 0)$.

11.3.50 Points $B$, $D$, $H$ and $J$ have $y$-coordinate 0, so the graph is at the pole for each of these points. Points $A$ and $K$ lie where the graph intersects the negative $x$-axis. $C$ and $I$ are at the top of the two large loops, while $F$ is where the graph intersects the positive $x$-axis. $E$ and $G$ are the extreme points of the large wide loop.

11.3.51 Points $B$, $D$, $F$, $H$, $J$, $L$, $N$ and $P$ are at the origin. $C$, $G$, $K$ and $O$ are on the ends of the long loops, while $A$, $E$, $I$ and $M$ are at the ends of the smaller loops.

11.3.52 Points $C$, $E$, $G$ and $I$ are at the origin. $B$ and $D$ are at the ends of the two bigger loops, $F$ and $H$ are at ends of the two smaller loops. $A$ and $J$ are the points where the graph intersects the positive $x$-axis.

11.3.53

Because $r = \theta \sin \theta$ is unbounded as $\theta \to \infty$, no finite interval can generate the entire graph.
11.3.54

The interval \([0, 2\pi]\) generates the entire graph.

11.3.55

The interval \([0, 2\pi]\) generates the entire graph.

11.3.56

The interval \([0, 2\pi]\) generates the entire graph.
11.3.57

The interval $[0, 5\pi]$ generates the entire graph.

11.3.58

The interval $[0, 7\pi]$ generates the entire graph.

11.3.59

The interval $[0, 2\pi]$ generates the entire graph.
11.3.60

The interval \([0, 2\pi]\) generates the entire graph.

11.3.61

a. True. Note that \(r^2 = 8\) and \(\tan\theta = -1\).

b. True. Their intersection point (in Cartesian coordinates) is \((4, -2)\).

c. False. They intersect at the polar coordinates \((2, \frac{\pi}{2})\) and \((2, \frac{5\pi}{4})\).

d. False. \(3\cos\pi \neq 3\).

e. True. The first is the line \(x = 2\) because \(x = r\cos\theta = 2\sec\theta \cos\theta = 2\), and the second is \(y = 3\) because \(y = r\sin\theta = 3\csc\theta \sin\theta = 3\).

11.3.62 We have \(y = r\sin\theta = 3\), so \(r = \frac{3}{\sin\theta} = 3\csc\theta\).

11.3.63 We have \(r\sin\theta = r^2\cos^2\theta\), so \(r = \frac{\sin\theta}{\cos^2\theta} = \tan\theta \sec\theta\).

11.3.64 We have \((r\cos\theta - 1)^2 + r^2\sin^2\theta = 1\), so \(r^2\cos^2\theta - 2r\cos\theta + 1 + r^2\sin^2\theta = 1\), and thus \(2r\cos\theta = r^2\). Thus \(r = 2\cos\theta\).

11.3.65 We have \(r\sin\theta = \frac{1}{r\cos\theta}\), so \(r^2 = \sec\theta \csc\theta\).

11.3.66

11.3.67
11.3.74 Let \( x = r \cos \theta \) and \( y = r \sin \theta \), so that \( r^2 = x^2 + y^2 \). Then the given equation can be written \( (x^2 + y^2) - 2ax - 2by + (a^2 + b^2) = R^2 \), which in turn can be written as \( (x - a)^2 + (y - b)^2 = R^2 \), which is the equation of a circle of radius \( R \) centered at \( (a, b) \).

11.3.75 Consider the circle with center \( C(r_0, \theta_0) \), and let \( A \) be the origin and \( B(r, \theta) \) be a point on the circle not collinear with \( A \) and \( C \). Note that the length of side \( BC \) is \( R \), and that the angle \( CAB \) has measure \( \theta - \theta_0 \). Applying the law of cosines to triangle \( CAB \) yields the equation \( R^2 = r^2 + r_0^2 - 2rr_0 \cos(\theta - \theta_0) \), which is equivalent to the given equation.
11.3.76

Use Exercise 74; then $a = 3$ and $b = 0$ and thus $R^2 - a^2 - b^2 = R^2 - 9 = 16$ so that $R^2 = 25$. Hence we have a circle centered at $(3, 0)$ with radius 5.

11.3.77

Use Exercise 75; then $r_0 = 2$ and $\theta_0 = \frac{\pi}{3}$ and thus $R^2 - 4 = 12$ so that $R^2 = 16$. Hence this is a circle with polar center $(2, \frac{\pi}{3})$ and radius 4.

11.3.78

Use Exercise 75; then $r_0 = 4$ and $\theta_0 = \frac{\pi}{2}$ and thus $R^2 - 16 = 9$, so that $R^2 = 25$. Hence this is a circle with polar center $(4, \frac{\pi}{2})$ and radius 5.
11.3.79

Use Exercise 74; then \( a = 2 \) and \( b = 3 \) and thus \( R^2 - a^2 - b^2 = R^2 - 13 = 3 \), so that \( R^2 = 16 \). Hence we have a circle centered at \((2, 3)\) with radius 4.

11.3.80

Use Exercise 74; then \( a = -1 \) and \( b = 3 \) and thus \( R^2 - a^2 - b^2 = R^2 - 10 = 4 \), so that \( R^2 = 14 \). Hence we have a circle centered at \((-1, 3)\) with radius \( \sqrt{14} \).

11.3.81

Use Exercise 74; then \( a = -1 \) and \( b = 2 \) and thus \( R^2 - a^2 - b^2 = R^2 - 5 = 4 \), so that \( R^2 = 9 \). Hence we have a circle centered at \((-1, 2)\) with radius 3.

11.3.82 The radius of a circle inscribed in a triangle with side lengths \( a \), \( b \), and \( c \) is \( \frac{2A}{a+b+c} \) where \( A \) is the area of the triangle. So for the bigger circle, \( R = r_0 = \frac{2A}{2+2\sqrt{2}} = \frac{1}{1+\sqrt{2}} \). For each of the smaller circles, we have
The area inside the three circles is thus $2\pi \cdot \frac{1}{(2+\sqrt{2})^2} + \pi \cdot \frac{1}{(1+\sqrt{2})^2} \approx 1.078$. Because the area of the square is 2, there is more area inside the circles than outside the circles but inside the square. Using problem 75, the equation of the largest circle is $r^2 - 2r \left( \frac{1}{1+\sqrt{2}} \right) \cos (\theta - \frac{\pi}{2}) = 0$. The smaller circle in the 3rd quadrant has center with polar radius $r_0 = \sqrt{\frac{\sqrt{2}}{2} - \frac{1}{2+\sqrt{2}}} = \sqrt{\frac{\sqrt{2}}{2} - \frac{3}{2}}$, so its equation is $r^2 - 2r \left( \sqrt{\frac{\sqrt{2}}{2} - \frac{3}{2}} \right) \cos (\theta + \frac{5\pi}{4}) = R^2 - r_0^2 = \sqrt{2} - \frac{3}{2}$.

**11.3.83**

**a.** On all three intervals, the graph is the same vertical line, oriented upward.

**b.** For $\theta \neq \frac{2m+1}{2} \pi$ where $m$ is an integer, we have $\cos \theta \neq 0$, so the equation is equivalent to $x = r \cos \theta = 2$. So the graph is a vertical line.

**11.3.84**

**a.** Given $y = mx + b$, let $x = r \cos \theta$ and $y = r \sin \theta$. Then $r \sin \theta = m(r \cos \theta) + b$, so $r \sin \theta - mr \cos \theta = b$, and thus $r(\sin \theta - m \cos \theta) = b$, and $r = \frac{b}{\sin \theta - m \cos \theta}$, provided $\sin \theta - m \cos \theta \neq 0$.

**b.** Using the right triangle shown, we see that $\frac{r_0}{r} = \cos (\theta_0 - \theta)$, so $r_0 = r \cos (\theta_0 - \theta)$.

**11.3.85**

Using problem 84b, this is the line with $r_0 = 3$ and $\theta_0 = \frac{\pi}{3}$. So it is the line through the polar point $(3, \frac{\pi}{3})$ in the direction of angle $\frac{\pi}{3} + \frac{5\pi}{4} = \frac{19\pi}{12}$. Since the Cartesian coordinates of $(3, \frac{\pi}{3})$ are $\left( \frac{3}{2}, \frac{3\sqrt{3}}{2} \right)$, and the direction $\frac{19\pi}{12}$ corresponds to the slope $-\frac{1}{\sqrt{3}}$, we get for the Cartesian equation of this line

$y - \frac{3\sqrt{3}}{2} = -\frac{1}{\sqrt{3}} \left( x - \frac{3}{2} \right)$, or $y = -\frac{x}{\sqrt{3}} + 2\sqrt{3}$.
11.3.86

Using problem 84b, this is the line with $r_0 = 4$ and $\theta_0 = -\pi/6$. So it is the line through the polar point $(4, -\pi/6)$ in the direction of angle $-\pi/6 + \pi/2 = \pi/3$. Since the Cartesian coordinates of $(4, -\pi/6)$ are $(-2\sqrt{3}, -2)$, and the direction $\pi/3$ corresponds to the slope $\sqrt{3}$, we get for the Cartesian equation of this line

$$y - (-2) = \sqrt{3} \left( x - (-2\sqrt{3}) \right),$$

or $y = x\sqrt{3} - 8$.

11.3.87

Using problem 84a, this is the line with $b = 3$ and $m = 4$, so $y = 4x + 3$.

11.3.88

Using problem 84a, this is the line with $b = \frac{3}{2}$ and $m = \frac{3}{2}$, so $y = \frac{3}{2}x + \frac{3}{2}$.

11.3.89

a. This matches (A), because we have $|a| = 1 = |b|$, and the graph is a cardioid.

b. This matches (C). This has an inner loop because $|a| = 1 < 2 = |b|$. Note that $r = 1$ when $\theta = 0$, so it can’t be (D).
c. This matches (B). This has $|a| = 2 > 1 = |b|$, so it has an oval-like shape.

d. This matches (D). This has an inner loop because $|a| = 1 < 2 = |b|$. Note that $r = -1$ when $\theta = 0$, so this can’t be (C).

e. This matches (E). Note that there is an inner loop because $|a| = 1 < 2 = |b|$, and that $r = 3$ when $\theta = \frac{\pi}{2}$.

f. This matches (F).

11.3.90 As $b \to \infty$, the inner loop approaches the outer loop, so that for large $b$ the graph appears to be a single circle with diameter $b$. Thus, there is no limiting curve as $b \to \infty$. 

11.3.91

11.3.92

11.3.93

11.3.94
11.3.95

11.3.96

11.3.97

11.3.98

11.3.99 Note that $a \sin m\theta = 0$ for $\theta = \frac{k\pi}{m}, \ k = 1, 2, \ldots, 2m$. Thus the graph is back at the pole $r = 0$ for each of these values, and each of these gives rise to a distinct petal of the rose if $m$ is odd. If $m$ is even, then by symmetry, each petal for $k = 1, 2, \ldots, \frac{m}{2}$ is equivalent to one for $k = \frac{m}{2} + 1, \frac{m}{2} + 2, \ldots, m$. (Note that this follows because the sine function is odd.) A similar result holds for the rose $r = a \cos m\theta$.

11.3.100 The spirals wind outward counterclockwise.

11.3.101 For $a = 1$, the spiral winds outward counterclockwise. For $a = -1$, the spiral winds inward counterclockwise.

Copyright © 2014 Pearson Education, Inc.
11.3.102 The spirals wind inward counterclockwise for both \(a = 1\) and \(a = -1\).

11.3.103 Suppose \(2 \cos \theta = 1 + \cos \theta\). Then \(\cos \theta = 1\), so this occurs for \(\theta = 0\) and \(\theta = 2\pi\). At those values, \(r = 2\), so the curves intersect at the polar point \((2, 0)\). The curves also intersect when \(r = 0\), which occurs for \(\theta = \frac{\pi}{2}\) and \(\theta = \frac{3\pi}{2}\) for the first curve and \(\theta = \pi\) for the second.

11.3.104 Suppose \(4 \cos \theta = 1 + 2 \cos \theta + \cos^2 \theta\). Then \((\cos \theta - 1)^2 = 0\), so \(\theta = 0\). At that value, \(r = 2\), so the curves intersect at the polar point \((2, 0)\). The curves also intersect when \(r = 0\), which occurs for the first curve at \(\frac{\pi}{2}\) and \(\frac{3\pi}{2}\), and for the second curve at \(\pi\). Also, the curves intersect when \(4 \cos \theta = -1 - 2 \cos \theta - \cos^2 \theta\), which occurs for \(\cos^2 \theta + 6 \cos \theta + 1 = 0\), or (using the quadratic formula) \(\theta = \cos^{-1}(-3 + 2\sqrt{2}) \approx 1.743\). This leads to the polar intersection points at approximately \((0.828, \pm 1.743)\).

11.3.105 Suppose \(1 - \sin \theta = 1 + \cos \theta\), or \(\tan \theta = -1\). Then \(\theta = \frac{3\pi}{4}\) or \(\theta = \frac{7\pi}{4}\). So the curves intersect at the polar points \(\left(1 + \frac{\sqrt{2}}{2}, \frac{7\pi}{4}\right)\) and \(\left(1 - \frac{\sqrt{2}}{2}, \frac{3\pi}{4}\right)\). They also intersect at the pole \((0, 0)\), which occurs for the first curve at \(\frac{\pi}{2}\) and for the second curve at \(\pi\).

11.3.106 Suppose \(\cos 2\theta = \sin 2\theta \geq 0\) (since they must both equal \(r^2\)). Thus \(2\theta\) must be a first quadrant angle, and \(\tan 2\theta = 1\). This occurs at \(\theta = \frac{\pi}{8}\) and \(\theta = \frac{9\pi}{8}\). The curves intersect at \(\frac{\pi}{8}\) and at \(\frac{9\pi}{8}\) where both \(\cos 2\theta\) and \(\sin 2\theta\) have value \(\frac{\sqrt{2}}{2}\). The curves also intersect at the pole, which occurs for the first curve at \(\frac{\pi}{8}\), and \(\frac{\pi}{4}\), \(\frac{5\pi}{8}\), and \(\frac{7\pi}{8}\), and for the second curve at \(0, \frac{\pi}{8}, \pi,\) and \(\frac{9\pi}{8}\). Thus the intersection points in polar coordinates are \((0, 0)\) as well as \((2^{-1/4}, \frac{\pi}{8})\) and \((2^{-1/4}, \frac{9\pi}{8})\). (In cartesian coordinates, these are \((0, 0)\), and approximately \((0.841, 0.393)\) and \((-0.841, -0.393)\).)

11.3.107  

a. Plotting these parametric equations gives

\[
\begin{align*}
    x &= 3 \cos \pi t \\
    y &= 3 \sin \pi t,
\end{align*}
\]

while the orbit of Earth has period 1 and radius 2, so it has parametric equations

\[
\begin{align*}
    x_E &= 2 \cos 2\pi t \\
    y_E &= 2 \sin 2\pi t.
\end{align*}
\]

Now let \( \theta = \pi t \) for simplicity. Then the orbit of Mars as seen from the Earth clearly has parametric equations

\[
\begin{align*}
    x_{M-E} &= 3 \cos \theta - 2 \cos 2\theta \\
    y_{M-E} &= 3 \sin \theta - 2 \sin 2\theta,
\end{align*}
\]

where

\[
\begin{align*}
    f(\theta) &= 3 - 4 \cos \theta.
\end{align*}
\]

By the margin note in Example 9 in this section, or by using Exercise 115 in this section, these equations are parametric equations for the polar curve

\[
\begin{align*}
    r &= f(\theta) = 3 - 4 \cos \theta,
\end{align*}
\]

which is a limaçon. Hence the orbit of Mars as viewed from Earth is a limaçon (at least assuming that Earth and Mars started at the coordinates (2, 0) and (3, 0) respectively).

11.3.108  

a. The region is given by

\[
\{(r, \theta) : 1 \leq r \leq 2, 0 \leq \theta \leq \pi\}.
\]

b. The inflow is given by

\[
\{(r, \theta) : 1 \leq r \leq 2, \theta = 0\}.
\]

The outflow is given by

\[
\{(r, \theta) : 1 \leq r \leq 2, \theta = \pi\}.
\]

c. The tangential velocity at \((1.5, \pi/4)\) is

\[
v(1.5) = 10 \cdot 1.5 = 15 \text{ meters per second.}
\]

At \((1.2, 3\pi/4)\) it is

\[
v(1.2) = 10 \cdot 1.2 = 12 \text{ meters per second, so it is greater at } 1.5.
\]

d. The velocity is greater at \( r = 1.3 \), because \( \int_3^{1.3} 5r^2 \, dr = 5 \int_3^{1.3} r^2 \, dr = 5 \left[ \frac{r^3}{3} \right]_3^{1.3} = 13.862 \), so the flow is greater in part c).

e. \( \int_1^2 10r \, dr = 5r^2 \bigg|_1^2 = 15 \), while \( \int_1^2 \frac{20}{r} \, dr = 20 \ln r \bigg|_1^2 \approx 13.862 \), so the flow is greater in part c).

11.3.109  

With \( r = a \cos \theta + b \sin \theta \), we have

\[
x^2 = ar \cos \theta + br \sin \theta,
\]

or

\[
y^2 = ax + by,
\]

so

\[
(x - \frac{a}{2})^2 + (y - \frac{b}{2})^2 = \frac{a^2 + b^2}{4}.
\]

Thus, the center is \((\frac{a}{2}, \frac{b}{2})\) and \( r = \sqrt{x^2 + y^2} \).

11.3.110  

Note that \( \cos 2\theta = \cos^2 \theta - \sin^2 \theta \), so

\[
r^2 = a^2(\cos^2 \theta - \sin^2 \theta),
\]

so

\[
r^4 = a^2(r^2 \cos^2 \theta - r^2 \sin^2 \theta),
\]

so

\[
(x^2 + y^2)^2 = a^2(x^2 - y^2).
\]

Copyright © 2014 Pearson Education, Inc.
11.3.111 Because \( \sin \frac{\theta}{2} = \sin \left( \pi - \frac{\theta}{2} \right) = \sin \frac{2\pi - \theta}{2} \), we see that the graph is symmetric with respect to the \( x \)-axis.

11.3.112

a. 

\[ \begin{array}{c}
\includegraphics[width=0.4\textwidth]{fig1}\end{array} \]

b. 

\[ \begin{array}{c}
\includegraphics[width=0.4\textwidth]{fig2}\end{array} \]

c. If \( n \) is even, then the whole curve is generated for \( 0 \leq \theta \leq 2m\pi \). If \( n \) is odd, then the whole curve is generated for \( 0 \leq \theta \leq m\pi \).

11.3.113

a. 

\[ \begin{array}{c}
\includegraphics[width=0.4\textwidth]{fig3}\end{array} \]

b. It adds multiple layers of the same type of curve as \( \sin \frac{5\theta}{12} \) oscillates between \(-1\) and \(1\) for \( 0 \leq \theta \leq 24\pi \).

11.3.114

a. \( f(0) = \cos 1 - 1.5 \), and \( f(2\pi) = \cos((1 + 12\pi)^{1/2\pi}) - 1.5 = \cos(1 + 12\pi) - 1.5 = \cos 1 - 1.5 = f(0) \). The points correspond to the polar points \((-0.960, 0)\).

b. No. The curve for \(-\pi \leq \theta \leq 0\) has nowhere where the absolute value of the radius is equal to 1, whereas the curve for \( \pi \leq \theta \leq 2\pi \) has numerous places where this is true, because \( a^{x} \) has a much bigger range on \([0, \pi]\) than on \([-\pi, 0]\).

c. Because \( (1 + 2k\pi)^{1/2\pi} = 1 \) and \((1 + 2k\pi)^{1/2\pi})^{2\pi} = 1 + 2k\pi\), we have that \( f(0) = \cos 1 - b = \cos(1 + 2k\pi) - b = \cos 1 - b = f(2\pi) \).
11.3. POLAR COORDINATES

d.

\[ r = \frac{1}{\sin \theta} \]

\[ k = 6 \]

\[ r = \frac{1}{\cos \theta} \]

\[ k = 12 \]

\[ r = \frac{1}{\sin 2\theta} \]

\[ k = 15 \]

\[ r = \frac{1}{\cos 2\theta} \]

\[ k = 45 \]

11.3.115

a.

\[ r = \frac{1}{\sin \theta} \]

\[ m = 3 \]

\[ r = \frac{1}{\cos \theta} \]

\[ m = 5 \]

\[ r = \frac{1}{\sin 2\theta} \]

\[ m = 7 \]
11.4 Calculus in Polar Coordinates

11.4.1 Because $x = r \cos \theta$ and $y = r \sin \theta$, we have $x = f(\theta) \cos \theta$ and $y = f(\theta) \sin \theta$.

11.4.2 We need $\frac{dy}{dx}$, which can be computed using Exercise 1 and the formula $\frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta} = \frac{f' (\theta) \sin \theta + f(\theta) \cos \theta}{f' (\theta) \cos \theta - f(\theta) \sin \theta}$, which will then need to be evaluated at $\theta = \theta_0$.

11.4.3 Because slope is given relative to the horizontal and vertical coordinates, it is given by $\frac{dy}{dx}$, not by $\frac{dy}{d\theta}$.

11.4.4 By the definition in the text, this is given by $\frac{1}{2} \int_{\alpha}^{\beta} (f(\theta)^2 - g(\theta)^2) \, d\theta$.

11.4.5 Solving the equation $f(\theta) = g(\theta)$ will find only those points of intersection where the values of $\theta$ are the same. But the same point may have different polar representation. For example consider the curves $r = 2 + 2 \sin \theta$ and $r = 2 - 2 \sin \theta$. Solving for equality gives $\sin \theta = 0$, so that $\theta = 0$ or $\theta = \pi$; the associated points of intersection are $(2, 0)$ and $(2, \pi)$, which in Cartesian coordinates are $(2, 0)$ and $(-2, 0)$. However, they also intersect at the origin, which for the first curve corresponds to $\theta = \pi$ but for the second curve to $\theta = 0$. See Exercises 37-40.

11.4.6 From the definition in the text, the arc length of $r = f(\theta)$ on $[\alpha, \beta]$ is

$$\int_{\alpha}^{\beta} \sqrt{f'(\theta)^2 + f(\theta)^2} \, d\theta.$$
11.4.12 \( \frac{dy}{dx} = 6\cos^2 \theta + 2\sin \theta \cos \theta \). The tips of the leaves occur at \( \theta = \frac{7\pi}{6}, \frac{\pi}{2}, \) and \( \frac{5\pi}{6} \). At \( \frac{7\pi}{6} \), we have \( \frac{dy}{dx} = \frac{\sqrt{3}}{4} = -\sqrt{3} \). At \( \frac{\pi}{2} \) we have \( \frac{dy}{dx} = 0 \). At \( \frac{5\pi}{6} \) we have \( \frac{dy}{dx} = -\sqrt{3} \). The graph intersects the origin at \( \theta = 0, \theta = \frac{\pi}{2}, \theta = \frac{2\pi}{3} \) and \( \theta = \pi, \) and these are the corresponding equations of the tangent lines. (Note that the lines \( \theta = 0 \) and \( \theta = \pi \) are the same.)

11.4.13 \( \frac{dy}{dx} = -\frac{8\sin 2\theta + 4\cos 2\theta}{8\sin 2\theta + 4\cos 2\theta} \). The tips of the leaves occur at \( \theta = 0, \frac{\pi}{2}, \pi \) and \( \frac{3\pi}{2} \). At \( 0 \) and \( \pi \), we see that \( \frac{dy}{dx} \) doesn’t exist. At \( \frac{\pi}{2} \) and \( \frac{3\pi}{2} \) we have \( \frac{dy}{dx} = 0 \). The graph intersects the origin for \( \theta = \frac{\pi}{4}, \theta = \frac{3\pi}{4}, \theta = \frac{5\pi}{4} \) and \( \theta = \frac{7\pi}{4}, \) and thus the two distinct tangent lines are \( \theta = \frac{\pi}{2} \) and \( \theta = \frac{3\pi}{4}. \)

11.4.14 \( \frac{dy}{dx} = \frac{0 + 3(\sqrt{2}/2)}{0 - 3(\sqrt{2}/2)} = -1 \). The curve is at the origin when \( \sin 2\theta = -\frac{1}{2} \), which occurs when \( 2\theta = \frac{7\pi}{6}, \frac{11\pi}{6}, \) and \( \frac{19\pi}{6}, \) or \( \theta = \frac{7\pi}{12}, \frac{11\pi}{12}, \frac{19\pi}{12}, \) and \( \frac{23\pi}{12}. \)

11.4.15 Note that the curve is at the origin at \( \frac{\pi}{3} \), so there is a vertical tangent at \( (0, \frac{\pi}{3}) \). Also, \( \frac{dy}{dx} = \frac{-4\sin^2 \theta + 4\cos \theta}{8\sin \theta \cos \theta - 2\sin 2\theta} \). Thus, there are horizontal tangents at \( \frac{\pi}{4} \) and \( \frac{3\pi}{4} \), which correspond to the polar points \( (2\sqrt{2}, \frac{\pi}{4}) \) and \( (-2\sqrt{2}, \frac{3\pi}{4}) \). There is also a vertical tangent where \( \theta = 0 \), at the point \( (4, 0) \).

11.4.16 Note that the curve is at the origin at \( \frac{3\pi}{2} \), so there is a vertical tangent at \( (0, \frac{3\pi}{2}) \). Also, \( \frac{dy}{dx} = \frac{2\cos \theta \sin \theta + (2 + 2\sin \theta) \cos \theta}{2\cos \theta \sin \theta - (2 + 2\sin \theta) \sin \theta} = \frac{\cos \theta (2 + 4\sin \theta)}{(2 - 4\sin^2 \theta) \sin \theta - 2\sin \theta}. \) Thus, there are horizontal tangents where this expression is 0 at \( \frac{\pi}{2} \), at \( \frac{\pi}{4} \), and at \( \frac{11\pi}{4} \) — at the polar points \( (4, \frac{\pi}{4}) \), \( (1, \frac{\pi}{4}) \) and \( (1, \frac{11\pi}{4}) \). There are vertical tangents where the denominator is 0 and the numerator isn’t, which occurs at the points \( (3, \frac{\pi}{6}) \) and \( (3, \frac{5\pi}{6}) \).

11.4.17 Using the double angle identities:

\[
\frac{dy}{dx} = \frac{2\cos 2\theta \sin \theta + \sin 2\theta \cos \theta}{2\cos 2\theta \cos \theta - \sin 2\theta \sin \theta} = \frac{\sin \theta (\cos 2\theta + \cos 2\theta)}{\cos \theta (\cos 2\theta - \sin 2\theta)} = \frac{\sin \theta (3\cos^2 \theta - 1)}{\cos \theta (3\sin^2 \theta - 1)}.
\]

The numerator is 0 for \( \theta = 0 \) and for \( \theta = \pm \cos^{-1}(\pm \frac{\sqrt{3}}{2}) \), so there are horizontal tangents at the corresponding points \((0, 0), (0, 0.943, 0.955), (-0.943, 2.186), (0.943, 4.097), \) and \((-0.943, 5.328) \). The denominator is 0 for \( \theta = \frac{\pi}{2} \) and \( \frac{3\pi}{2} \), and for \( \theta = \pm \cos^{-1}(\pm \frac{\sqrt{3}}{2}) \), so there are vertical tangents at \((0, 0), (0.943, 0.615), (-0.943, 2.526), (0.943, 3.757), \) and \((-0.943, 5.668) \).

11.4.18 The curve intersects the origin at \( \theta = \frac{7\pi}{6}, \) and \( \theta = \frac{11\pi}{6} \), so those don’t give rise to vertical or horizontal tangents. We have \( \frac{dy}{dx} = \frac{\theta \sin \theta + 3\cos \theta \sin \theta}{\theta \cos \theta - 3\sin \theta \cos \theta + \sin \theta \cos \theta} = \frac{\cos \theta (1 + 4\sin \theta)}{(2 - \sin \theta - 4\sin^2 \theta) \sin \theta}. \) Thus there are horizontal tangents for \( \theta = \frac{\pi}{2} \) and \( \frac{3\pi}{2} \), at the corresponding points \((9, \frac{\pi}{2}) \) and \((-3, \frac{3\pi}{2}) \), and at the points where \( \sin \theta = -\frac{1}{4} \), which are \((\frac{7}{4}, 3.394) \) and \((\frac{7}{4}, 6.031) \). There are vertical tangents where the denominator is 0, which occurs for \( \theta = \sin^{-1}(\pm \frac{\sqrt{3}}{8}) \), so the corresponding points are \((-2.058, 5.280) \), and \((6.558, 0.635) \).

11.4.19 The curve intersects the origin at \( \theta = \frac{\pi}{2} \), and there is a vertical tangent at \( (0, \frac{\pi}{2}) \).

\[
\frac{dy}{dx} = -\frac{-\cos \theta \sin \theta + (1 - \sin \theta) \cos \theta}{-\cos^2 \theta - (1 - \sin \theta) \sin \theta} = \frac{\cos \theta (1 - 2 \sin \theta)}{\sin^2 \theta - \cos^2 \theta - \sin \theta} = \frac{\cos \theta (1 - 2 \sin \theta)}{2 \sin^2 \theta - \sin \theta - 1}.
\]

There are horizontal tangents when \( \sin \theta = \frac{1}{4} \), which occurs for \( \theta = \frac{\pi}{2}, \frac{5\pi}{2}, \) and when \( \cos \theta = 0 \) but \( \sin \theta \neq 1 \), which occurs at \( \theta = \frac{3\pi}{2} \). So the horizontal tangents are at \((\frac{1}{2}, \frac{7\pi}{6}), (\frac{1}{2}, \frac{5\pi}{6}) \) and \((2, \frac{3\pi}{2}) \). There are vertical tangents when \( 2 \sin^2 \theta - \sin \theta - 1 = (2 \sin \theta + 1)(\sin \theta - 1) = 0 \), or \( \theta = \frac{5\pi}{6}, \theta = \frac{11\pi}{6}, \) and \( \theta = \frac{\pi}{2} \). The vertical tangents are thus \((\frac{1}{2}, \frac{7\pi}{6}), (\frac{1}{2}, \frac{11\pi}{6}) \) and \((0, \frac{\pi}{2}) \).

11.4.20 Note that this curve is actually the vertical line \( x = 1 \), so it has no horizontal tangents, and a vertical tangent at every \( \theta \), so at (sec \( \theta, \theta \)) for every \( \theta \).
11.4.21

\[ A = 2 \cdot \frac{1}{2} \int_{0}^{\pi/2} \cos \theta \, d\theta = \sin \theta \bigg|_{0}^{\pi/2} = 1. \]

11.4.22

\[ A = 2 \cdot \frac{1}{2} \int_{0}^{\pi/4} \cos 2\theta \, d\theta = \frac{1}{2} \sin 2\theta \bigg|_{0}^{\pi/4} = \frac{1}{2}. \]

11.4.23

\[ A = \frac{1}{2} \int_{0}^{\pi} (8 \sin \theta)^2 \, d\theta = 32 \int_{0}^{\pi} \sin^2 \theta \, d\theta \\
= 32 \int_{0}^{\pi} \frac{1 - \cos 2\theta}{2} \, d\theta = 32 \left( \frac{1}{2} \theta - \frac{\sin \theta \cos \theta}{2} \right) \bigg|_{0}^{\pi} \\
= 16\pi. \]
11.4.24

\[ A = \frac{1}{2} \int_0^{2\pi} (4 + 4 \sin \theta)^2 \, d\theta = 8 \int_0^{2\pi} (1 + 2 \sin \theta + \sin^2 \theta) \, d\theta = 8 \left( \theta - 2 \cos \theta + \frac{1}{2} \theta - \frac{\sin \theta \cos \theta}{2} \right) \bigg|_0^{2\pi} = 24\pi. \]

11.4.25

Using symmetry, we have

\[ \frac{1}{2} \cdot 2 \int_0^{\pi/2} (2 + \cos \theta)^2 \, d\theta = \int_0^{\pi/2} (4 + 4 \cos \theta + \cos^2 \theta) \, d\theta = \left( 4\theta + 4 \sin \theta + \frac{1}{2} \theta + \frac{\sin \theta \cos \theta}{2} \right) \bigg|_0^{\pi/2} = \frac{9\pi}{2}. \]

11.4.26

Because there are four symmetric leaves, we compute the area of \( \frac{1}{2} \) of one of the leaves, and then multiply by 8 to get the total area. We have

\[ \frac{1}{2} \int_0^{\pi/4} 9 \sin^2 2\theta \, d\theta = \frac{9}{2} \int_0^{\pi/4} \sin^2 2\theta \, d\theta = \frac{9}{4} \left( \theta - \frac{\sin 2\theta \cos 2\theta}{2} \right) \bigg|_0^{\pi/4} = \frac{9\pi}{16}. \]

So the total area is \( 8 \cdot \frac{9\pi}{16} = \frac{9\pi}{2}. \)
11.4.27

\[ 2 \cdot \frac{1}{2} \int_0^{\pi/6} \cos^2 3\theta \, d\theta = \int_0^{\pi/6} \frac{1 + \cos 6\theta}{2} \, d\theta = \left( \frac{\theta}{2} + \frac{\sin 6\theta}{12} \right) \bigg|_0^{\pi/6} = \frac{\pi}{12}. \]

11.4.28

\[ 2 \cdot \frac{1}{2} \int_0^{\pi/3} \left( \cos \theta - \frac{1}{2} \right)^2 \, d\theta = \int_0^{\pi/3} \left( \cos^2 \theta - \cos \theta + \frac{1}{4} \right) \, d\theta = \int_0^{\pi/3} \left( \frac{1}{2} \cos 2\theta - \cos \theta + \frac{3}{4} \right) \, d\theta = \left( \frac{1}{4} \sin 2\theta - \sin \theta + \frac{3\theta}{4} \right) \bigg|_0^{\pi/3} = \frac{\sqrt{3}}{8} - \frac{\sqrt{3}}{2} + \frac{\pi}{4} = \frac{\pi}{4} - \frac{3\sqrt{3}}{8}. \]

11.4.29

The area is given by

\[ 2 \cdot \frac{1}{2} \int_0^{\pi/3} \left( \cos^2 \theta - \left( \frac{1}{2} \right)^2 \right) \, d\theta = \int_0^{\pi/3} \left( \frac{1}{2} \cos 2\theta + \frac{1}{4} \right) \, d\theta = \left( \frac{1}{4} \sin 2\theta + \frac{\theta}{4} \right) \bigg|_0^{\pi/3} = \frac{\sqrt{3}}{8} + \frac{\pi}{12}. \]
11.4.30

Note that the two curves intersect where $\sqrt{\cos \theta} = \frac{1}{\sqrt{2}}$, or $\cos \theta = \frac{1}{2}$, so for $\theta = \pm \frac{\pi}{3}$. By symmetry, we can compute the shaded area from $\theta = 0$ to $\theta = \frac{\pi}{3}$ and double it:

$$2 \cdot \frac{1}{2} \int_0^{\pi/3} \left( \cos \theta - \frac{1}{2} \right) d\theta = \left( \sin \theta - \frac{\theta}{2} \right) \bigg|_0^{\pi/3} = \frac{\sqrt{3}}{2} - \frac{\pi}{6}.$$ 

11.4.31

The region inside the circle between 0 and $\frac{\pi}{3}$ is one sixth the area of a circle of radius $\frac{1}{\sqrt{2}}$ so it has area $\frac{1}{6} \pi r^2 = \frac{1}{2} \pi \cdot \frac{1}{2} = \frac{\pi}{12}$. The rest of the area is given by

$$\frac{1}{2} \int_{\pi/3}^{\pi/2} \cos \theta \ d\theta = \frac{1}{2} \sin \theta \bigg|_{\pi/3}^{\pi/2} = \frac{1}{2} \left( 1 - \frac{\sqrt{3}}{2} \right).$$

The total area is therefore $\frac{\pi}{12} + \frac{1}{2} - \frac{\sqrt{3}}{4}$.

11.4.32

The region inside the circle between 0 and $\frac{\pi}{6}$ is $\frac{1}{12}$ the area of a circle of radius $\frac{1}{\sqrt{2}}$ so it has area $\frac{1}{12} \pi r^2 = \frac{1}{12} \pi \cdot \frac{1}{2} = \frac{\pi}{24}$. The rest of the area is given by

$$\frac{1}{2} \int_{\pi/6}^{\pi/4} \cos 2\theta \ d\theta = \frac{1}{4} \sin 2\theta \bigg|_{\pi/6}^{\pi/4} = \frac{1}{4} \left( 1 - \frac{\sqrt{3}}{2} \right).$$

The total area is thus $\frac{\pi}{24} + \frac{1}{4} - \frac{\sqrt{3}}{8}$.

Copyright © 2014 Pearson Education, Inc.
11.4.33

Using symmetry, we compute the area of half of one leaf, and then double it. We have

\[ A = \frac{1}{2} \int_{0}^{\pi/10} \cos^2 5\theta \, d\theta = \frac{1}{10} \int_{0}^{\pi/2} \cos^2 u \, du \]
\[ = \frac{1}{10} \left( \frac{1}{2} u + \frac{\cos u \sin u}{2} \right) \bigg|_{0}^{\pi/2} = \frac{\pi}{40}. \]

So the area of one leaf is \[2 \cdot \frac{\pi}{40} = \frac{\pi}{20}.\]

11.4.34

The curves intersect where \[4 \cos 2\theta = 2,\] or \[\theta = \frac{\pi}{6}.\] By symmetry, we can compute the area of half of the tip of one leaf, and then multiply by 8. The area of half of the tip of one leaf is given by

\[ \frac{1}{2} \int_{0}^{\pi/6} (4 \cos 2\theta)^2 - 4 \, d\theta \]
\[ = \int_{0}^{\pi/6} (8 \cos^2 2\theta - 2) \, d\theta \]
\[ = (4\theta + \sin 4\theta) \bigg|_{0}^{\pi/6} = \frac{\pi}{3} + \frac{\sqrt{3}}{2}. \]

Thus the total area desired is \[8 \left( \frac{\pi}{3} + \frac{\sqrt{3}}{2} \right) = \frac{8\pi}{3} + 4\sqrt{3}.\]

11.4.35

Note that the area inside one leaf of the rose but outside the circle is given by

\[ \frac{1}{2} \int_{\pi/12}^{5\pi/12} (16 \sin^2 2\theta - 4) \, d\theta \]
\[ = (2\theta - \sin 4\theta) \bigg|_{\pi/12}^{5\pi/12} = \sqrt{3} + \frac{2\pi}{3}. \]

Also, the area inside one leaf of the rose is \[\frac{1}{2} \int_{0}^{\pi/2} 16 \sin^2 2\theta \, d\theta = (4\theta - \sin 4\theta) \bigg|_{0}^{\pi/2} = 2\pi.\] Thus the area inside one leaf of the rose and inside the circle must be \[2\pi - (\sqrt{3} + \frac{2\pi}{3}) = \frac{4\pi}{3} - \sqrt{3},\] and the total area inside the rose and inside the circle must be \[4 \left( \frac{4\pi}{3} - \sqrt{3} \right) = \frac{16\pi}{3} - 4\sqrt{3}.\]
11.4.36

The curves intersect for $2\sin 2\theta = 1$, which occurs in the first quadrant at $\theta = \frac{\pi}{12}$ and $\theta = \frac{5\pi}{12}$. So one half of the total desired area is given by

$$\frac{1}{2} \int_{\pi/12}^{5\pi/12} (2\sin 2\theta - 1) \, d\theta$$

$$= \frac{1}{2} \left[ (-\cos 2\theta - \theta) \right]_{\pi/12}^{5\pi/12}$$

$$= -\frac{1}{2} \left( -\sqrt{3} + \frac{\pi}{3} \right) = \frac{\sqrt{3}}{2} - \frac{\pi}{6}.$$ 

So the total desired area is $\sqrt{3} - \frac{\pi}{3}$.

11.4.37

These curves intersect when $\sin \theta = \cos \theta$, which occurs at $\theta = \frac{\pi}{4}$ and $\theta = \frac{5\pi}{4}$, and when $r = 0$ which occurs for $\theta = 0$ and $\theta = \pi$ for the first curve and $\theta = \frac{\pi}{2}$ and $\theta = \frac{3\pi}{2}$ for the second curve. Only two of these intersection points are unique: the origin and the point $\left( \frac{3\sqrt{2}}{2}, \frac{\pi}{4} \right) = \left( -\frac{3\sqrt{2}}{2}, \frac{5\pi}{4} \right)$.

11.4.38

The curves intersect where $2 + 2\sin 2\theta = 2 - 2\sin \theta$, which occurs when $\sin \theta = 0$. The curves also intersect at the origin, which occurs for the first curve at $\theta = \frac{3\pi}{2}$ and for the second curve at $\frac{\pi}{2}$. The only points of intersection are the origin, $(2, 0)$ and $(2, \pi)$. 

Copyright © 2014 Pearson Education, Inc.
11.4.39

The curves intersect when \( \sin \theta = \cos \theta \), which occurs for \( \theta = \frac{\pi}{4} \) and \( \theta = \frac{5\pi}{4} \). The corresponding points are \( \left(\frac{2+\sqrt{2}}{2}, \frac{\pi}{4}\right) \) and \( \left(\frac{2-\sqrt{2}}{2}, \frac{5\pi}{4}\right) \). They also intersect at the pole: the first curve is at the pole at \((0, \pi)\) and the other at \((0, \frac{3\pi}{4})\).

11.4.40

The intersection points of these curves will all be of the form \( (\pm 1, \theta) \), so that \( \cos 2\theta = \pm \frac{\sqrt{2}}{2} \). Now, \( \cos 2\theta = \frac{\sqrt{2}}{2} \) for \( \theta = \frac{\pi}{8}, \frac{7\pi}{8}, \frac{9\pi}{8}, \frac{11\pi}{8}, \) and \( \frac{13\pi}{8} \). Thus the solutions are \( (1, \frac{\pi}{8}), (1, \frac{7\pi}{8}), (1, \frac{9\pi}{8}), (1, \frac{11\pi}{8}), (-1, \frac{3\pi}{8}), (-1, \frac{\pi}{8}), (-1, \frac{5\pi}{8}), \) and \( (-1, \frac{13\pi}{8}) \). The last four are the same points at \((1, \frac{11\pi}{8}), (1, \frac{13\pi}{8}), (1, \frac{3\pi}{8}), \) and \((1, \frac{5\pi}{8})\).

11.4.41

By symmetry, we need to compute the area inside \( r = 3 \sin \theta \) between 0 and \( \frac{\pi}{4} \) and then double that result. We have

\[
2 \cdot \frac{1}{2} \int_0^{\pi/4} 9 \sin^2 \theta \, d\theta = \frac{9}{2} \int_0^{\pi/4} (1 - \cos 2\theta) \, d\theta = \frac{9}{2} \left( \theta - \frac{1}{2} \sin 2\theta \right) \bigg|_0^{\pi/4} = \frac{9}{2} \left( \frac{\pi}{4} - \frac{1}{2} \right) = \frac{9}{8} (\pi - 2).
\]

11.4.42

By symmetry, we need to compute the area of the region inside \( r = 2 - 2 \sin \theta \) between 0 and \( \frac{\pi}{2} \) and then quadruple it. We have

\[
4 \cdot \frac{1}{2} \int_0^{\pi/2} (2 - 2 \sin \theta)^2 \, d\theta = 8 \int_0^{\pi/2} (1 - 2 \sin \theta + \sin^2 \theta) \, d\theta
= 8 \int_0^{\pi/2} \left( \frac{3}{2} - 2 \sin \theta - \frac{1}{2} \cos 2\theta \right) \, d\theta
= (12\theta + 16 \cos \theta - 2 \sin 2\theta) \bigg|_0^{\pi/2}
= 6\pi + 0 - (0 + 16 - 0) = 6\pi - 16.
\]
11.4.43 By symmetry, we can compute the area between \( \frac{\pi}{4} \) and \( \frac{3\pi}{4} \) inside \( r = 1 + \cos \theta \) and then double it. This will include both the bigger and smaller enclosed regions. We have

\[
2 \frac{1}{2} \int_{\pi/4}^{5\pi/4} (1 + \cos \theta)^2 \, d\theta = \int_{\pi/4}^{5\pi/4} \left( 1 + 2 \cos \theta + \frac{1}{2} (1 + \cos 2\theta) \right) \, d\theta
\]

\[
= \int_{\pi/4}^{5\pi/4} \left( \frac{3}{2} + 2 \cos \theta + \frac{1}{2} \cos 2\theta \right) \, d\theta
\]

\[
= \left[ \frac{3\theta}{2} + 2 \sin \theta + \frac{1}{4} \sin 2\theta \right]_{\pi/4}^{5\pi/4}
\]

\[
= \left( \frac{15\pi}{8} - \sqrt{2} + \frac{1}{4} \right) - \left( \frac{3\pi}{8} + \sqrt{2} + \frac{1}{4} \right)
\]

\[
= \frac{3\pi}{2} - 2\sqrt{2}.
\]

11.4.44 By symmetry, we can compute the area between 0 and \( \frac{\pi}{8} \) within the circle \( r = 1 \) and add it to the area between \( \frac{\pi}{8} \) and \( \frac{\pi}{4} \) within the curve \( \sqrt{2} \cos 2\theta \) and then multiply this by 8. The area within the circle between 0 and \( \frac{\pi}{8} \) is \( \frac{1}{16} \) of the area of the circle, so its area is \( \frac{\pi}{16} \). The area between \( \frac{\pi}{8} \) and \( \frac{\pi}{4} \) within \( \sqrt{2} \cos 2\theta \) is given by

\[
\frac{1}{2} \int_{\pi/8}^{\pi/4} 2 \cos^2 2\theta \, d\theta = \frac{1}{2} \int_{\pi/8}^{\pi/4} (1 + \cos 4\theta) \, d\theta = \frac{1}{2} \left( \theta + \frac{1}{4} \sin 4\theta \right) \bigg|_{\pi/8}^{\pi/4} = \frac{1}{2} \left( \frac{\pi}{4} + 0 - \left( \frac{\pi}{8} + \frac{1}{4} \right) \right) = \frac{\pi}{16} - \frac{1}{8}.
\]

Adding this to the previously computed area gives that \( \frac{1}{8} \) of the total area is \( \frac{\pi}{16} - \frac{1}{8} + \frac{\pi}{16} = \frac{\pi}{8} - \frac{1}{8} \). Thus the total area we are seeking is \( \pi - 1 \).

11.4.45 Note that the diameter of the circle is \( a \), and that the complete circle is traversed for \( 0 \leq t \leq \pi \). Then \( L = \int_0^\pi \sqrt{(a \sin t)^2 + (a \cos t)^2} \, d\theta = \int_0^\pi a \, d\theta = \pi a \).

11.4.46 \( L = \int_0^{2\pi} \sqrt{(2 - 2 \sin^2 \theta)^2 + 4 \cos^2 \theta} \, d\theta = \int_0^{2\pi} \sqrt{8 - 8 \sin^2 \theta} \, d\theta \). By symmetry, this is

\[
2 \sqrt{8} \int_{-\pi/2}^{\pi/2} \sqrt{1 - \sin \theta} \cdot \frac{\sqrt{1 + \sin \theta}}{\sqrt{1 + \sin \theta}} \, d\theta = 2 \sqrt{8} \int_{-\pi/2}^{\pi/2} \cos \theta \, d\theta.
\]

Let \( u = 1 + \sin \theta \) so that \( du = \cos \theta \, d\theta \). Then we have \( L = 2 \sqrt{8} \int_0^1 u^{-1/2} \, du = 4 \sqrt{8} \cdot \sqrt{u}_{0}^{1} = 4 \sqrt{8} \cdot \sqrt{2} = 16 \).

11.4.47 \( L = \int_0^{2\pi} \sqrt{\theta^4 + 4\theta^2} \, d\theta = \int_0^{\pi} \theta \sqrt{\theta^4 + 4} \, d\theta \). Let \( u = \theta^2 + 4 \), so that \( du = 2\theta \, d\theta \). Substituting gives

\[
\frac{1}{2} \int_4^{16} \sqrt{u} \, du = \frac{1}{2} \cdot \frac{2}{3} \cdot u^{3/2} \bigg|_4^{16} = \frac{1}{3} (8(\pi^2 + 1)^{3/2} - 8) = \frac{8}{3} ((\pi^2 + 1)^{3/2} - 1).
\]

11.4.48 \( L = \int_0^{2\pi} e^{2\theta} + e^{-2\theta} \, d\theta = \sqrt{2} \int_0^{2\pi} e^\theta \, d\theta = \sqrt{2} e^\theta \bigg|_0^{2\pi} = \sqrt{2}(e^{2\pi} - 1) \).

11.4.49 Using symmetry,

\[
L = 2 \int_{-\pi/2}^{\pi/2} \sqrt{(4 + 4 \sin \theta)^2 + (4 \cos \theta)^2} \, d\theta
\]

\[
= 8 \int_{-\pi/2}^{\pi/2} \sqrt{(1 + \sin \theta)^2 + (\cos \theta)^2} \, d\theta
\]

\[
= 8 \int_{-\pi/2}^{\pi/2} 2 + 2 \sin \theta \, d\theta
\]

\[
= 8 \sqrt{2} \int_{-\pi/2}^{\pi/2} \sin \theta \cdot \frac{1}{\sqrt{1 - \sin \theta}} \, d\theta
\]

\[
= 8 \sqrt{2} \int_{-\pi/2}^{\pi/2} \cos \theta \, d\theta.
\]

Copyright © 2014 Pearson Education, Inc.
Let \( u = 1 - \sin \theta \) so that \( du = -\cos \theta \, d\theta \). Then \( L = -8\sqrt{2} \int_0^1 \frac{1}{\sqrt{u}} \, du = -16\sqrt{2} \cdot \sqrt{u}|_0^1 = 32 \).

11.4.50 \( L = \int_0^\theta \sqrt{(4\cos^2 \theta) + 4\theta^2} \, d\theta = \int_0^\theta 4\sqrt{\cos^2 \theta + \theta^2} \, d\theta \). Let \( u = \theta^2 + 4 \) so that \( du = 2\theta \, d\theta \). Then

\[
L = 2 \int_4^{40} u^{1/2} \, du = \frac{4}{3} \left[ (40^{3/2} - 8) \right] = \frac{32}{3}(10\sqrt{10} - 1).
\]

11.4.51 \( L = \int_0^{\ln 8} \sqrt{4e^{4\theta} + 16e^{4\theta}} \, d\theta = 2\sqrt{5} \int_0^{\ln 8} e^{2\theta} \, d\theta = \sqrt{5} e^{2\theta}|_0^{\ln 8} = \sqrt{5}(64 - 1) = 63\sqrt{5} \).

11.4.52 \( L = \int_0^\pi \sqrt{\sin^2 \frac{\theta}{2} + \sin^2 \frac{\theta}{2} \cos^2 \frac{\theta}{2}} \, d\theta = \int_0^\pi \sqrt{\sin^2 \frac{\theta}{2}} \, d\theta = -2 \cos \frac{\theta}{2}|_0^\pi = 2 \).

11.4.53

\[
L = \int_0^{\pi/2} \sqrt{\sin^6 \frac{\theta}{3} + \sin^4 \frac{\theta}{3} \cos^2 \frac{\theta}{3}} \, d\theta = \int_0^{\pi/2} \sin^2 \frac{\theta}{3} \, d\theta = \frac{1}{2} \int_0^{\pi/2} \left( 1 - \cos \frac{2\theta}{3} \right) \, d\theta
\]

\[
= \frac{1}{2} \left( \theta - \frac{3}{2} \sin \frac{2\theta}{3} \right)|_0^{\pi/2} = \frac{1}{2} \left( \frac{\pi}{2} - \frac{3\sqrt{3}}{4} \right) = \frac{2\pi - 3\sqrt{3}}{8}.
\]

11.4.54

\[
L = \int_0^{\pi/2} \sqrt{\frac{2}{(1 + \cos \theta)^2} + \left( \frac{\sqrt{2} \sin \theta}{(1 + \cos \theta)^2} \right)^2} \, d\theta = \int_0^{\pi/2} \sqrt{\frac{2(1 + \cos \theta)^2 + 2\sin^2 \theta}{(1 + \cos \theta)^4}} \, d\theta
\]

\[
= \int_0^{\pi/2} \sqrt{\frac{4 + 4 \cos \theta}{(1 + \cos \theta)^3}} \, d\theta = 2 \int_0^{\pi/2} (1 + \cos \theta)^{-3/2} \, d\theta.
\]

Now note that

\[
(1 + \cos \theta)^{-3/2} = (\sqrt{1 + \cos \theta})^{-3} = \left( \sqrt{2} \cos \frac{\theta}{2} \right)^{-3} = \frac{1}{2\sqrt{2} \sec^3 \frac{\theta}{2}},
\]

so

\[
L = \frac{2}{2\sqrt{2}} \int_0^{\pi/2} \sec^3 \frac{\theta}{2} \, d\theta = \frac{2}{\sqrt{2}} \int_0^{\pi/4} \sec^3 u \, du
\]

\[
= \frac{1}{\sqrt{2}} (\sec u \tan u + \ln |\sec u + \tan u|)|_0^{\pi/4} = \frac{\sqrt{2}}{2} \left( \sqrt{2} + \ln(\sqrt{2} + 1) \right) = 1 + \frac{\sqrt{2}}{2} \ln(\sqrt{2} + 1).
\]

11.4.55

a. False. The area is given by \( \frac{1}{2} \int_0^\theta f(\theta)^2 \, d\theta \).

b. False. The slope is given by \( \frac{dy}{dx} \), which can be computed using the formula

\[
\frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta} = \frac{f'(\theta) \sin \theta + f(\theta) \cos \theta}{f'(\theta) \cos \theta - f(\theta) \sin \theta}.
\]

11.4.56 The polar point \((-1, \frac{3\pi}{4})\) is equivalent to the polar point \((1, \frac{\pi}{2})\) which does satisfy the equation.

11.4.57 The circles intersect for \( \theta = \frac{\pi}{6} \) and \( \theta = \frac{5\pi}{6} \). The area inside \( r = 2 \sin \theta \) but outside of \( r = 1 \) is given by

\[
\frac{1}{2} \int_{\pi/6}^{5\pi/6} (4 \sin^2 \theta - 1) \, d\theta = \frac{1}{2} (\theta - \sin 2\theta)|_{\pi/6}^{5\pi/6} = \frac{\pi}{3} + \frac{\sqrt{3}}{2}.
\]

The total area of \( r = 2 \sin \theta \) is \( \pi \). Thus, the area inside both circles is \( \pi - \left( \frac{\pi}{2} + \frac{\sqrt{3}}{2} \right) = \frac{2\pi}{3} - \frac{\sqrt{3}}{2} \).
11.4.58 The inner loop is traced from $\theta = \frac{2\pi}{3}$ to $\theta = \frac{4\pi}{3}$. So the area is given by
\[
\frac{1}{2} \int_{\frac{2\pi}{3}}^{\frac{4\pi}{3}} (2 + 4 \cos \theta)^2 \, d\theta = \frac{1}{3} \int_{\frac{2\pi}{3}}^{\frac{4\pi}{3}} (2 + 8 \cos \theta + 8 \cos^2 \theta) \, d\theta = (2\theta + 8 \sin \theta + 4\theta + 2\sin 2\theta) \bigg|_{\frac{2\pi}{3}}^{\frac{4\pi}{3}} = 4\pi - 6\sqrt{3}.
\]

11.4.59 The inner loop is traced out between $\theta = \frac{\pi}{6}$ and $\theta = \frac{5\pi}{6}$, so its area is given by
\[
\frac{1}{2} \int_{\frac{\pi}{6}}^{\frac{5\pi}{6}} (3 - 6 \sin \theta)^2 \, d\theta = \frac{1}{2} \int_{\frac{\pi}{6}}^{\frac{5\pi}{6}} (9 - 36 \sin \theta + 36 \sin^2 \theta) \, d\theta
= \frac{3}{2} (3\theta + 12 \cos \theta + 6\theta - 3 \sin 2\theta) \bigg|_{\frac{\pi}{6}}^{\frac{5\pi}{6}} = 9\pi - \frac{27\sqrt{3}}{2}.
\]

We can determine the area inside the outer loop by using symmetry and doubling the area of the region traced out between $\frac{5\pi}{6}$ and $\frac{3\pi}{2}$. Thus the area inside the outer region is
\[
2 \cdot \frac{1}{2} \int_{\frac{5\pi}{6}}^{\frac{3\pi}{2}} (3 - 6 \sin \theta)^2 \, d\theta = 3(3\theta + 12 \cos \theta + 6\theta - 3 \sin 2\theta) \bigg|_{\frac{5\pi}{6}}^{\frac{3\pi}{2}} = 18\pi + \frac{27\sqrt{3}}{2}.
\]

So the area outside the inner loop and inside the outer loop is $18\pi + \frac{27\sqrt{3}}{2} - \left(9\pi - \frac{27\sqrt{3}}{2}\right) = 9\pi + 27\sqrt{3}$.

11.4.60 The curves intersect at $\theta = \frac{\pi}{3}$, and using symmetry, the area we seek is
\[
A = 2 \cdot \frac{1}{2} \int_{0}^{\pi/3} (1 + \cos \theta)^2 \, d\theta + 2 \cdot \frac{1}{2} \int_{\pi/3}^{\pi/2} (3 \cos \theta)^2 \, d\theta
= \int_{0}^{\pi/3} (1 + 2 \cos \theta + \cos^2 \theta) \, d\theta + \int_{\pi/3}^{\pi/2} 9 \cos^2 \theta \, d\theta
= \left(\theta + 2 \sin \theta + \frac{\theta}{2} + \frac{\sin 2\theta}{4}\right) \bigg|_{0}^{\pi/3} + \left(9\theta + \frac{9 \sin 2\theta}{4}\right) \bigg|_{\pi/3}^{\pi/2}
= \frac{\pi}{2} + 2 \cdot \frac{\sqrt{3}}{2} + \frac{\sqrt{3}}{8} + 9\pi - \left(3\pi + \frac{9\sqrt{3}}{8}\right)
= \frac{5\pi}{4}.
\]

11.4.61 A plot of the spiral is
11.4.62

a. The area of one half of one leaf is \( \frac{1}{2} \int_0^{\pi/(4m)} \cos^2 2m\theta \, d\theta = \left( \frac{\theta + \sin 4m\theta}{4m} \right)|_0^{\pi/(4m)} = \frac{\pi}{2m} \). So the area of all 8m half-leaves is \( \frac{\pi}{m} \).

b. The area of one half of one leaf is \( \frac{1}{2} \int_0^{\pi/(4m+2)} \cos^2(2m + 1)\theta \, d\theta = \left( \frac{\theta + \sin 2(2m+1)\theta}{4(4m+2)} \right)|_0^{\pi/(4m+2)} = \frac{\pi}{4(2m+1)} \). So the area of all 2(2m + 1) half-leaves is \( \frac{\pi}{2m+1} \).

11.4.63

a. \( A_n = \frac{1}{2} \int_{2(n-2)\pi}^{(2n-1)\pi} e^{-2\theta} \, d\theta - \frac{1}{2} \int_{2n\pi}^{(2n+1)\pi} e^{-2\theta} \, d\theta = -\frac{1}{4} e^{-(4n-2)\pi} + \frac{1}{4} e^{-(4n-4)\pi} + \frac{1}{4} e^{-(4n+2)\pi} - \frac{1}{4} e^{4n\pi} \).

b. Each term tends to 0 as \( n \to \infty \) so \( \lim_{n \to \infty} A_n = 0 \).

c. \( \frac{A_{n+1}}{A_n} = \frac{e^{-(4n+2)\pi} + e^{-(4n)\pi} + e^{-(4n+6)\pi} - e^{-(4n+4)\pi}}{e^{-(4n-2)\pi} + e^{-(4n-4)\pi} + e^{-(4n+2)\pi} - e^{4n\pi}} = e^{-4\pi} \), so \( \lim_{n \to \infty} \frac{A_{n+1}}{A_n} = e^{-4\pi} \).

11.4.64 The area of one half of one leaf is \( \frac{1}{2} \int_0^{\pi/6} \cos^2 3\theta \, d\theta = \left( \theta + \frac{\sin 6\theta}{6} \right)|_0^{\pi/6} = \frac{\pi}{6} \). So the area of all 6 half-leaves is \( \pi \).

11.4.65 One half of the area is given by \( \frac{1}{2} \int_0^{\pi/6} 6 \sin 2\theta \, d\theta = -3 \cos 2\theta|_0^{\pi/6} = 3 \), so the total area is 6.

11.4.66 By symmetry, we can compute the area between \( \theta = \frac{5\pi}{6} \) and \( \theta = \frac{3\pi}{2} \) and double it. Thus, the total area we seek is given by
\[
\int_{5\pi/6}^{3\pi/2} (2 - 4 \sin \theta)^2 \, d\theta = \left[ 4 - 16 \sin \theta + 16 \sin^2 \theta \right]|_{5\pi/6}^{3\pi/2} = (4\theta + 16 \cos \theta + 8\theta - 4 \sin 2\theta)|_{5\pi/6}^{3\pi/2} = 6\sqrt{3} + 8\pi.
\]

11.4.67 The area is given by
\[
\frac{1}{2} \int_0^{2\pi} (4 - 2 \cos \theta)^2 \, d\theta = \left[ 8\theta - 8 \sin \theta + \frac{1}{2} \sin 2\theta \right]|_0^{2\pi} = 18\pi.
\]

11.4.68

a. \( L = \int_0^{\sqrt{12}} \sqrt{f(\theta)^2 + f'(\theta)^2} \, d\theta = \int_0^{\sqrt{12}} \sqrt{\theta^4 + 4\theta^2} \, d\theta = \int_0^{\sqrt{12}} \theta \sqrt{\theta^2 + 4} \, d\theta \). Now substitute \( u = \theta^2 + 4 \), so that \( du = 2\theta \, d\theta \); then \( \theta = 0 \) corresponds to \( u = 4 \) and \( \theta = \sqrt{12} \) corresponds to \( u = 16 \), and we get
\[
L = \frac{1}{2} \int_4^{16} \sqrt{u} \, du = \frac{1}{3} u^{3/2}|_4^{16} = \frac{56}{3}.
\]

b. Use the same approach as in part (a):
\[
L = \int_0^6 \sqrt{\phi^2 + 4\phi^2} \, d\phi = \int_0^6 \sqrt{\phi^2 + 4\phi^2} \, d\phi = \int_0^6 \phi \sqrt{\phi^2 + 4} \, d\phi = \frac{1}{2} \int_4^{6} \sqrt{u} \, du = \frac{1}{3} u^{3/2}|_4^{6} = \frac{1}{3} \left( (\theta^2 + 4)^{3/2} - 8 \right).
\]
11.4.69 \( r'(\theta) = -ae^{-a\theta} \). Thus,

\[
L = \int_{0}^{\theta} \sqrt{e^{-2a\theta} + a^2e^{-2a\theta}} d\theta \\
= \sqrt{1 + a^2} \int_{0}^{\theta} e^{-a\theta} d\theta \\
= \lim_{b \to \infty} \sqrt{1 + a^2} \int_{0}^{b} e^{-a\theta} d\theta \\
= \frac{\sqrt{1 + a^2}}{-a} \lim_{b \to \infty} e^{-a\theta} \Big|_{0}^{b} \\
= \frac{\sqrt{1 + a^2}}{-a} (0 - 1) = \frac{\sqrt{1 + a^2}}{a}.
\]

Then \( \lim_{p \to \infty} V_{\text{avg}} = V \cdot \lim_{p \to \infty} = \frac{2p}{2p+2} = V \). Plots are:

\[
\begin{align*}
p=1 \\
r \quad v
\end{align*}
\[
\begin{align*}
p=2 \\
r \quad v
\end{align*}
\[
\begin{align*}
p=6 \\
r \quad v
\end{align*}
\]
11.4.71 Suppose that the goat is tethered at the origin, and that the center of the corral is \((1, \pi)\). The circle that the goat can graze is \(r = a\), and the corral is given by \(r = -2 \cos \theta\). The intersection occurs for \(\theta = \cos^{-1} \left( -\frac{a}{2} \right) \). The area grazed by the goat is twice the area of the sector of the circle \(r = a\) between \(\cos^{-1} \left( -\frac{a}{2} \right) \) and \(\pi\), plus twice the area of the circle \(r = -2 \cos \theta\) between \(\frac{\pi}{2}\) and \(\cos^{-1} \left( -\frac{a}{2} \right) \). Thus we need to compute

\[
A = \int_{\cos^{-1} \left( -\frac{a}{2} \right) / 2}^{\pi} a^2 \, d\theta + \int_{\pi/2}^{\cos^{-1} \left( -a/2 \right) / 2} 4 \cos^2 \theta \, d\theta \\
= a^2 \pi - a^2 \cos^{-1} \left( -\frac{a}{2} \right) + (2 \cos \theta \sin \theta + 2\theta)|_{\cos^{-1} \left( -a/2 \right) / 2}^{\pi/2} \\
= a^2 \left( \pi - \cos^{-1} \left( \frac{a}{2} \right) \right) - \pi - \frac{1}{2} a \sqrt{4 - a^2} + 2 \cos^{-1} \left( -\frac{a}{2} \right).
\]

Note that \(\pi - \cos^{-1} \left( -\frac{a}{2} \right) = \cos^{-1} \frac{a}{2}\), so this can be written as \((a^2 - 2) \cos^{-1} \frac{a}{2} + \pi - \frac{1}{2} a \sqrt{4 - a^2}\). Note that for \(a = 0\) this is 0, and for \(a = 2\) this is \(\pi\), as desired.

11.4.72 Imagine that the boundary of the concrete slab is the fence from the previous problem. Then the area the goat could graze in the previous problem becomes the area it can’t graze in this problem. If the slab weren’t there, the goat could graze a region of area \(\pi a^2\). Thus, the goat can graze a region of area

\[
\pi a^2 - \left( (a^2 - 2) \cos^{-1} \frac{a}{2} + \pi - \frac{1}{2} a \sqrt{4 - a^2} \right) = \pi (a^2 - 1) + \frac{1}{2} a \sqrt{4 - a^2} + (2 - a^2) \cos^{-1} \frac{a}{2}.
\]

If \(a = 0\), this quantity is 0, while if \(a = 2\), this quantity is 3\(\pi\).

11.4.73 Again suppose that the goat is tethered at the origin, and that the center of the corral is \((1, \pi)\) in polar coordinates. Note that to the right of the vertical line \(\theta = \frac{\pi}{2}\), the goat can graze a half-circle of area \(\frac{\pi}{2} a^2\). Also, there is a region in the 2nd quadrant and one in the 3rd quadrant of equal size that can also be grazed. Let this region have area \(A\), so that the total area grazed will then be \(\frac{\pi a^2}{2} + 2A\). To determine \(A\), consider the following diagram:

Now imagine that the goat is walking “west” from the polar point \((a, \frac{\pi}{2})\), and is keeping the rope taut until his whole rope is along the fence in the second quadrant. Let \(\phi\) be the central angle from the origin to the polar point \((1, \pi)\) to the point on the fence that the goat’s rope is touching as he makes this walk, and consider a wedge with angle \(d\phi\) at that point. By the same argument as given in the text when discussing areas of polar regions, the area of this wedge is approximately \(\frac{d\phi}{2\pi}\) times the area of a circle of radius \(a - \phi\), so it is \(\approx \frac{d\phi}{2\pi} \cdot \pi (a - \phi)^2 = \frac{1}{2} (a - \phi)^2 d\phi\). When the goat is at \((a, \frac{\pi}{2})\), we have \(\phi = 0\). When the goat is all the way to the fence, we have \(\phi = a\). So in the limit, the sum of the areas of all of these wedges becomes

\[
A = \int_0^a \left( \frac{1}{2} (a - \phi)^2 \right) d\phi = \frac{1}{2} \left( a^2 \phi - a\phi^2 + \frac{\phi^3}{3} \right) |_{\phi=0}^{\phi=a} = \frac{a^3}{6}.
\]

Thus the goat can graze a region of area \(\frac{\pi a^2}{2} + \frac{a^3}{3}\).
11.4.74

a. The slope of the line tangent to \( r = f(\theta) \) at \( P \) is \( \left. \frac{dy}{dx} \right|_P \). Also, the slope of a line intersecting the \( x \)-axis at an angle \( \alpha \) is \( \tan \alpha \). (Note that in the picture, \( \tan(\pi - \alpha) = -\tan \alpha = \frac{\text{rise}}{\text{run}} = \text{slope of the tangent line}. \)

b. Draw a vertical line through \( P \) and let \( Q \) be the point where this line intersects the \( x \)-axis. Then in triangle \( OPQ \) we see \( \tan \theta = \frac{y}{x} \).

c. Note that \( \frac{dy}{dx} = f'(\theta) \frac{\sin \theta + f(\theta) \cos \theta}{f'(\theta) \cos \theta - f(\theta) \sin \theta} = \frac{\tan \theta + \frac{f(\theta)}{f'(\theta)} \tan \theta}{1 - \frac{f(\theta)}{f'(\theta)} \tan \theta} = \tan \alpha \).

Because \( \alpha = \phi + \theta \) and \( \tan(\phi + \theta) = \frac{\tan \theta + \tan \phi}{1 - \tan \theta \tan \phi} \), we see that \( \tan \phi = \frac{f(\theta)}{f'(\theta)} \).

d. \( l \) is parallel to the \( x \)-axis when \( \frac{dy}{dx} = 0 \), or when \( f'(\theta) \sin \theta + f(\theta) \cos \theta = 0 \), hence if \( \tan \theta = -\frac{f(\theta)}{f'(\theta)} \).

e. \( l \) is parallel to the \( y \)-axis when \( \frac{dx}{dy} = 0 \), which occurs when \( f'(\theta) \cos \theta - f(\theta) \sin \theta = 0 \), hence if \( \tan \theta = \frac{f'(\theta)}{f(\theta)} \).

11.4.75

a. If \( \cot \varphi = \frac{f'(\theta)}{f(\theta)} \) is constant for all \( \theta \), then \( \varphi = \cot^{-1} \left( \frac{f'(\theta)}{f(\theta)} \right) \) is constant. Then \( \frac{d}{d\theta} \ln(f(\theta)) = \frac{1}{f(\theta)} \cdot f'(\theta) = \cot \varphi \) is constant.

b. If \( f(\theta) = Ce^{k\theta} \), then \( \cot \varphi = \frac{f'(\theta)}{f(\theta)} = \frac{kCe^{k\theta}}{Ce^{k\theta}} = k. \)

c. 

11.5 Vectors in the Plane

11.5.1 The coordinates of a point determine its location, but a given point has no width or breadth, so it has no size or direction. A nonzero vector has size (magnitude) and direction, but it has no location in the sense that it can be translated to a different initial point and be considered the same vector.

11.5.2 A position vector is one with its tail at the origin.

11.5.3

Copyright © 2014 Pearson Education, Inc.
11.5.5 Two vectors are equal if they have the same magnitude and direction. Given a position vector, any translation of that vector to a different initial point yields an equivalent vector. Because there are infinitely many such translations which don’t change the given vector’s direction or magnitude, there are infinitely many vectors equivalent to the given one.

11.5.6 To find the sum $\mathbf{u} + \mathbf{v}$, translate $\mathbf{v}$ so that its tail is at the head of $\mathbf{u}$. The sum of the two vectors is the one whose tail is the tail of $\mathbf{u}$ and whose head is the head of $\mathbf{v}$.

11.5.7 If $c > 0$ is given, the scalar multiple $c \mathbf{v}$ of the vector $\mathbf{v}$ is obtained by scaling the magnitude of $\mathbf{v}$ by a factor of $c$, and keeping the direction the same. If $c < 0$, then the head and tail of $\mathbf{v}$ are interchanged, and then the vector’s magnitude is scaled by a factor of $|c|$.

11.5.8 If $P(x_0, y_0)$ and $Q(x_1, y_1)$ are given, then the vector $\vec{PQ}$ is given by $(x_1 - x_0, y_1 - y_0)$.

11.5.9 $\mathbf{u} + \mathbf{v} = \langle u_1, u_2 \rangle + \langle v_1, v_2 \rangle = \langle u_1 + v_1, u_2 + v_2 \rangle$.

11.5.10 $c \mathbf{v} = c \langle v_1, v_2 \rangle = \langle cv_1, cv_2 \rangle$.

11.5.11 $|\mathbf{v}| = |\langle v_1, v_2 \rangle| = \sqrt{v_1^2 + v_2^2}$.

11.5.12 $\mathbf{v} = \langle v_1, v_2 \rangle = v_1 \mathbf{i} + v_2 \mathbf{j}$.

11.5.13 If $P(p_1, p_2)$ and $Q(q_1, q_2)$ are given, then $|\vec{PQ}| = |\langle q_1 - p_1, q_2 - p_2 \rangle| = \sqrt{(q_1 - p_1)^2 + (q_2 - p_2)^2}$.

11.5.14 Given a nonzero vector $\mathbf{v} = \langle v_1, v_2 \rangle$, the vectors $\frac{1}{\sqrt{v_1^2 + v_2^2}} \cdot \mathbf{v} = \frac{\mathbf{v}}{|\mathbf{v}|}$ and $-\frac{1}{\sqrt{v_1^2 + v_2^2}} \cdot \mathbf{v} = -\frac{\mathbf{v}}{|\mathbf{v}|}$ are unit vectors parallel to $\mathbf{v}$.

11.5.15 The vector $10 \cdot \frac{\mathbf{v}}{|\mathbf{v}|} = 10 \cdot \frac{1}{\sqrt{9 + 4}} \cdot \langle 3, -2 \rangle = \langle \frac{30}{\sqrt{13}}, -\frac{20}{\sqrt{13}} \rangle$ has the desired properties.

11.5.16 The unit vector in the desired direction is given by $\langle \frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2} \rangle$, so the desired vector is $100 \cdot \langle \frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2} \rangle = \langle 50\sqrt{2}, -50\sqrt{2} \rangle$.

11.5.17 The vectors in choices a, c, and e are all equal to $\vec{CE}$.

11.5.18 The vectors in choices b, c, and e are equal to $\vec{BK}$.

b. $\vec{QP}$

i. 

ii. $|3\mathbf{i} + 2\mathbf{j}| = \sqrt{13}$.

ii. $|-\mathbf{i} + 0 \cdot \mathbf{j}| = 1$.

c. $\vec{RQ}$

i. 

ii. $|10\mathbf{i} + 3\mathbf{j}| = \sqrt{109}$.

11.5.24 $\vec{PU} = (9, 5)$, $\vec{TR} = (-3, 0)$, $\vec{SQ} = (-4, -3)$. 

Copyright © 2014 Pearson Education, Inc.
11.5.25 \( \vec{Q}U = \langle 7, 2 \rangle \), \( \vec{P}T = \langle 7, 3 \rangle \), \( \vec{RS} = \langle 2, 3 \rangle \).

11.5.26 \( \vec{P}Q = \langle 2, 3 \rangle \), \( \vec{RS} = \langle 2, 3 \rangle \), and \( \vec{T}U = \langle 2, 2 \rangle \), so \( \vec{P}Q = \vec{RS} \).

11.5.27 \( \vec{Q}T = \langle 5, 0 \rangle \), while \( \vec{ST} = \langle 3, -1 \rangle \).

11.5.28 \( \mathbf{u} + \mathbf{v} = \langle 4, -2 \rangle + \langle -4, 6 \rangle = \langle 0, 4 \rangle \).

11.5.29 \( \mathbf{w} - \mathbf{u} = \langle 0, 8 \rangle - \langle 4, -2 \rangle = \langle -4, 10 \rangle \).

11.5.30 \( 2\mathbf{u} + 3\mathbf{v} = 2\langle 4, -2 \rangle + 3\langle -4, 6 \rangle = \langle -4, 14 \rangle \).

11.5.31 \( \mathbf{w} - 3\mathbf{v} = \langle 0, 8 \rangle - 3\langle -4, 6 \rangle = \langle 12, -10 \rangle \).

11.5.32 \( 10\mathbf{u} - 3\mathbf{v} + \mathbf{w} = 10\langle 4, -2 \rangle - 3\langle -4, 6 \rangle + \langle 0, 8 \rangle = \langle 52, -30 \rangle \).

11.5.33 \( 8\mathbf{w} + \mathbf{v} - 6\mathbf{u} = 8\langle 0, 8 \rangle + \langle -4, 6 \rangle - 6\langle 4, -2 \rangle = \langle -28, 82 \rangle \).

11.5.34 \( |\mathbf{u} + \mathbf{v}| = |\langle 4, -3 \rangle| = \sqrt{16 + 9} = 5 \).

11.5.35 \( |-2\mathbf{v}| = |\langle -2, -2 \rangle| = \sqrt{4 + 4} = 2\sqrt{2} \).
11.5.48 A unit vector parallel to \( \mathbf{v} \) is one unit vector, while the other is \( -\mathbf{u} = \left\langle -\frac{6}{\sqrt{61}}, -\frac{5}{\sqrt{61}} \right\rangle \).

11.5.49 Let \( \mathbf{b} = (20,0) \) represent the boat relative to the shore. Then the vector \( \mathbf{v} \) which represents the boat relative to the water is given by \( \mathbf{v} + \mathbf{w} = \mathbf{b} \), so \( \mathbf{v} = \mathbf{b} - \mathbf{w} = (20, 10) \). Note that \( |(20, 10)| = 10\sqrt{5} \approx 22.361 \) miles per hour represents the speed of the boat. The direction is the direction of the vector \( (2, 1) \) which is \( \tan^{-1} \frac{1}{2} \cdot \frac{180}{\pi} \approx 26.565 \) degrees north of east.

11.5.50 Let \( \mathbf{p} \) represent the vector’s terminal velocity vector. \( \mathbf{p} = (10, -4) \), and \( |\mathbf{p}| = \sqrt{100 + 16} = 2\sqrt{29} \). \( \theta = \tan^{-1} \frac{10}{1} \approx 1.190 \) radians, or 68.199°. Thus, the speed is \( 2\sqrt{29} \) meters per second, and the direction is about 68.199° east of vertical.

11.5.51 The plane’s vector is given by \( \mathbf{u} = -320i + 20\sqrt{2}(i + j) = (-320 - 20\sqrt{2})i - 20\sqrt{2}j \). The magnitude of \( \mathbf{u} \) is \( \sqrt{(-320 - 20\sqrt{2})^2 + (-20\sqrt{2})^2} \approx 349.431 \) miles per hour. \( \theta = \tan^{-1} \frac{20\sqrt{2}}{320 + 20\sqrt{2}} \approx 0.081 \) radians, or about 4.643° south of west.
11.5.52
The canoe’s vector \( \mathbf{u} \) is given by \( \mathbf{u} = -4\mathbf{i} + (-\sqrt{2}\mathbf{i} + \sqrt{2}\mathbf{j}) = -(4 + \sqrt{2})\mathbf{i} + \sqrt{2}\mathbf{j} \). The magnitude of \( \mathbf{u} \) is given by \( \sqrt{(4 + \sqrt{2})^2 + (\sqrt{2})^2} \approx 5.596 \) miles per hour.
\[ \theta = \tan^{-1} \frac{\sqrt{2}}{4 + \sqrt{2}} \approx 0.255 \text{ radians, or about } 14.639^\circ. \]
The canoe has speed about 5.6 miles per hour in the direction 14.639° north of west.

11.5.53 Let \( \mathbf{u} = \mathbf{i} \) represent the velocity of the current and \( \mathbf{v} = \sqrt{3}\cos \frac{\pi}{6}\mathbf{i} + \sqrt{3}\sin \frac{\pi}{6}\mathbf{j} = \frac{3}{2}\mathbf{i} + \frac{\sqrt{3}}{2}\mathbf{j} \) represent the velocity of the boat relative to land. If \( \mathbf{w} \) represents the wind, then \( \mathbf{w} = \mathbf{v} - \mathbf{u} = \frac{1}{2}\mathbf{i} + \frac{\sqrt{3}}{2}\mathbf{j} \).

Then \[ \theta = \tan^{-1} \frac{\sqrt{3}}{3} = \frac{\pi}{3}, \text{ or } 60^\circ. \] The speed of the wind is 1 meter per second in the direction 60° north of east (or 30° east of north.)

11.5.54
\[ \mathbf{F} = 150\cos \frac{\pi}{6}\mathbf{i} + 150\sin \frac{\pi}{6}\mathbf{j} = 75\sqrt{3}\mathbf{i} + 75\mathbf{j}. \] The horizontal component of the force is 75\sqrt{3} pounds, and the vertical component is 75 pounds.

11.5.55
a. \( \mathbf{F} = 40\cos \frac{\pi}{4}\mathbf{i} + 40\sin \frac{\pi}{4}\mathbf{j} = 20\mathbf{i} + 20\sqrt{2}\mathbf{j}, \) so the horizontal component is 20 and the vertical is 20\sqrt{2}.

b. Yes. If it is 45 degrees, the horizontal component would be \( 40\cos \frac{\pi}{4} = 20\sqrt{2} > 20. \)

c. No. If it is 45 degrees, the vertical component would be \( 40\sin \frac{\pi}{4} = 20\sqrt{2} < 20\sqrt{2}. \)

11.5.56 Let \( \mathbf{F}_1 = 100\cos \frac{\pi}{3}\mathbf{i} + 100\sin \frac{\pi}{3}\mathbf{j} = 50\mathbf{i} + 50\sqrt{3}\mathbf{j}, \) and let \( \mathbf{F}_2 = 60\cos \frac{\pi}{6}\mathbf{i} + 60\sin \frac{\pi}{6}\mathbf{j} = 30\sqrt{3}\mathbf{i} + 30\mathbf{j}. \)

Note that \( \mathbf{F}_2 \) has a greater horizontal component, because \( 30\sqrt{3} \approx 51.962 > 50. \)

11.5.57 Let the magnitude of the force on the two chains be \( f. \) Let \( \mathbf{F}_1 = \left(-\frac{\sqrt{3}}{2}\mathbf{i} + \frac{\sqrt{2}}{2}\mathbf{j}\right) f \) and let \( \mathbf{F}_2 = \left(\frac{\sqrt{2}}{2}\mathbf{i} + \frac{\sqrt{3}}{2}\mathbf{j}\right) f. \) Then \( \mathbf{F}_1 + \mathbf{F}_2 - 500\mathbf{j} = 0, \) and solving for \( f \) yields \( f = 250\sqrt{2} \) pounds.

11.5.58
\[
\mathbf{F} = \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 \\
= \sqrt{2}(-50\mathbf{i} + 50\mathbf{j}) + (30\sqrt{3}\mathbf{i} + 30\mathbf{j}) + (-75\mathbf{i} - 75\sqrt{3}\mathbf{j}) \\
= (-50\sqrt{2} + 30\sqrt{3} - 75)\mathbf{i} + (50\sqrt{2} + 30 - 75\sqrt{3})\mathbf{j}.
\]

Thus \( |\mathbf{F}| \) is about \( \sqrt{(-50\sqrt{2} + 30\sqrt{3} - 75)^2 + (50\sqrt{2} + 30 - 75\sqrt{3})^2} \) which is about 98.189 pounds.
\[
\theta = \tan^{-1} \frac{50\sqrt{2} + 30 - 75\sqrt{3}}{50\sqrt{2} + 30\sqrt{3} - 75} \approx 17.296^\circ. \]
The magnitude of the net force is about 98 pounds, and the direction is 17.296° south of west.

11.5.59
a. True. This follows because \( (\mathbf{u} + \mathbf{v}) + \mathbf{w} = (\mathbf{w} + \mathbf{v}) + \mathbf{u} \) (vector addition is commutative and associative.)
b. True. This is because \( \mathbf{u} + (-\mathbf{u}) = \mathbf{0} \).

c. False. For example, if \( \mathbf{u} = \langle 3, 4 \rangle \) and \( \mathbf{v} = \langle -3, -1 \rangle \), then \( |\mathbf{u} + \mathbf{v}| = |\langle 0, 3 \rangle| = 3 \), while \(|\mathbf{u}| = 5\).

d. False. For example, if \( \mathbf{u} = \langle 3, 4 \rangle \) and \( \mathbf{v} = \langle -1, -4 \rangle \), then \( |\mathbf{u} + \mathbf{v}| = |\langle 2, 0 \rangle| = 2 \), while \(|\mathbf{u}| + |\mathbf{v}| = 5 + \sqrt{17}\).

e. False. For example, if \( \mathbf{u} = \langle 3, 0 \rangle \) and \( \mathbf{v} = \langle 6, 0 \rangle \), then \( \mathbf{u} \) and \( \mathbf{v} \) are parallel, but have different lengths.

f. False. For example, given \( A(0, 0), B(3, 4), C(1, 1) \) and \( D(4, 5) \), we have \( \overrightarrow{AB} = \langle 3, 4 \rangle \) and \( \overrightarrow{CD} = \langle 3, 4 \rangle \), but \( A \neq C \) and \( B \neq D \).

g. False. For example, if \( \mathbf{u} = \langle 0, 1 \rangle \) and \( \mathbf{v} = \langle -1, 0 \rangle \) are perpendicular, but \( |\mathbf{u} + \mathbf{v}| = \sqrt{2} \), while \(|\mathbf{u}| + |\mathbf{v}| = 2\).

h. True. Suppose \( \mathbf{v} = k \mathbf{u} \) with \( k > 0 \). Then

\[ |\mathbf{u} + \mathbf{v}| = |\mathbf{u} + k \mathbf{u}| = |(1 + k) \mathbf{u}| = |\mathbf{u}| + |k \mathbf{u}| = |\mathbf{u}| + |\mathbf{v}|. \]

### 11.5.60

a. \( \overrightarrow{AB} = \langle 6, 16 \rangle - \langle -2, 0 \rangle = \langle 8, 16 \rangle \).

b. \( \overrightarrow{AC} = \langle 1, 4 \rangle - \langle -2, 0 \rangle = \langle 3, 4 \rangle \).

c. \( \overrightarrow{EF} = \langle 3\sqrt{2}, -4\sqrt{2} \rangle - \langle \sqrt{2}, \sqrt{2} \rangle = \langle 2\sqrt{2}, -5\sqrt{2} \rangle \).

d. \( \overrightarrow{CD} = \langle 5, 4 \rangle - \langle 1, 4 \rangle = \langle 4, 0 \rangle \).

### 11.5.61

a. Because the magnitude of \( \mathbf{v} \) is \( \sqrt{36 + 64} = 10 \), the two desired vectors are \( \langle \frac{6}{10}, -\frac{8}{10} \rangle = \langle \frac{3}{5}, -\frac{4}{5} \rangle \) and \( \langle \text{etc} \rangle \).

b. If the magnitude of \( \mathbf{v} \) is 1, then \( \sqrt{\frac{1}{5} + b^2} = 1 \), so \( b^2 = \frac{8}{9} \), so \( b = \pm \frac{2\sqrt{2}}{3} \).

c. If the magnitude of \( \mathbf{w} \) is 1, then \( \sqrt{a^2 + \frac{a^2}{9}} = 1 \), so \( \frac{10a^2}{9} = 1 \), so \( a = \pm \frac{3}{\sqrt{10}} \).

### 11.5.62

\( \overrightarrow{AB} = \langle 3, 6 \rangle \) and \( \overrightarrow{CD} = \langle b - a + 2, -a - b - 3 \rangle \). The system of linear equations \( -a + b + 2 = 3 \), \( -a - b - 3 = 6 \) has the unique solution \( a = -5 \), \( b = -4 \), so these are the only possible values for \( a \) and \( b \).

### 11.5.63

10 \( \langle a, b \rangle = \langle 2, -3 \rangle \), so 10\( a = 2 \), and \( a = \frac{1}{5} \). Also, 10\( b = -3 \), so \( b = -\frac{3}{10} \). Thus \( \mathbf{x} = \langle \frac{1}{5}, -\frac{3}{10} \rangle \).

### 11.5.64

2 \( \langle a, b \rangle + \langle 2, -3 \rangle = \langle -4, 1 \rangle \), so \( \langle a, b \rangle = \langle -3, 2 \rangle = \mathbf{x} \).

### 11.5.65

3 \( \langle a, b \rangle - 4 \langle 2, -3 \rangle = \langle -4, 1 \rangle \), so \( \langle a, b \rangle = \frac{1}{3} \langle 4, -11 \rangle = \mathbf{x} \).

### 11.5.66

\( -4 \langle a, b \rangle = \langle 2, -3 \rangle - 8 \langle -4, 1 \rangle = \langle 34, -11 \rangle \), so \( \langle a, b \rangle = \frac{1}{4} \langle -34, 11 \rangle = \mathbf{x} \).

### 11.5.67

\( \langle 4, -8 \rangle = 4\mathbf{i} - 8\mathbf{j} \).

### 11.5.68

Suppose \( \langle 4, -8 \rangle = c_1 \langle 1, 1 \rangle + c_2 \langle -1, 1 \rangle \). Then \( c_1 - c_2 = 4 \) and \( c_1 + c_2 = -8 \). Adding these two equations to each other yields \( 2c_1 = -4 \), so \( c_1 = -2 \). And thus \( c_2 = -6 \). We have \( \langle 4, -8 \rangle = -2\mathbf{u} - 6\mathbf{v} \).

### 11.5.69

Let \( \langle a, b \rangle = c_1 \mathbf{u} + c_2 \mathbf{v} \). Then \( c_1 - c_2 = a \) and \( c_1 + c_2 = b \). Adding these two equations to each other yields \( 2c_1 = a + b \), so \( c_1 = \frac{a+b}{2} \). And thus \( c_2 = \frac{b-a}{2} \). We have \( \langle a, b \rangle = \frac{a+b}{2} \mathbf{u} + \frac{b-a}{2} \mathbf{v} \).

### 11.5.70

Because \( 2\mathbf{u} = \mathbf{i} \) and \( 2(\mathbf{u} - 4\mathbf{v}) = 2\mathbf{j} \), we can conclude that \( 8\mathbf{v} = \mathbf{i} - 2\mathbf{j} \) (by subtracting). Thus \( \mathbf{u} = \frac{1}{2}\mathbf{i} \) and \( \mathbf{v} = \frac{1}{8}\mathbf{i} - \frac{1}{2}\mathbf{j} \).

### 11.5.71

Because \( 2\mathbf{u} + 3\mathbf{v} = \mathbf{i} \) and \( -2(\mathbf{u} - \mathbf{v}) = -2\mathbf{j} \), we can conclude that \( 3\mathbf{v} + 2\mathbf{v} = \mathbf{i} - 2\mathbf{j} \) (by adding), so \( \mathbf{v} = \frac{1}{5}\mathbf{i} - \frac{2}{5}\mathbf{j} \). It then follows that \( \mathbf{u} = \mathbf{v} + \mathbf{j} = \frac{1}{5}\mathbf{i} - \frac{3}{5}\mathbf{j} + \mathbf{j} = \frac{1}{5}\mathbf{i} + \frac{2}{5}\mathbf{j} \).

Copyright © 2014 Pearson Education, Inc.
11.5.72 \( \mathbf{u} = 3(3, -5) - 9(6, 0) = (-45, -15) \).

11.5.73 \( \mathbf{u} = 3\left(\frac{5, -12}{\sqrt{25+144}}\right) = \frac{3}{35} (5, -12) \).

11.5.74 \( \mathbf{u} = -\langle 6, -8 \rangle \cdot 10 = \langle -6, 8 \rangle \).

11.5.75 \( \mathbf{u} = \mathbf{u}_1 + \mathbf{u}_2 = \langle 4, -6 \rangle + (5, 9) = (9, 3) \).

11.5.76

Let \( \mathbf{u} \) represent the motion of the ant on the paper, and let \( \mathbf{v} \) represent the motion of the paper. \( \mathbf{u} + \mathbf{v} = 2\mathbf{i} + (\mathbf{i} - \mathbf{j}) = 3\mathbf{i} - \mathbf{j} \). \( |\mathbf{u} + \mathbf{v}| = \sqrt{9 + 1} = \sqrt{10} \). \( \theta = \tan^{-1} \left( -\frac{3}{4} \right) = -18.435 \) degrees. The ant moves in the direction 18.435 degrees south of east with speed \( \sqrt{10} \) miles per hour.

11.5.77

a. The sum is 0 because each vector has exactly one additive inverse in the set among the 12 vectors.

b. The 6:00 vector, because the others cancel in pairs, but this vector remains.

c. If we remove the 1:00 through 6:00 vectors, the sum is as large as possible, because all the vectors are pointing toward the left side of the clock. Removing any 6 consecutive vectors gives a sum whose magnitude is as large as possible.

d. Let \( \mathbf{w} \) be the vector that points from 12:00 toward 6:00 but which has length \( r \) equal to the radius of the clock. The sum of the vectors pointing to 1:00 and 11:00 add up to \( (2 - \sqrt{3})\mathbf{w} \), the sum of the vectors pointing to 2:00 and 10:00 is \( \mathbf{w} \), the vectors pointing to 3:00 and 9:00 add up to \( 2\mathbf{w} \), the vectors pointing to 4:00 and 8:00 add up to \( 3\mathbf{w} \), and the vectors pointing to 5:00 and 7:00 add up to \( (\sqrt{3} + 2)\mathbf{w} \). Finally, the single vector pointing to 6:00 is \( 2\mathbf{w} \). The sum of all of these is \( 12\mathbf{w} \).

11.5.78 Because the ring doesn’t move, \( \mathbf{F}_3 \) is the opposite of \( \mathbf{F}_1 + \mathbf{F}_2 \), so \( \mathbf{F}_3 = (50\sqrt{2} - 30\sqrt{3}, -50\sqrt{2} - 30) \). Thus \( |\mathbf{F}_3| \approx 102.441 \) pounds, and the direction is given by \( \alpha = \tan^{-1} \left( \frac{50\sqrt{2} + 30}{50\sqrt{2} - 30\sqrt{3}} \right) \approx 79.454^\circ \) south of east.

11.5.79 The magnitude of the net force is \( |\mathbf{F}| = \sqrt{40^2 + 30^2} = 50 \) pounds. \( \alpha = \tan^{-1} \frac{3}{4} \approx 0.644 \) radians or 36.870 degrees. The net force has magnitude 50 pounds in the direction 36.870 degrees north of east.

11.5.80

The component parallel to the plane is \( mg \sin 30^\circ = 490 \text{ kg} \cdot \text{m/s}^2 \). The component perpendicular to the plane is \( mg \cos 30^\circ \approx 848.705 \text{ kg} \cdot \text{m/s}^2 \).

11.5.81 \( \mathbf{u} + \mathbf{v} = (u_1, u_2) + (v_1, v_2) = (u_1 + v_1, u_2 + v_2) = (v_1 + u_1, v_2 + u_2) = (v_1, v_2) + (u_1, u_2) = \mathbf{v} + \mathbf{u} \).
11.5. VECTORS IN THE PLANE

11.5.82

\[(\mathbf{u} + \mathbf{v}) + \mathbf{w} = (\langle u_1, u_2 \rangle + \langle v_1, v_2 \rangle) + \langle w_1, w_2 \rangle\]

\[= \langle u_1 + v_1, u_2 + v_2 \rangle + \langle w_1, w_2 \rangle\]

\[= \langle (u_1 + v_1) + w_1, (u_2 + v_2) + w_2 \rangle\]

\[= \langle u_1 + (v_1 + w_1), u_2 + (v_2 + w_2) \rangle\]

\[= \langle u_1, u_2 \rangle + \langle v_1 + w_1, v_2 + w_2 \rangle\]

\[= \mathbf{u} + (\mathbf{v} + \mathbf{w}).\]

11.5.83 \(a(\mathbf{v}) = a(\langle v_1, v_2 \rangle) = a(\langle cv_1, cv_2 \rangle) = a(\langle cv_1 \rangle, a(cv_2)) = (a(c)\langle v_1 \rangle, (a)\langle v_2 \rangle) = (ac)\langle v_1, v_2 \rangle = (ac)\mathbf{v}.\)

11.5.84

\[a(\mathbf{u} + \mathbf{v}) = a(\langle u_1, u_2 \rangle + \langle v_1, v_2 \rangle)\]

\[= a(\langle u_1 + v_1, u_2 + v_2 \rangle)\]

\[= \langle a(u_1 + v_1), a(u_2 + v_2) \rangle\]

\[= \langle au_1 + av_1, au_2 + av_2 \rangle\]

\[= \langle au_1, av_2 \rangle + (av_1, av_2)\]

\[= a\mathbf{u} + a\mathbf{v}.\]

11.5.85

\[(a + c)\mathbf{v} = (a + c)\langle v_1, v_2 \rangle\]

\[= \langle (a + c)v_1, (a + c)v_2 \rangle\]

\[= \langle av_1 + cv_1, av_2 + cv_2 \rangle\]

\[= \langle av_1, av_2 \rangle + \langle cv_1, cv_2 \rangle\]

\[= a\mathbf{v} + c\mathbf{v}.\]

11.5.86

Let \(M(x, y)\) be the midpoint. Because \(\overrightarrow{OM} = \overrightarrow{OP} + \frac{1}{2}\overrightarrow{PQ},\) we have

\[\langle x, y \rangle = \langle x_1, y_1 \rangle + \frac{1}{2}(\langle x_2, y_2 \rangle - \langle x_1, y_1 \rangle)\]

\[= \langle x_1, y_1 \rangle + \left\langle \frac{1}{2}x_2, \frac{1}{2}y_2 \right\rangle + \left\langle -\frac{1}{2}x_1, -\frac{1}{2}y_1 \right\rangle\]

\[= \left\langle \frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right\rangle.\]

11.5.87 \(|c\mathbf{v}| = |c\langle v_1, v_2 \rangle| = \|\langle cv_1, cv_2 \rangle\| = \sqrt{(cv_1)^2 + (cv_2)^2} = \sqrt{c^2v_1^2 + c^2v_2^2} = |c||\mathbf{v}|.\)

11.5.88 Yes. Because \(\overrightarrow{PQ} = \overrightarrow{RS},\) we have that these two vectors are parallel and have the same magnitude. Thus the quadrilateral \(RSQP\) is a parallelogram. Hence, \(PR\) is parallel to \(QS\) and they have the same magnitude, and are thus equal.

11.5.89

a. Note that \(-6\mathbf{u} = \mathbf{v},\) so \(\{\mathbf{u}, \mathbf{v}\}\) is linearly dependent. But there is no scalar \(c\) so that \(c\mathbf{u} = \mathbf{w},\) nor any scalar \(d\) so that \(d\mathbf{v} = \mathbf{w}\) so \(\{\mathbf{u}, \mathbf{w}\}\) is linearly independent and \(\{\mathbf{v}, \mathbf{w}\}\) is linearly independent.

b. Two nonzero vectors are linearly independent when they are not parallel, and are linearly dependent when they are parallel.

Copyright © 2014 Pearson Education, Inc.
c. Suppose \( \mathbf{u} \) and \( \mathbf{v} \) are linearly independent. Consider the equation \( c_1 \mathbf{u} + c_2 \mathbf{v} = \mathbf{w} \) for a given vector \( \mathbf{w} \). We are seeking a solution for the system of linear equations \( c_1 u_1 + c_2 v_1 = w_1 \) and \( c_1 u_2 + c_2 v_2 = w_2 \). The solution for this system is given by \( c_1 = \frac{1}{u_1 v_2 - u_2 v_1} (v_2 w_1 - v_1 w_2) \) and \( c_2 = \frac{1}{u_1 v_2 - u_2 v_1} (-u_2 w_1 + u_1 w_2) \), provided \( u_1 v_2 - u_2 v_1 \neq 0 \). This condition is equivalent to saying that \( \mathbf{v} \) is not a multiple of \( \mathbf{u} \). Thus a solution to the system of linear equations exists exactly when the vectors \( \mathbf{u} \) and \( \mathbf{v} \) are linearly independent.

11.5.90 Suppose that \( u_1 v_1 + u_2 v_2 = 0 \). Suppose first that \( u_1 \neq 0 \) and \( v_1 \neq 0 \). Then \( \frac{u_2}{u_1} \cdot \frac{v_2}{v_1} = -1 \). Let \( m_1 = \frac{u_2}{u_1} \), and note that this is the slope of the line containing the vector \( \mathbf{u} \). Likewise let \( m_2 = \frac{v_2}{v_1} \), and note that this is the slope of the line containing the vector \( \mathbf{v} \). Because \( m_1 \cdot m_2 = -1 \), the vectors are perpendicular. If \( u_1 = 0 \), then the original equation becomes \( u_2 v_2 = 0 \), so that either \( u_2 \) or \( v_2 \) is zero. But \( u_2 \) cannot be zero since otherwise \( \mathbf{u} \) is the zero vector. Thus \( v_2 = 0 \) and the two vectors are \( \langle 0, u_2 \rangle \) and \( \langle v_1, 0 \rangle \). Since the first vector is vertical while the second is horizontal, they are perpendicular. A similar argument handles the case where \( v_1 = 0 \).

11.5.91
a. If \( \mathbf{u} \) and \( \mathbf{v} \) are parallel, we must have \( \frac{a}{b} = \frac{5}{5} \), so \( a = \frac{5}{3} \).

b. If \( \mathbf{u} \) and \( \mathbf{v} \) are perpendicular, we must have \( 2a + 30 = 0 \), so \( a = -15 \).

11.5.92
a. The triangle rule states that in any triangle, the length of one side is less than or equal to the sum of the lengths of the other two sides. Suppose that \( \mathbf{u} = \mathbf{OA} \) and \( \mathbf{v} = \mathbf{AB} \). Then \( \mathbf{u} + \mathbf{v} = \mathbf{OB} \). The triangle rule applied to triangle \( OAB \) assures us that \( |\mathbf{OB}| \leq |\mathbf{OA}| + |\mathbf{AB}| \), so \( |\mathbf{u} + \mathbf{v}| \leq |\mathbf{u}| + |\mathbf{v}| \).

b. Equality occurs when either \( \mathbf{u} \) or \( \mathbf{v} \) is the zero vector, or when \( \mathbf{u} \) and \( \mathbf{v} \) are parallel and in the same direction, so that \( \mathbf{v} = k\mathbf{u} \) where \( k > 0 \). Then \( |\mathbf{u} + \mathbf{v}| = |(1 + k)\mathbf{u}| = (1 + k) |\mathbf{u}| = |\mathbf{u}| + |k\mathbf{u}| = |\mathbf{u}| + |\mathbf{v}| \).

11.6 Calculus of Vector-Valued Functions

11.6.1 It has one, namely \( t \).

11.6.2 It has two, namely \( x = f(t) \) and \( y = g(t) \).

11.6.3 For every real number \( t \) that is put into the function, the output is a vector \( \mathbf{r}(t) \).

11.6.4 Subtract componentwise to obtain the vector \( \mathbf{d} = (x_1 - x_0, y_1 - y_0) \).

11.6.5 First find the direction vector \( \mathbf{d} \) as in the previous problem, and then let \( \mathbf{r}(t) = \langle x_0, y_0 \rangle + td \).

11.6.6 It is continuous at \( a \) exactly when the component functions \( x = f(t) \) and \( y = g(t) \) are continuous at \( a \).

11.6.7 Compute \( \lim_{t \to a} f(t) = L_1 \) and \( \lim_{t \to a} g(t) = L_2 \). Then \( \lim_{t \to a} \mathbf{r}(t) = \langle L_1, L_2 \rangle \).
11.6.8 Compute the derivative of each of the component functions, and then $\mathbf{r}'(t) = \langle f'(t), g'(t) \rangle$.

11.6.9 $\mathbf{r}'(t)$ is a vector tangent to the curve $\mathbf{r}(t)$.

11.6.10 $\mathbf{r}'(t) = \langle 10t^3, 8 \rangle$, so $\mathbf{r}''(t) = \langle 90t^2, 0 \rangle$.

11.6.11 Compute the indefinite integral of each of the component functions, and then

$$\int \mathbf{r}(t) \, dt = \left\langle \int f(t) \, dt, \int g(t) \, dt \right\rangle.$$

11.6.12 $\int_a^b \mathbf{r}(t) \, dt = \left\langle \int_a^b f(t) \, dt, \int_a^b g(t) \, dt \right\rangle$.

11.6.13 The line is $\mathbf{r}(t) = \langle 0, 0 \rangle + t \langle 4, 7 \rangle$.

11.6.14 The line is $\mathbf{r}(t) = \langle -3, 2 \rangle + t \langle 1, -2 \rangle$.

11.6.15 The direction is $\langle 0, 1 \rangle$, which is parallel to the $y$ axis, so the line $l_1$ is $\mathbf{r}(t) = \langle 0, 1 \rangle + t \langle 0, 1 \rangle$, or simply $t \langle 0, 1 \rangle$.

11.6.16 The direction is $\langle 1, 0 \rangle$, which is parallel to the $x$ axis, so the line $l_2$ is $\langle 0, 1 \rangle + t \langle 1, 0 \rangle$.

11.6.17 The direction is $\langle 1, 2 \rangle - \langle 0, 0 \rangle = \langle 1, 2 \rangle$, so the line is $\mathbf{r}(t) = t \langle 1, 2 \rangle$.

11.6.18 The direction is $\langle 3, -3 \rangle - \langle 1, 0 \rangle = \langle 2, -3 \rangle$, so the line is $\mathbf{r}(t) = \langle 1, 0 \rangle + t \langle 2, -3 \rangle$.

11.6.19 The direction is $\langle 5, -1 \rangle - \langle -3, 4 \rangle = \langle 8, -5 \rangle$, so the line is $\mathbf{r}(t) = \langle -3, 4 \rangle + t \langle 8, -5 \rangle$.

11.6.20 The direction is $\langle 10, -5 \rangle - \langle 0, 4 \rangle = \langle 10, -9 \rangle$, so the line is $\mathbf{r}(t) = \langle 0, 4 \rangle + t \langle 10, -9 \rangle$.

11.6.21 The direction is $\langle -2, 8 \rangle$, so the line is $\mathbf{r}(t) = \langle 0, 0 \rangle + t \langle -2, 8 \rangle = t \langle -2, 8 \rangle$.

11.6.22 The direction is $\langle 4, -1 \rangle$, so the line is $\mathbf{r}(t) = \langle 1, -3 \rangle + t \langle 4, -1 \rangle$.

11.6.23 A vector perpendicular to $\mathbf{u}$ is $\langle 0, 1 \rangle$, so that the direction is $\langle 0, 1 \rangle$ and thus the line is $\langle 0, 0 \rangle + t \langle 0, 1 \rangle = t \langle 0, 1 \rangle$.

11.6.24 A vector perpendicular to $\langle 1, 1 \rangle$ is $\langle -1, 1 \rangle$, so this is a direction vector, and thus the line is $\langle -3, 4 \rangle + t \langle -1, 1 \rangle$.

11.6.25 Because $\langle 1, 2 \rangle - \langle 0, 0 \rangle = \langle 1, 2 \rangle$, the line segment is $\mathbf{r}(t) = t \langle 1, 2 \rangle$, where $0 \leq t \leq 1$.

11.6.26 Because $\langle 0, -2 \rangle - \langle 1, 0 \rangle = \langle -1, -2 \rangle$, the line segment is $\mathbf{r}(t) = \langle 1, 0 \rangle + t \langle -1, -2 \rangle$, where $0 \leq t \leq 1$.

11.6.27 Because $\langle 7, 5 \rangle - \langle 2, 4 \rangle = \langle 5, 1 \rangle$, the line segment is $\mathbf{r}(t) = \langle 2, 4 \rangle + t \langle 5, 1 \rangle$, where $0 \leq t \leq 1$.

11.6.28 Because $\langle -9, 5 \rangle - \langle -1, -8 \rangle = \langle -8, 13 \rangle$, the line segment is $\mathbf{r}(t) = \langle -1, -8 \rangle + t \langle -8, 13 \rangle$, where $0 \leq t \leq 1$.
11.6.29

11.6.30

11.6.31

11.6.32
11.6.33 \[ \lim_{t \to \pi/2} \langle \cos 2t, -4 \sin t \rangle = \langle \cos \pi, -4 \sin \frac{\pi}{2} \rangle = \langle -1, -4 \rangle. \]

11.6.34 \[ \lim_{t \to \ln 2} \langle 2e^t, 6e^{-t} \rangle = \langle 2e^{\ln 2}, 6e^{-\ln 2} \rangle = \langle 4, 3 \rangle. \]

11.6.35 \[ \lim_{t \to \infty} \left\langle \tan^{-1} t, \frac{-2t}{t+1} \right\rangle = \langle \frac{\pi}{2}, -2 \rangle. \]

11.6.36 \[ \lim_{t \to 2} \left\langle \frac{t}{t^2+1}, -4e^{-t} \sin \pi t \right\rangle = \left\langle \frac{2}{5}, 0 \right\rangle. \]
11.6.41 Using l'Hôpital's rule once in each component gives
\[
\lim_{t \to 0} \left( \frac{\sin t}{t}, \frac{e^t - t - 1}{t} \right) = \lim_{t \to 0} \left( \cos t, 1 - e^t \right) = (1, 0) = i.
\]

11.6.42 Using l'Hôpital's rule once in each component gives
\[
\lim_{t \to 0} \left( \frac{\tan t}{t}, -\frac{3t}{\sin t} \right) = \lim_{t \to 0} \left( \sec^2 t, -\frac{3}{\cos t} \right) = (1, -3) = 1 - 3j.
\]

11.6.43 \( r'(t) = (-\sin t, 2t) \).

11.6.44 \( r'(t) = (4e^t, 0) \).

11.6.45 \( r'(t) = \left( 6t, \frac{3}{\sqrt{t}} \right) \).

11.6.46 \( r'(t) = (0, -6\sin 2t) \).

11.6.47 \( r'(t) = (e^t, -2e^{-t}) \).

11.6.48 \( r'(t) = (\sec^2 t, \sec t \tan t) \).

11.6.49 \( r'(t) = (e^{-t}(1 - t), 1 + \ln t) \).

11.6.50 \( r'(t) = \left( -\frac{1}{(t+1)^2}, \frac{1}{t^2+1} \right) \).

11.6.51 \( r'(t) = (1, 6t) \), so \( r'(1) = (1, 6) \).

11.6.52 \( r'(t) = (e^t, 3e^{3t}) \), so \( r'(0) = (1, 3) \).

11.6.53 \( r'(t) = (1, -2\sin 2t) \), so \( r' \left( \frac{\pi}{2} \right) = (1, 0) \).

11.6.54 \( r'(t) = (2\cos t, -3\sin t) \), so \( r'(\pi) = (-2, 0) \).

11.6.55 \( r'(t) = (8t^3, 9\sqrt{t}) \), so \( r'(1) = (8, 9) \).

11.6.56 \( r'(t) = (2e^t, -2e^{-2t}) \), so \( r'(\ln 3) = (6, -\frac{2}{3}) \).

11.6.57
\[
(t^{12} + 3t)u'(t) + u(t)(12t^{11} + 3) = (t^{12} + 3t) \left( 6t^2, 2t \right) + \left( 2t^3, t^2 - 1 \right) (12t^{11} + 3)
= \left( 30t^{14} + 24t^3, 14t^{13} - 12t^{11} + 9t^2 - 3 \right).
\]

11.6.58
\[
(4t^8 - 6t^3)v'(t) + v(t)(32t^7 - 18t^2) = (4t^8 - 6t^3) \left( e^t, -2e^{-t} \right) + \left( e^t, 2e^{-t} \right) (32t^7 - 18t^2)
= \left( (4t^8 + 32t^7 - 6t^3 - 18t^2)e^t, (-8t^8 + 64t^7 + 12t^3 - 36t^2)e^{-t} \right).
\]

11.6.59
\[
u'(t^4 - 2t) \cdot (4t^3 - 2) = \left( 6(t^4 - 2t)^2, 2(t^4 - 2t) \right) (4t^3 - 2)
= \left( 6(t^4 - 2t)^2(4t^3 - 2), 2(t^4 - 2t)(4t^3 - 2) \right)
= 4t(2t^3 - 1) (t^3 - 2)(3t^3 - 2)(3t^3 - 2, 1).
\]

11.6.60 \( v'(\sqrt{t}) \cdot \frac{1}{2\sqrt{t}} = \left( e^{\sqrt{t}}, -2e^{-\sqrt{t}} \right) \cdot \frac{1}{2\sqrt{t}} = \left( \frac{e^{\sqrt{t}}}{2\sqrt{t}}, -\frac{1}{\sqrt{e^{\sqrt{t}}}} \right) \).

11.6.61 \( r'(t) = (2t, 1) \), \( r''(t) = (2, 0) \), \( r'''(t) = (0, 0) \).
11.6.62 \( r'(t) = \langle 36t^{11} - 2t, 8t^3 + 3t^2 \rangle \), \( r''(t) = \langle 396t^{10} - 2, 56t^6 + 6t \rangle \), \( r'''(t) = \langle 3960t^9, 336t^5 + 6 \rangle \).

11.6.63 \( r'(t) = (-3 \sin 3t, 4 \cos 4t) \), \( r''(t) = (-9 \cos 3t, -16 \sin 4t) \), \( r'''(t) = (27 \sin 3t, -64 \cos 4t) \).

11.6.64 \( r'(t) = \langle 4e^{4t}, -8e^{-4t} \rangle \), \( r''(t) = \langle 16e^{4t}, 32e^{-4t} \rangle \), \( r'''(t) = \langle 64e^{4t}, -128e^{-4t} \rangle \).

11.6.65 \( r'(t) = \left\langle \frac{1}{2\sqrt{t^4}}, \frac{1}{t(t^2+1)} \right\rangle \), \( r''(t) = \left\langle -\frac{1}{4(t^2+2)^{3/2}}, -\frac{2}{(t^2+1)^3} \right\rangle \), \( r'''(t) = \left\langle \frac{3}{8(t^2+2)^{5/2}}, \frac{6}{(t^2+1)^3} \right\rangle \).

11.6.66 \( r'(t) = \langle \sec^2 t, 1 - \frac{1}{t^2} \rangle \), \( r''(t) = \langle 2 \tan t \sec^2 t, \frac{2}{t^3} \rangle \), \( r'''(t) = \langle 2 \sec^4 t + 4 \tan^2 t \sec^2 t, -\frac{6}{t} \rangle \).

11.6.67 \( \int (t^4 - 3t, 2t - 1) \, dt = \left\langle \frac{t^5}{5} - \frac{3}{2} t^2, t^2 - t \right\rangle + C \).

11.6.68 \( \int (5t^4 - t^2, t^6 - 4t^3) \, dt = \left\langle -\frac{5}{3} t^3 - \frac{t^7}{7}, t^4 \right\rangle + C \).

11.6.69 \( \int (2 \cos t, 2 \sin 3t) \, dt = \left\langle 2 \sin t, \frac{2}{3} \cos 3t \right\rangle + C \).

11.6.70 \( \int (te^t, t \sin t^2) \, dt = \left\langle (t+1)e^t, -\frac{1}{2} \cos t^2 \right\rangle + C \).

11.6.71 \( \int \left\langle e^{3t}, \frac{1}{1+t^2} \right\rangle \, dt = \left\langle \frac{e^{3t}}{3}, \tan^{-1} t \right\rangle + C \).

11.6.72 \( \int \left\langle t^2, \frac{1}{1+2t} \right\rangle \, dt = \left\langle \frac{t^4}{2 \ln 2}, \frac{1}{2} \ln |1+2t| \right\rangle + C \).

11.6.73 \( \int (e^t, \sin t) \, dt = \left\langle e^t, -\cos t \right\rangle + C \). Because \( r(0) = (2, 2) = (1, -1) + C \), we have \( C = \langle 1, 3 \rangle \). Thus, \( r(t) = \langle e^t, -\cos t \rangle + (1, 3) = (1 + e^t, 3 - \cos t) \).

11.6.74 \( \int (0, 2) \, dt = (0, 2t) + C \). Because \( r(1) = (4, 3) \), we have \( r(1) = (0, 2) + C = (4, 3) \), so \( C = \langle 4, 1 \rangle \). Thus, \( r(t) = (4, 2t + 1) \).

11.6.75 \( \int (1, 2t) \, dt = \left\langle t, t^2 \right\rangle + C \). Because \( r(1) = (4, 3) \), we have \( (1, 1) + C = (4, 3) \), so \( C = \langle 3, 2 \rangle \), and \( r(t) = \left\langle t + 3, t^2 + 2 \right\rangle \).

11.6.76 \( \int \left\langle \sqrt{t}, \cos \pi t \right\rangle \, dt = \left\langle \frac{2}{3} t^{3/2}, \frac{\sin \pi t}{\pi} \right\rangle + C \). Because \( r(1) = (2, 3) \), we have \( \langle \frac{2}{3}, 0 \rangle + C = (2, 3) \), so \( C = \langle \frac{4}{3}, 3 \rangle \), and \( r(t) = \left\langle \frac{2}{3} t^{3/2} + \frac{4}{3} \sin \pi t \right\rangle + 3 \).

11.6.77 \( \int \left\langle e^{2t}, 1 - 2e^{-t} \right\rangle \, dt = \left\langle \frac{e^{2t}}{2}, t + 2e^{-t} \right\rangle + C \). Because \( r(0) = (1, 1) \), we have \( \langle \frac{1}{2}, 2 \rangle + C = (1, 1) \), so \( C = \langle \frac{1}{2}, -1 \rangle \), and \( r(t) = \left\langle \frac{e^{2t}}{2} + \frac{1}{2} t + 2e^{-t} - 1 \right\rangle \).

11.6.78 \( \int \left\langle \frac{t}{t^2+1}, te^{-t} \right\rangle \, dt = \left\langle \frac{1}{2} \ln(t^2+1), -\frac{e^{-t}}{2} \right\rangle + C \). Because \( r(0) = (1, \frac{3}{2}) \), we have \( \langle 0, -\frac{1}{2} \rangle + C = \langle 1, \frac{3}{2} \rangle \), so \( C = \langle 1, 2 \rangle \), and \( r(t) = \left\langle \frac{1}{2} \ln(t^2+1) + 1, -\frac{e^{-t}}{2} + 2 \right\rangle \).

11.6.79 \( \int_1^{-1} (1, t) \, dt = \left\langle t, \frac{t^2}{2} \right\rangle \bigg|_1^{-1} = (2, 0) \).
11.6.80 \( \int_1^4 (6t^2, 8t^3) \, dt = \langle 2t^3, 2t^4 \rangle \bigg|_1^4 = \langle 128, 512 \rangle - \langle 2, 2 \rangle = \langle 126, 510 \rangle. \)

11.6.81 \( \int_0^{\ln 2} (e^t, e^t \cos \pi e^t) \, dt = \left[ e^t, \frac{\sin \pi e^t}{\pi} \right]_0^{\ln 2} = \langle 2, 0 \rangle - \langle 1, 0 \rangle = \langle 1, 0 \rangle = \mathbf{i}. \)

11.6.82 \[ \int_{1/2}^{1} \left( \frac{3}{1 + 2t}, -\pi \csc^2 \frac{\pi t}{2} \right) \, dt = \left[ \frac{3}{2} \ln(1 + 2t), 2 \cot \frac{\pi t}{2} \right]_{1/2}^{1} = \left\{ \frac{3}{2} \ln 3, 0 \right\} - \left\{ \frac{3}{2} \ln 2, 2 \right\} = \left\{ \frac{3}{2} \ln \frac{3}{2}, -2 \right\}. \]

11.6.83 \( \int_{-\pi}^{\pi} \langle \sin t, \cos t \rangle \, dt = \langle -\cos t, \sin t \rangle \bigg|_{-\pi}^{\pi} = \langle 0, 0 \rangle. \)

11.6.84 \( \int_0^{\ln 2} \langle e^{-t}, 2e^{2t} \rangle \, dt = \langle -e^{-t}, e^{2t} \rangle \bigg|_0^{\ln 2} = \left\{ \frac{1}{2}, 3 \right\}. \)

11.6.85 \( \int_0^{2} \langle te^t, 2te^t \rangle \, dt = \langle (t-1)e^t, 2(t-1)e^t \rangle \bigg|_0^2 = \langle e^2 + 1, 2e^2 + 2 \rangle = \langle e^2 + 1 \rangle \langle 1, 2 \rangle. \)

11.6.86 \( \int_0^{\pi/4} \langle \sec^2 t, -2 \cos t \rangle \, dt = \langle \tan t, -2 \sin t \rangle \bigg|_{0}^{\pi/4} = \langle 1, -\sqrt{2} \rangle. \)

11.6.87

a. True. This curve passes through the origin at \( t = -\frac{1}{2} \).

b. True. If the two lines are nonparallel, then the equations of the two lines have a unique solution, which is their point of intersection.

c. True. Both component functions approach 0 as \( t \to \infty \), so this curve approaches the origin as \( t \to \infty \).

d. True. Both have limit \( \langle 0, 0 \rangle \) since \( \lim_{t \to \infty} e^{-t^2} = \lim_{t \to -\infty} e^{-t^2} = 0. \)

e. False. For example, if \( r(t) = \langle \cos t, \sin t \rangle \), then \( r'(t) = \langle -\sin t, \cos t \rangle \) is not parallel to \( r(t) \), and is in fact perpendicular to it.

f. True. This follows because \( \int_{-d}^{d} o(x) \, dx = 0 \) for any odd function \( o(x) \).

11.6.88 The first component function has domain \((-\infty, 1) \cup (1, \infty)\), and the second has domain \((-\infty, -2) \cup (-2, \infty)\), so the domain of \( r(t) \) is \((-\infty, -2) \cup (-2, 1) \cup (1, \infty)\).

11.6.89 The first component function has domain \([-2, \infty)\) and the second has domain \((-\infty, 2)\), so the domain of \( r(t) \) is \([-2, 2]\).

11.6.90 The first component function is defined everywhere and the second has domain \([0, \infty)\), so the domain of \( r(t) \) is \([0, \infty)\).

11.6.91 The first component function has domain \([-2, 2]\) and the second has domain \([0, \infty)\), so the domain of \( r(t) \) is \([0, \infty)\).

11.6.92 \( r'(t) = \langle e^t, 2e^{2t} \rangle \), so \( r'(0) = \langle 1, 2 \rangle. \) We have \( r(0) = \langle 1, 1 \rangle \), so the tangent line is given by \( \langle 1 + t, 1 + 2t \rangle \).

11.6.93 \( r'(t) = \langle -\sin t, 2 \cos 2t \rangle \), so \( r' \left( \frac{\pi}{2} \right) = \langle -1, -2 \rangle. \) We have \( r \left( \frac{\pi}{2} \right) = \langle 2, 3 \rangle \), so the tangent line is given by \( \langle 2 - t, 3 - 2t \rangle \).

11.6.94 \( r'(t) = \langle \frac{1}{\sqrt{2\pi + 1}}, \pi \cos t \rangle \), so \( r'(4) = \langle \frac{1}{3}, \pi \rangle. \) We have \( r(4) = \langle 3, 0 \rangle \), so the tangent line is given by \( \langle 3 + \frac{1}{3}t, \pi t \rangle \).
The velocity is the derivative of position, the speed is the magnitude of velocity, and the acceleration is the derivative of velocity.

For the circle \( r(t) = \langle a \cos t, a \sin t \rangle \) for \( a > 0 \), the two vectors are orthogonal, with the velocity vector tangent to the circle.

\[ ma(t) = F(t). \]

Integrate the acceleration to find an expression for the velocity plus a constant, and then use the initial velocity condition to find the constant.

Integrate the velocity to find an expression for the position plus a constant, and then use the initial position condition to find the constant.

a. \( v(t) = \langle 6t, 8t \rangle \), so the speed is \( \sqrt{36t^2 + 64t^2} = \sqrt{100t^2} = 10t \).

b. \( a(t) = (6, 8) \).

a. \( v(t) = \langle 5t, 12t \rangle \), so the speed is \( \sqrt{25t^2 + 144t^2} = \sqrt{169t^2} = 13t \).

b. \( a(t) = (5, 12) \).

a. \( v(t) = r'(t) = \langle 2, -4 \rangle \), so the speed is \( |r'(t)| = \sqrt{20} = 2\sqrt{5} \).

b. \( a(t) = r''(t) = \langle 0, 0 \rangle \).

a. \( v(t) = r'(t) = \langle -2t, 6t^2 \rangle \), so the speed is \( |r'(t)| = \sqrt{4t^2 + 36t^4} = 2t \sqrt{1 + 9t^2} \).

b. \( a(t) = r''(t) = \langle -2, 12t \rangle \).

a. \( v(t) = r'(t) = \langle 8 \cos t, -8 \sin t \rangle \), so the speed is \( |r'(t)| = 8 \).

b. \( a(t) = r''(t) = \langle -8 \sin t, -8 \cos t \rangle \).

a. \( v(t) = r'(t) = \langle -3 \sin t, 4 \cos t \rangle \), so the speed is \( |r'(t)| = \sqrt{9 \sin^2 t + 16 \cos^2 t} = \sqrt{9 + 7 \cos^2 t} \).

b. \( a(t) = r''(t) = \langle -3 \cos t, -4 \sin t \rangle \).

Copyright © 2014 Pearson Education, Inc.
11.7.13

a. \( \mathbf{v}(t) = \langle e^t \cos t - e^t \sin t, e^t \sin t + e^t \cos t \rangle = \langle e^t(\cos t - \sin t), e^t(\cos t + \sin t) \rangle \), so the speed is

\[
\begin{align*}
\sqrt{e^{2t}(\cos t - \sin t)^2 + e^{2t}(\cos t + \sin t)^2} \\
= e^t \sqrt{\cos^2 t - 2 \cos t \sin t + \sin^2 t + \cos^2 t + 2 \cos t \sin t + \sin^2 t} \\
= e^t \sqrt{2}.
\end{align*}
\]

b. \( \mathbf{a}(t) = \langle e^t(\cos t - \sin t) + e^t(-\sin t - \cos t), e^t(\cos t + \sin t) + e^t(\cos t + \sin t) \rangle \\
= \langle -2e^t \sin t, 2e^t \cos t \rangle \\
= 2e^t \langle -\sin t, \cos t \rangle .
\]

11.7.14

a. \( \mathbf{v}(t) = \langle 10e^{2t}, 24e^{2t} \rangle \), so the speed is \( \sqrt{100e^{4t} + 576e^{4t}} = \sqrt{676e^{4t}} = 26e^{2t} \).

b. \( \mathbf{a}(t) = \langle 20e^{2t}, 48e^{2t} \rangle \).

11.7.15

a. \( \mathbf{v}(t) = \mathbf{r}'(t) = (1, -4) \), so the speed is \( |\mathbf{r}'(t)| = \sqrt{1 + 16} = \sqrt{17} \).

b. \( \mathbf{a}(t) = \mathbf{r}''(t) = (0, 0) \).

11.7.16

a. \( \mathbf{v}(t) = \mathbf{r}'(t) = (-\sin e^t \cdot e^t, \cos e^t \cdot e^t) = (-e^t \sin e^t, e^t \cos e^t) \), so the speed is

\[
|\mathbf{r}'(t)| = \sqrt{e^{2t} \sin^2 e^t + e^{2t} \cos^2 e^t} = e^t \sqrt{\sin^2 e^t + \cos^2 e^t} = e^t .
\]

b. \( \mathbf{a}(t) = \mathbf{r}''(t) = (-e^t \sin e^t - e^t \cos e^t \cdot e^t, e^t \cos e^t - e^t \sin e^t \cdot e^t) \\
= (-e^t \sin e^t - e^{2t} \cos e^t, e^t \cos e^t - e^{2t} \sin e^t) .
\]

11.7.17

a. The interval must be shrunk by a factor of 2, so \( [c, d] = [0, 1] \).

b. \( \mathbf{r}'(t) = (1, 2t) \), and \( \mathbf{R}'(t) = (2, 8t) \).

c. \( |\mathbf{r}'(t)| = \sqrt{1 + 4t^2} \) and \( |\mathbf{R}'(t)| = 2\sqrt{1 + 16t^2} \).
11.7.18

a. The interval must be shrunk by a factor of 3, so \([c,d] = [0,2]\).

b. \(\mathbf{r}'(t) = (3, 4)\), and \(\mathbf{R}'(t) = (9, 12)\).

c. \(|\mathbf{r}'(t)| = \sqrt{9 + 16} = 5\) and \(|\mathbf{R}'(t)| = \sqrt{81 + 144} = 15\).

11.7.19

a. The interval must be shrunk by a factor of 3, so \([c,d] = [0, \frac{2\pi}{3}]\).

b. \(\mathbf{r}'(t) = (-\sin t, 4\cos t)\), and \(\mathbf{R}'(t) = (-3\sin 3t, 12\cos 3t)\).

c. \(|\mathbf{r}'(t)| = \sqrt{\sin^2 t + 16\cos^2 t}\) and \(|\mathbf{R}'(t)| = 3\sqrt{\sin^2 3t + 16\cos^2 3t}\).
11.7.20

a. Because $e^0 = 1$ and $e^{\ln 10} = 10$, we have $[c, d] = [1, 10]$.

b. $r'(t) = \langle -e^t, e^{-t} \rangle$, and $R'(t) = \langle -1, \frac{1}{t^2} \rangle$.

c. $|r'(t)| = \sqrt{e^{2t} + e^{-2t}}$ and $|R'(t)| = \sqrt{1 + \frac{1}{t^4}}$.

11.7.21

a. The object is moving eastward when the $x$ component of its velocity is positive; since this component is $\frac{1}{t+1}$, the object is always moving eastward for $t \geq 0$. The object is moving northward when the $y$ component of its velocity is positive; since this component is $e^{-t}$, the object is always moving northward for $t \geq 0$.

b. The position vector for the object is

$$r(t) = \int v(t) \, dt = \int \langle \frac{1}{t+1}, e^{-t} \rangle \, dt = \langle \ln |t+1|, -e^{-t} \rangle + C.$$  

Because $t \geq 0$, this simplifies to $r(t) = \langle \ln(t+1), -e^{-t} \rangle + C$. Now, the object starts at the origin at $t = 0$, so we get $r(t) = \langle \ln(t+1), 1 - e^{-t} \rangle$.

c. The $x$ coordinate of the object goes to infinity as $t \to \infty$, while the $y$ coordinate approaches 1. The graph approaches the line $y = 1$ from below.

11.7.22

a. The object is moving eastward when the $x$ component of its velocity is positive; since this component is $e^{-t}(1-t)$, the object is moving eastward for $0 \leq t < 1$. The object is moving northward when the $y$ component of its velocity is positive; since this component is $\sin t$, the object is moving northward for $t \in (0, \pi)$.

b. The position vector for the object is

$$r(t) = \int v(t) \, dt = \int \langle e^{-t}(1-t), \sin t \rangle \, dt = \langle te^{-t}, -\cos t \rangle + C.$$  

Since the object starts at the origin at $t = 0$, we get $r(t) = \langle te^{-t}, 1 - \cos t \rangle$.  

Copyright © 2014 Pearson Education, Inc.
c. On the interval \( t \in [0, 2\pi] \), the \( y \) coordinate starts at zero, increases to 2, and decreases back to zero, while the \( x \) coordinate starts at zero, gets larger, then starts decreasing again almost to zero at \( t = 2\pi \) as the exponential term takes over. Thus the graph should look almost like a closed curve, since it starts at the origin and ends near the origin:

11.7.23 \( \mathbf{v}(t) = \int \mathbf{a}(t) \, dt = \int \langle 0, 1 \rangle \, dt = \langle 0, t \rangle + \mathbf{C} \). Because \( \mathbf{v}(0) = \langle 2, 3 \rangle \), we have \( \mathbf{C} = \langle 2, 3 \rangle \). Thus, \( \mathbf{v}(t) = \langle 2, t + 3 \rangle \).
\[
\mathbf{r}(t) = \int \mathbf{v}(t) \, dt = \int \langle 2, t + 3 \rangle \, dt = \left\langle 2t, \frac{t^2}{2} + 3t \right\rangle + \mathbf{D}.
\]
Because \( \mathbf{r}(0) = \langle 0, 0 \rangle \), we have \( \mathbf{D} = \langle 0, 0 \rangle \). Therefore, \( \mathbf{r}(t) = \left\langle 2t, \frac{t^2}{2} + 3t \right\rangle \).

11.7.24 \( \mathbf{v}(t) = \int \mathbf{a}(t) \, dt = \int \langle 1, 2 \rangle \, dt = \langle t, 2t \rangle + \mathbf{C} \). Because \( \mathbf{v}(0) = \langle 1, 1 \rangle \), we have \( \mathbf{C} = \langle 1, 1 \rangle \). Thus, \( \mathbf{v}(t) = \langle t + 1, 2t + 1 \rangle \).
\[
\mathbf{r}(t) = \int \mathbf{v}(t) \, dt = \int \langle t + 1, 2t + 1 \rangle \, dt = \left\langle \frac{t^2}{2} + t, t^2 + t \right\rangle + \mathbf{D}.
\]
Because \( \mathbf{r}(0) = \langle 2, 3 \rangle \), we have \( \mathbf{D} = \langle 2, 3 \rangle \). Therefore, \( \mathbf{r}(t) = \left\langle \frac{t^2}{2} + t + 2, t^2 + t + 3 \right\rangle \).

11.7.25 \( \mathbf{v}(t) = \int \mathbf{a}(t) \, dt = \int \langle 0, 10 \rangle \, dt = \langle 0, 10t \rangle + \mathbf{C} \). Because \( \mathbf{v}(0) = \langle 0, 5 \rangle \), we have \( \mathbf{v}(t) = \langle 0, 10t + 5 \rangle \).

Next, \( \mathbf{r}(t) = \int \mathbf{v}(t) \, dt = \int \langle 0, 10t + 5 \rangle \, dt = \langle 0, 5t^2 + 5t \rangle + \mathbf{D} \), and because \( \mathbf{r}(0) = \langle 1, -1 \rangle \), we have \( \mathbf{r}(t) = \langle 1, 5t^2 + 5t - 1 \rangle \).

11.7.26 \( \mathbf{v}(t) = \int \mathbf{a}(t) \, dt = \int \langle 1, t \rangle \, dt = \left\langle t, \frac{t^2}{2} \right\rangle + \mathbf{C} \). Because \( \mathbf{v}(0) = \langle 2, -1 \rangle \), we have \( \mathbf{v}(t) = \left\langle t + 2, \frac{t^2}{2} - 1 \right\rangle \).

Also, \( \mathbf{r}(t) = \int \mathbf{v}(t) \, dt = \int \left\langle t + 2, \frac{t^2}{2} - 1 \right\rangle \, dt = \left\langle \frac{t^2}{2} + 2t, \frac{t^3}{6} - t \right\rangle + \mathbf{D} \), and because \( \mathbf{r}(0) = \langle 0, 8 \rangle \), we have \( \mathbf{r}(t) = \left\langle \frac{t^2}{2} + 2t, \frac{t^3}{6} - t + 8 \right\rangle \).

11.7.27 \( \mathbf{v}(t) = \int \mathbf{a}(t) \, dt = \int \langle \cos t, 2 \sin t \rangle \, dt = \langle \sin t, -2 \cos t \rangle + \mathbf{C} \). Because \( \mathbf{v}(0) = \langle 0, 1 \rangle \), we have \( \mathbf{v}(t) = \langle \sin t, 3 - 2 \cos t \rangle \).

Also, \( \mathbf{r}(t) = \int \mathbf{v}(t) \, dt = \int \langle \sin t, 3 - 2 \cos t \rangle \, dt = \langle -\cos t, 3t - 2 \sin t \rangle + \mathbf{D} \), and because \( \mathbf{r}(0) = \langle 1, 0 \rangle \), we have \( \mathbf{r}(t) = \langle 2 - \cos t, 3t - 2 \sin t \rangle \).
11.7.28 \( \mathbf{v}(t) = \int \mathbf{a}(t) \, dt = \int (e^{-t}, 1) \, dt = (e^{-t}, t) + \mathbf{C} \). Because \( \mathbf{v}(0) = (1, 0) \), we have \( \mathbf{v}(t) = (2 - e^{-t}, t) \).

Also, \( \mathbf{r}(t) = \int \mathbf{v}(t) \, dt = \int (2 - e^{-t}, t) \, dt = (2t + e^{-t}, \frac{t^2}{2}) + \mathbf{D} \), and because \( \mathbf{r}(0) = (0, 0) \), we have
\[
\mathbf{r}(t) = \left(2t + e^{-t} - 1, \frac{t^2}{2}\right).
\]

11.7.29

a. \( \mathbf{v}(t) = \int (0, -9.8) \, dt = (0, -9.8t) + \mathbf{C} \), and because \( \mathbf{v}(0) = (30, 6) \), we have \( \mathbf{v}(t) = (30, 6 - 9.8t) \).

Also, \( \mathbf{r}(t) = \int \mathbf{v}(t) \, dt = \int (30, 6 - 9.8t) \, dt = (30t, 6t - 4.9t^2) + \mathbf{D} \), and because \( \mathbf{r}(0) = (0, 0) \), we have \( \mathbf{r}(t) = (30t, 6t - 4.9t^2) \).

b. 

\[c. \text{The ball hits the ground when } 6t - 4.9t^2 = 0, \text{ which occurs for } t = \frac{6}{4.9} \approx 1.224 \text{ seconds. The range of the ball is approximately } 30 \cdot 1.224 \approx 36.735 \text{ meters.}\]

d. \text{The maximum height occurs at time } T \approx \frac{1.224}{2} = 0.612 \text{ seconds, and is } 6T - 4.9T^2 \approx 1.837 \text{ meters.}\]

11.7.30

a. \( \mathbf{v}(t) = \int (0, -32) \, dt = (0, -32t) + \mathbf{C} \), and because \( \mathbf{v}(0) = 150 \left(\frac{\sqrt{3}}{2}, \frac{1}{2}\right) = (75\sqrt{3}, 75) \), we have \( \mathbf{v}(t) = (75\sqrt{3}, -32t + 75) \).

Also, \( \mathbf{r}(t) = \int \mathbf{v}(t) \, dt = \int (75\sqrt{3}, -32t + 75) \, dt = (75\sqrt{3}t, -16t^2 + 75t) + \mathbf{D} \), and because \( \mathbf{r}(0) = (0, 0) \), we have \( \mathbf{r}(t) = (75\sqrt{3}t, -16t^2 + 75t) \).

b. 

\[c. \text{The ball hits the ground when } -16t^2 + 75t = 0, \text{ which occurs for } t = \frac{75}{16} \approx 4.688 \text{ seconds. The range of the ball is approximately } 75\sqrt{3} \cdot 4.688 \approx 608.924 \text{ feet.}\]

d. \text{The maximum height occurs at time } T \approx \frac{4.688}{2} \approx 2.344, \text{ and is } -16 \cdot 2.344^2 + 75 \cdot 2.344 \approx 87.891 \text{ feet.}\]

11.7.31

a. \( \mathbf{v}(t) = \int (0, -32) \, dt = (0, -32t) + \mathbf{C} \), and because \( \mathbf{v}(0) = (80, 10) \), we have \( \mathbf{v}(t) = (80, 10 - 32t) \).

Also, \( \mathbf{r}(t) = \int \mathbf{v}(t) \, dt = \int (80, 10 - 32t) \, dt = (80t, 10t - 16t^2) + \mathbf{D} \), and because \( \mathbf{r}(0) = (0, 6) \), we have \( \mathbf{r}(t) = (80t, 6 + 10t - 16t^2) \).

b. 

\[c. \text{The ball hits the ground when } -16t^2 + 10t + 6 = -2(t - 1)(8t + 3) = 0, \text{ which occurs for } t = 1 \text{ second. The range of the ball is } 80 \cdot 1 = 80 \text{ feet.}\]

d. \text{The maximum height occurs at time } T \approx \frac{10}{22} \approx 0.313, \text{ and is } -16 \cdot 0.313^2 + 10 \cdot 0.313 + 6 \approx 7.563 \text{ feet.}\]
11.7.32

a. \( v(t) = \int \langle 0, -32 \rangle \, dt = \langle 0, -32t \rangle + C \), and because \( v(0) = 132 \langle 1, 0 \rangle \), we have \( v(t) = \langle 132, -32t \rangle \).

Also, \( r(t) = \int v(t) \, dt = \int \langle 132, -32t \rangle \, dt = \langle 132t, -16t^2 \rangle + D \), and because \( r(0) = \langle 0, 10 \rangle \), we have \( r(t) = \langle 132t, -16t^2 + 10 \rangle \).

b. The ball hits the ground when \(-16t^2 + 10 = 0\), which occurs for \( t = \sqrt{\frac{10}{16}} \approx 0.791\) second. The range of the ball is approximately \( 132 \cdot 0.791 \approx 104.355\) feet.

d. The maximum height occurs at time \( T = 0 \), and is 10 feet.

11.7.33

a. \( v(t) = \int \langle 0, -32 \rangle \, dt = \langle 0, -32t \rangle + C \), and because \( v(0) = 250 \langle \frac{1}{2}, \frac{\sqrt{3}}{2} \rangle = \langle 125, 125\sqrt{3} \rangle \), we have \( v(t) = \langle 125, 125\sqrt{3} - 32t \rangle \).

Also, \( r(t) = \int v(t) \, dt = \int \langle 125, 125\sqrt{3} - 32t \rangle \, dt = \langle 125t, 125\sqrt{3}t - 16t^2 \rangle + D \), and because \( r(0) = \langle 0, 20 \rangle \), we have \( r(t) = \langle 125t, 20 + 125\sqrt{3}t - 16t^2 \rangle \).

b. The ball hits the ground when \( 20 + 125\sqrt{3}t - 16t^2 = 0 \), which occurs for \( t \approx 13.623\) seconds. The range of the ball is approximately \( 125 \cdot 13.623 \approx 1702.925\) feet.

d. The maximum height occurs when \( 125\sqrt{3} - 32t = 0 \), which is when \( t \approx 6.766 \) and it is about \( 20 + 125\sqrt{3} \cdot 6.766 - 16 \cdot 6.766^2 \approx 752.422\) feet.

11.7.34

a. \( v(t) = \int \langle 0, -9.8 \rangle \, dt = \langle 0, -9.8t \rangle + C \), and because \( v(0) = 10\sqrt{2} \langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \rangle = \langle 10, 10 \rangle \), we have \( v(t) = \langle 10, 10 - 9.8t \rangle \).

Also, \( r(t) = \int v(t) \, dt = \int \langle 10, 10 - 9.8t \rangle \, dt = \langle 10t, 10t - 4.9t^2 \rangle + D \), and because \( r(0) = \langle 0, 40 \rangle \), we have \( r(t) = \langle 10t, 40 + 10t - 4.9t^2 \rangle \).
Each of these values on the moon would be 6 times the corresponding value on the earth, because
the factor of $g$ in the denominator would result in an extra factor of 6 if $g$ were replaced by $\frac{g}{6}$.
11.7.41 We desire \( \frac{v_0^2}{2} \sin \alpha \cos \alpha \) = 300 meters, so we require \( \sin 2\alpha = 300 \cdot \frac{9.8}{60} \approx 0.817 \). So \( 2\alpha = \sin^{-1} 0.817 \), and \( \alpha \approx 27.376^\circ \) or \( \alpha \approx 62.624^\circ \).

11.7.42

a. Let \( V \) stand for the initial speed. The range is given by \( \frac{V^2}{2} \sin 2\alpha \), so we require \( \frac{9800}{\sin 2\alpha} = V^2 \), so \( V = \sqrt{9800 \csc 2\alpha} \).

b. The speed is minimized when \( \frac{dV}{d\alpha} = -\frac{9800 \csc 2\alpha \cot 2\alpha}{\sqrt{9800 \csc 2\alpha}} = 0 \), which occurs when \( \cos 2\alpha = 0 \), or \( \alpha = \frac{\pi}{4} \). At this value of \( \alpha \), the value of \( V \) is about 99 meters per second.

c. The flight time is given by \( T = \frac{2|V| \sin \alpha}{g} \), so if \( V = \sqrt{9800 \csc 2\alpha} \), this would be \( T = 2\sqrt{9800 \csc 2\alpha} \sin \alpha = c\sqrt{\tan \alpha} \) for a positive constant \( c \). Thus \( T \) is an increasing function on \( (0, \frac{\pi}{2}) \), so smaller angles give a shorter flight time, but no minimum exists on \( (0, \frac{\pi}{2}) \).

11.7.43

a. If \( t_1 > t_0 \) are two values of \( t \), we have \( r(t_1) - r(t_0) = (f(t_1) - f(t_0)) \langle a, b \rangle \), which is always a vector in the same direction, regardless of the values of \( t_1 \) and \( t_0 \).

b. \( r'(t) = f'(t) \langle a, b \rangle \) is a multiple of \( \langle a, b \rangle \), so the tangent vector is always a multiple of the vector \( \langle a, b \rangle \), so the motion of the object doesn’t vary in direction, although it might vary in speed.
11.7.44  a. 

\[ r(t) \] describes the circular arc from \((4, 0)\) to \((-4, 0)\) for \(t \in [0, 8]\); during that time, \(R(t)\) describes the parabola \(y = x^2 - 16\) for \(x \in [-4, 4]\) (to see this, write \(x = 4 - t\) in the equation of \(R(t)\)).

\[ r(t) \] describes the circular arc from \((4, 0)\) to \((-4, 0)\) for \(t \in [0, 8]\); during that time, \(R(t)\) describes the parabola \(y = x^2 - 16\) for \(x \in [-4, 4]\) (to see this, write \(x = 4 - t\) in the equation of \(R(t)\)).

b. 

The speeds are

\[
|v_{r(t)}| = \left| \left\langle -\frac{\pi}{2} \sin \left( \frac{\pi t}{8} \right), \frac{\pi}{2} \cos \left( \frac{\pi t}{8} \right) \right\rangle \right| = \frac{\pi}{2}
\]

\[
|v_{R(t)}| = \left| (-1)^2 + (-2(4-t))^2 \right| = \sqrt{4t^2 - 32t + 65}
\]

c. Both travelers arrive at \(t = 8\).

11.7.45  a. The object traverses the circle once over the interval \([0, \frac{2\pi}{\omega}]\).

b. The velocity is \(v(t) = (-\omega \sin \omega t, \omega \cos \omega t)\). The velocity is not constant in direction, but it is constant in speed, because the speed is \(|\omega|\).
11.7. TWO-DIMENSIONAL MOTION

11.7.46

a. Since the speed is constant, we assume that the velocity in each direction to be constant. In the $x$ direction, the object moves from 1 to $-6$ as $t$ varies from 0 to 5, so its velocity in the $x$ direction is $-\frac{7}{5}$. Similarly, its velocity in the $y$ direction is $\frac{6}{5}$. Integrating and noting that $r(0) = (1, 2)$ gives $r(t) = \langle 1 - \frac{7}{5}t, 2 + \frac{6}{5}t \rangle$.

b. Assume the velocity vector is $\langle ac^t, be^t \rangle$ for some constants $a$ and $b$. Since the object moves $-7$ units in the $x$ direction as it moves 6 units in the $y$ direction, we must have $\frac{a}{b} = -\frac{7}{6}$; since we want the speed to be $e^t$, we must also have $a^2 + b^2 = 1$. Solving gives $a = -\frac{7}{\sqrt{85}}$ and $b = \frac{6}{\sqrt{85}}$. Thus the velocity vector is $\langle -\frac{7}{\sqrt{85}}e^t, \frac{6}{\sqrt{85}}e^t \rangle$, so that

$$r(t) = \int v(t) \, dt = \int \left\langle -\frac{7}{\sqrt{85}}e^t, \frac{6}{\sqrt{85}}e^t \right\rangle \, dt = \left\langle -\frac{7}{\sqrt{85}}e^t, \frac{6}{\sqrt{85}}e^t \right\rangle + C.$$  

Assume $t = 0$ corresponds to $P$; then we get

$$r(0) = (1, 2) = C + \left\langle -\frac{7}{\sqrt{85}}, \frac{6}{\sqrt{85}} \right\rangle,$$

so that

$$r(t) = \left\langle 1 + \frac{7}{\sqrt{85}}e^t - \frac{6}{\sqrt{85}}e^t \right\rangle + \left\langle -\frac{7}{\sqrt{85}}e^t, \frac{6}{\sqrt{85}}e^t \right\rangle.$$

Finally, the $x$ coordinate is $-6$ when

$$-6 = 1 + \frac{7}{\sqrt{85}}e^t - \frac{6}{\sqrt{85}}e^t,$$

so that $e^t = \frac{7 + \frac{6}{\sqrt{85}}}{\frac{7}{\sqrt{85}}} = \sqrt{85} + 1$,

so that $t = \ln(\sqrt{85} + 1)$, and we have $0 \leq t \leq \ln(\sqrt{85} + 1)$. Other answers are possible. The fact that $r(t)$ traverses a straight line follows from exercise 43.

11.7.47

a. Clockwise motion is for example (other choices are possible) given by $\langle \sin t, \cos t \rangle$. Since the radius is 5 and one lap is completed every twelve seconds, we want the period of the trig functions to be 12. Thus we get $r(t) = \left\langle 5 \sin \frac{\pi}{6}, 5 \cos \frac{\pi}{6} \right\rangle$ for $0 \leq t \leq 12$. Note that the speed is the constant $\frac{5\pi}{6}$, and that $r(0) = (0, 5) = r(12)$.

b. Suppose $r(t) = \langle 5 \sin f(t), 5 \cos f(t) \rangle$; then the initial point is $(0, 5)$ as desired, and

$$v(t) = \langle 5f'(t) \cos f(t), -5f'(t) \sin f(t) \rangle,$$

so that the speed is

$$\sqrt{25f'(t)^2 \cos^2 f(t) + 25f'(t)^2 \sin^2 f(t)} = 5f'(t) \text{ (assuming } f'(t) \geq 0).$$
We want $5f'(t) = e^{-t}$, so that $f''(t) = \frac{1}{2}e^{-t}$ and $f(t) = C - \frac{1}{2}e^{-t}$. Since $r(0) = (0, 5)$, we want $f(0) = 0$, so that $f(t) = 1 - \frac{e^{-t}}{2}$. Thus

$$r(t) = \left(5\sin \frac{1 - e^{-t}}{5}, 5\cos \frac{1 - e^{-t}}{5}\right).$$

This position function has the required properties.

11.7.48 Let the angle be $\alpha$. Then $v(t) = (150\cos \alpha, 150\sin \alpha - 32t)$, and $r(t) = (150t\cos \alpha, 150t\sin \alpha - 16t^2)$. Because we require the ball to land in the hole, we need the point $(390, 40)$ to be on the curve. So $150t\cos \alpha = 390$ and $150t\sin \alpha - 16t^2 = 40$. Thus $t = \frac{390}{150\cos \alpha}$, and therefore $150\cdot \frac{390 - 150\sin \alpha}{150\cos \alpha} - 16 \left(\frac{390}{150\cos \alpha}\right)^2 = 40$. This can be written $390\tan \alpha - \frac{2704}{25}(1 + \tan^2 \alpha) - 40 = 0$, or

$$390\tan \alpha - \frac{2704}{25}(1 + \tan^2 \alpha) - 40 = -\frac{2704}{25}\tan^2 \alpha + 390\tan \alpha - \frac{3704}{25} = 0.$$ 

By the quadratic formula, we have

$$\tan \alpha = \frac{1}{208} \left(375 - \sqrt{81361}\right) \quad \text{and} \quad \tan \alpha = \frac{1}{208} \left(375 + \sqrt{81361}\right).$$

Applying the inverse tangent and then writing the answer in degrees, we obtain $\alpha = 72.514^\circ$ and $\alpha = 23.342^\circ$.

11.7.49 Let the angle be $\alpha$. Then $v(t) = (120\cos \alpha, 120\sin \alpha - 32t)$, and $r(t) = (120t\cos \alpha, 120t\sin \alpha - 16t^2)$. Because we require the ball to land in the hole, we need the point $(420, -50)$ to be on the curve. So $120t\cos \alpha = 420$ and $120t\sin \alpha - 16t^2 = -50$. Thus $t = \frac{420}{120\cos \alpha}$, and therefore $120\cdot \frac{420 - 120\sin \alpha}{120\cos \alpha} - 16 \left(\frac{420}{120\cos \alpha}\right)^2 = -50$. This can be written $420\tan \alpha - 196\sec^2 \alpha + 50 = -196\tan^2 \alpha + 420\tan \alpha - 146 = 0$. By the quadratic formula, we have

$$\tan \alpha = \frac{1}{14} \left(15 - \sqrt{79}\right) \quad \text{and} \quad \tan \alpha = \frac{1}{14} \left(15 + \sqrt{79}\right).$$

Applying the inverse tangent and then writing the answer in degrees, we obtain $\alpha = 59.627^\circ$ and $\alpha = 23.584^\circ$.

11.7.50 Let $s$ be the initial speed of the ball. Note that

$$v(t) = \left(s\frac{\sqrt{2}}{2}, s\frac{\sqrt{2}}{2} - 32t\right) \quad \text{and} \quad r(t) = \left(st\frac{\sqrt{2}}{2}, st\frac{\sqrt{2}}{2} - 16t^2\right).$$

Because we want the second coordinate to be 40 when the first coordinate is 390, we have $s\frac{\sqrt{2}}{2} = 390$ and $s\frac{\sqrt{2}}{2} - 16t^2 = 40$. Solving the first equation for $t$ yields $t = \frac{780}{\sqrt{2}s}$. Putting this value into the second equation yields $s \cdot \frac{780}{\sqrt{2}s} \cdot \frac{\sqrt{2}}{2} - 16 \left(\frac{780}{\sqrt{2}s}\right)^2 = 40$. Solving this last equation for $s$ yields $s = \frac{\sqrt{2}\cdot 780}{\sqrt{3}80} \approx 117.925$.

11.7.51 Let $s$ be the initial speed of the ball. Note that

$$v(t) = \left(s\frac{\sqrt{3}}{2}, s\frac{\sqrt{3}}{2} - 32t\right) \quad \text{and} \quad r(t) = \left(st\frac{\sqrt{3}}{2}, st\frac{\sqrt{3}}{2} - 16t^2\right).$$

Because we want the second coordinate to be $-50$ when the first coordinate is 420, we have $s\frac{\sqrt{3}}{2} = 420$ and $s\frac{\sqrt{3}}{2} - 16t^2 = -50$. Solving the first equation for $t$ yields $t = \frac{840}{\sqrt{3}s}$. Putting this value into the second equation yields $s \cdot \frac{840}{\sqrt{3}s} \cdot \frac{\sqrt{3}}{2} - 16 \left(\frac{840}{\sqrt{3}s}\right)^2 = -50$. Solving this last equation for $s$ yields $s \approx 113.429$.

11.7.52 a. $v(t) = (40, -9.8t)$ and $r(t) = (40t, 8 - 4.9t^2)$. Let $x = 40t$ and $y = 8 - 4.9t^2$. Then the equation of trajectory is $y = 8 - 4.9 \left(\frac{x}{40}\right)^2$. The equation of the outrun surface is $y = -\frac{1}{\sqrt{3}}x$. These curves intersect when $8 - 4.9 \left(\frac{x}{40}\right)^2 = -\frac{1}{\sqrt{3}}x$, which when solved for $x$ yields $\approx 201.487$, and then $y \approx -116.329$. Thus the length of the jump is $\sqrt{201.487^2 + 116.329^2} \approx 232.658$ m.
b. In this scenario, \( \mathbf{v}(t) = \langle 40 - 0.15t, -9.8t \rangle \) and \( \mathbf{r}(t) = \langle 40t - 0.075t^2, 8 - 4.9t^2 \rangle \). Let \( x = 40t - 0.075t^2 \) and \( y = 8 - 4.9t^2 \). Then \( \frac{8-y}{4.9} = t^2 \), so \( x = 40\sqrt{\frac{8-y}{4.9}} - 0.075(\frac{8-y}{4.9}) \). Because we also have \( x = -\sqrt{3}y \), we are looking for the solution to the equation \(-\sqrt{3}y = 40\sqrt{\frac{8-y}{4.9}} - 0.075(\frac{8-y}{4.9}) \). This results in \( y \approx -114.291 \) and \( x \approx 197.958 \). Thus the length of the jump is \( \sqrt{114.291^2 + 197.958^2} \approx 228.582 \) m.

11.7.53 We have \( \mathbf{v}(t) = \langle v_0 \cos \alpha, v_0 \sin \alpha - gt \rangle \), and \( \mathbf{r}(t) = \langle v_0 t \cos \alpha, y_0 + v_0 t \sin \alpha - \frac{1}{2}gt^2 \rangle \). Suppose that object hits the ground at \((a, 0)\). Then \( a = v_0 T \cos \alpha \) and \( 0 = y_0 + v_0 T \sin \alpha - \frac{1}{2}gT^2 \) where \( T \) is the time of the flight. So by the quadratic formula, \( T = \frac{v_0 \sin \alpha + \sqrt{v_0^2 \sin^2 \alpha + 2gy_0}}{g} \). Thus \( a = v_0 T \cos \alpha = v_0 \cos \alpha \left( \frac{v_0 \sin \alpha + \sqrt{v_0^2 \sin^2 \alpha + 2gy_0}}{g} \right) \) is the range. Because the maximum height when \( y_0 = 0 \) is \( \frac{v_0^2 \sin^2 \alpha}{2g} \), the maximum height in this scenario is \( y_0 + \frac{v_0^2 \sin^2 \alpha}{2g} \).

11.7.54

a. Let \( |\mathbf{v}_0| = v_0 \). We have \( \mathbf{v}(t) = \langle v_0 \cos \alpha, v_0 \sin \alpha - gt \rangle \) and \( \mathbf{r}(t) = \langle v_0 t \cos \alpha, v_0 t \sin \alpha - \frac{1}{2}gt^2 \rangle \). Let the point where the object strikes the ground be \((a, -a \tan \theta)\). If \( T \) is the time of the flight, we have \( a = v_0 T \cos \alpha \) and \(-a \tan \theta = v_0 T \sin \alpha - \frac{1}{2}gT^2 \). Eliminating \( a \) from these two equations gives \( T = \frac{2v_0}{g} \cos \alpha \tan \theta + \sin \alpha \). Eliminating \( T \) gives \( a = \frac{2v_0^2 \cos^2 \alpha}{g} \). We have \( v_0 \cos \alpha \left( \frac{v_0 \sin \alpha + \sqrt{v_0^2 \sin^2 \alpha + 2gy_0}}{g} \right) \) is the range. Because the maximum height when \( y_0 = 0 \) is \( \frac{v_0^2 \sin^2 \alpha}{2g} \), the maximum height in this scenario is \( y_0 + \frac{v_0^2 \sin^2 \alpha}{2g} \).

b. Again we have \( \mathbf{v}(t) = \langle v_0 \cos \alpha, v_0 \sin \alpha - gt \rangle \) and \( \mathbf{r}(t) = \langle v_0 t \cos \alpha, v_0 t \sin \alpha - \frac{1}{2}gt^2 \rangle \). Let the point where the object strikes the ground be \((a, a \tan \theta)\). If \( T \) is the time of the flight, we have \( a = v_0 T \cos \alpha \) and \( a \tan \theta = v_0 T \sin \alpha - \frac{1}{2}gT^2 \). Eliminating \( a \) from these two equations gives \( T = \frac{2v_0}{g} (\cos \alpha \tan \theta + \sin \alpha) \). Eliminating \( T \) gives \( a = \frac{2v_0^2 \cos^2 \alpha}{g} (\cos \alpha \tan \theta + \sin \alpha) \). The maximum height occurs when \( v_0 \sin \alpha - gt = 0 \), or \( t = \frac{v_0 \sin \alpha}{g} \). The value of the maximum height is \( y = \frac{v_0^2 \sin^2 \alpha}{g} - \frac{g}{2} \frac{v_0^2 \sin^2 \alpha}{g^2} = \frac{v_0^2 \sin^2 \alpha}{2g} \).

11.7.55 We have \( x = u_0 t + x_0 \), and \( y = -\frac{gt^2}{2} + v_0 t + y_0 \). Eliminating \( t \) gives \( y = -\frac{g}{2} \left( \frac{x - x_0}{v_0} \right)^2 + v_0 \frac{x - x_0}{v_0} + y_0 \), which is a segment of a parabola. If \( y(T) = 0 \), then we have \( \frac{-g}{2} T^2 + v_0 T + y_0 = 0 \), so \( T^2 - \frac{2v_0}{g} T - \frac{2y_0}{g} = 0 \), so by the quadratic formula we have \( T = \frac{v_0}{g} \pm \sqrt{\left(\frac{v_0}{g}\right)^2 + \frac{2y_0}{g}} = \frac{v_0 + \sqrt{v_0^2 + 2gy_0}}{g} \).

11.7.56

a. In right triangle \( ABO \), we have \( \tan \theta = \frac{AB}{OB} = \frac{b \sin t}{a \cos t} = \frac{b}{a} \tan t \).

b. \( \theta = \tan^{-1} \left( \frac{b}{a} \tan t \right) \), so \( \theta'(t) = \frac{1}{1 + (\frac{b}{a} \tan t)^2} \cdot \frac{b}{a} \sec^2 t = \frac{ab}{a^2 \cos^2 t + b^2 \sin^2 t} \).

c. \( \frac{dA}{dt} = \frac{dA}{dt} \cdot \frac{dy}{dt} = \frac{1}{2} |r(\theta(t))|^2 \cdot \frac{ab}{a^2 \cos^2 t + b^2 \sin^2 t} = \frac{1}{2}ab \).

d. Because \( \frac{dA}{dt} \) is a constant, the object sweeps out equal areas in equal times as it moves about the ellipse.
Chapter Review

1. False. For example, \( x = r \cos t, y = r \sin t \) for \( 0 \leq t \leq 2\pi \) and \( x = r \sin t, y = r \cos t \) for \( 0 \leq t \leq 2\pi \) generate the same circle.

b. False. Because \( e^t > 0 \) for all \( t \), this only describes the portion of that line where \( x > 0 \).

c. True. They both describe the point whose cartesian coordinates are \( (3 \cos (-\frac{3\pi}{4}), 3 \sin (-\frac{3\pi}{4})) = (-3 \cos \frac{\pi}{4}, -3 \sin \frac{\pi}{4}) = \left( -\frac{3}{\sqrt{2}}, -\frac{3}{\sqrt{2}} \right) \).

d. False. The given integral counts the inner loop twice.

e. True. Addition of vectors is commutative.

f. False. For example, the vector in the direction of \( \mathbf{i} \) with the length of \( \mathbf{j} \) is \( \mathbf{i} \), but the vector in the direction of \( \mathbf{j} \) with the length of \( \mathbf{i} \) is \( \mathbf{j} \), and \( \mathbf{i} \neq \mathbf{j} \).

g. True, because it then follows that \( \mathbf{u} = -\mathbf{v} \), so the two are parallel.

2. 

a. 

\[
\begin{align*}
\text{b. } &x = t^2 + 4 = (6 - y)^2 + 4. \\
\text{c. } &\text{The curve is a parabola which opens in the positive } x\text{-direction, with vertex at (4, 6).} \\
\text{d. } &\frac{dy}{dx} = \frac{-1}{2t}. \text{ At the point (5, 5) we have } t = 1, \text{ so } \\
&\frac{dy}{dx} = \frac{-1}{2}.
\end{align*}
\]

3. 

a. 

\[
\begin{align*}
\text{b. } &y = 3(e^t)^{-2} = \frac{3}{e^t}. \\
\text{c. } &\text{The curve represents the portion of } \frac{3}{e^t} \text{ for } x > 0. \\
\text{d. } &\frac{dy}{dx} = -\frac{6}{x^2}, \text{ so at (1, 3) we have } \\
&\frac{dy}{dx} = -6.
\end{align*}
\]
4.

b. \((\frac{x}{10})^2 + (\frac{y}{15})^2 = \sin^2 2t + \cos^2 2t = 1\).

c. The curve represents an ellipse traced clockwise.

d. \(\frac{dy}{dx} = -\frac{32\sin 2t}{20\cos 2t}\), and at \(t = \frac{\pi}{6}\) this is equal to \(-\frac{8\sqrt{3}}{5}\).

5.

b. Because \(\ln t^2 = 2\ln t\) for \(t > 0\), we have \(y = 16x\) for \(0 \leq x \leq 2\).

c. The curve represents a line segment from \((0,0)\) to \((2,32)\).

d. \(\frac{dy}{dx} = 16\) for all value of \(x\).

6.

a. At \(t = -\frac{2\pi}{5}\) we get \((\cos(-2\pi), \sin 2\pi) = (1, 0)\), while at \(t = \frac{4\pi}{3}\) we get \((\cos 3\pi, \sin 3\pi) = (-1, 0)\). Thus the initial and terminal points are not the same, so this is not one complete circuit of the unit circle centered at the origin.

b. Since \(\cos^2 t + \sin^2 t = 1\), this is the line \(x + y = 1\) in the first quadrant.

c. This is not a complete circuit. At \(t = 0\) we get the point \((\sin 1, \cos 1)\), and at \(t = \ln 2\pi\) we get \((0, 1)\). Points corresponding to first-quadrant points with angles \(\frac{\pi}{2} - 1 < \theta < \frac{\pi}{2}\) are not traced.

d. This is a complete circuit. It is the same as the function \(\mathbf{r}(t) = (\sin t, \cos t)\) for \(-\pi \leq t \leq \pi\), which traces the circle once. The orientation is clockwise, since \(\mathbf{r}(-\pi) = (0, -1)\) and \(\mathbf{r}\left(-\frac{\pi}{2}\right) = (-1, 0)\).

e. This is a complete circuit. Substituting \(e^t\) for \(t\) gives \((\cos x, \sin x)\) for \(1 \leq e^x \leq e^{2\pi}\), or \(0 \leq x \leq 2\pi\). This is a trace of the circle in the counterclockwise direction.
7. Note that \((\frac{x}{4})^2 + (\frac{y}{3})^2 = 1\). This represents an ellipse generated counterclockwise.

8. Note that \((x+1)^2 + (y-2)^2 = 1\), so \((x+1)^2 + (y-2)^2 = 16\). This is a circle of radius 4 centered at \((-1, 2)\) generated counterclockwise.

9. Note that \((x+3)^2 + (y-6)^2 = 1\). This is the right half of a circle of radius 1 centered at \((-3, 6)\). It is generated clockwise.

10. If we let \(r = 1 + \cos t\), then \(x = r \cos t\) and \(y = r \sin t\). The curve \(r = 1 + \cos t\) is a cardioid.

11. \(x = 3 \sin t, y = 3 \cos t, 0 \leq t \leq 2\pi\).

12. \(x = 3 \cos t, y = 2 \sin t, 0 \leq t \leq \pi\).

13. \(x = 3 \cos t, y = 2 \sin t, -\frac{\pi}{2} \leq t \leq \frac{\pi}{2}\).

14. \(x = t, y = 4t + 11, -\infty \leq t \leq \infty\).

15. From \(P\) to \(Q\), we use \((x(t), y(t)) = tQ + (1 - t)P = (t, t) + (t - 1, 0) = (2t - 1, t)\). So \(x(t) = 2t - 1, y(t) = t, 0 \leq t \leq 1\). From \(Q\) to \(P\), we use \((x(t), y(t)) = tP + (1 - t)Q = (-t, 0) + (1 - t, 1 - t) = (1 - 2t, 1 - t), 0 \leq t \leq 1\). Thus \(x(t) = 1 - 2t, y(t) = 1 - t, 0 \leq t \leq 1\).

16. \(x = t, y = t^3 + 2t, 0 \leq t \leq 2\).

17. \(\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{\sin t}{1 - \cos t} = 2 + \sqrt{3}\). At \(t = \frac{\pi}{6}\), the slope of the tangent line is \(\frac{1}{2 - \sqrt{3}} = 2 + \sqrt{3}\). So the equation of the tangent line is \(y - (1 - \sqrt{3}/2) = (2 + \sqrt{3})(x - (\frac{\pi}{6} - \frac{1}{2}))\), or \(y = (2 + \sqrt{3})x + (2 - \frac{\pi}{3} - \frac{\pi\sqrt{3}}{6})\).

At \(t = \frac{2\pi}{3}\), the slope of the tangent line is \(\sqrt{3}/2\), so the equation of the tangent line is \(y - \frac{3}{2} = \frac{\sqrt{3}}{2}(x - (\frac{2\pi}{3} - \frac{\sqrt{3}}{2}))\), or \(y = \frac{\sqrt{3}}{2} + 2 - \frac{2\pi}{3\sqrt{3}}\).

18.  

19.  

20.  

a. This matches (F). Note that there are 8 solutions to the equation \(3 \sin 4\theta = 3\) for \(0 \leq t \leq 2\pi\), corresponding to the tips of the petals.

b. This matches (D). Note that for every value of \(\theta\) for \(-\frac{\pi}{2} < \theta < \frac{\pi}{2}\), there are two symmetric values for \(r\).

c. This matches (B). Note that this limaçon has its largest value for \(r\) at \(\theta = \frac{3\pi}{2}\).

d. This matches (E). Note that this limaçon has its largest value for \(r\) at \(\theta = 0\).

e. This matches (C). Note that there are 3 unique solutions to \(r = 3 \cos \theta = 3\) for \(0 \leq \theta \leq \pi\) that correspond to the tips of the petals. Note that the curve is generated for \(0 \leq \theta \leq \pi\).

Copyright © 2014 Pearson Education, Inc.
f. This matches (A). Note that $r \to 0$ as $\theta \to \infty$, and $r \to \infty$ as $\theta \to -\infty$.

21. The three curves are

Liz should choose the cardioid, which is $r = 1 - \sin \theta$.

22. The three curves are

Jake should send $r^2 = \cos 2\theta$.

23. Letting $x = r \cos \theta$, $y = r \sin \theta$, and $r^2 = x^2 + y^2$, we have $x^2 + y^2 + 2y - 6x = 0$, which can be written as $x^2 - 6x + 9 + y^2 + 2y + 1 = 10$, or $(x - 3)^2 + (y + 1)^2 = 10$, so this is a circle of radius $\sqrt{10}$ centered at $(3, -1)$.

24.

a. We can write the equation as $r \sin \theta + r \cos \theta = 4$, or $x + y = 4$. This is a straight line with slope $-1$ and $y$-intercept 4.
b. The line goes to infinity when the radius is infinite, so when \( \sin \theta + \cos \theta = 0 \). This happens when \( \tan \theta = -1 \), so for \( \theta = \tan^{-1}(-1) = -\frac{\pi}{4} \) and \( \theta = \pi - \frac{\pi}{4} = \frac{3\pi}{4} \). Thus the curve is traced completely for \( \theta \) between these two values.

25. Because \( x = r \cos \theta \) and \( y = r \sin \theta \), the equation becomes \( (r \cos \theta - 4)^2 + r^2 \sin^2 \theta = 16 \), so \( r^2 \cos^2 \theta - 8r \cos \theta + 16 + r^2 \sin^2 \theta = 16 \), so \( r^2 = 8r \cos \theta \), and thus \( r = 8 \cos \theta \). The complete circle is traced for \( -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2} \).

26. We have \( r \cos \theta = r^2 \sin^2 \theta \), so \( r = \cot \theta \csc \theta \). The whole parabola is traced for \( 0 < \theta < \pi \).

27.

a. There are 4 intersection points.

b. Note that \( 2 - 4 \cos \theta = 1 \) for \( \theta = \cos^{-1} \frac{1}{4} \approx 1.318 \), and \( 2 - 4 \cos \theta = -1 \) for \( \theta = \cos^{-1} \frac{3}{4} \approx 0.723 \). The points of intersection (in polar form) are approximately \((1, \pm 1.318)\) and \((-1, \pm 0.723)\).

28. 

a. By Theorem 11.2, \( \frac{dy}{dx} = \frac{-4 \sin 2\theta \sin \theta + 2 \cos 2\theta \cos \theta}{-4 \sin 2\theta \cos \theta - 2 \cos 2\theta \sin \theta} \). This is 0 when \( -4 \sin 2\theta \sin \theta + 2 \cos 2\theta \cos \theta = -8 \sin^2 \theta \cos \theta + 2 \cos^3 \theta - 2 \sin^2 \theta \cos \theta = 0 \), which occurs for \( \cos \theta = 0 \), and for \( 2 \cos^2 \theta - 10 \sin^2 \theta = 0 \), or \( \tan^2 \theta = \frac{1}{5} \). So there are 6 places with horizontal tangent lines: at \( \theta = \pm \frac{\pi}{2} \), \( \theta = \pm \tan^{-1} \frac{1}{\sqrt{5}} \), and \( \theta = \pi \pm \tan^{-1} \frac{1}{\sqrt{5}} \).

Copyright © 2014 Pearson Education, Inc.
Vertical tangent lines occur when 
\[-4 \sin 2\theta \cos \theta - 2 \cos 2\theta \sin \theta = -8 \sin \theta \cos^2 \theta - 2 \cos^2 \theta \sin \theta + 2 \sin^3 \theta = 0.\]
Thus occurs when \(\sin \theta = 0\), and when \(-8 \cos^2 \theta - 2 \cos^2 \theta + 2 \sin^2 \theta = 0\), which can be written as \(\tan^2 \theta = 5\). So the vertical tangent lines occur at \(\theta = 0\), \(\theta = \pi\) and \(\theta = \pm \tan^{-1} \sqrt{5}\).

b. The curve is at the origin for \(\theta = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \) and \(\frac{7\pi}{4}\). At these values, \(\frac{dy}{dx} = \pm 1\), so the tangent lines have the equation \(y = x\) or \(y = -x\).

c.

![Graph of the curve](image)

29.

a. By Theorem 11.2, \(\frac{dy}{dx} = \frac{2 \cos \theta \sin \theta + (4 + 2 \sin \theta) \cos \theta}{2 \cos \theta \cos \theta - (4 + 2 \sin \theta) \sin \theta} = \frac{4 \cos \theta + 4 \sin \theta \cos \theta}{2 \cos^2 \theta - 2 \sin^2 \theta - 4 \sin \theta}\)

This is 0 when \(\cos \theta = 0\), and when \(4 \sin \theta = -4\), so the only solutions are \(\theta = \frac{\pi}{2}, \frac{3\pi}{2}\). These correspond to the points \((6, \frac{\pi}{2})\) and \((2, \frac{3\pi}{2})\).

The denominator is 0 when \(2 - 4 \sin^2 \theta - 4 \sin \theta = 0\) which occurs (using the quadratic formula) for \(\sin \theta = -\frac{1}{2} + \sqrt{\left(\frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2}\), so there are vertical tangent lines at \(\theta = \sin^{-1} \left(-\frac{1}{2} + \frac{\sqrt{3}}{2}\right)\) and \(\theta = \pi - \sin^{-1} \left(-\frac{1}{2} + \frac{\sqrt{3}}{2}\right)\).

These correspond to the points

\[
\left(4 + 2 \left(-\frac{1}{2} + \frac{\sqrt{3}}{2}\right), \sin^{-1} \left(-\frac{1}{2} + \frac{\sqrt{3}}{2}\right)\right) = \left(3 + \sqrt{3}, \sin^{-1} \left(-\frac{1}{2} + \frac{\sqrt{3}}{2}\right)\right) \approx (4.732, 0.374)
\]

\[
\left(4 + 2 \left(-\frac{1}{2} + \frac{\sqrt{3}}{2}\right), \pi - \sin^{-1} \left(-\frac{1}{2} + \frac{\sqrt{3}}{2}\right)\right) = \left(3 + \sqrt{3}, \pi - \sin^{-1} \left(-\frac{1}{2} + \frac{\sqrt{3}}{2}\right)\right) \approx (4.732, 2.767).
\]

b. The curve is never at the origin, since \(|\sin \theta| \leq 1\) so that \(4 + 2 \sin \theta \geq 2\) for all \(\theta\).
30.

a. By Theorem 11.2, \[ \frac{dy}{dx} = \frac{6 \sin \theta \cdot \sin \theta + (3 - 6 \cos \theta) \cos \theta}{6 \sin \theta \cos \theta - (3 - 6 \cos \theta) \sin \theta} = \frac{6 - 12 \cos^2 \theta + 3 \cos \theta}{12 \sin \theta \cos \theta - 3 \sin \theta}. \]

This is 0 when \( \cos^2 \theta - \frac{1}{4} \cos \theta - \frac{1}{2} = 0 \), which (by the quadratic formula) occurs where \( \cos \theta = \frac{1}{8} \pm \frac{\sqrt{33}}{8} \), so for \( \theta \approx 0.568, 2.206, 4.078, \) and 5.715. These are the points \((2.058, 0.568), (6.558, 2.206), (6.558, 4.078), (-2.058, 5.715)\).

The denominator is 0 when \( \sin \theta = 0 \) and when \( 12 \cos \theta - 3 = 0 \), or \( \theta = \pm \cos^{-1} \frac{1}{4} \). These points are \((9, \pi)\), \((-3, 0)\) = \((3, \pi)\)

\[
\left(3 - 6 \cdot \frac{1}{4}, \cos^{-1} \frac{1}{4}\right) = \left(\frac{3}{2}, \cos^{-1} \frac{1}{4}\right) \approx (1.5, 1.318)
\]

\[
\left(3 - 6 \cdot \frac{3}{4}, -\cos^{-1} \frac{1}{4}\right) = \left(\frac{3}{2}, -\cos^{-1} \frac{1}{4}\right) \approx (1.5, -1.318).
\]

b. The curve is at the origin for \( \theta = \pm \frac{\pi}{3} \), and because \( \tan \frac{\pi}{3} = \sqrt{3} \), the tangent lines have the equations \( y = \pm \sqrt{3}x \).

c.
31.

a. Note that the whole curve is generated for $\frac{-\pi}{4} \leq \theta \leq \frac{\pi}{4}$, so we restrict ourselves to that domain. Write the equation as $r = \sqrt{2} \cos 2\theta$. Then

$$\frac{dy}{d\theta} = \sqrt{2} \cos 2\theta \cos \theta - \sin \theta \frac{2 \sin 2\theta}{\sqrt{2} \cos 2\theta} = \frac{\cos \theta}{\sqrt{2} \cos 2\theta} (2 \cos 2\theta - 4 \sin^2 \theta) = \frac{\cos \theta}{\sqrt{2} \cos 2\theta} (2 - 8 \sin^2 \theta)$$

$$\frac{dx}{d\theta} = -\sqrt{2} \cos 2\theta \sin \theta - \cos \theta \frac{2 \sin 2\theta}{\sqrt{2} \cos 2\theta} = \frac{\sin \theta}{\sqrt{2} \cos 2\theta} (-4 \cos^2 \theta - 2 \cos 2\theta) = \frac{(2 - 8 \cos^2 \theta) \sin \theta}{\sqrt{2} \cos 2\theta}.$$

Thus

$$\frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta} = \cot \theta \left( \frac{1 - 4 \sin^2 \theta}{1 - 4 \cos^2 \theta} \right).$$

This expression is 0 on the given domain only for $\sin^2 \theta = \frac{1}{4}$, so there are horizontal tangent lines at $\theta = \pm \frac{\pi}{6}$. There are vertical tangent lines on the given domain only for $\theta = 0$. In cartesian coordinates, the lines are $x = \pm \sqrt{2}$.

b. The curve is at the origin for $\theta = \pm \frac{\pi}{4}$, and because $\tan \frac{\pi}{4} = 1$, the tangent lines have the equations $y = \pm x$.

c.

32.

One leaf is traced for $0 \leq \theta \leq \frac{\pi}{4}$, so

$$A = 8 \cdot \frac{1}{2} \int_0^{\pi/4} (3 \sin 4\theta)^2 \, d\theta = 36 \int_0^{\pi/4} \sin^2 4\theta \, d\theta$$

$$= 36 \left( \left. \left(-\frac{1}{8} \sin 4\theta \cos 4\theta + \frac{\theta}{2} \right) \right|_0^{\pi/4} \right)$$

$$= 36 \cdot \frac{\pi}{8} = \frac{9\pi}{2}.$$

Copyright © 2014 Pearson Education, Inc.
33.

The area is given by

\[
A = \frac{1}{2} \int_0^{2\pi} (3 - \cos \theta)^2 \, d\theta = \frac{1}{2} \int_0^{2\pi} (9 - 6 \cos \theta + \cos^2 \theta) \, d\theta
\]

\[
= \left. \frac{1}{2} \left( 9\theta - 6 \sin \theta + \frac{1}{2} (\cos \theta \sin \theta + \theta) \right) \right|_0^{2\pi}
\]

\[
= \frac{1}{2} (18\pi + \pi) = \frac{19\pi}{2}.
\]

34.

The curves intersect at \( \theta = \pm \frac{\pi}{2} \). By symmetry, the area is twice the area outside the circle and inside the limaçon between 0 and \( \frac{\pi}{2} \). We have

\[
A = 2 \cdot \frac{1}{2} \int_0^{\pi/2} ((2 + \cos \theta)^2 - 2^2) \, d\theta = \int_0^{\pi/2} (4 \cos \theta + \cos^2 \theta) \, d\theta
\]

\[
= \left( 4 \sin \theta + \frac{1}{2} (\cos \theta \sin \theta + \theta) \right) \left|_0^{\pi/2} \right.
\]

\[
= 4 + \frac{\pi}{4}.
\]

35.

The curves intersect at \( \theta = \pm \frac{1}{2} \cos^{-1} \frac{1}{16} \). By symmetry the total desired area is

\[
A = 4 \cdot \frac{1}{2} \int_0^{\cos^{-1}(1/16)/2} (4 \cos 2\theta - \frac{1}{4}) \, d\theta
\]

\[
= 2 \left( 2 \sin 2\theta - \frac{\theta}{4} \right) \left|_0^{\cos^{-1}(1/16)/2} \right.
\]

\[
= \frac{1}{4} \sqrt{255} - \frac{\cos^{-1}(1/16)}{4}.
\]
36. The region looks like

\[
\begin{align*}
4 \cdot \frac{1}{2} \int_0^{\pi/2} (1 - \cos \theta)^2 d\theta &= 2 \int_0^{\pi/2} \left( 1 - 2 \cos \theta + \frac{1}{2} \cos 2\theta \right) d\theta \\
&= \left( 3\theta - 4 \sin \theta + \frac{1}{2} \sin 2\theta \right) \bigg|_0^{\pi/2} \\
&= \frac{3\pi}{2} - 4 + 0 - (0 - 0 + 0) = \frac{3\pi}{2} - 4.
\end{align*}
\]

37. The region looks like

\[
\begin{align*}
A &= 2 \cdot \frac{1}{2} \int_0^{\pi/2} \left( (1 + \cos \theta)^2 - (1 - \cos \theta)^2 \right) d\theta \\
&= \int_0^{\pi/2} (1 + 2 \cos \theta + \cos^2 \theta - 1 - 2 \cos \theta - \cos^2 \theta) d\theta \\
&= 4 \int_0^{\pi/2} \cos \theta d\theta \\
&= 4 \sin \theta \bigg|_0^{\pi/2} = 4.
\end{align*}
\]

42. \( \mathbf{u} - 3 \mathbf{v} = \langle 2, 4 \rangle - \langle -18, 30 \rangle = \langle 20, -26 \rangle. \)

43. \( |\mathbf{u} + \mathbf{v}| = |\langle -4, 14 \rangle| = \sqrt{16 + 196} = \sqrt{212} = 2\sqrt{53}. \)

44. \( \frac{\mathbf{u}}{|\mathbf{u}|} = \frac{1}{\sqrt{4+16}} \langle 2, 4 \rangle = \frac{1}{2\sqrt{5}} \langle 2, 4 \rangle = \left\langle \frac{1}{\sqrt{5}}, \frac{2}{\sqrt{5}} \right\rangle. \)

45. \( |\mathbf{v}| = \sqrt{36 + 100} = \sqrt{136} = 2\sqrt{34}. \) So the desired vector is \( \frac{2}{2\sqrt{34}} \langle -6, 10 \rangle = \left\langle -\frac{6}{\sqrt{34}}, \frac{10}{\sqrt{34}} \right\rangle. \) The vector \( \left\langle \frac{6}{\sqrt{34}}, -\frac{10}{\sqrt{34}} \right\rangle \) also has the desired property.

46. We must have \( a + 3b = -2 \) and \( 2a + b = 6. \) This has the solution \( a = 4, \ b = -2, \) so that \( \langle -2, 6 \rangle = 4 \langle 1, 2 \rangle - 2 \langle 3, 1 \rangle. \)

47. Note that northwest is an angle of \( \frac{3\pi}{4}, \) and \( \langle \cos \frac{3\pi}{4}, \sin \frac{3\pi}{4} \rangle = \left\langle -\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \right\rangle. \) Then

a. \( \mathbf{v} = 550 \left\langle -\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \right\rangle = \langle -275\sqrt{2}, 275\sqrt{2} \rangle. \)

b. \( \mathbf{v} = 550 \left\langle -\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \right\rangle + \langle 0, 40 \rangle = \langle -275\sqrt{2}, 275\sqrt{2} + 40 \rangle. \)
48.

Adding the vectors gives \( \mathbf{F} = \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 = \langle -10, 0 \rangle + \langle 0, 40 \rangle + \langle -50, 20 \rangle = \langle -60, 60 \rangle \). Then \( |\mathbf{F}| = 60\sqrt{(-1)^2 + 1^2} = 60\sqrt{2} \).

49. Let north be the positive \( x \) direction and up be the positive \( y \) direction. Then the velocity of the probe is \( \langle 4, -60 + 10 \rangle = \langle 4, -50 \rangle \). The magnitude of the velocity (the speed) is \( \sqrt{4^2 + 50^2} = \sqrt{2516} \approx 50.160 \text{ m/s} \). The direction is about \( \cos^{-1} \frac{4}{\sqrt{2516}} \approx 85.426^\circ \) below the horizontal in the northerly horizontal direction.

50. The vector parallel to the hillside makes an angle of \( 60^\circ \) with the vertical, so the component parallel to the hillside is \( |\mathbf{F}_{\text{par}}| = 180 \cos 60^\circ = 90 \). The vector perpendicular to the hillside makes an angle of \( 30^\circ \) with the vertical, so the component perpendicular to the hillside is \( |\mathbf{F}_{\text{perp}}| = 180 \cos 30^\circ = 90\sqrt{3} \).

51.

The curve is a circle of radius 4 with center \((0, 0)\).
Chapter 11. Parametric and Polar Curves

52. Note that if \((x, y) = (e^t, 2e^t)\), then \(y = 2x\). So this is the line \(y = 2x\); since \(e^t > 0\), it is the portion of that line in the first quadrant.

53. Note that \(2x^2 + y^2 = 2\), so this is an ellipse.

54. The initial velocity of the ball is given by \(\left\langle s \frac{\sqrt{3}}{2}, \frac{s}{2} \right\rangle\) where \(s\) is the initial speed of the ball. We have 
\[
\mathbf{r}(t) = \left\langle s \frac{\sqrt{3}}{2} \cdot t, -16t^2 + \frac{s}{2} \cdot t + 2 \right\rangle.
\]
We know that \(s \frac{\sqrt{3}}{2} \cdot t = 10\) when \(-16t^2 + \frac{s}{2} \cdot t + 2 = 0\). Solving the first equation for \(t\) gives 
\[
t = \frac{20}{s \sqrt{3}}.
\]
Putting this into the second equation gives 
\[
-16 \left( \frac{20}{s \sqrt{3}} \right)^2 + \frac{s}{2} \cdot \frac{20}{s \sqrt{3}} = -2.
\]
Solving for \(s\) gives \(s \approx 16.566\) feet per second.

55. a. The trajectory is given by \(\mathbf{r}(t) = \left\langle 50t, 50t - 16t^2 \right\rangle\). The projectile is at \(y = 30\) when \(-16t^2 + 50t - 30 = 0\), which occurs at 
\[
t = \frac{1}{16} (25 \pm \sqrt{145}) \approx 0.810\text{ and } 2.315.
\]
At these times, \(x = 50t \approx 40.495\) and 115.755. The first time represents when the projectile has not yet reached the cliff, while the second time represents when the projectile lands on the cliff, so the coordinates of the landing spot are approximately (115.755, 30).

Copyright © 2014 Pearson Education, Inc.
b. The maximum height occurs where \( y' = 0 \), which occurs for \( 50 - 32t = 0 \), or \( t = \frac{25}{16} \). The maximum height is \( 50 \cdot \frac{25}{16} - 16 \left( \frac{25}{16} \right)^2 = \frac{39063}{16} \) feet.

c. As mentioned above, the flight ends at \( t \approx 2.315 \) seconds.

d. The length of the trajectory is \( \int_0^{3.315} \sqrt{x'(t)^2 + y'(t)^2} \, dt = \int_0^{3.315} \sqrt{2500 + (50 - 32t)^2} \, dt \).

e. \( L \approx 128.710 \) feet.

f. Suppose the launch angle is \( \theta \). Then \( r(t) = (50\sqrt{2} \cos \alpha, 50\sqrt{2} \sin \alpha - 16t^2) \). We want \( y \geq 30 \) when \( x = 50 \). We know that \( x = 50 \) when \( t = \sec \frac{\theta}{\sqrt{2}} \). At this time, we have \( y = 50 \tan \alpha - 8 \sec^2 \alpha \). This expression is greater than or equal to 30 for approximately \( 41.523^\circ \leq \alpha \leq 79.441^\circ \).

56. Because \( \cos 45^\circ = \sin 45^\circ = \frac{\sqrt{2}}{2} \), the initial velocity of the ball is given by \( s \left( \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \right) \) where \( s \) is the initial speed. Then \( r(t) = \left( s \frac{\sqrt{2}}{2} \cdot t, -16t^2 + s \frac{\sqrt{2}}{2} \cdot t + 6 \right) \). We know that \( s \frac{\sqrt{2}}{2} \cdot t = 15 \) when \( -16t^2 + s \frac{\sqrt{2}}{2} \cdot t + 6 = 10 \). Solving the first equation for \( t \) gives \( t = \frac{30}{s \sqrt{2}} \). Putting this into the second equation gives \(-16 \left( \frac{30}{s \sqrt{2}} \right)^2 + s \frac{\sqrt{2}}{2} \cdot \frac{30}{s \sqrt{2}} = 4 \). Solving for \( s \) gives \( s \approx 25.584 \) feet per second.

57. We get
\[
L = \int_0^2 \sqrt{x'(t)^2 + y'(t)^2} \, dt = \int_0^2 \sqrt{9t^4 + 64t^2} \, dt = \int_0^2 t \sqrt{9t^2 + 64} \, dt.
\]
Use the substitution \( u = 9t^2 + 64 \), so that \( du = 18t \, dt \). Then \( t = 0 \) corresponds to \( u = 64 \) while \( t = 2 \) corresponds to \( u = 100 \), and we get for the integral
\[
L = \frac{1}{18} \int_{64}^{100} \sqrt{u} \, du = \frac{1}{27} u^{3/2} \bigg|_{64}^{100} = \frac{1}{27} (1000 - 512) = \frac{488}{27}.
\]

58. We have
\[
L = \int_0^2 \sqrt{x'(t)^2 + y'(t)^2} \, dt = \int_0^2 \sqrt{(t^2/2)^2 + (t^2)^2} \, dt = \int_0^2 \sqrt{t^4 + t^2} \, dt = \int_0^2 t^2 \sqrt{t^2 + 1} \, dt.
\]
Use the substitution \( u = t^2 + 1 \), so that \( du = 2t \, dt \). Then \( t = 0 \) corresponds to \( u = 1 \) while \( t = 2 \) corresponds to \( u = 9 \), and we get for the integral
\[
L = \frac{1}{3} \int_1^9 \sqrt{u} \, du = \frac{2}{9} u^{3/2} \bigg|_1^9 = \frac{2}{9} (27 - 1) = \frac{52}{9}.
\]

59. We have
\[
L = \int_0^{\pi/6} \sqrt{x'(t)^2 + y'(t)^2} \, dt
\]
\[
= \int_0^{\pi/6} \sqrt{1^2 + \tan^2 t} \, dt
\]
\[
= \int_0^{\pi/6} \sec t \, dt
\]
\[
= \ln |\sec t + \tan t| \bigg|_0^{\pi/6}
\]
\[
= \ln \left( \frac{2}{\sqrt{3}} + \frac{1}{\sqrt{3}} \right) = \ln \sqrt{3} = \frac{1}{2} \ln 3.
\]

60. \( L = \int_0^{2\pi} \sqrt{(3 + 2 \cos \theta)^2 + (-2 \sin \theta)^2} \, d\theta = \int_0^{2\pi} \sqrt{13 + 12 \cos \theta} \, d\theta \approx 21.010 \).

61. \( L = \int_0^{2\pi} \sqrt{(3 - 6 \cos \theta)^2 + (6 \sin \theta)^2} \, d\theta = \int_0^{2\pi} 3\sqrt{5 - 4 \cos \theta} \, d\theta \approx 40.095 \).
62.

a. We have \( \lim_{t \to 0} (t + 1, t^2 - 3) = (0 + 1, 0^2 - 3) = (1, -3) \). However, since both \( t \) and \( t^2 \to \infty \) as \( t \to \infty \), we see that \( \lim_{t \to \infty} \mathbf{r}(t) \) does not exist.

b. \( \mathbf{r}'(t) = (1, 2t) \), so that \( \mathbf{r}'(0) = (1, 2 \cdot 0) = (1, 0) \).

c. \( \mathbf{r}''(t) = (0, 2) \).

d. \( \int \mathbf{r}(t) \, dt = \int (t + 1, t^2 - 3) \, dt = \left( \frac{1}{2}t^2 + t, \frac{1}{3}t^3 - 3t \right) + \mathbf{C} \).

63.

a. We have \( \lim_{t \to 0} \left( \frac{1}{2t+1}, \frac{t}{t+1} \right) = \left( \frac{1}{2 \cdot 0 + 1}, \frac{0}{0 + 1} \right) = (1, 0) \), and
\[
\lim_{t \to \infty} \left( \frac{1}{2t+1}, \frac{t}{t+1} \right) = \lim_{t \to \infty} \left( \frac{1}{2t + 1}, \frac{1}{1 + 1/t} \right) = (0, 1) .
\]

b. \( \mathbf{r}'(t) = \frac{d}{dt} \left( \frac{2t+1}{1}, \frac{t}{1 + t} \right) = -2(2t+1)^{-2} \frac{t+1 - t}{(t+1)^2} = \left( -2, \frac{1}{(t+1)^2} \right) \). Thus, \( \mathbf{r}'(0) = \left( -2, 1 \right) \).

c. \( \mathbf{r}''(t) = \frac{d}{dt} \left( -2(2t+1)^{-2}, (t+1)^{-2} \right) = \left( 8(2t+1)^{-3}, -2(t+1)^{-3} \right) = \left( \frac{8}{(2t+1)^3}, -\frac{2}{(t+1)^3} \right) \).

d. \( \int \mathbf{r}(t) \, dt = \int \left( \frac{1}{2t+1}, \frac{t}{t+1} \right) \, dt = \int \left( \frac{1}{2t+1}, 1 - \frac{1}{t+1} \right) \, dt = \left( \frac{1}{2} \ln |2t+1|, t - \ln |t+1| \right) + \mathbf{C} .

64.

a. We have (using L'Hôpital's rule for the second limit)
\[
\lim_{t \to 0} \left( e^{-2t}, te^{-t} \right) = \left( e^{-2 \cdot 0}, 0 \cdot e^{-0} \right) = (1, 0)
\]
\[
\lim_{t \to \infty} \left( e^{-2t}, te^{-t} \right) = \lim_{t \to \infty} \left( \frac{1}{e^{2t}}, \frac{t}{e^t} \right) = \lim_{t \to \infty} \left( \frac{1}{e^{2t}}, \frac{1}{e^t} \right) = (0, 0) .
\]

b. \( \mathbf{r}'(t) = \left( -2e^{-2t}, e^{-t} - te^{-t} \right) = \left( -2e^{-2t}, (1 - t)e^{-t} \right) \), so that \( \mathbf{r}'(0) = (0, 1) \).

c. \( \mathbf{r}''(t) = \left( 4e^{-2t}, -(1 - t)e^{-t} + (-1) \cdot e^{-t} \right) = \left( 4e^{-2t}, (t - 2)e^{-t} \right) \).

d. Using integration by parts for the second component, we get
\[
\int \mathbf{r}(t) \, dt = \int \left( e^{-2t}, te^{-t} \right) \, dt = \left( \frac{1}{2} e^{-2t}, (-t - 1)e^{-t} \right) + \mathbf{C} .
\]

65.

a. We have \( \lim_{t \to 0} \left( \sin 2t, 3 \cos 4t \right) = \left( \sin 0, 3 \cos 0 \right) = (0, 3) . \) Since both \( \sin 2t \) and \( \cos 4t \) oscillate between \( -1 \) and \( 1 \) as \( t \to \infty \), the limit as \( t \to \infty \) does not exist.

b. \( \mathbf{r}'(t) = \left( 2 \cos 2t, -12 \sin 4t \right) \), so that \( \mathbf{r}'(0) = \left( 2 \cos 0, -12 \sin 0 \right) = (2, 0) \).

c. \( \mathbf{r}''(t) = \left( -4 \sin 2t, -48 \cos 4t \right) \).

d. \( \int \mathbf{r}(t) \, dt = \int \left( \sin 2t, 3 \cos 4t \right) \, dt = \left( -\frac{1}{2} \cos 2t, \frac{3}{4} \sin 4t \right) + \mathbf{C} .
\]
AP Practice Questions

Multiple Choice

1. B is correct. Since \(x = 2t\), substitute \(t = \frac{x}{2}\) in the second equation to get \(y = -3 \cdot \frac{x}{2} + 3\); multiply both sides by 2 to clear fractions, and collect terms to get \(3x + 2y = 6\).

2. B is correct. The object is moving in the negative \(x\)-direction when the \(x\) component of its velocity is negative. Since \(r(t) = \left\langle \frac{1}{t^2+1}, \frac{1}{t+6} \right\rangle\), differentiating gives \(v(t) = \left\langle -\frac{2t}{(t^2+1)^2}, -\frac{1}{(t+6)^2} \right\rangle\). Clearly the \(x\) component is negative precisely when \(t > 0\), so that the time interval is \((0, 5]\).

3. E is correct. We have

\[ L = \int_0^1 \sqrt{x'(t)^2 + y'(t)^2} \, dt = \int_0^1 \sqrt{16t^2 + 9t^4} \, dt = \int_0^1 t\sqrt{16 + 9t^2} \, dt. \]

Now use the substitution \(u = 16 + 9t^2\), so that \(du = 18t \, dt\). Then \(x = 0\) corresponds to \(u = 16\), and \(x = 1\) to \(u = 25\), so the integral becomes

\[ L = \frac{1}{18} \int_{16}^{25} u^{1/2} \, du = \frac{1}{27} u^{3/2} \bigg|_{16}^{25} = \frac{125 - 64}{27} = \frac{61}{27}. \]

4. E is correct. Recall that the area under a polar curve for \(\theta \in [\alpha, \beta]\) is \(\frac{1}{2} \int_{\alpha}^{\beta} f(\theta)^2 \, d\theta\). Thus

\[ \frac{9}{2} \int_0^{\pi/4} \sin^2 4\theta \, d\theta = \frac{1}{2} \int_0^{\pi/4} 9\sin^2 4\theta \, d\theta = \frac{1}{2} \int_0^{\pi/4} (3\sin 4\theta)^2 \, d\theta. \]

So this is the area under the curve \(r = 3\sin 4\theta\) from \(\theta = 0\) to \(\theta = \frac{\pi}{4}\); a plot of this curve with the relevant region shaded is

[Diagram of polar curve with shaded region]
5. D is correct. A graph of the curve is shown. The area under the curve is twice the area from \( \theta = 0 \) to \( \theta = \pi \), so we have

\[
A = 2 \cdot \frac{1}{2} \int_0^\pi (1 - \cos \theta)^2 \, d\theta
\]

\[
= \int_0^\pi (1 - 2 \cos \theta + \cos^2 \theta) \, d\theta
\]

\[
= \int_0^\pi \left( \frac{3}{2} - 2 \cos \theta + \frac{1}{2} \cos 2\theta \right) \, d\theta
\]

\[
= \left( \frac{3}{2} \theta - 2 \sin \theta + \frac{1}{4} \sin 2\theta \right) \bigg|_0^\pi
\]

\[
= \frac{3\pi}{2}.
\]

6. E is correct. Since \( \mathbf{r}(t) = \langle t, 1 - 2t + t^2 \rangle \), we have \( \mathbf{r}'(t) = \langle 1, 2t - 2 \rangle \), so that the speed is \( |\mathbf{r}'(t)| = \sqrt{1^2 + (2t - 2)^2} = \sqrt{4t^2 - 8t + 5} \). The speed is minimized when this quantity is minimized, which occurs when \( f(t) = 4t^2 - 8t + 5 \) is minimized. We have \( f'(t) = 8t - 8 \), so that \( f' \) is zero when \( t = 1 \). Checking values on either side of \( t = 1 \) confirms that \( t = 1 \) is a local minimum.

7. B is correct. Given \( \mathbf{v}(t) \), we have

\[
\mathbf{r}(t) = \int \mathbf{v}(t) \, dt = \int (-16t + 40, 0) \, dt = (-8t^2 + 40t, 0) + \mathbf{C}.
\]

Since \( \mathbf{r}(0) = (0, 10) = (-8 \cdot 0^2 + 40 \cdot 0, 0) + \mathbf{C} \), we get \( \mathbf{C} = (0, 10) \), so that \( \mathbf{r}(t) = (-8t^2 + 40t, 10) \).

8. D is correct. Using the formula for arc length of a polar curve, we get

\[
L = \int_0^{\sqrt{5}} \sqrt{f'(\theta)^2 + f''(\theta)^2} \, d\theta = \int_0^{\sqrt{5}} \sqrt{\theta^4 + 40^2} \, d\theta = \int_0^{\sqrt{5}} \theta \sqrt{\theta^2 + 4} \, d\theta.
\]

Now use the substitution \( u = \theta^2 + 4 \), so that \( du = 2\theta \, d\theta \). Then \( \theta = 0 \) corresponds to \( u = 4 \), and \( \theta = \sqrt{5} \) to \( u = 9 \), and we get

\[
L = \frac{1}{2} \int_4^9 u^{1/2} \, du = \frac{1}{3} u^{3/2} \bigg|_4^9 = \frac{1}{3} (27 - 8) = \frac{19}{3}.
\]
9. C is correct. The slope of the tangent is
\[ \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{e^{t^2} - 2}{3\cos(3t - 6)}. \]
The point (0, 1) corresponds to \( t = 2 \), so evaluating the derivative at \( t = 2 \), we see that the slope of the tangent at (0, 1) is \( \frac{e^2 - 2}{3\cos 0} = \frac{1}{3} \). Thus the equation of the tangent line is \( y - 1 = \frac{1}{3}x \), or \( y = \frac{1}{3}x + 1 \).

10. C is correct. A plot of the region is

The region is traced out for \( \theta \in [0, \pi] \), so that the area between the two curves is
\[
A = \frac{1}{2} \int_{0}^{\pi} \left( (1 + \sin \theta)^2 - 1^2 \right) d\theta \\
= \frac{1}{2} \int_{0}^{\pi} (2\sin \theta + \sin^2 \theta) d\theta \\
= \frac{1}{2} \int_{0}^{\pi} \left( 2\sin \theta + \frac{1}{2} - \frac{1}{2} \cos 2\theta \right) d\theta \\
= \frac{1}{2} \left( -2\cos \theta + \frac{1}{2} \theta - \frac{1}{4} \sin 2\theta \right) \bigg|_{0}^{\pi} \\
= \frac{1}{2} \left( 4 + \frac{\pi}{2} \right) = 2 + \frac{\pi}{4} \approx 2.785.
\]

11. D is correct. The slope of the tangent line is
\[ \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{\cos t}{-2\sin t} = -\frac{1}{2} \cot t. \]
Thus the slope of the tangent line is 1 when \( \cot t = -2 \), or \( \tan t = -\frac{1}{2} \). Solving numerically gives \( t \approx -0.464 \) and \( t \approx 2.678 \).

12. D is correct. By Theorem 11.2, the slope at \( \theta = 0 \) is (with \( f(\theta) = 1 - \sin \theta \))
\[ \frac{dy}{dx} = \frac{f'(0)\sin 0 + f(0)\cos 0}{f'(0)\cos 0 - f(0)\sin 0} = \frac{1}{-1} = -1. \]
Free Response

1. a. The velocity vector is \( \mathbf{v}(t) = \langle u_0, -gt + v_0 \rangle = \langle 10, -9.8t + 30 \rangle \).
   
b. The position vector is \( \mathbf{r}(t) = \langle u_0t + x_0, -\frac{1}{2}gt^2 + v_0t + y_0 \rangle = \langle 10t, -4.9t^2 + 30t + 10 \rangle \).
   
c. The rocket returns to the ground when \(-4.9t^2 + 30t + 10 = 0\); solving numerically gives \( t \approx -0.317 \) and \( t \approx 6.439 \). Discarding the negative root, we see that the rocket hits the grounds at \( t \approx 6.439 \) s.
   
d. At \( t \approx 6.439 \), we have \( x(t) = 10t \approx 64.39 \) m.

2. a. The object is moving in the positive \( x \)-direction when \( x'(t) = 2(1 - e^{-t}) > 0 \). This happens when \( e^{-t} < 1 \), so for \( t > 0 \).
   
b. The object is moving in the positive \( y \)-direction when \( y'(t) = -\frac{4}{2t+1} > 0 \). Since \( t \geq 0 \), this never happens, so that the object is never moving in the positive \( y \)-direction.
   
c. At \( t = 2 \), the velocity is \( \mathbf{v}(2) = \langle 2(1 - e^{-2}), -\frac{4}{5} \rangle \), so that its speed is
   \[
   \sqrt{4(1 - e^{-2})^2 + \frac{16}{25}} \approx 1.905 \text{ m/s}.
   \]
   
d. Differentiating gives \( \mathbf{a}(t) = \langle 2e^{-t}, \frac{8}{(2t+1)^2} \rangle \), so that at \( t = 2 \), the acceleration is \( \langle \frac{2}{e^2}, \frac{8}{25} \rangle \) m/s\(^2\).
   
e. Integrate \( \mathbf{v}(t) \) to get
   \[
   \mathbf{r}(t) = \int \mathbf{v}(t) \, dt = \int \langle 2(1 - e^{-t}), -\frac{4}{2t+1} \rangle \, dt = \langle 2(t + e^{-t}), -2\ln(2t+1) \rangle + \mathbf{C}.
   \]
   
   Since \( \mathbf{r}(0) = \langle 8, 6 \rangle = \langle 2(0 + e^0), -2\ln 1 + 2, 0 \rangle + \mathbf{C} = \langle 2, 0 \rangle + \mathbf{C} \), we have \( \mathbf{C} = \langle 6, 6 \rangle \) and thus \( \mathbf{r}(t) = \langle 2(t + e^{-t}) + 6, 6 - 2\ln(2t+1) \rangle \). Then at \( t = 2 \), we have
   \[
   \mathbf{r}(2) = \langle 2(2 + e^{-2}) + 6, 6 - 2\ln 5 \rangle \approx \langle 10.271, 2.781 \rangle \text{ m}.
   \]

3. a. The object is moving in the negative \( x \)-direction when \( x'(t) = \sin t < 0 \), so for \( \pi < t < 2\pi \).
   
b. The object is moving in the negative \( y \)-direction when \( y'(t) = e^{\cos t} - 1 < 0 \), or when \( e^{\cos t} < 1 \). Taking logs gives \( \cos t < 0 \), which happens for \( \pi < t < \frac{3\pi}{2} \).
   
c. At \( t = \pi \), the speed is
   \[
   |\mathbf{v}(\pi)| = \sqrt{(\sin \pi)^2 + (e^{\cos \pi} - 1)^2} = \sqrt{\left(\frac{1}{e} - 1\right)^2} = 1 - \frac{1}{e} \text{ ft/s}.
   \]
   
d. The distance traveled is the arc length of the curve, which is (evaluating numerically)
   \[
   L = \int_0^{2\pi} \sqrt{\sin^2 t + (e^{\cos t} - 1)^2} \, dt \approx 6.743 \text{ ft}.
   \]
   
e. The displacement of the object in the \( y \) direction between \( t = 0 \) and \( t = 1 \) is
   \[
   \int_0^1 (e^{\cos t} - 1) \, dt \approx 1.342 \text{ ft}.
   \]
   
   Since the object starts at \( y = 0 \), its \( y \)-coordinate at \( t = 1 \) is \( \approx 1.342 \) ft.
4.  
   a. The velocity vector is \( \mathbf{v}(t) = \mathbf{r}'(t) = (8, -32t + 64). \)

   b. The projectile strikes the ground when \( y(t) = 0. \) Solving \(-16t^2 + 64t = 0\) gives \( t = 0, \) corresponding to the launch time, and \( t = 4. \) The projectile strikes the ground at \( t = 4 \) s.

   c. At \( t = 4, \) we have \( x(t) = 8 \cdot 4 = 32, \) so the projectile travels 32 feet along the ground.

   d. The maximum height is achieved when the projectile stops rising, which is when \( y'(t) = -32t + 64 = 0, \) or when \( t = 2. \) At \( t = 2, \) the height of the projectile is \( y(2) = -16 \cdot 2^2 + 64 \cdot 2 = 64 \) feet.

5.  
   a. The slope of the tangent line is 

\[
\frac{dy}{dx} = \frac{dy}{dt} \cdot \frac{dt}{dx} = \frac{4 \cos t}{-3 \sin t} = -\frac{4}{3} \cot t.
\]

   The tangent line has slope \( \frac{4}{3} \) when \( \cot t = -1. \) This happens for \( t = \frac{3\pi}{4} \) and \( t = \frac{7\pi}{4}. \) The corresponding points on the curve are

\[
\left(3 \cos \frac{3\pi}{4}, 4 \sin \frac{3\pi}{4}\right) = \left(-\frac{3}{\sqrt{2}}, \frac{4}{\sqrt{2}}\right), \quad \left(3 \cos \frac{7\pi}{4}, 4 \sin \frac{7\pi}{4}\right) = \left(\frac{3}{\sqrt{2}}, -\frac{4}{\sqrt{2}}\right).
\]

   b. The tangent line is vertical when \( \frac{dx}{dt} = 0, \) so when \( -3 \sin t = 0. \) This happens for \( t = 0, t = \pi, \) and \( t = 2\pi. \) The corresponding points on the curve are \( (3,0) \) and \( (-3,0) \) (note that \( (3,0) \) is reached for \( t = 0 \) and for \( t = 2\pi \)).

   c. The length of the curve is

\[
L = \int_0^{2\pi} \sqrt{x'(t)^2 + y'(t)^2} \, dt = \int_0^{2\pi} \sqrt{9 \sin^2 t + 16 \cos^2 t} \, dt = \int_0^{2\pi} \sqrt{9 + 7 \cos^2 t} \, dt.
\]

   d. The object is moving entirely in the \( x \) direction when its north-south velocity is zero, which means that \( \frac{dy}{dt} = 0. \) This happens when \( 4 \cos t = 0, \) so when \( t = \frac{\pi}{2} \) and \( t = \frac{3\pi}{2}. \)
